Introduction

Public procurement is a key sector of the EU economy accounting for about 16% of GDP. Modernising and opening up procurement markets across borders – including through the expansion of electronic procurement - is crucial to Europe's competitiveness and for creating new opportunities for EU businesses.

Using information technology appropriately can contribute to reducing costs, improving efficiency and removing barriers to trade, which will ultimately result in savings for taxpayers. The Directives adopted in March 2004 as part of the public procurement legislative package provide a legal framework aimed at boosting the development and use of electronic procurement.

The Commission has issued an Action Plan in order to help Member States implement the Directives correctly, so as to release the full potential of electronic public procurement. Read the press release.

2.2. Achieve greater efficiency in procurement, improve governance and competitiveness ………………………………………………………………………………………...9

2.3. Work towards an international framework for electronic public procurement…….13

3. Implementation of e-procurement Action Plan and Monitoring…………………...13

1. INTRODUCTION

This Communication proposes an Action Plan for the implementation of the new legal framework for electronic public procurement adopted in April 2004 as part of the legislative package of Procurement Directives, 2004/18/EC and 2004/17/EC. These provide a coherent framework for conducting procurement electronically in an open, transparent and non-discriminatory way, establish rules for tendering electronically and fix the conditions for modern purchasing techniques based on electronic means of communication.

If online procurement is generalised, it can save governments up to 5% on expenditure and up to 50-80% on transaction costs for both buyers and suppliers. While it is difficult to quantify competition and efficiency benefits for the EU as a whole, greater competition and efficiency in public procurement markets can impact - directly and indirectly - on the whole economy and play an important role in achieving the Lisbon objectives.

However, the inappropriate introduction of e-procurement carries high risks of market fragmentation. The legal, technical and organisational barriers that may result from procurement online are one of the greatest challenges for policy makers.

The consultations as part of the impact assessment conducted by the Commission[1] confirm the need for an Action Plan. Member States, candidate countries and businesses are ready to participate in it. Building upon existing efforts to modernise European public procurement markets and to make these more open and competitive, the Commission proposes measures along three axes:

- *Ensure a well functioning Internal Market when public procurement is conducted electronically;*

- *Achieve greater efficiency in procurement and improve governance;*

- *Work towards an international framework for electronic public procurement.*

2. OBJECTIVES AND ACTION

2.1. Ensure a well functioning Internal Market in electronic public procurement

2.1.1. Implement the legal framework correctly and on time

Member States are required to implement the new legal framework by 31 January 2006, but slippages cannot be excluded. Early adoption of the new e-procurement provisions is essential to avoid barriers to and distortion of competition. It is also very important for the rapid development and the effective use of e-procurement by economic operators. Member States should deploy all efforts to comply with the Directives' deadline.

Erroneous or divergent interpretation of the new rules can create barriers to cross-border trade and ultimately fragment the market. The Commission will monitor transposition closely and encourage appropriate exchanges with the Member States at the draft stage in order to facilitate understanding of the legal framework. It will issue an interpretative document on the

[1] SEC (2004)1639, Extended Impact Assessment for an Action Plan on electronic public procurement, Commission staff working document

legal requirements for e-procurement. At the same, time training demonstrators simulating the new electronic environment will be available to support initiation of administrations and businesses.

- **1st quarter 2005** The Commission issues an interpretative document on the new rules on electronic public procurement
- **1st quarter 2005** The Commission makes online training demonstrators available, allowing contracting authorities and economic operators to familiarise with the new e-procurement provisions and tools
- **2005** The Commission provides appropriate assistance to Member States in transposing the new legal provisions

2.1.2. Complete the legal framework by the appropriate basic tools

Of all notices sent for publication on TED[2], 90 % are still in paper form. The standard forms established by Directive 2001/78/EC have slightly improved the situation. Their processing however still implicates high costs, delaying publication and increasing risks of errors.

The new Directives do not provide for an all electronic notification system; this would not be feasible in the short run given the different levels of development and penetration of electronic means in the Member States. Instead, a phased approach has been chosen. The Commission will adopt in early 2005 a Regulation on standard forms adjusting the existing forms to the elements introduced by the new Directives, e.g. e-auctions, dynamic purchasing systems and buyer profiles. By the end of 2006, the Commission will propose a new generation of structured electronic standard forms to allow for the electronic collection, processing and dissemination of all procurement notices covered by the Directives. This new generation should facilitate the automatic production of summaries in all official EU languages, and should be easy to integrate into all operational e-procurement systems. The establishment of an electronic directory of EU public purchasers should also be considered.

The new Directives make the use of the Common Procurement Vocabulary (CPV), introduced by Regulation 2195/2002/EC, mandatory. Electronic public procurement creates new possibilities for using the CPV, e.g. structuring and analysing procurement expenditure, or the compilation of statistics. Revision of the CPV is under way to adjust it for use in a fully electronic environment. To this end, a study was launched to which Member States and interested parties will be invited to actively contribute. If successfully completed it should lead to a world class international classification model for public procurement contracts.

- **In early 2005** The Commission adopts new Standard Forms taking account of new procedures and the use of electronic means of communication.
- **By early 2006** The Commission presents proposals for revising the Common Procurement Vocabulary based on the results of the review study currently under way
- **By end 2006** the Commission presents a blueprint for a fully electronic system for the collection and publication of procurement notices on TED
- **By end 2007** Member States implement fully electronic systems at national level including appropriate tools for automated collection and publishing in TED

[2] 'Tenders Electronic Daily', the EU official website which publishes all notices covered by the Procurement Directives.

2.1.3. Remove / prevent barriers in carrying public procurement procedures electronically

Barriers businesses fear most in cross-border tendering are inappropriate design of tendering systems and incompatible IT standards. Diversity and incompatibility of technical solutions can render suppliers' access to e-procurement systems impossible or discourage their participation because of additional difficulties or increased costs. Barriers may exist in terms of functional as well as technical characteristics.

In moving procurement online Member States should at all stages be guided by the basic concept that means of communication and tools used in electronic public procurement systems be non-discriminatory, generally available and interoperable and by no means restrict economic operators' access to the tendering procedure.

To prevent the emergence of e-barriers, Member States should use the results of the Commission's functional requirements analysis undertaken by IDA[3] when drafting legislation and designing e-procurement systems. The results of the project will be validated by the Commission and the Member States in light of the interpretative document to be issued by the Commission in 2005.

To build up confidence in e-procurement, the development of compliance verification schemes should be promoted. The Commission strongly recommends that Member States, in accordance with the Directives, introduce or maintain voluntary accreditation schemes to ascertain that e-procurement systems conform to the requirements of the Directives. A European scheme which would build on and integrate national schemes would seem desirable to ensure the smooth functioning of the Internal Market. The Commission and Member States should examine through a feasibility study the development of such a *TRUST* (*T*ransparent *R*eliable *U*nhindered *S*ecure *T*endering) scheme based on the functional requirements.

Some horizontal problems also threaten to negatively affect the functioning of the Internal Market and the initiation of e-procurement. Potential difficulties relate to the use of advanced electronic signatures, in particular signatures based on a qualified certificate and which are created by a secure-signature-creation device (hereafter 'qualified signatures').

The new Directives do not define which type of e-signature should be used in electronic tendering. Thus Member States - who have different legal signature concepts – may choose the level they require in conformity with the e-signatures Directive 1999/93/EC. However, the Directives oblige any public purchaser in the EU to effectively recognize, receive and process tenders submitted, if required, with a qualified signature and their accompanying certificates, regardless of their origin within the EU or their technical characteristics, and even when they contain documents of different origins (i.e., from a consortium of suppliers) and possibly bear signatures of different levels from different sources (i.e., from different national authorities).

This makes e-procurement the first sector in which businesses use qualified signatures in transactions with public authorities in a Member State other than their home country. The existing significant differences between qualified signatures as required by some Member States should therefore be reason for great concern. The interoperability problems detected

[3] 'Interchange of data between administrations' programme

despite the existence of standards[4], and the absence of a mature European market for this type of signatures pose a real and possibly persistent obstacle to cross-border e-procurement[5].

A project called Bridge/Gateway CA was launched under the IDA programme in 2002 to address the issue of recognition and trust of electronic certificates issued by different Certification Authorities (CAs) in the framework of exchanging secure e-mails and signatures between different national administrations. The results of the Bridge/Gateway CA Pilot, including recommendations on technical, organisational and operational aspects of such operational schemes, should be available by mid-2005. Although addressing some issues related to e-procurement, it would not, however, be enough to resolve the problems described above before the 2006 deadline. Building on the current efforts, Member States and the Commission, hearing industry's views, should work together on an operational project to rapidly find a solution based on the mutual recognition principle. At this stage, the Commission would favour a solution to test and promote solutions enabling cross-border use of qualified signatures. Any solution identified should be easy to generalise also in other fields of activity. In the meantime, the Commission recommends that Member States examine any appropriate transitional measures, e.g., confirmation in paper form for tenderers whose electronic signature does not correspond to the required one.

Lack of generalised and interoperable e-ordering and e-invoicing tools across the Internal Market also creates obstacles to the equal participation of suppliers in cross-border procurement. At present, these types of transactions are little used in practice and on an optional basis only. The Commission will continue monitoring the situation while solutions are being sought in the framework of standardisation activities undertaken by the EU.

- **In 2005** Member States and the Commission test, refine and validate the results of the IDA common functional requirements for e-procurement systems, based on the 2004 IDA study on common functional requirements
- **Early 2006** Member States review whether all operational e-procurement systems have been adjusted to the requirements of the Directives
- **By mid-2005** Member States introduce national accreditation schemes to verify compliance of electronic tendering systems with the legal framework
- **By end 2005** Member States and Commission consider through a feasibility study whether to introduce a European compliance verification scheme
- **In 2005-2006** The Commission proposes an action under the IDABC programme to help Member States coordinate implementing the use of advanced qualified signatures to resolve interoperability problems[6]
- **By 31 January 2006** Member States apply, if required by national law, interoperable qualified electronic signatures

[4] Pursuant to Directive 1999/93/EC, technical standards have been promulgated within ETSI ESI and CEN/ISSS e-Sign Workshop.

[5] For a detailed analysis see "The legal and market aspects of electronic signatures", Study for the European Commission, Interdisciplinary Centre for Law and Information Technology, CUL, Leuven, Oct. 2003.

[6] The European Parliament and the Council formally adopted on 21 April 2004 Decision 2004/387/EC establishing the new IDABC Programme. Building on the achievements of the preceding IDA programme its aim is to identify, support and promote the development of interoperable pan-European e-Government services as of 2005.

2.1.4. Detect and address interoperability problems over time

In light of the above, it is clear that interoperability problems are persisting or may still emerge. Some have already been detected and appropriate actions have already been induced; others should be discovered through the gap analysis on interoperability needs in e-procurement currently carried out by CEN/ISSS[7]. However, interoperability should remain a constant concern. Technical and operational developments make it necessary to continuously revise and improve existing systems covering all stages of the purchasing cycle. Standards in the area are market-driven. Relevant input from RTD projects in the area of e-government should also be considered. Governments must follow and work on interoperable solutions through dialogue between the different parties involved either at national or European level and trail developments in business-to-business (B2B) electronic commerce in order to avoid driving a wedge between private and public procurement markets.

The Commission will continue to monitor the situation with respect to the emergence of interoperability problems in the Internal Market and in international trade and, if appropriate, consider issuing standardisation mandates. It would be desirable to continue current work in the IDA e-Procurement workshop and to continue monitoring developments so as to share information on specifications and good practices.

- **By 1st quarter of 2005** CEN/ISSS completes gap analysis on interoperability needs for effective electronic public procurement
- **2005-2007** The Commission proposes to continue activities on electronic public procurement under the IDABC programme for exchange and discussion on interoperability issues and monitoring of Member States developments
- **2005-2007** The Commission and Member States promote standardisation activities at European level and liaise with international standardisation bodies

2.2. Achieve greater efficiency in procurement, improve governance and competitiveness

2.2.1. Increase efficiency of public procurement and improve governance

Moving public sector procurement online requires legal, institutional and organisational changes at many levels. Member States will have to decide on the type and scope of purchases to computerise, the policies to implement, the systems and tools to use and the level of administrations involved. The risks of failure are not negligible. It is therefore essential to plan and monitor these efforts.

Greater efficiency will depend on the degree of automation in the field of public procurement as a whole, although a phased development of e-procurement is most likely to maximise benefits for both the public and the private sector. The Commission invites all Member States to transpose into national law all aspects of the legislative package in a comprehensive manner. Governments should, however, be able to modulate and adjust implementation of the new electronic tools and techniques over time. In particular, they should pay attention to potential excessive or abusive centralisation of purchases, inappropriate use of electronic auctions and preferences for closed purchasing systems (e.g. framework agreements) over open systems. Such practices may cancel out the benefits from increased efficiency.

To optimise benefits, Member States should establish national plans to be complemented by individual plans especially for their most powerful buyers. Setting uniform targets and ways

[7] Centre Européen de Normalisation/Workshop on Information Society Standardisation Systems

for generalising e-procurement would not be expedient, as conditions in each Member State vary considerably. The Commission should assist Member States in this exercise where appropriate and facilitate the dissemination and sharing out of information. It will also monitor developments through appropriate indicators using data from the TED database. The Public Procurement Network established in Copenhagen in January 2003 could provide a forum for the exchange between Member States.

Increased efficiency depends also on the automation of certain types of transactions such as invoices, orders and payments. Today at an early stage, their development is likely to pick-up driven by standardisation and automation of financial and budget systems. Following a mandate from the Commission, CEN/ISSS has assessed standards requirements and is finalising detailed guidance material on the implementation of Directive 115/EC/2001 on electronic invoices. In addition, IDA is running a project for developing XML schemas for e-procurement, including e-invoicing and e-ordering. Efforts in this area should be pursued in view of achieving interoperable solutions.

National policies can hardly be developed in the appropriate quality without a detailed picture of procurement markets. Existing statistical information is mostly incomplete and data collection mechanisms are poorly organised. E-procurement presents the opportunity to remedy this situation. The Commission will mobilise the Advisory Committee on Public Contracts (ACPC) and the Working Group on Statistical Information to fully exploit the introduction of e-procurement new technologies.

- **By end 2005** Each Member State prepares a national plan for introducing electronic public procurement setting measurable performance targets, taking account of the specific national needs
- **By end 2005** Each Member State encourages preparation of similar plans by individual national buyers and to coordinate and monitor their implementation
- **In 2005-2006** The Commission continues monitoring work on e-invoices by CEN/ISSS and proposes the continuation of XML activities undertaken in 2003-2004 on e-invoices and e-ordering under IDABC
- **By end 2006** Member States set up efficient electronic systems for the collection and processing of statistical procurement data

2.2.2. *Increase competitiveness of public procurement markets across the EU*

The Commission’s online consultation of businesses identified transparency as a major aspect of computerisation of public procurement, together with confidence in the fairness of awarding procedures. Electronic means offer more transparency as they allow for easy and timely dissemination of contract information and reduce opportunities and incentives for fraud. They can also improve the quality of government procurement management, including monitoring and decision-making. Practices for disseminating contract related information may differ among Member State as well as requirements for traceability and auditing of e-procurement operations. The Public Procurement Network could play an active role in exchanging information and practices on those issues. The Commission could support a benchmarking exercise with a view to compare and measure performances.

The majority of businesses consider that online procurement should require less effort than traditional procedures. National administrative provisions and guidelines regulating procurement procedures have been conceived with a view to the handling of operations in paper form. Electronic means offer new opportunities to streamline procedures and save suppliers time and money. Success depends on the degree of transformation of off-line practices to fully fledged online services. This requires re-thinking the service provided and re-engineering the different processes.

To generalise e-procurement, it is important that all steps are taken to reduce the regulatory burden. Standardising and restructuring business documents as well as more uniform tendering documents should help automating certain purchase routines and allow both sides to concentrate on the substance of the purchase.

A typical example of red tape concerns the numerous certificates and business documents required. These are rarely available in electronic form. Additionally, they need to be usable and acceptable across borders. The Commission and Member States should analyse and compare results achieved in this area at national level in the framework of the ACPC with a view to agreeing in early 2006 on a common set of electronic certificates, at least for some of those most frequently required. E-procurement would be an excellent test base for the development of such e-government services. The Commission will propose this line of action to Member States.

The use of e-catalogues is another major issue. Their deployment is important in particular for involving small and medium-sized enterprises (SMEs) in public procurement. Current applications make it possible for enterprises to present their products and services to contracting entities at reasonable cost, time and effort. Lack of uniform specifications and standards for e-catalogues means that there is a risk of IT applications on the market not meeting requirements of the public sector. Work to prepare framework standards for cataloguing is under way in a specific CEN/ISSS workshop. Building upon the IDA functional requirements project, the use of e-catalogues in dynamic purchasing systems and e-procurement framework agreements could be further studied and tested.

Finally, businesses expect e-procurement to increase contract opportunities, facilitate cross-border market access and make procurement procedures faster and cheaper. Public e-procurement represents a great potential for SMEs. In order to encourage those SMEs interested in public contracts, Member States have every interest to promote standard e-procurement systems based on existing and simple technologies and to tailor contract opportunities so as to not exclude SMEs.

- **2nd half 2005** The Commission considers proposing services for the electronic supply of business information and certificates in public procurement for implementation under the IDABC programme
- **In 2005-2006** Member States and the Commission agree on a common set of frequently required electronic certificates for use in e-procurement procedures
- **In 2005** The Commission proposes launching a study on e-catalogues in dynamic purchasing systems and electronic framework agreements using work by CEN/ISSS under the IDABC programme
- **In 2005** The Public Procurement Network launches a benchmark exercise on transparency, auditing and traceability of e-procurement systems
- **In 2006** The Public Procurement Network organises workshops to promote exchanges on tender document standardisation
- **2005-2007** Member States launch and support specific awareness campaigns and training programmes targeted at SMEs at national and regional level

2.3. Work towards an international framework for electronic public procurement

While e-procurement develops worldwide, the existing international agreements do not regulate its use. Legal and technical choices in e-procurement systems may reduce procurement opportunities for EU businesses in third countries, as well as restrict access of third country suppliers to the EU market. The Commission will monitor developments to ensure that implementation of the new EU procurement regime fully respects the international obligations of the Union, while accordingly taking initiatives to adapt international disciplines. It will also follow attentively current and future international standardisation initiatives.

The Commission will also consider any adjustments necessary and the feasibility of e-procurement in the context of the EU's external aid instruments. It already cooperates closely with international bodies such as the World Bank to ensure that execution of purchases financed by these in third countries does not hinder EU suppliers. Finally, it will take all appropriate measures aimed at sharing EU experiences and achievements with developing countries.

- **In 2005** The Commission pursues negotiations on the review of the Government Procurement Agreement (GPA)
- **In 2007** The Commission takes initiatives in the GPA to progress towards utilisation of a single common nomenclature for the classification of procurement goods and services
- **In 2005-2007** The Commission promotes the activities of and liaises with international standardisation bodies and fora to avoid emergence of technological interoperability barriers at international level
- **In 2005-2007** The Commission cooperates with the Multilateral Development Banks (MDBs) network in view of co-ordinating technical assistance to third countries supporting re-organising and computerising their public procurement regimes
- **In 2005** The Commission considers any adjustments necessary and the feasibility of e-procurement in the context of the EU's external aid instruments

3. IMPLEMENTATION OF E-PROCUREMENT ACTION PLAN AND MONITORING

In the long run, computerising public procurement practices will impact on the way in which national public purchasing practices are organised. Successful implementation of e-procurement may require changing administrative practices, not only those directly linked to the procurement process, but also indirectly, such as budgetary reviews. The sooner such reforms are implemented, the better for Europe’s citizens and businesses. The Commission considers that the Action Plan measures provide the best possible blend in order to fully exploit the potential benefits from moving public procurement online while minimising risks. Candidate countries will be closely associated with the implementation of the Action Plan.

The Commission assisted by the Advisory Committee for Public Contracts will monitor overall progress. By end of 2007, the Commission will review the situation and report on the results achieved; it will propose at any time, if need be, corrective action or additional measures.

IP/05/66

Brussels, 19 January 2005

Public procurement – Commission sets out Action Plan to move public purchasing in Europe online

The European Commission has published an Action Plan on electronic public procurement to assist Member States in implementing the new Procurement Directives adopted in 2004. The objective is to enable any business with a PC and an internet connection to bid for public contracts electronically anywhere in the EU, based on clear conditions and procedures and with all the necessary security. The Directives provide for the first time a coherent EU framework for the transparent and non-discriminatory use of electronic means in public procurement, which will help make procurement more competitive and efficient. As public procurement accounts for over 16% of the EU economy (see IP/04/149), opening up procurement markets can significantly boost competitiveness and reduce government spending.

Single Market Commissioner Charlie McCreevy said: "Electronic procurement means real benefits for buyers, suppliers and, most importantly, for the taxpayers who ultimately fund public purchases. We already have the necessary legal framework but it needs to be implemented correctly if new barriers are to be avoided. This Action Plan is an excellent roadmap to make e-procurement work in practice and to reap the full benefits of an enlarged Single Market".

Moving public procurement online promises substantial savings on expenditure and transaction costs for buyers and suppliers. However, it is a complex operation and experience of e-procurement is limited. Inconsistent implementation, with different rules and incompatible systems in different Member States, could hinder its uptake. There is a risk of new 'e-barriers' in cross-border trade or in government-to-business and business-to-business procurement.

The Action Plan, prepared in close association with Member States and businesses, sets out how the Commission and Member States can best implement the e-procurement aspects of the new Directives. For this the Action Plan sets an ambitious timetable for 2005 – 2007.

As a first step, the Commission will issue an interpretative document and a list of functional requirements, to ensure e-procurement systems in all Member States comply with the same basic legal and technical rules and are compatible with each other. Member States are invited to set up comprehensive national plans for a rapid adoption of the Directives and a tailored transition to e-procurement, including measurable performance targets.

Further steps include the development of a new generation of online standard forms for the publication of notices and an improved product classification (CPV) compatible with e-procurement. The development of interoperable technical standards, such as for advanced electronic signatures, will be promoted.

To make life easier for suppliers, there will be specific measures to cut red tape, for example by agreeing on electronic certificates that every public purchaser usually requires and on standards for electronic catalogues.

The Action Plan aims to modernise the general procurement environment and encourages Member States to automate steps in all phases of the procurement cycle. It does not take a 'one-size-fits-all' approach but supports Member States in designing e-procurement solutions adapted to their needs, in line with the Directives.

View full Action Plan at:

1. INTRODUCTION

The introduction of electronic means in the public procurement process raises a number of legal questions. However, few of these are new or specific to the use of electronic means: most deal with the issue of how to organise electronically procedures initially designed for paper. Electronic public procurement (hereafter e-procurement) is therefore firmly rooted in a well understood legal framework which provides the principles and rules which regulate the awarding process. The basic guiding principle is that in the absence of specific provisions to the contrary the use of electronic means does not change any of the steps of the relevant procedure.

The *rationale* for the legal provisions specifically devoted to e-procurement in the new public procurement Directives (Directive 2004/18/EC[1] and 2004/17/EC[2]), is that each and every economic operator across the Union should be able to participate, with simple and commonly used equipment and basic technical know-how, in a public procurement process which takes place partially or entirely by electronic means.

The aim of this document is to present the rules and principles governing e-procurement under the new public procurement Directives. First, the general rules and principles and the features that are relevant to all communications in an e-procurement process will be examined. Second, the rules governing notices and access to contract documents will be presented. Third, the rules related to the reception of requests to participate and tenders will be analysed in relation to both, individual "one-off" purchases and to repetitive purchases under framework agreements and dynamic purchasing systems. Finally, the new purchasing technique of electronic auctions will be examined more closely, followed by a consideration of the main features of the electronic dynamic systems.

This analysis will cover those aspects of a procurement procedure that are regulated by the Directives, i.e. from the publication of the contract notice to the receipt of tenders, and the re-opening of competition.[3] Other aspects of the procurement cycle that may also impact on e-procurement (i.e. electronic invoicing, electronic payments etc.) are addressed by other relevant Community policies and legislation and discussed in the Commission Action Plan on e-procurement (COM 2004/841/EC).

As electronic procurement processes and methods are under constant development, the Directives do not pretend to regulate in detail the use of all such methods. Other electronic purchasing techniques may be used, "providing such use complies with the

[2] Directive 2004/17/EC of the European Parliament and of the Council of 31 March 2004 coordinating the procurement procedures of entities operating in the water, energy, transport and postal services sectors, OJ L 134, 30.4.2004, p. 1.

[3] A project was initiated under the Commission's IDA programme and is currently continued under the new IDABC programme translating the legal framework into functional requirements, so as to facilitate technical implementation of operational systems for conducting electronic public procurement (http://europa.eu.int/idabc/eprocurement).

rules drawn up under this Directive and the principles of equal treatment, non-discrimination and transparency" (cf. recitals 12 and 20).

2. RULES APPLICABLE TO COMMUNICATIONS

2.1. Electronic means of communication and their use in the procurement process

2.1.1. Electronic means of communication

The new public procurement Directives define electronic means as those using electronic equipment for the processing (including digital compression) and storage of data which is transmitted, conveyed and received by wire, by radio, by optical means or by other electromagnetic means (Article 1(13) of Directive 2004/18/EC and Article 1(12) of Directive 2004/17/EC).

Electronic means of communication typically rely upon a network which is able to handle and transmit digital signals. According to Articles 42(2) and 48(2)[4] the chosen means must be generally available and thus not restrict access to the tendering procedure. This means that the network in question must be open and everybody must be able to connect to it.

Today such generally available electronic means of communication would include Internet and e-mail. However technology is constantly and rapidly evolving. In order to define generally available means, it is preferable therefore not to interpret the provision restrictively in terms of a specific standard but rather to try to identify the relevant criteria.

These are most obviously the geographic coverage, the terminal equipment and the formalities/procedures needed for connection to the network, the level of ICT literacy required and the costs involved. If a means of communication implies a connection to a network which is not available everywhere and to everybody and/or the use of equipment which is not in common use (i.e. satellite communication today) and/or the costs of which are unreasonably high for the use to which it is destined, the means cannot be deemed to satisfy the requirement of general availability.

Therefore, only a pragmatic approach focusing on the obligation not to restrict the operators' access to the tendering procedures will help contracting authorities to determine if the chosen means of communication is indeed generally available and thus satisfies the first requirement of the Directives.

Freely available and reliable access to the contracting authority's connection to an open network is another important factor needed to guarantee that access to the tendering procedure is not restricted and to ensure equal treatment and effective competition.

[4] The reference is hereunder always made first to the relevant article of Directive 2004/18/EC immediately followed by the reference to the corresponding relevant article of Directive 2004/17/EC, unless otherwise indicated.

Since the Internet is available 24 hours a day, the access to most operations (browsing, registration, downloading of documents, submission of requests to participate or tenders) should in principle be available round the clock. Reasonable access limitations can be envisaged, mainly for maintenance reasons; however they should never extend into normal business hours. In contrast, those operations that require interaction (i.e. e-auctions) may only be accessible during normal business hours. Only if tenders are to be collected in real time, as in some e-auctions, might it be necessary to modify opening hours in order to allow all tenderers to participate. To avoid any ambiguity the deadline for submitting offers should be clearly specified, i.e. with reference to Coordinated Universal Time (UTC) or by adding "local time".

The contracting authority's system should also be set up so as to provide adequate protection against unauthorised actions aimed at disrupting its normal operation and so as to provide a reasonable level of protection and guarantee of security to economic operators.

Technical problems within the contracting authority's network, service disruptions and system failures may impede access to contract documents, or may disrupt the procurement process at a critical moment (e.g. during the transmission of requests for clarification or the corresponding answers, during receipt of tenders or requests to participate, or during auctions). Problems within the public or open network and problems specific to the device or the platform of the contracting authority should be distinguished: only in the latter case must the contracting authority remedy the failure by, for example extending the deadlines and providing the relevant information to all interested parties. The contracting authority is not responsible for the open network failure and is not obliged to take any remedial actions, even though it may do so where this seems appropriate (respective disclaimers may be included in an appropriate location).

The new provisions on e-procurement do not address the issue of charges for accessing the contracting authority's system. It is reasonable to envisage that each party covers its own costs. Economic operators would bear the communication costs to access the procurement system or the costs of obtaining a digital signature. Contracting authorities would bear the cost of the system for receiving tenders and for making available the contract documents. Depending on the services offered by the system (alert mechanisms, database management etc.) certain fees could be charged to economic operators, except where dynamic purchasing systems are involved, provided that such fees are justified, proportionate and do not discriminate or restrict access to the procurement procedure.

2.1.2. *The use of electronic means in the procurement process*

Electronic means are for the first time put on par with traditional means of communication (Recitals 35 and 46; Articles 1(12) and 1(11)).

Contracting authorities may decide that all communications and exchanges of information with economic operators will be performed exclusively by electronic means (Articles 42(1) and 48(1)) or by a combination of electronic means and paper. If a combination is chosen it may continue in parallel at every stage of the procedure, or in successive stages in which only one or the other is used (e.g. only electronic means for the request of contract documents and only traditional means for the submission of tenders). Contracting authorities can also leave the choice of means up to economic operators.

The right of contracting authorities to choose the means of communication is nonetheless limited by the Directives:

- The receipt of documents, certificates and declarations that do not exist in electronic format must be organised following the traditional procedures on paper (Articles 42(5)(d) and 48(5)(d))[5];
- Some procuring methods/instruments such as auctions and dynamic purchasing systems (hereafter DPS) may only be conducted by electronic means (Articles 1(7) second indent and 1(6));
- When there are reasons to believe that, due to the volume and/or complexity of the data to be submitted, the communication, exchange and storage of it cannot be properly handled by electronic means, and therefore the requirements of Articles 42(3) and 48(3) are not satisfied, they should be handled by traditional means of communication. In such cases data shall be exchanged on physical supports like paper or generally used supports for electronic storage of data such as floppy disks, CD-ROMs or memory sticks.

2.2. Tools for communicating by electronic means

Articles 42(4) and 48(4) provide that the tools for communicating by electronic means, as well as their technical characteristics, *must be non-discriminatory, generally available and interoperable with the information and communication technology products in general use*.

2.2.1. General availability and non discrimination

The pragmatic approach described above for determining the general availability of the chosen means of communication also applies to the tools to be used for communicating by electronic means.

In contrast to electronic means, electronic tools do not imply the presence of a network. The term refers to products, mainly software products, which are used by contracting authorities and economic operators in order to communicate effectively. The requirement for electronic tools to be generally available is therefore slightly different. Bearing in mind that the guiding principle is always that whoever can have access to the Internet via a normal computer with standard applications and programs shall be able to participate in the public procurement procedure, two different cases may occur.

The tool for communicating has to be owned by the economic operator: in this scenario the necessary tool must be off-the shelf software which is easy to buy (available everywhere at a cost which is proportionate to the use to which it is

[5] It must be noted that economic operators shall in any case respect the time limits set by the contracting authority and submit the certificates that exist only on paper before the expiry of the deadline.

destined), easy to install if need be, and reasonably easy to use. The general principle of proportionality can be used to assess the level of technical knowledge the tool requires (i.e. when procuring computer services or products, the contracting authority may probably require a higher level of ICT literacy from potential suppliers).

The tool is made available by the contracting authority to the interested economic operators: this is mainly where the chosen tool would not be "easy to buy" for economic operators. However, this apart, the same requirements of general availability and non-discrimination will apply as for a tool owned by economic operators. This is also the case where the requirement of interoperability is more important.

The level of ICT literacy required for using the tool should be considered. If the contracting authority can choose between two families of software for presenting drawings and plans, the exclusive choice of one of them could benefit some operators to the detriment of others. In such cases, in order to comply with the requirement of non-discrimination, if the contracting authority really cannot accept both tools it should consider providing longer time limits to allow economic operators to get acquainted with the tool.

Finally, and without prejudice to the right of the contracting authority to require tenders to be drafted in its own language (Annexes VII A (12)(d) and XIII A (10)(c)), the issue of the language of the tool should be taken into account by the contracting authority. Software in or at least the presence of some minimum indications in another language may be advisable to facilitate the installation and use of the tool made available by the contracting authority, to facilitate access to contract documents or uploading of tenders especially when complex instructions are needed.

2.2.2. *Interoperability of the tools for communicating by electronic means*

'Interoperability' is used here to refer to the capability of ICT systems (and of the business processes they support) to exchange information or services directly and satisfactorily between them and/or their users, so as to operate effectively together. This requires the capability to provide interchange of electronic data among, e.g. different signal formats, transmission media, applications or performance levels.

Interoperable tools permit unhindered communication between different and distinct systems, bringing together heterogeneous technologies and software. This is the case, i.e. when suppliers connect to a contracting authority's system, electronically access tender documents from a mainframe, or upload an offer by connecting to a different application written in a different programming language.

Different and incompatible technical solutions – lack of interoperability - can render suppliers' access to e-procurement systems impossible or discourage their participation because of additional difficulties or increased costs. Barriers may arise in terms of either functional or technical characteristics, or both, of the systems and tools used. These barriers should be addressed on a case by case basis.

For the purposes of the legal framework, the requirement of interoperable electronic tools is that the chosen tool must be able to function and to interact with commonly used equipment and applications, i.e. allowing the main functionalities for communicating and exchanging data with basic office tools. It does not mean that it must be interoperable which each single specific application of economic operators' electronic equipment.

The legal framework is technology-neutral and does not distinguish between open source and commercial products as long as they are interoperable with information and communication technology products in general use.

2.3. Integrity and security of data

Articles 42(3) and 48(3) determine the conditions to be fulfilled by the chosen means of communication during the communication, exchange and storage of information. These conditions have to guarantee the data-integrity and confidentiality of tenders or requests to participate, and ensure that they are kept securely locked away until the deadline set for their opening.

These are not typically conditions specific to electronic means, because they also apply traditionally to paper based communication, exchange and storage of information. *Ad hoc* solutions may be required, however, in order to meet these conditions in an electronic environment.

In particular, neither signatures nor encryption should be used by economic operators unless they are invited to do so by the contracting authority. Member States may regulate the level of electronic signature required and restrict the choice of contracting authorities to qualified signatures (Articles 42(5)(b) and 48(5)(b) and Annexes X and XXIV). In any case the provisions of Article 5 of Directive 1999/93, in particular its Para. 2[6] apply.

Secure channels (https, SSL) and/or encryption may be used to preserve the data-integrity and the confidentiality of tenders and requests to participate, although encryption may require higher levels of ICT literacy from economic operators. In any case in order to comply with the general principles of non discrimination, general availability and transparency as well as Articles 42(5)(a) and 48(5)(a), information about encryption must be made available to interested parties together with all necessary information regarding the specifications for the electronic submission of tenders and of requests to participate.

[6] "Article 5 Legal effects of electronic signatures

1. Member States shall ensure that advanced electronic signatures which are based on a qualified certificate and which are created by a secure-signature-creation device:

(a) satisfy the legal requirements of a signature in relation to data in electronic form in the same manner as a handwritten signature satisfies those requirements in relation to paper-based data; and

(b) are admissible as evidence in legal proceedings.

2. Member States shall ensure that an electronic signature is not denied legal effectiveness and admissibility as evidence in legal proceedings solely on the grounds that it is:

- in electronic form, or
- not based upon a qualified certificate, or
- not based upon a qualified certificate issued by an accredited certification-service-provider, or
- not created by a secure signature-creation device."

Contracting authorities may refuse to accept messages which could harm their system or their reception devices and they can take appropriate steps to this end[7]. Information on the antivirus mechanism should preferably be specified on the website and in the contract documents. Antivirus checks are normally operated upon receipt of the message. However, concerning a message that is a tender (or a request to participate) the antivirus check shall be conducted in a way that guarantees the confidentiality and the inaccessibility of the tender before its formal opening as required by Articles 42(3) and 48(3) and annexes X and XXIV. When this is not possible, the antivirus check shall be conducted upon the formal opening of tenders.

Whatever the solution, the senders of messages which are rejected because they are infected by a virus should be instantaneously informed in order to allow them, where possible, to re-submit the message within any deadlines that may be in force. No re-submission after the expiry of a deadline shall be allowed.

These requirements are further developed in section 4.1.2 with specific reference to the devices for receiving tenders, requests for participation, and plans and projects in design contests.

2.4. Traceability

Contracting authorities shall take appropriate steps to document the progress of award procedures conducted by electronic means (Art. 43, second indent and 50(1) last indent).

This requirement of traceability must be understood as referring to each stage of the procurement process conducted electronically, including the stage at which contract documents are made available.

There should be equipment and functionalities in place to maintain the original version of all documents and a true and faithful record of all exchanges with economic operators in order to provide any of the evidence which might be needed in case of litigation.

For the secure locking of tenders until the expiry of the deadline for the submission and the protection of data against unauthorised access, the traceability of operations, including the exact time and date of receipt of data is very important.

Traceability should make it possible to verify what message/data has been transmitted or made available, by whom, to whom, and when, including the duration of the communication. It should also be possible to reconstitute the sequence of events including any automatic data processing or automated calculations.

While it is not mandatory to record who visited or accessed contract documents over the open network, this may well be advisable. Contracting authorities generally welcome functionality capable of identifying who has accessed the contract documents and provided such identification is kept to a minimum, this is admissible.

[7] A document infected by a virus could also be sent by the contracting authority or hosted in its website. In case this occurs, the correspondent stage of the procedure should be cancelled and reinitiated.

The traceability of operations should also make it possible to establish whether the site hosting the procurement process has been compromised or tampered with.

3. NOTICES AND ELECTRONIC ACCESS TO CONTRACT DOCUMENTS

Providing for the electronic submission of notices to the Office for Official Publications of the European Communities and the electronic access to tender documents allows contracting authorities to significantly save time in the procurement process; in both cases, time-limits can be reduced for the procedure as a whole.

3.1. Electronic submission of notices to the Commission

If sent electronically to the Publications Office, procurement notices are published on TED[8] within five days of being sent, instead of the current twelve days (Art. 36(3) and 44(3)). The time limits for the receipt of tenders and for the receipt of requests to participate can consequently be shortened by seven days (Art. 38(5) and 45(3)). This applies to all procedures, including the competitive dialogue.

To effectively achieve publication in such a short time, the notices have to be sent in the format required by the Directives, using the standard forms available for this purpose (Art. 35(1), 36(2), Annex VIII points 1, 3 and Art. 41(1), 44(2), Annex XX points 1, 3)[9]. Currently, this refers to the standard forms contained in Directive 2001/78/EC. These will be replaced by a new set of forms in the forthcoming Regulation on Standard Forms, to be adopted as an Implementing Measure of the Commission. The templates for these standard forms are made available online in the SIMAP website (http://www.simap.eu.int) as well as technical documentation for sending notices in structured electronic format (XML).

In order to correctly identify in the standard forms the goods or services to be purchased, the Directives make mandatory the use of the Common Procurement Vocabulary (CPV) (Art. 1(14), 35 (1)(a) and Art. 1(13), 41(1)).

In addition, contracting authorities are encouraged to have and maintain an Internet website, the so called "buyer profile", where they may publish prior information notices (in this case, a notice of the publication on the buyer's profile shall be sent electronically to the Publications Office), and other notices also published by the Publications Office, as well as specifications and additional documents (Art. 35(1), Annex VIII points 1, 2 and Art. 41(1), 44(5), Annex XX points 1, 2). The buyer profile may also include information on ongoing invitations to tender, scheduled purchases, contracts concluded, procedures cancelled and any useful general information, such as the contact details of the contracting authority (Annexes VIII and XX point 2(b)).

[8] Tenders Electronic Daily, the EU electronic publication board (http://ted.publications.eu.int).

[9] The standard forms in the most frequently used electronic formats are available on the website. The Commission envisages organising soon the electronic submission of notices only in a structured XML format.

3.2. Electronic access to tender documents by economic operators

Tender documents can be either made available to, or sent to, economic operators by electronic means. In both cases all the rules on electronic communications apply.

The choice between these two possibilities belongs to the contracting authority except in dynamic purchasing systems, for which it is mandatory to offer unrestricted and full direct electronic access from the date the notice setting up the system is published until the expiry of the DPS (Art. 33(3)(c) and 15(3)(c)).

3.2.1. Unrestricted and full direct access to tender documents by electronic means

Electronic availability of tender documents can be provided in various ways, which must be indicated in the notice.[10] However, only the provision of *unrestricted and full direct access by electronic means* entitles contracting authorities to shorten the time limits as prescribed by Articles 38(6) and 45(6).

To achieve unrestricted and full direct access to the contract documents *all* relevant documents must be accessible round the clock, from the date of publication of the notice until the expiry of the deadline for submitting tenders (or the expiry of the DPS) at the website indicated in the notice itself, without any intermediary stage. This means i.e. that if an access fee has to be paid then payment can take place instantaneously (i.e. at present by accepting all common international payment cards). No other way of making available the tender documents electronically (i.e. by automatic response email or by sending electronic documents on physical supports like CD-ROMs or others) permits the deadlines for submitting tenders to be reduced.

The possibility to browse contract documents without previous registration should ideally be provided. Contracting authorities may want to ask interested economic operators to register before downloading documents. To this effect a simple user ID and password, a valid e-mail account and the use of properly dated e-mail accompanied by the automatic acknowledgement of receipt are the most appropriate tools. However, the requirement to use a qualified signature at this stage is not justified and constitutes a hindrance to the access of documents. Contracting authorities may also want to ask interested economic operators to accept the conditions of operation of their site upon registration.

3.2.2. The reduction of deadlines for submitting tenders

Deadlines can be reduced provided that the above requirements are satisfied, regardless of the means chosen for the other stages of the procurement process. According to Articles 38(6) and 45(6), the deadlines for the receipt of tenders in open and restricted procedures may be shortened by five days.[11]

[10] When inviting the selected candidates to submit their tenders or to negotiate or to take part in the competitive dialogue, contracting authorities shall make sure the invitation includes the reference to accessing the specifications and the other documents (Articles 40 and 47).

[11] In the Utilities Directive (2004/17/2004), such reduction of the deadline for the submission of tenders is also possible in respect of negotiated procedures, cf. Art. 45(6) provided the cumulative effect of reductions does not result in a time limit for the receipt of tenders of less than 10 days (Art. 45(8)(2)).

In open procedures[12] it is possible to cumulate the two possibilities of reduction, the one for electronic transmission of the notice and the one for the unrestricted and full direct access to tender documents, leading to a total reduction of the deadline for submitting tenders of twelve days.

4. ELECTRONIC DEVICE FOR THE RECEIPT OF TENDERS, REQUESTS TO PARTICIPATE AND PLANS AND PROJECTS IN CONTESTS

4.1. The electronic receipt of tenders and requests to participate in one-off purchases

Further into the procurement process, electronic means can be used to transmit and receive tenders and requests to participate, as well as plans and projects in design contests. Articles 42(5) and 48(5) determine the key rules and refer to Annexes X and XXIV for the specific minimum requirements for the security and confidentiality of electronic reception devices. Thus all requirements previously mentioned relating to the definition and use of electronic means and tools equally apply to the device, together with the specific requirements explained below.

Contracting authorities are free to choose the appropriate means of communication and are responsible for organising the electronic receipt of tenders and requests to participate with respect to the legal requirements set out in the Directives discussed above. Economic operators shall comply with the specifications of the reception device in order to present a valid tender or request to participate.

4.1.1. Access to the reception device

To guarantee access to the device, the first requirement is that the necessary specifications, including encryption, are made available to interested parties (Articles 42(5)(a) and 48(5)(a)). These specifications should be indicated in the contract notice or in the contract documents, including the type of formats to be used. Contracting authorities may require a specific format and that tenders be structured in a specific way.

4.1.2. Security of data

4.1.2.1. Identity of tenderers and electronic signatures

The device for the electronic receipt of tenders and requests to participate must guarantee that the electronic signatures used are in conformity with the national provisions adopted pursuant to Directive 1999/93/EC on electronic signatures (Annex X(a) and Annex XXIV(a)).

[12] In respect of the other procedures, the reduction of deadlines in case of electronic transmission of notices applies to the deadline for the presentation of requests to participate. That is why it is not possible to cumulate the two grounds for a reduction of deadlines in order to shorten the sole deadline for the presentation of tenders; for restricted procedures it possible to cumulate in the sense of applying both reductions the one for the deadline for submitting requests to participate and the one for submitting tenders within the same award procedure, cf. Art. 38(6)(2) of Directive 2004/18/EC and Art. 45(6) and 45(8)(2) of Directive 2004/17/EC.

Member States are free to set the level of the type of signature required; in particular they can ask for the tenders and/or requests to participate to be accompanied by advanced qualified electronic signatures (Art. (42(5)(b) and 48(5)(b)).

The Directives require contracting authorities to accept any signature that was legally produced in any other Member State. Therefore, whilst the device should be organised with reference to the required level of signature it should also be equipped to receive and handle other signatures in conformity with Article 5 of Directive 1999/93/EC. In any case the device should be able to deal with extremely complex tenders (e.g. tenders emanating from *consortia* that combine different signatures, i.e. from public administrations and economic operators, of different level and origin from different Member States). In practice, this may lead to problems of interoperability of the different signatures, both at a technical level (effective receipt and processing of the foreign signatures) and at organisational level (definition and mutual recognition of specific types and levels of foreign signatures).

Until a solution to the interoperability issue is found, it seems that a viable provisional alternative would consist in organising a submission on paper in parallel to the electronic one or to accept simple electronic signatures, possibly followed by confirmation on paper.

If the national legislation requires that anonymity be preserved until the opening of tenders, the device should guarantee that sender-related information is inaccessible as well as the content of the tender.

4.1.2.2. Time stamping

The device shall guarantee the exact time stamping of the receipt (Annexes X (b) and XXIV (b)). This means that data should be automatically time stamped and locked. Irrefutable time stamping can be performed by an independent third party; however, other solutions providing a reasonable level of certainty are also acceptable. A time stamp should be made at the beginning and end of reception. The time zone should be part of the time stamp as where they are stored documents could depend on the location of the provider of the tendering platform service.

In practice transmission of data could take some time. The specification should indicate at which moment events will be taken into account. In the absence of any specific indication it shall be considered that the transmission must be completed before the expiry of the deadline.

An acknowledgement of the successful receipt of the tender should ideally be automatically issued by the device and sent to the tenderer's electronic address.

The device shall provide appropriate information to tenderers if the uploading or submission of the tender did not succeed particularly in cases where a virus is detected. In this case it shall be considered that no submission was made and re-submission should be possible provided the deadline is still running.

4.1.2.3. Access to the data transmitted

According to Annex X (c) and (d) and Annex XXIV (c) and (d), the device shall guarantee the locking of the data transmitted, including detection any unauthorised access.

This means that data transmitted should be received and stored automatically without anyone being able to tamper with it until the relevant deadline for opening it has passed. It is technically possible to document each server access. The system logs and any operation performed on the data should be recorded and safely stored to ensure the traceability of operations. Before the data is opened the system should confirm that no unauthorised access has been detected.

According to Annex X (e) and XXIV (e), the device shall guarantee that only authorised persons can set or change the dates for opening data received. It might be necessary, in fact, to delay the opening of some parts of the tenders. The device shall allow this without compromising the security for the unopened parts and in general it must guarantee that the modification of dates does not have any untoward consequences for the confidentiality of tenders.

Internal security measures based on the "four eyes" principle must be implemented. This means that at least two persons should by simultaneous action perform opening of tenders.

According to Annex X (f), (g), and (h) and XXIV (f),(g) and (h), the device shall guarantee that access to the data submitted is only possible through simultaneous action by authorised persons, only after the prescribed date has expired, and lastly, that data once received and opened remain accessible only to persons authorised to acquaint themselves therewith.

It can be assumed that the opening of data is an on-line function. *Simultaneous action,* in this context, means that the designated authorised persons within a time span of some few minutes, shall produce logs of what components have been opened and when.

The security features of the device may render the practice of opening tenders in public difficult to organise. However an on-line public opening can always be envisaged, at least insofar as the information normally disclosed during the public opening could be made immediately available electronically. Physical presence of the opening board in a specific location should not be a requirement unless paper documents exist as complete, separate tenders or as components of tenders.

Each authorised person would need an individualised key. Codes may be distributed in advance but preferably after the expiry of the deadline for submitting tenders. On the date and time fixed for the opening of tenders and requests to participate the authorised persons should proceed to the simultaneous unlocking of data for read-only access. Electronic signatures should be verified and the integrity of data should be confirmed. The timely submission of data should be checked as well. Paper copies could be distributed but only the electronic version shall be considered original. As long as documents are kept within the system they could be checked against master files.

Whatever modalities for the antivirus check have been adopted, the device shall ensure that the confidentiality and the inaccessibility of the tender or of the request to participate to anybody before the formal opening of offers, and to unauthorised persons afterwards, are in any circumstance fully respected, as well as the requirement for traceability of all operations.

If national law requires the tender to be presented in separate parts (e.g. as separate technical and economic offers) the device should allow the deferred opening of the separate files in the required sequence in the same way as with sealed envelopes. National law will also regulate which parts of the tender need to be signed and by whom.

In case data is encrypted and the key is owned by the tenderer, the latter must ensure that the key reaches the contracting authority before date set for the opening of tenders.

4.2. The electronic receipt of tenders in the re-opening of competition under multi-suppliers framework agreements and dynamic purchasing systems – the use of electronic catalogues

4.2.1. The electronic receipt of tenders in repetitive procedures and electronic catalogues

Everything said above on the receipt of tenders for one-off purchases applies to repetitive purchases.

The only difference is that in framework agreements and DPS, at the stage of the re-opening of competition, the contracting authority and the participants operate in a closed circuit, where all the actors are already known.

As a consequence, unless forbidden by the national legislation, the level of signature required by the contracting authority can be lowered even if the general rule is the qualified signature.

The stage of re-opening of competition in particular allows for the use of electronic catalogues (e-catalogues). Electronic catalogues are electronic documents established by the suppliers which describe products and prices which may, under certain conditions, constitute a tender; these are either transmitted or uploaded to the contracting authority website or made available in the suppliers' website.

Economic operators may use e-catalogues to present their tenders provided they comply with the above mentioned requirements for electronic communication tools as well as with possible requirements set by the contracting authority (i.e. the use of a specific format). In such cases appropriate indications following Articles 42(5)(a) and 48(5)(a) shall be provided.

In theory, e-catalogues can also be used to present the tender in a one-off procedure or the initial tender in a repetitive procedure. However, it is precisely when the supplier and products have already been admitted that e-catalogues may easily be used to update the indicative tender for a DPS or to submit a new tender.

In running framework agreements and DPSs, e-catalogues shall refer to the tender/product for which the supplier has been selected and shall not contain substantial amendments to the terms laid down in the framework agreement (Article 32(2)). At the stage of setting up the multi-supplier framework agreement or of setting up or joining the DPS, e-catalogues can only be submitted in a ‘frozen’ or “snapshot’ format under the conditions specified in Articles 42 and 48 and Annexes X and XXIV, because the public purchaser operates in an open environment to which anyone must have access.

4.2.2. The active collection of tenders

Traditionally, the contracting authority passively receives the tenders submitted by suppliers.

The situation is different at the stage of the re-opening of competition when the contracting authority operates in a closed circuit where all possible suppliers (even the newcomers in a DPS) are already known. In a closed circuit it does not make any difference from a technical point of view whether the updated tender is transmitted by the supplier or retrieved from the supplier’s website by the contracting authority. All the requirements and procedural stages related to the submission of tenders including the invitation the time-limits and the locking of tenders shall be valid; the only thing that changes is the way the tender arrives.

In particular, in this scenario the contracting authority must take care to inform all suppliers in due time when and how the tender data – updated indicative offers or new offers – will be retrieved by it.

Provided the catalogues are in conformity with the requirements of the contracting authority (in terms of their content, presentation, format, and tools), and that all the requirements of Annexes X and XXIV are satisfied, the contracting authority may decide to have exclusive access to the catalogue on a dedicated platform or, if the supplier agrees, to have access to it via the supplier’s website.

5. ELECTRONIC AUCTIONS

Electronic auctions are reiterative processes involving an electronic device that allows tenderers to present new prices, and/or new values for some or all elements of their tenders (Articles 1(7) and 1(6)). Electronic auctions constitute a particular step of the awarding stage of the procurement procedure and as such they shall always be preceded by the full evaluation of the tenders received, which will result in a score (notation) that enables the contracting authority to rank the tenders using automatic evaluation methods.

Member States may regulate and limit the resort to e-auctions (Art. 54(1) and 56(1)) but if they are allowed, they must be organised in strict conformity with the requirements of the Directives.

5.1. Conditions for the use of electronic auctions

Electronic auctions can be used under most procedures[13] but because they include automatic evaluation, they cannot be used for certain service contracts and certain works contracts having as their subject-matter intellectual performances, such as the design of works, (Art. 1(7) second indent and 1(6)).

The e-auction can be based either solely on prices (whether award criteria is the lowest price or the most advantageous tender) or on prices and/or new values for other features that are indicated in the specification. The features have to be quantifiable and expressed in figures. "2nd price" auctions, where the auction is won by the lowest price bidder but at the price of the second lowest one, are not allowed.

The e-auction must be based on the award criteria published in the contract notice or tender documents. What can be offered in the auction are new technical characteristics in terms of values referring to features that can be expressed in figures or percentages, and/or new prices. The criteria and their relative weighting stay the same; before the start of the auction any range must be reduced to a specific value.

Contracting authorities have to announce their intention to hold e-auctions in the contract notice (Art. 54(3) and 56(3)). Once the e-auction has been announced it becomes mandatory to hold it, unless only one valid tender is received.

5.2. Information to be provided in the specifications

The specification shall indicate those features, whose values will be the subject of the auction, information about the electronic equipment used and the arrangements and technical specifications for connection (Art. 54(3) and 56(3)).

It shall also contain the main rules of the auction, in particular:

- whether there are any limits on the new values which may be submitted, (limitations are inherent to the technical characteristics indicated in the specification which cannot be modified);

- what information will be made available to the tenderers in the course of the auction, and the relevant timetable, (the minimum requirement should be to ensure equal treatment by providing the same information to all participants at the same time);

- relevant information on the process,

- the bidding conditions (in particular the minimum amount by which a bid must be higher or lower to qualify as a new bid).

[13] In open, restricted, negotiated procedures with prior publication of a contract notice justified by the presence of irregular or unacceptable tenders in the case of Article 30(1)(a), on the reopening of competition among the parties of a framework agreement and on the opening of competition under a DPS if it is possible to establish the contract specifications with precision (Art. 54(2) of Directive 2004/18/EC); in open, restricted or negotiated procedures with a prior call for competition and on the opening for competition of contracts to be awarded under a DPS (Article 56(2) of Directive 2004/17/EC).

Finally the specification should also indicate how the invitations to auction will be sent.

5.3. Information to be provided in the invitation to submit new prices/values

A full evaluation of the tenders based on the award criteria published in the notice or in the specification and their relative weighting must precede the auction. At the end of the full initial evaluation, all tenderers who have submitted admissible tenders shall be invited simultaneously to submit new prices and/or values (Art. 54(4) and 56(4)). Rejected tenderers shall be informed in conformity with Articles 41(2) and 49(2).

Invitations shall be sent individually by electronic means to each admissible tenderer. The use of e-mail with acknowledgement of receipt and compliance with the requirement of traceability can provide the necessary certainty. In comparison, the posting of the invitation on an internet site is not sufficient.

The invitation shall indicate the result of the full initial evaluation (Art. 54(5) and 56(5)) by communicating the notation (i.e. the number of points allocated to the individual tenderer). There is no obligation to communicate at this stage the precise ranking (i.e. the relative position of the individual tenderer compared to the other participants) so long as this is done when the auction starts.

The invitation shall also provide the mathematical formula (if it has not already been announced in the specifications) which will be used to determine new rankings on the basis of new values submitted. The formula shall incorporate the weighting of all the criteria used to determine the most advantageous tender. To this purpose any ranges must be reduced to a specified value beforehand and a separate formula provided for each variant. Making the formula available to interested parties constitutes the minimal safeguard against potential distortions in the application of the award criteria.

The invitation shall also contain all the details of the auction:

- the date and time of the start of the auction (no sooner than 2 working days after the date the invitations are sent) (Art. 54(4) and 56(4));

- how and when the auction will close(Art. 54(7) and 56(4));

- the timetable for each phase of the auction (Art. 54(7) and 56(7))

Finally the invitation shall indicate all relevant information concerning individual connection to the electronic equipment being used (Art. 54(4) and 56(4)).

Thus, while the specification indicates the general rules for the auction, the invitation should state practical details that could not be or were not fixed beforehand. For example, if the specification indicates the general number and duration of rounds to be completed before the end of the auction, the invitation should indicate the exact time and date for each round.

5.4. Auction device and running of the auction

Contracting authorities shall communicate instantaneously to all tenderers sufficient information to enable them to ascertain their relative ranking at any moment (Articles 54(6) and 56(6)). The ranking shall be provided at least as from the beginning of the auction but the contracting authority may also communicate this information before it starts.

Contracting authorities shall not disclose the identities of the tenderers at any point in the auction.

Apart from these mandatory requirements contracting authorities may choose to communicate other information provided this was stated in the specification, i.e. the number of participants, prices or values provided by all other participants or only by some of them, their relative ranking.

The rules of the auction can change if this possibility has been announced and precisely specified in the specifications.

If the device for running the auction is technically incapable of dealing with the number of admissible tenders, the auction must be postponed and participants must be informed. If the device runs out of capacity during the auction, it must be cancelled and postponed as well. In case of system failure it is the responsibility of the contracting authority to decide if either the entire auction or one of its phases must be postponed to a later date; only if it is possible to provide timely and appropriate information to each participant, can extension of deadlines and re-submission of bids be envisaged.

Secure transmission of data, confidentiality of communication, authentification and identification of participants, as well as traceability of communications and of processing/calculations must all be ensured appropriately.

The contracting authority could in theory require advanced signatures for each bid where this is technically feasible; however at this stage, the process takes place in a closed environment and this appears to be neither required nor necessary.

Incorrect or unacceptable entries should be registered for reasons of traceability but not taken into account and appropriate feedback provided to the participants.

If everything has been correctly organised there is no need to foresee any communications during the auction other than the submission of prices/values. In any case no human intervention by the contracting authority side should be allowed during the running of the auction.[14] In case of errors, violations of the rules of the game or abnormal behaviour[15], traceability shall ensure that events can be re-constituted.

[14] A contact point external to the device for urgent communications concerning possible technical problems may be offered to participants.

[15] National legislation on the behaviour in auctions, if any, is applicable provided it does not conflict with the rules and principles of the Directives. The Commission services have launched a “Legal study on unfair commercial practices within B2B e-markets” in order to assess the need for further action.

Contracting authorities must organise the closure of the auction by choosing one of the options given by Articles 54(7) and 56(7) or by combining them: on the date and time fixed in the invitation; when no more new prices/values are received after the time indicated in the invitation has elapsed; or when the number of phases fixed in the invitation has been completed.

The contracting authority must award the contract to the best tender following the auction, according to the criteria of the specification. This does not impede the application of Articles 55 and 57 on abnormally low tenders. Contracting authorities may not have improper recourse to e-auctions nor may they use them to prevent, restrict or distort competition or to change the subject-matter of the contract as indicated in the contract notice and in the specification (Article 54(7) and 56(9).

6. DYNAMIC PURCHASING SYSTEMS

By deciding to resort to a dynamic purchasing system (DPS), contracting authorities place themselves and the purchasing process in an entirely electronic context. This means contracting authorities shall use solely electronic means to set up the DPS and to award the contracts, according to Articles 33 and 15.

Member States may regulate and limit the resort to DPSs (Art. 33(1) and 15(1)) but if they are allowed, they must be organised in strict conformity with the requirements of the Directives.

Contracting authorities may decide to set up a DPS in order to purchase over several years (maximum 4, except in duly justified cases) commonly used goods or services which are generally available on the market (i.e. off-the shelf products for which the evaluation can be quick).

The DPS is an open electronic multi-supplier system, which allows for repetitive purchases while granting tenderers the possibility to join throughout its duration. To join the DPS, economic operators shall satisfy the selection criteria and submit an indicative tender which is evaluated for compliance with the specification. Based on their indicative tender, which may be renewed at any time during the DPS life cycle, admitted economic operators can then submit tenders for the specific contracts advertised in a simplified procedure.

No charges may be billed to the interested economic operators or to parties to the DPS (Articles 33(7) and 15(7))) and the rules of the open procedures must be followed during all steps necessary to set up, to manage, and to award each single contract under the DPS (Articles 33(2) and 15(2)).

6.1. Admission to the DPS

To set up the DPS contracting authorities have to publish a contract notice that must indicate that a DPS is involved, how long it will last and the Internet address at which the specification and any additional documents may be consulted. Direct and full access to the specification and any additional documents shall be made available on publication of the notice and remain available as long as the DPS lasts. Award criteria have to be indicated already at this stage even if they can be formulated more precisely later in the invitation to tender. The possible use of electronic auctions shall also be indicated at this stage.

The specification must describe the nature of the purchases envisaged as well as the necessary information concerning the DPS, the electronic equipment and the technical connection arrangements and specifications used.

To be admitted to the DPS tenderers shall satisfy the selection criteria and submit an indicative tender which complies with the specification. At any time during the entire period of validity of the DPS indicative tenders can be submitted and be evaluated within a maximum of 15 days. (The period for evaluation can be extended in which case no invitation to tender may be issued in the meantime).

Upon setting up of the DPS, the time limit for submitting the indicative tenders is that of the open procedure (which may be shortened because of the electronic transmission of the contract notice accompanied by the unrestricted and full and direct access to the specification). However, as the evaluation of indicative tenders is continuous against the selection criteria and the specification of the DPS, they can be opened progressively as they arrive. In this case therefore the device for the receipt of indicative tenders does not need to comply with the requirements of Annex X and XX related to the date for opening tenders.

6.2. Opening for competition of contracts to be awarded under the DPS

Each time contracting authorities want to award a contract under the DPS, they must publish a simplified contract notice inviting all interested economic operators (both those which are already part of the DPS and those who are not) to submit an indicative tender. The time limit for this may not be less than 15 days from the date the simplified notice is sent, to allow new tenderers to join the DPS.

All indicative tenders received by that deadline, either received in response to the simplified contract notice, or previously submitted, shall be evaluated before issuing the invitations to tender.

After evaluating all indicative tenders, contracting authorities send the invitation to tender to all the admitted tenderers (both those already in the DPS as well as those newcomers who satisfy the selection criteria and have submitted indicative tenders which comply with the specification) and set an appropriate deadline for the submission of tenders. At this stage, the award criteria which were already stated in the contract notice setting up the DPS may be formulated more precisely.

After full evaluation of the tenders received, contracting authorities have two possibilities to proceed: either they award the contract to the tenderer who submitted the best tender on the basis of the criteria set out in the contract notice setting up the DPS or the more precisely formulated ones indicated in the invitation to tender; alternatively, if they had announced in the contract notice setting up the DPS that they would run an auction, they determine the admissible tenders and proceed with the auction by sending the invitations to auction according to Article 54(4). All the rules related to electronic auctions are applicable to auctions held in the context of a DPS. c. .

The result of the award of the contracts based on the DPS shall be published. To this end, contracting authorities either send each contract award notice to the Publications Office within 48 days from the award of each contract, or they group such notices on a quarterly basis and send them within 48 days of the end of each quarter.

IP/05/948

Brussels, 15 July 2005

Public procurement: Commission provides assistance on implementation of new “e-procurement” rules

The European Commission has published a document that explains and interprets the rules on electronic public procurement (“e-procurement”) that are part of the new public procurement Directives (2004/18/EC and 2004/17/EC). The aim is to assist Member States in writing the rules into national law and contracting authorities in implementing them. The document is available at the following address: http://europa.eu.int/comm/internal_market/publicprocurement/e-procurement_en.htm

Internal Market and Services Commissioner Charlie McCreevy said: *"e-procurement will enable public authorities to make better purchases and get better value for money. It will also increase competition and by cutting red tape make it much easier for companies to apply for public contracts. Of course, it is vital that these new rules are implemented on time and correctly without technical or organisational barriers between Member States. That is why we have published this document explaining and interpreting the rules in greater detail. I encourage everyone involved to make use of it."*

The new public procurement Directives aim to computerise traditional procedures for the award of contracts and to introduce both new purchase techniques and new instruments made possible by the advances in technology and the Internet.

Member States have to write the Directives into national law by the end of January 2006. The interpretative document aims to facilitate this task by providing clear replies to questions on the legal aspects of e-procurement. It also explains terminology to purchasers who will be required to computerise their orders.

The document analyses the rules applicable to online communications from a practical and pragmatic point of view. It covers all stages of the contract award procedure that can be computerised, as well as the new instruments and purchase techniques.

The publication of this document is one of the actions envisaged by the “Action Plan for the implementation of the legal framework for electronic public procurement”, adopted by the Commission in December 2004. This Action Plan aims to take all necessary steps over a three-year period to ensure that electronic public procurement in Europe is implemented as well as possible.

FUNCTIONAL REQUIREMENTS FOR CONDUCTING ELECTRONIC PUBLIC PROCUREMENT UNDER THE EU FRAMEWORK

VOLUME I

JANUARY 2005

Produced by EUROPEAN DYNAMICS S.A.

on behalf of the EUROPEAN COMMISSION

EXECUTIVE SUMMARY

The new public procurement directives set the legislative framework for public eProcurement in Europe, which should be adopted by all Member States by 31 of January 2006. To assist public administrations in building eProcurement systems in compliance with the new directives, a public eProcurement project was launched in 2003, under the Interchange of Data between Administrations programme (IDA) with a twofold objective:

- to develop functional requirements and suggest technical solutions for the implementation of electronic public procurement systems in compliance with the new legislative framework
- to create eLearning demonstrators simulating the public eProcurement functionalities described by the new directives, allowing administrations and suppliers to familiarise themselves and to experiment with it

The development of guidelines and demonstrators followed an iterative approach, starting with a conceptual design of an eProcurement system and then the elaboration of static and dynamic models for individual contracts, dynamic purchasing systems, framework agreement systems and electronic auctions. In this respect, the present Functional Requirements report has gone through a number of validation cycles, incorporating feedback received by the European Commission and Member States, ensuring that all information included is accurate.

This report analyses procedural aspects of the eProcurement procedures described by the new directives and includes functional and non-functional requirements for implementing them electronically. In addition it provides technical solutions for their implementation, enriched with good practices resulting from the two deliverables of the "analysis phase" of the project:

- State of the Art case studies on European electronic public procurement projects
- Description of electronic public procurement systems in non-European countries.

An overview of possible technical specifications is also presented in the current report, comprising the proposed conceptual model for an eProcurement system supporting all required procedures and a Use Case analysis. Functioning as a mechanism for further projects, the report also incorporates a section documenting several "open issues" related to Public eProcurement, as discussed in various IDA workshops where the current report was presented.

The report is structured in two volumes.

- **Volume I:** the current document, presenting information and activity flows for all eProcurement procedures, functional requirements, non-functional requirements, an overview of technical specifications with a conceptual model and high-level Use Cases, and open issues related to eProcurement
- **Volume II:** presenting an in-depth technical analysis (Use Case analysis) for the main actors and functionalities of an eProcurement system supporting all eProcurement procedures. It also provides scenarios for interested parties to experiment with the dynamic demonstrators, developed in the context of the current project, so as to further understand the concepts described in the Functional Requirements report.

Abbreviations / Acronyms

Abbreviation or Acronym	Term
API	Application Program(ming) Interface
CA	Certification Authority
COTS	Commercial Off-The-Shelf
CPV	Common Procurement Vocabulary (European Community)

GLOSSARY

Term	Description
Authentication	Proving a user’s identity. To be able to access a Website or resource, a user must provide authentication via a password or some combination of tokens, biometrics and passwords.
Authorisation	The act of granting approval. Authorisation to resources or information within an application can be based on simple or complex access control methods.
Browser Based	This term describes software that does not require any client software to be installed or configured on users' systems, except of the commercially supported Web-browsers (IE, NS, Mozilla, Opera, etc). Unlike a browser plug-in, browser based applications do not require manual download and execution of an installation program prior to Web site access; Unlike an ActiveX control or some Java applets, browser based applications do not force the user to agree to potentially confusing security warning dialogs. Unlike other client applications, browser based applications do not have a noticeable download time. In fact, download is transparent to the end-user.
Call	Call for Tenders
Certificate	An electronic "passport", typically contain a user's name and public key. A CA authorises certificates by signing the contents using its CA signing private key.
Certificate validation	The process of checking the trustworthiness of a certificate. Certificate validation involves checking that the certificate has not been tampered with, has not expired, is not revoked and was issued by a CA you trust.
Certification Authority (CA)	The system responsible for issuing secure electronic identities to users in the form of certificates.
Electronic signature	Data in electronic form which are attached to or logically associated with other electronic data and which serve as a method of authentication
Encryption / Decryption	To encrypt a file is to apply a mathematical function that transforms character(s) in the file into some other character(s). Encryption renders the file unreadable. This means no one, including the actor, can read the file until it is decrypted. Only authorised recipients can decrypt the file.
Identification	see Authentication
Private key	The portion of a key pair that is kept secret by the owner of the key pair. Private keys sign or decrypt data.
Public key	The portion of a key pair that is available publicly.
Public Key Infrastructure (PKI)	A system that provides the basis for establishing and maintaining a trustworthy networking environment through the generation and distribution of keys and certificates. This is also the foundation technology for providing enhanced Internet security.
Secure Sockets Layer (SSL)	A secure session protocol used to maintain data confidentiality only between Web-browsers and Web servers. This is a fundamental component of basic Internet security.
Time Stamping	The validity of storing the official date and time a business transaction has occurred.
Web Portal	A Web portal is a single doorway for employees, customers and partners to access an organisation's content, data and services online. Also known as Enterprise portals, Web portals make it possible to establish online relationships by providing personalised content to different individuals and entities. Organisations are building portals not only to increase loyalty, but also to create competitive advantage, strengthen relationships, speed access to services and satisfy regulatory requirements. Portals also make it possible to increase revenue, efficiencies and cost savings by moving business processes online.
XML	XML is the standard messaging format for business communication, allowing companies to connect their business systems with those of customers and partners using the existing Internet infrastructure. Similar to HTML, XML uses tags (words bracketed by '<' and '>') and attributes (of the form name="value") to help place structured data into text files. XML is different from HTML in that it is a meta-language (a language for describing languages) and, therefore, does not define specific tags and attributes.

List of Functional Requirements

Functional Req. 1: User Registration……………………………………………………………………… 18

Functional Req. 2: User Profiling…………………………………………………………………………. 18

Functional Req. 3: User Authentication…………………………………………………………………… 18

Functional Req. 4: User Authorisation……………………………………………………………………. 18

Functional Req. 5: Tender workspace creation…………………………………………………………… 19

Functional Req. 6: Preparation of a Prior Information Notice…………………………………………….. 19

Functional Req. 7: Use of the Common Procurement Vocabulary (CPV) classification standard………. 20

Functional Req. 8: Publication of a Prior Information Notice………………………………………………20

Functional Req. 9: Nomenclature of Territorial Units for Statistics (NUTS) classification standard……..20

Functional Req. 10: Tender Evaluation Mechanism…………………………………………………………21

Functional Req. 11: Interface with the OJEU……………………………………………………………….. 21

Functional Req. 12: Publication of Contract Documents…………………………………………………… 22

Functional Req. 13: Search Calls mechanism……………………………………………………………….. 22

Functional Req. 14: Visualise/Download Call for Tenders specifications…………………………………. 22

Functional Req. 15: Request for Additional Documents……………………………………………………. 23

Functional Req. 16: Automated Notifications……………………………………………………………….. 23

Functional Req. 17: Submission of Tenders………………………………………………………………… 23

Functional Req. 18: Four-eye Principle……………………………………………………………………….24

Functional Req. 19: Tender Confidentiality…………………………………………………………………. 24

Functional Req. 20: Tender Evaluation………………………………………………………………………24

Functional Req. 21: Creation of Mandatory Reports regulated by the legislation………………………... 25

Functional Req. 22: Invitation to Tender……………………………………………………………………..30

Functional Req. 23: DPS reporting……………………………………………………………………………34

Functional Req. 24: Creation of specific contract workspaces within DPS workspace……………………35

Functional Req. 25: Indicative Tenders in the form of electronic catalogues (eCatalogues) …………….. 35

Functional Req. 26: Creation of eAuction workspace and establishing eAuction parameters…………. 48

1 INTRODUCTION

This report may concern anyone who is interested or involved in implementing systems for electronic public procurement in the EU. It was commissioned by the European Commission and seeks to assist interested parties to avoid problems and prevent the emergence of "e-barriers" by clarifying the functional and non-functional requirements for public eProcurement systems, as they result from the specific provisions of the new European public procurement directives.

The new public procurement directives set the legislative framework for public eProcurement in Europe, which should be adopted by all Member States by 31 of January 2006. To assist public administrations in building eProcurement systems in compliance with the new directives, a public eProcurement project was launched in 2003, under the Interchange of Data between Administrations programme (IDA) with a twofold objective:

- to develop functional requirements and technical solutions for the implementation of electronic public procurement systems, in compliance with the new legislative framework
- to create eLearning demonstrators, simulating the public eProcurement functionalities described by the new directives, allowing administrations and suppliers to familiarise themselves and to experiment with them

The development of guidelines and demonstrators followed an iterative approach, starting with a conceptual design of an eProcurement system and then the elaboration of static and dynamic models for individual contracts, dynamic purchasing systems, framework agreement systems and electronic auctions.

In a first phase, the project focused on the analysis and assessment of existing European and international eProcurement systems and the deduction of interesting eProcurement practices that could enhance the operation of new eProcurement systems. These findings are presented in detail within the:

- state of the Art case studies on European electronic public procurement projects
- description of electronic public procurement systems in non-European countries

Based on the new public procurement directives, and taking into account the findings of the reports above, the functional requirements to be respected by fully integrated eProcurement systems were identified. This should provide a conceptual framework for the technical implementation of electronic public procurement systems in compliance with the new legislative framework.

The report describes the functional system requirements and pre-requisites derived from the legal framework and presents the different actors participating in eProcurement systems, as well as information and activity flow diagrams for all eProcurement procedures. In addition, a technical overview for the creation of such system and some non-functional requirements are also presented.

Some of the functional requirements identified are direct legal requirements, while others are functional prerequisites for implementing those legal requirements in a fully integrated eProcurement system. The report should be understood as a set of indicative guidelines aimed at assisting Member States in transposing the EU framework and in setting up and managing eProcurement systems that are compliant with EU public procurement legislation. Its purpose is to serve as a reference for designing new eProcurement systems or for adapting existing ones, as well as for guiding standardisation activities at all levels.

The report has undergone several review cycles, improving the earlier versions and incorporating additional information about public eProcurement. The reviews were performed by European Commission services, as well as, the IDA eProcurement expert group bringing together delegates from all Members States of the European Union and other countries participating in the IDA programme.

1.1 Structure of the report

The report is split into two volumes. The structure of the report is described below:

- **Volume I:**
    - **Section 1:** introduction
    - **Section 2**: analyses the eProcurement procedures regulated under the new directives, namely individual contracts (open and restricted) and repetitive contracts (DPS, framework agreement). Furthermore, extensions for both individual contracts and repetitive procedures are analysed (eAuction). This section includes eProcurement information flows, outlining the different steps involved in each procedure, and activity diagrams, clearly showing all different tasks, subtasks, branches, etc, that are related to the eNotification, eTendering, and eAwarding phases of each procedure
    - **Section 3**: provides potential technical solutions for the implementation of a fully integrated eProcurement system capable of supporting the procedures required by the new directives
    - **Section 4**: details non-functional requirements of an eProcurement system, as they emerge from the new EU eProcurement legislation, categorised into five main areas: usability, reliability, interoperability, scalability and security
    - **Section 5**: provides an overview of technical specifications, through a conceptual model and high-level Use Cases for eProcurement systems supporting individual contracts, repetitive procedures and electronic auctions
    - **Section 6**: documents "open issues" related to eProcurement, as they have been discussed in several fora
    - **Section 7:** outlines main conclusions

- **Volume II:**
    - **Section 1:** Provides an in-depth Use Case analysis for all main actors and functionalities of an eProcurement system supporting *individual contracts*
    - **Section 2:** Provides an in-depth Use Case analysis for all main actors and functionalities of an eProcurement system supporting *Dynamic Purchasing Systems*
    - **Section 3:** Provides an in-depth Use Case analysis for all main actors and functionalities of an eProcurement system supporting *Framework Agreements*
    - **Section 4:** Provides an in-depth Use Case analysis for all main actors and functionality of an eProcurement system supporting *eAuctions*
    - **Section 5:** Provides scenarios for interested parties to experiment with the dynamic demonstrators, which were elaborated in the context of the current project, so as to gain further understanding of the concepts discussed in the report

1.2 Business framework

The analysis performed for all eProcurement procedures is based on the EU public procurement Directive 2004/18/EC on the coordination of procedures for award of public works contracts, public supply contracts and public service contracts. All functional requirements and activity flow diagrams presented are independent from the technical implementation of an eProcurement system.

The modelling of these procedures was based on the following assumptions.

- One or more contracting authorities offer online eProcurement services, using a commonly accessible electronic platform. This platform operates as a single access point for users (e.g. procurement officers, economic operators, etc). For instance, such a platform might be a web-portal, openly accessible via the Internet.
- It is assumed that contracting authorities already make use of a number of existing information systems (e.g. back-office, legacy, etc.). The integration of the eProcurement platform with such systems can further assist contracting authorities to efficiently perform eProcurement. Whenever in the current document such an integration with existing information systems is discussed, it is assumed that the communication channel between these systems and the eProcurement platform is technically feasible, secure and reliable.
- Notices concerning Calls for Tenders are officially published on the Tender Electronic Daily (TED) website of the EU. This is a service offered by the EC Publications Office, which receives on a daily basis notices for all contracts covered by the Directives and provides facilities for the online searching, retrieval, visualisation, and downloading of notices.
- The functional analysis carried out for this document is based on requirements deriving from the EC public procurement Directive 2004/18/EC. It does not cover other aspects of the procurement cycle that contracting authorities may choose to implement electronically, in order to enhance their systems, such as electronic ordering or invoicing.
- Finally, it is also assumed that contracting authorities may have to adhere to national, regional and/or local legal requirements, depending on the field of their operation.
- The analysis presented in this report does not consider the negotiated procedure, as well as, competitive dialogues.

2 DESCRIPTION OF EPROCUREMENT PROCEDURES

This chapter presents an analysis of the procurement procedures described in the new EU directives. The procurement procedures for awarding public contracts are classified according to the following contract types:

- ***Individual contracts***
  - ***Open procedure***: whereby any interested Economic Operator may submit a Tender
  - ***Restricted procedure***: whereby any Economic Operator may request to participate. Only those Economic Operators invited by the contracting authority may submit a Tender
- ***Repetitive contracts***
  - ***Dynamic Purchasing System (DPS)***: constitutes a fully electronic process for contracting authorities for making commonly used purchases, which are generally available on the market and meet the requirements of the contracting authority. The duration of a DPS should not exceed 4 years and should be open throughout its validity to any Economic Operator satisfying the selection criteria and having submitted an indicative Tender compliant with the specification
  - ***Framework Agreement***: is an agreement between one or more contracting authorities and one or more Economic Operators, the purpose of which is to establish the terms governing contracts to be awarded during a given period, in particular with regard to price and, where appropriate, the quantity envisaged
- ***Extensions***
  - ***Electronic auctions***: are repetitive processes involving the use of an electronic device for the presentation by tenderers of improved offers for a specific Call for Tenders (i.e. the submission of new prices revised downwards, and/or new values concerning certain elements of tenders, thus allowing the use of automatic evaluation methods). This occurs after an initial full evaluation of the Tenders. eAuctions can be used with contracts for works, supplies or services for which the specifications can be determined/quantified with precision. This excludes non-quantifiable elements of a tender, as well as, certain service and work contracts having as their subject-matter intellectual performances. Electronic auctions can be utilised as an extension to the awarding phase of a tendering procedure. They do not constitute a complete eProcurement procedure for awarding contracts.

2.1 Individual Contracts

This section considers the procedural aspects of the procurement processes that Contracting Authorities need to follow for procuring electronically under individual contracts. Individual contracts can be procured following any of the three public procurement procedures, namely: open, restricted and negotiated (with and without advertisement). In the subsequent sections, only the two main procedures, e.g. the open and the restricted procedures are analysed. The report describes the exact flows of events that need to be followed, and deduces functional requirements for the realisation of a fully integrated eProcurement system that would be compliant with the new EU public procurement legislation.

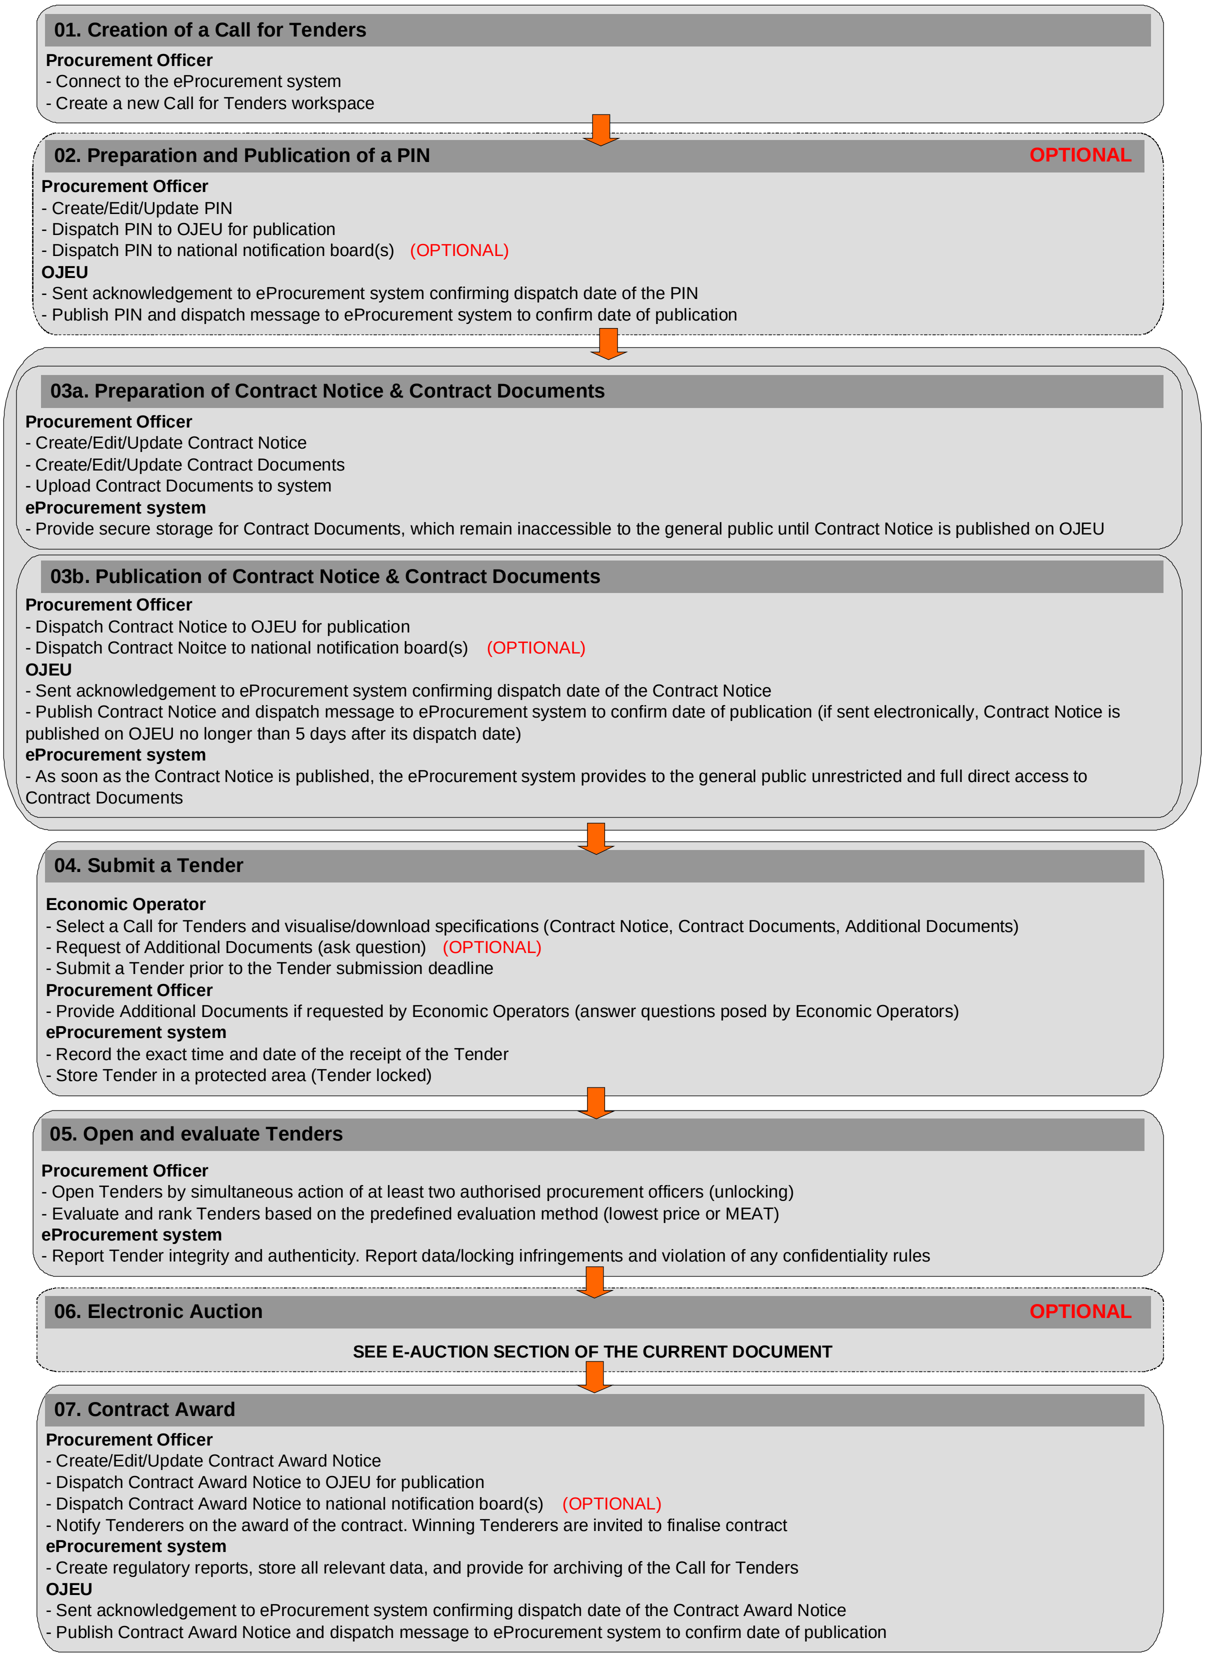
2.1.1 Open Procedure

The open procedure is a procedure whereby any interested Economic Operator may submit a Tender in response to a call for tender. It is the only procedure for the procurement of individual contracts in which any interested Economic Operator can participate by submitting a Tender, without the Contracting Authority performing a prior selection and/or dispatching an invitation.

2.1.1.1 Information Flow Diagram

Figure 2-1 depicts the different steps of the open procedure, focusing on the actions performed by all parties involved.

Figure 2-1: Information Flow Diagram for the Open Procedure



01. Creation of a Call for Tenders

Procurement Officer
- Connect to the eProcurement system
- Create a new Call for Tenders workspace

02. Preparation and Publication of a PIN OPTIONAL

Procurement Officer
- Create/Edit/Update PIN
- Dispatch PIN to OJEU for publication
- Dispatch PIN to national notification board(s) (OPTIONAL)

OJEU
- Sent acknowledgement to eProcurement system confirming dispatch date of the PIN
- Publish PIN and dispatch message to eProcurement system to confirm date of publication

03a. Preparation of Contract Notice & Contract Documents

Procurement Officer
- Create/Edit/Update Contract Notice
- Create/Edit/Update Contract Documents
- Upload Contract Documents to system

eProcurement system
- Provide secure storage for Contract Documents, which remain inaccessible to the general public until Contract Notice is published on OJEU

03b. Publication of Contract Notice & Contract Documents

Procurement Officer
- Dispatch Contract Notice to OJEU for publication
- Dispatch Contract Noitce to national notification board(s) (OPTIONAL)

OJEU
- Sent acknowledgement to eProcurement system confirming dispatch date of the Contract Notice
- Publish Contract Notice and dispatch message to eProcurement system to confirm date of publication (if sent electronically, Contract Notice is published on OJEU no longer than 5 days after its dispatch date)

eProcurement system
- As soon as the Contract Notice is published, the eProcurement system provides to the general public unrestricted and full direct access to Contract Documents

04. Submit a Tender

Economic Operator
- Select a Call for Tenders and visualise/download specifications (Contract Notice, Contract Documents, Additional Documents)
- Request of Additional Documents (ask question) (OPTIONAL)
- Submit a Tender prior to the Tender submission deadline

Procurement Officer
- Provide Additional Documents if requested by Economic Operators (answer questions posed by Economic Operators)

eProcurement system
- Record the exact time and date of the receipt of the Tender
- Store Tender in a protected area (Tender locked)

05. Open and evaluate Tenders

Procurement Officer
- Open Tenders by simultaneous action of at least two authorised procurement officers (unlocking)
- Evaluate and rank Tenders based on the predefined evaluation method (lowest price or MEAT)

eProcurement system
- Report Tender integrity and authenticity. Report data/locking infringements and violation of any confidentiality rules

06. Electronic Auction OPTIONAL

SEE E-AUCTION SECTION OF THE CURRENT DOCUMENT

07. Contract Award

Procurement Officer
- Create/Edit/Update Contract Award Notice
- Dispatch Contract Award Notice to OJEU for publication
- Dispatch Contract Award Notice to national notification board(s) (OPTIONAL)
- Notify Tenderers on the award of the contract. Winning Tenderers are invited to finalise contract

eProcurement system
- Create regulatory reports, store all relevant data, and provide for archiving of the Call for Tenders

OJEU
- Sent acknowledgement to eProcurement system confirming dispatch date of the Contract Award Notice
- Publish Contract Award Notice and dispatch message to eProcurement system to confirm date of publication

2.1.1.2 Functional requirements for the Open Procedure

This section presents the functional requirements emerging from the legislation for the realisation of eProcurement systems capable to support the open procedure. All functional requirements are associated with one or more steps of Figure 2-1.

Step 01. Creation of a Call for Tenders

This step refers to the preparation of a virtual workspace in an eProcurement system where all information related to a specific call for tenders can be stored. In order to create and manage a Call for Tenders in an integrated eProcurement system, an isolated storage area is necessary where Notices, Contract Documents, Additional Documents, Tenders, etc. are safely kept. Furthermore, other information about the Call, like the associated persons involved, name of the specific Call for tenders, description, opening/closing dates, etc. are also stored in the Call for Tenders workspace.

The functional requirements identified for this step comprise:

Functional Req. 1. User registration

This functional requirement allows for the user registration of new Procurement Officers and Tenderers/Economic Operators to the eProcurement system. The registration process must ensure the confidential transfer and storage of all personal information of users. Furthermore, mechanisms may be put in place for the validation of the information provided by new users of the system. Hence, the registration process may be performed in two phases. One phase can allow new users to apply for registration to the system, and another phase can allow authorised personnel to validate the submitted information and approve or reject a registration application.

Functional Req. 2. User profiling

This functional requirement relates to the ability of the eProcurement system to store personal information of its registered users. Users can update their personal information if required. This personal information can be used for several other functionalities of the system, including reporting, automated notifications, etc. Also, each user is associated to a unique identifier, which can be used by the audit trailing facility of the system, in order to record all user activities, and to identify the initiator/actor of each activity.

Moreover, user profiling can allow users to setup their preferences when using the system, in terms of how data is searched, displayed, etc.

Functional Req. 3. User authentication

This functional requirement allows users to identify themselves to the eProcurement system. This is necessary for the system to display the appropriate data to users, as well as, to make available the appropriate activities to be executed according to a user’s role in the system.

Functional Req. 4. User authorisation

Each user in the system is commonly associated with a certain role. As presented in more detail in section 5.2, users can undertake and perform different roles, like Call administrators, Tender opening staff, Tender evaluating staff, etc. User authorisation can enable the eProcurement system to be aware of the role of a user. Depending on the user rights for each user, the system can control which activities a user can perform, as well as, what data a user should have access to.

Functional Req. 5. Tender workspace creation

When creating a Call for Tenders, the eProcurement system can make available to the Procurement Officers a virtual workspace for storing all Call-related information. This virtual workspace allows authorised users to provide core information about the Call, like its name, description, estimated value, etc., and provides the functionality for uploading documents, like Notices, Contract Documents, Additional Documents, etc.

Moreover, the Tender workspace can be used as the area for storing Tenders submitted by Tenderers, and all logically related data of a Call.

A Tender workspace needs to be well integrated with the User authorisation of the system (**Functional Req. 4: "User authorisation"**), as information stored in a Tender workspace should be accessed and/or manipulated by authorised users only. Furthermore, some activities should only be possible when certain events have already taken place (e.g. accessing the details of a Tender should only be possible for authorised personnel after Tenders are securely opened, following the four-eye principle).

Step 02. Preparation and Publication of a Prior Information Notice (PIN)

This step comprises the preparation of a Prior Information Notice (PIN). Contracting authorities should prepare and publish a PIN as early as possible, at the beginning of their budgetary year covering the awarding of the envisaged supplies and services contracts during the subsequent 12 months. For works contracts, a PIN may be published at any time. The use of a PIN is at the discretion of a contracting authority. Its use can shorten the time-limit for receipt of tenders to 36 days.

The functional requirements identified for this step comprise:

Functional Req. 6. Preparation of a Prior Information Notice

Procurement Officers may be assisted in creating a PIN by using an application for the preparation of the Notice to be published in the Official Journal. Such an application, commonly known as "Form Filling Tool", can be a part of the eProcurement system itself, or an external application integrated to the eProcurement system.

Document templates or electronic standard forms shall be used to prepare a PIN.

Procurement Officers can be further assisted in preparing a PIN by automatically utilising Call information already provided to the system within the Tender workspace, during STEP 1 of the procedure. The Form Filling Tool may obtain all pre-defined Call information from the eProcurement system, and automatically pre-fill as many fields in the PIN template as possible.

Functional Req. 7. Use of the Common Procurement Vocabulary (CPV) classification standard

The new Public Procurement Directives require contracting authorities to use the CPV to advertise their procurement needs. The CPV constitutes a European classification standard specifically tailored to describe goods, services or works purchased by public authorities by numerical codes. The CPV exists in the 20 official languages of the EU. Thanks to this classification, Economic Operators can easily identify the goods/services/works a contracting authority wishes to procure, irrespective of the language of the PIN and to perform specific searches on the TED database.

An eProcurement system can prompt Procurement Officers to make use of the CPV classification standard when creating a PIN.

Functional Req. 8. Publication of a Prior Information Notice

Once the PIN is created, Procurement Officers can be assisted to dispatch an appropriate electronic message to the OJEU, containing all information of the PIN, to request for its publication. The eProcurement system should be in position to store the dispatch date of the PIN to the OJEU.

Step 03a. Preparation of a Contract Notice & Contract Documents

This step comprises the preparation of the Contract Notice and Contract Documents for a specific Call for Tenders. The objective of the Contract Notice is to openly advertise to the general public the intention of the contracting authority to procure, as well as, to provide the core requirements for the contract. Contract Documents define more precisely the requirements/specifications of the contracting authority for the goods/services/works to be procured.

The main activities for the preparation of the Contract Notice are the same as those for the preparation of the PIN, the only difference being the content of the corresponding form. Hence, the basic functional requirements for the preparation of the Contract Notice are the same as those for the preparation of the PIN (**Functional Req. 6: “Preparation of a Prior Information Notice”** and **Functional Req. 8: "Publication of a Prior Information Notice”**). In addition, the preparation of a Contract Notice imposes some additional requirements.

Functional Req. 9. Nomenclature of Territorial Units for Statistics (NUTS) classification standard

The Contract Notice may specify the NUTS codes for the contract to be procured. NUTS is a classification standard for geographic regions, which uses numerical codes to define the location of the goods/services/works to be procured. Similarly to the CPV, the inclusion of NUTS codes in a Contract Notice allows Economic Operators to easily identify the locations to which they will be required to deliver the goods/services/works of the contract irrespective of the language of the Contract Notice.

An eProcurement system can prompt Procurement Officers to make use of the NUTS classification standard when creating a Contract Notice. This functional requirement is not legislated by the EU public procurement legal framework, nevertheless can significantly increase the services that can be offered by an eProcurement system (e.g, searching, reporting, system integration, etc.)

Functional Req. 10. Tender Evaluation Mechanism

Contracting authorities shall conclude a competition by performing the full evaluation of Tenders received, and the awarding of a contract. The evaluation of Tenders is based on one of the following two Tender evaluation models: either lowest price or Most Economically Advantageous Tender (MEAT). In both cases, the evaluation model to be used must be specified in the Contract Notice or the Contract Documents. In the latter case, this fact must be stated in the Contract notice. If the evaluation is based on the Most Economically Advantageous Tender, contracting authorities are required to define the exact evaluation criteria to be used, as well as to indicate their weightings either in the Contract Notice or in the Contract Documents. In the latter case this reference to the Contract Documents must be stated in the Contract Notice. In duly justified cases where the weighting cannot be established, contracting authorities must be able to give reasons, and indicate the descending order of importance of all criteria.

When the evaluation parameters of a Call based on MEAT can be established with precision, a contracting authority may decide that the award of the contract shall be preceded by an electronic auction. The intention of using an electronic auction as part of the awarding procedure needs to be mentioned in the Contract Notice of the Call.

To accommodate the above, an eProcurement system can prompt Procurement Officers to define the evaluation mechanism to be used, as well as automatically include the details of the evaluation mechanism in the Contract Notice and/or Contract Documents.

Step 03b. Publication of Contract Notice & Contract Documents

This step comprises the publication of the Contract Notice and Contract Documents of a Call for Tenders. This operation involves the dispatch of the electronic message of the Contract Notice to the OJEU, as well as, the publication of the Contract Documents to the general public.

The functional requirements identified for this step comprise:

Functional Req. 11. Interface with the OJEU

Once the Contract Notice of a Call for Tenders is completed, it needs to be made publicly available. For contracts above the EU thresholds, as defined in the EU public procurement directives, the Contract Notice needs to be published to the Official Journal of the European Union (OJEU).

The EU Publications Office, responsible for the daily publication of the Official Journal, offers several methods by which a notice can be published on the OJEU. An eProcurement system can offer the functionality for automating or semi-automating the publication of notices in the OJEU. This does not only simplify the processes a Procurement Officer needs to follow, but also allows to shorten the time-limit for the submission of Tenders.

Functional Req. 12. Publication of Contract Documents

The preparation of Contract Documents involves an “approval” lifecycle for documents (and possible notices), comprising their creation, validation, approval and publication. The “approval” lifecycle depends on the internal procedures of the contracting authority, and may involve multiple Procurement Officers. An eProcurement system can provide a functionality for modelling these internal workflows which can assist Procurement Officers to comply with the internal workflows of their contracting authority in a more efficient and time-effective manner. While a document is in “not-published” state, it is accessible only to the Procurement Officers associated with it.

The finalised Contract Documents approved by the contracting authority shall not be made publicly available until the Contract Notice is dispatched to the OJEU for publication. Once the Contract Notice has been published by the OJEU, it may also be published at the national level, and all interested parties should be given unrestricted and full access to the Contract Documents.

Once a Contract Document is made publicly available, it should not be possible for anyone to remove and/or modify this document.

Step 04. Submit a Tender

This step constitutes the eProcurement phase for the submission of Tenders by Economic Operators, commonly referred to as eTendering. During this phase, Economic Operators gain access to all publicly available information of a Call, may request Additional Documents, and submit their Tenders.

The functional requirements identified for this step comprise:

Functional Req. 13. Search Calls mechanism

At this step, the Call for Tender is considered “open”, as it is publicly available. An eProcurement system may provide a search Calls mechanism to any interested party, so that it can search through all publicly “open” Calls and locate interesting ones, for which s/he might wish to participate.

Functional Req. 14. Visualise/Download Call for Tenders specifications

Any interested party should be provided with the functionality to access all publicly available information of a Call, comprising PIN, Contract Notice, Contract Documents, Additional Documents, etc. An eProcurement system may require interested parties to provide some personal information, so that they are notified if and when new information about the Call is published (Additional Documents, new Contract Documents, etc.)

The eProcurement system should ensure that full and unrestricted access to all publicly available information is provided equally to all interested parties.

Functional Req. 15. Request for Additional Documents

Any interested party may be provided with the possibility to request Additional Documents about a Call (i.e. ask a question to the awarding authority). This may be provided only within a predefined time period (i.e. accept questions posted before a certain date). All requests for Additional Documents and the Additional Documents themselves need to be made publicly available to all interested parties, and in due time before the end of the time-limit for submission to ensure non-discrimination and equal treatment of Economic Operators. The identities of Economic Operators posting requests for Additional Documents should not be disclosed, neither to the general public nor to other Economic Operators.

Functional Req. 16. Automated Notifications

An eProcurement system may support an automated notification mechanism, which can automatically notify its users of interesting events. For instance, Economic Operators that requested an Additional Document (i.e. posted a question) may be automatically notified when an Additional Document is published by the contracting authority (i.e. the contracting authority has provided an answer to the posted question). As described in Functional Requirement 15, such a notification mechanism must ensure equal treatment of all Economic Operators and operate within the time-limit for submission of tenders.

Functional Req. 17. Submission of Tenders

Economic Operators interested in a Call shall have the possibility to submit electronically the Tenders that they have prepared through generally available, non-discriminatory, and interoperable means of communication. Contracting authorities examine whether the Tenders received are compliant with the requirements defined in the Tender specifications.

Economic Operators that have submitted a Tender should be provided with the possibility to update their Tender until the Tender submission deadline.

The eProcurement system must ensure that all Tenders for a Call are stored in a secure environment and cannot be accessed until authorised Procurement Officers authorise their opening following the four-eye principle. If access prohibition is infringed, it should be reasonably ensured that the infringement is clearly detectable.

Official time-stamping facility can ensure the exact submission date and time of a Tender is recorded, guaranteeing there are no misconceptions about the submission time of a Tender (see relevant non-functional requirement in section 4.3.3.2).

Security arrangements for all data transmitted to/from the eProcurement system and stored in the eProcurement system should ensure the integrity of the Tenders, as well as, the authenticity of the Economic Operators that have submitted them (see relevant non-functional requirements in section 4.5).

Step 05. Open and evaluate Tenders

This step refers to the opening and evaluation of electronic Tenders. Opening and evaluation take place once the Tender submission period has ended (i.e. eSubmission is complete). The secure opening of Tenders must involve at least two authorised procurement officers who proceed to open the Tenders received through simultaneous action following the so-called four-eye principle. Following this operation authorised procurement officers perform the evaluation of Tenders based on the pre-defined Tender evaluation mechanism and establish the ranking of Tenders.

Functional Req. 18. Four-eye Principle

An eProcurement system needs to ensure that access to Tenders cannot be obtained by anyone, until authorised procurement officers proceed to the opening of Tenders following the four-eye principle. To "open" or "unlock" Tenders, two or more authorised procurement officers need to perform simultaneous actions.

The opening of Tenders shall only be performed after the Tender submission deadline.

It is considered as best practice for the opening of Tenders to be performed in phases. Hence, for instance, proof documents are opened first, followed by the opening of technical document, and lastly the opening of financial offers. In all Tender opening phases, the Four-eye Principle can be applied.

Functional Req. 19. Tender Confidentiality

Once Tenders are opened, they can only be accessed by authorised personnel, ensuring that the confidentiality of Tenders is not violated.

Functional Req. 20. Tender Evaluation

An eProcurement system may assist procurement officers to perform the evaluation of Tenders, either in an automated or semi-automated manner. Initially, all Tenders should be evaluated in order to ensure that participating Tenderers satisfy the Conditions for Participation stated in the Contract Notice or Contract Documents of the Call.

This is followed by the full Tender evaluation according to the pre-defined evaluation mechanism stated in the Contract Notice or Contract Documents of the Call.

Step 06. Electronic Auctions

If the specifications of a Tender can be defined with precision, the contracting authority may choose to award the contract using an electronic auction. In this case, tenderers are given the opportunity to improve aspects of their Tenders through a repetitive bidding mechanism, increasing their possibility to win the competition. The evaluation of auction Bids is performed according to some or all of the evaluation criteria mentioned in step 3.

Electronic auctions can be used in an eProcurement competition only if this is clearly stated in the Contract Notice of the Call. The details regarding the steps involved in the execution of electronic auctions, as well as, related functional requirements are discussed in section 2.3.

Step 07. Contract Award

Once the awarding procedure is complete, the contract is awarded to the tenderer having submitted the lowest price or the Most Economically Advantageous Tender, as concluded by applying the evaluation methodology (defined in step 3). The contracting authorities are required to publish a Contract Award Notice, which informs all interested parties of the results of the competition. The procedure for creating and publishing a Contract Award Notice is the same as that for creating a PIN and a Contract Notice. Hence, **Functional Req. 6: "Preparation of a Prior Information Notice"**, **Functional Req. 8: "Publication of a Prior Information Notice"** and **Functional Req. 11: "Interface with the OJEU"** are also necessary for creating/publishing a Contract Award Notice.

In addition, contracting authorities shall contact the participating tenderers to inform them of the award decision. Upon request of the tenderer, the contracting authority should usually give the reasons for rejection. . An eProcurement system may assist in this process by automatically or semi-automatically preparing appropriate notification messages, which can inform tenderers accordingly. **Functional Req. 16: "Automated Notifications"** can assist in this process.

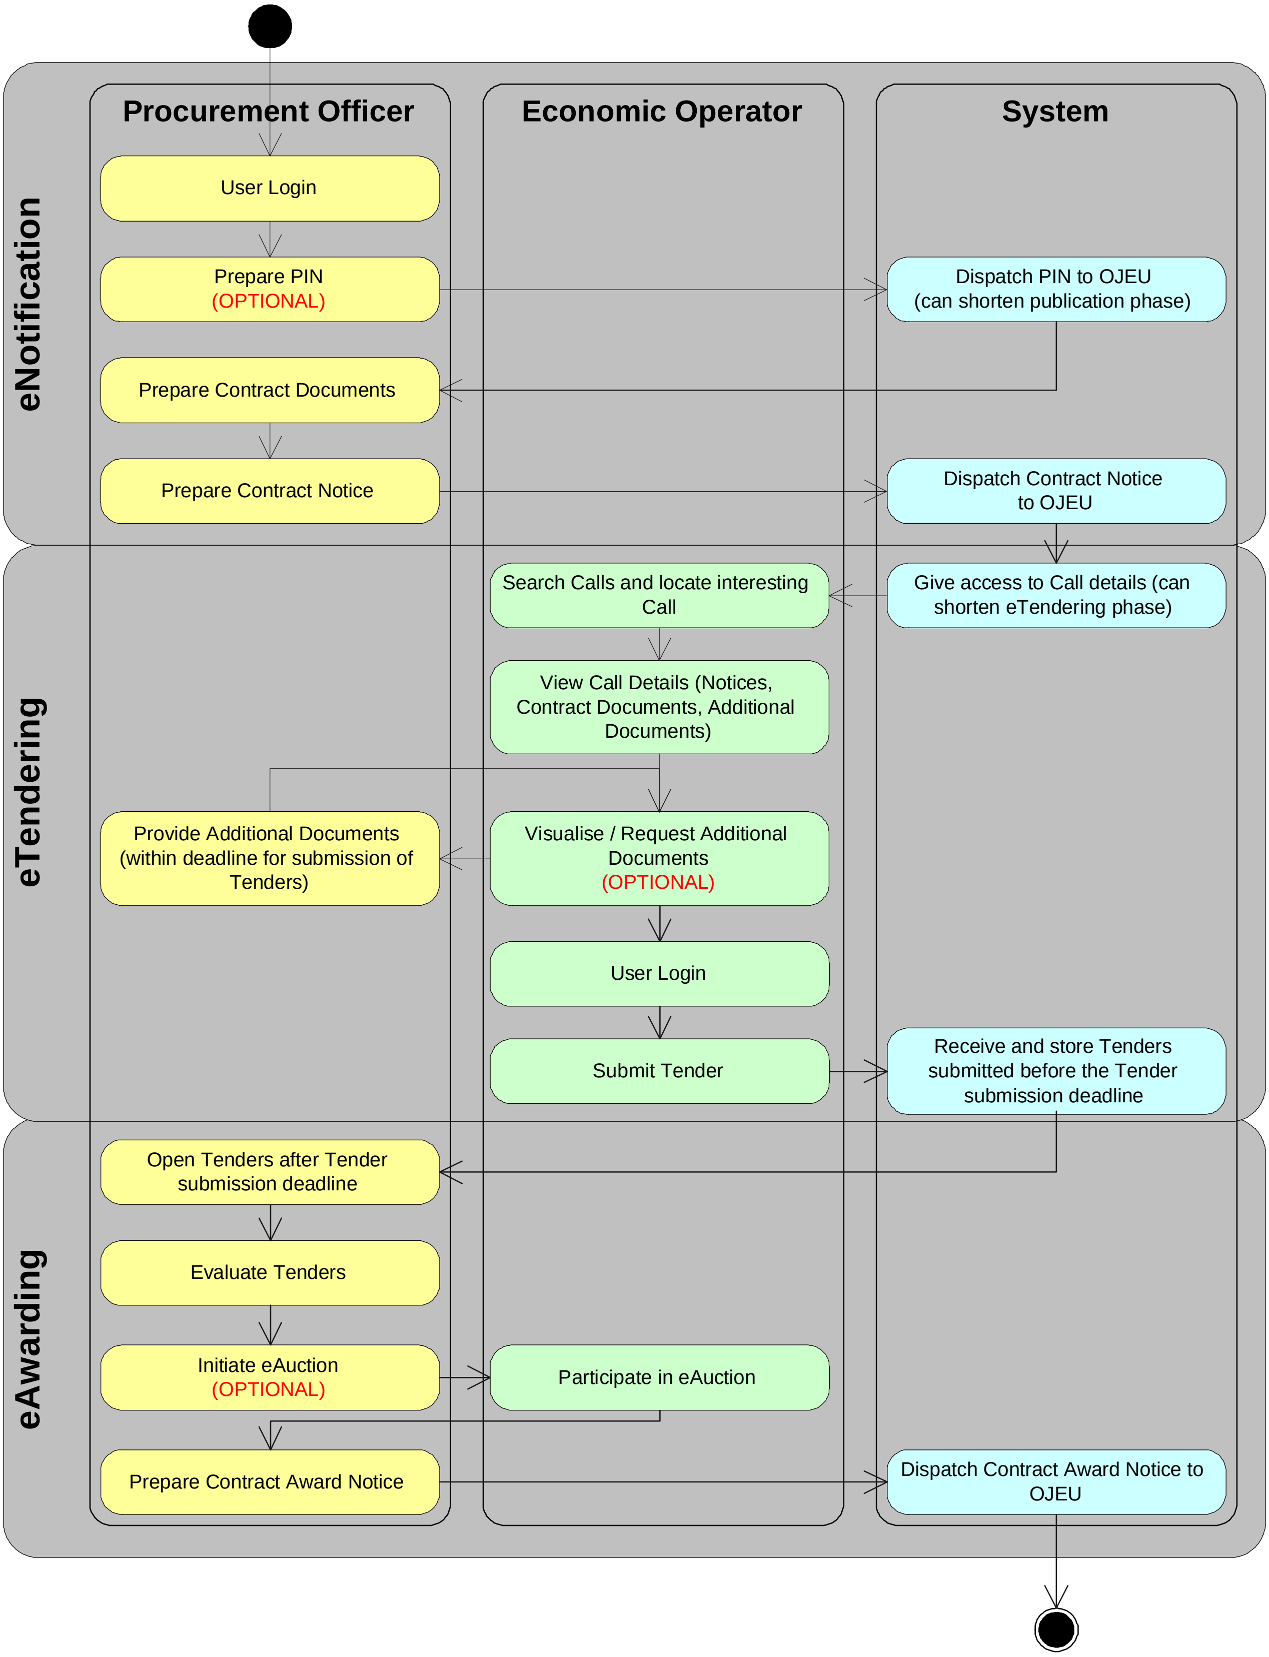
Functional Req. 21. Creation of Mandatory Reports regulated by the legislation

Another requirement of the legislation is related to the capability of the contracting authority to prepare regulatory reports, which provide information on all aspects of the competition. Such reports include information about the tenderers that participated in the competition, the successful tenderer(s), the reasons for their selection, etc. The contracting authority may be assisted in this process by an eProcurement system which, utilising all information created/stored in it during the competition, can automatically or semi-automatically produce such reports.

2.1.1.3 Open Procedure Activity Diagram

Figure 2-2 presents at granular level the open procedure, clearly displaying all activities that are being performed by the main actors (procurement officers, economic operators and an eProcurement system) in the different eProcurement phases: eNotification, eTendering, and eAwarding. The activity diagram groups in phases and serialises all activities that need to be performed in the whole procurement process. Some tasks are subject to legislated time-constraints that need to be respected by Contracting Authorities. Thus, the whole procurement process for a contract following the open procedure may require significant time.

Figure 2-2: Activity diagram for the open procedure



eNotification
eTendering
eAwarding
Procurement Officer
Economic Operator
System

2.1.2 Restricted Procedure

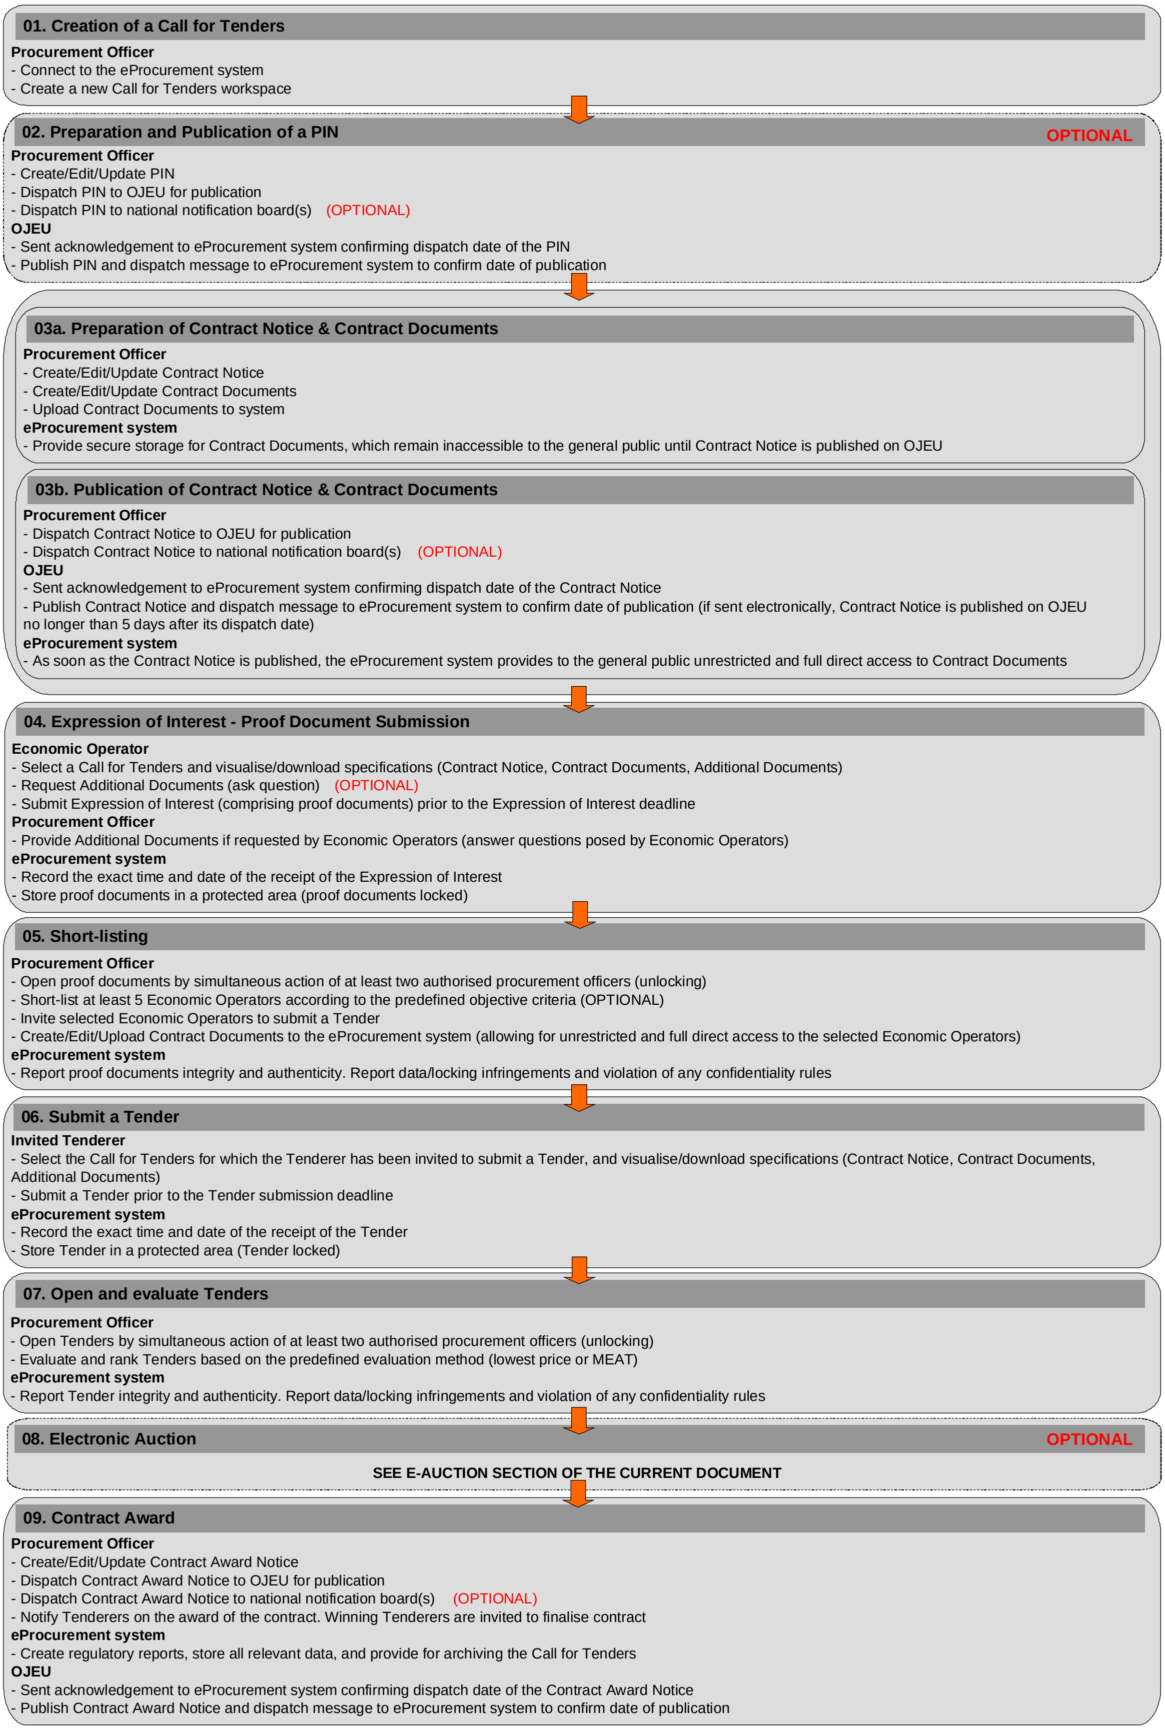
A Restricted procedure is a procedure in which any Economic Operator may request to participate and whereby only those Economic Operators invited by the contracting authority may submit a Tender. Following this procedure, contracting authorities issue a Contract Notice for advertising the contract. Any Economic Operator may express interest to participate by submitting an appropriate request for participation to the contracting authority.

The contracting authority may restrict the number of tenderers that will be invited to tender to a minimum of at least five. In this case, the contracting authority must state the objective criteria it will apply for short-listing in the Contract Notice, and only the candidates that are short-listed according to those criteria are subsequently invited to submit a tender. In the absence of such a restriction there is no short-listing. The contracting authority invites all Economic Operators that comply with the minimum capabilities required in the Contract notice to submit a tender.

2.1.2.1 Information Flow Diagram

Figure 2-3 depicts the different steps of the restricted procedure, focusing on the actions performed by all parties involved.

Figure 2-3: Information Flow Diagram for the Restricted Procedure



01. Creation of a Call for Tenders

Procurement Officer
- Connect to the eProcurement system
- Create a new Call for Tenders workspace

02. Preparation and Publication of a PIN OPTIONAL

Procurement Officer
- Create/Edit/Update PIN
- Dispatch PIN to OJEU for publication
- Dispatch PIN to national notification board(s) (OPTIONAL)

OJEU
- Sent acknowledgement to eProcurement system confirming dispatch date of the PIN
- Publish PIN and dispatch message to eProcurement system to confirm date of publication

03a. Preparation of Contract Notice & Contract Documents

Procurement Officer
- Create/Edit/Update Contract Notice
- Create/Edit/Update Contract Documents
- Upload Contract Documents to system

eProcurement system
- Provide secure storage for Contract Documents, which remain inaccessible to the general public until Contract Notice is published on OJEU

03b. Publication of Contract Notice & Contract Documents

Procurement Officer
- Dispatch Contract Notice to OJEU for publication
- Dispatch Contract Notice to national notification board(s) (OPTIONAL)

OJEU
- Sent acknowledgement to eProcurement system confirming dispatch date of the Contract Notice
- Publish Contract Notice and dispatch message to eProcurement system to confirm date of publication (if sent electronically, Contract Notice is published on OJEU no longer than 5 days after its dispatch date)

eProcurement system
- As soon as the Contract Notice is published, the eProcurement system provides to the general public unrestricted and full direct access to Contract Documents

04. Expression of Interest - Proof Document Submission

Economic Operator
- Select a Call for Tenders and visualise/download specifications (Contract Notice, Contract Documents, Additional Documents)
- Request Additional Documents (ask question) (OPTIONAL)
- Submit Expression of Interest (comprising proof documents) prior to the Expression of Interest deadline

Procurement Officer
- Provide Additional Documents if requested by Economic Operators (answer questions posed by Economic Operators)

eProcurement system
- Record the exact time and date of the receipt of the Expression of Interest
- Store proof documents in a protected area (proof documents locked)

05. Short-listing

Procurement Officer
- Open proof documents by simultaneous action of at least two authorised procurement officers (unlocking)
- Short-list at least 5 Economic Operators according to the predefined objective criteria (OPTIONAL)
- Invite selected Economic Operators to submit a Tender
- Create/Edit/Upload Contract Documents to the eProcurement system (allowing for unrestricted and full direct access to the selected Economic Operators)

eProcurement system
- Report proof documents integrity and authenticity. Report data/locking infringements and violation of any confidentiality rules

06. Submit a Tender

Invited Tenderer
- Select the Call for Tenders for which the Tenderer has been invited to submit a Tender, and visualise/download specifications (Contract Notice, Contract Documents, Additional Documents)
- Submit a Tender prior to the Tender submission deadline

eProcurement system
- Record the exact time and date of the receipt of the Tender
- Store Tender in a protected area (Tender locked)

07. Open and evaluate Tenders

Procurement Officer
- Open Tenders by simultaneous action of at least two authorised procurement officers (unlocking)
- Evaluate and rank Tenders based on the predefined evaluation method (lowest price or MEAT)

eProcurement system
- Report Tender integrity and authenticity. Report data/locking infringements and violation of any confidentiality rules

08. Electronic Auction OPTIONAL

SEE E-AUCTION SECTION OF THE CURRENT DOCUMENT

09. Contract Award

Procurement Officer
- Create/Edit/Update Contract Award Notice
- Dispatch Contract Award Notice to OJEU for publication
- Dispatch Contract Award Notice to national notification board(s) (OPTIONAL)
- Notify Tenderers on the award of the contract. Winning Tenderers are invited to finalise contract

eProcurement system
- Create regulatory reports, store all relevant data, and provide for archiving the Call for Tenders

OJEU
- Sent acknowledgement to eProcurement system confirming dispatch date of the Contract Award Notice
- Publish Contract Award Notice and dispatch message to eProcurement system to confirm date of publication

2.1.2.2 Functional requirements for the Restricted Procedure

The current section presents the functional requirements emerging from the legislation for the realisation of eProcurement systems capable to support the restricted procedure. Certain steps of the restricted procedure are identical to steps for the open procedure, discussed in section 2.1.1. Hence, only new steps, specific to the restricted procedure, are presented in this section. These new steps are Step 04. "Expression of Interest" and Step 05. "Short-listing".

Step 04. Expression of Interest – Proof Documents Submission

During this step Economic Operators express their interest to participate in a restricted procedure competition. This process is also commonly referred to as "request to participate".

Following the visualisation of the Call details, in the form of Contract Notice, Contract Documents and/or Additional Documents, Economic Operators may express their interest to participate in the Call, by submitting the necessary proof documents. The proof documents, comprising legal, technical and financial information, are subsequently used by the contracting authority to either invite an Economic Operator to submit a Tender, or reject the tenderer from the subsequent steps of the competition.

An eProcurement system may assist contracting authorities in this process, by providing the opportunity to Economic Operators to express their interest electronically. All functional requirements of Step 04 of the open procedure are also applicable in this step:

- **Functional Req. 13: Search Calls mechanism**
- **Functional Req. 14: Visualise/Download Call for Tenders specifications**
- **Functional Req. 15: Request for Additional Documents**
- **Functional Req. 16: Automated Notifications**
- **Functional Req. 17: Submission of Tenders**

Step 05. Short-listing (Optional)

If a contracting authority has announced in the Contract Notice its intention to limit the number of candidates that will be invited to submit a tender, it proceeds to a short-listing based on the expressions of interest it has received. To this end, it evaluates the received proof documents according to the selection criteria, as defined in step 03a and identifies a minimum number of five candidates to be invited.

All functional requirements of step 05 (Open and Evaluate Tenders) of the open procedure are also applicable in this instance:

- **Functional Req. 18: Four-eye Principle**
- **Functional Req. 19: Tender Confidentiality**
- **Functional Req. 20: Tender Evaluation**

Another activity of the contracting authority during this step is the preparation and publication of Contract Documents. Under the open procedure, Contract Documents need to be prepared and published when the Contract Notice is dispatched to the OJEU..

Functional Req. 22. Invitation to Tender

Once all proof documents have been examined and, where applicable, candidates have been short-listed based on the objective criteria stated in the Contract Notice, the contracting authority invites all or some Economic Operators to submit their Tenders until a defined submission deadline. Rejected Economic Operators should be notified that they will not be invited.

This process can be simplified for contracting authorities by an eProcurement system which can automatically or semi-automatically calculate the deadline for submitting Tenders, as well as, prepare appropriate messages to all Economic Operators involved. The identity of all Economic Operators involved must remain confidential.

From this point onward, all Call related information (comprising Contract Documents and Additional Documents) can be disclosed only to the economic operators selected to submit a Tender.

2.1.2.3 Restricted Procedure Activity Diagram

Figure 2-4 presents at granular level the restricted procedure, clearly displaying all activities that are performed by the main actors (procurement officers, economic operators and an eProcurement system) related to the different eProcurement phases: eNotification, eTendering, and eAwarding. The activity diagram groups in phases and serialises all activities that need to be performed in the whole procurement process. Some tasks are subject to legislated time-constraints that need to be respected by Contracting Authorities. Thus, the whole procurement process for a contract following the restricted procedure may require significant time.

Figure 2-4 : Activity diagram for the restricted procedure

Prepare PIN
(OPTIONAL)
Dispatch PIN to OJEU
(can shorten publication phase)
Prepare Contract Notice (and, if possible, Contract Documents)
Dispatch Contract Notice to OJEU
Search Calls and locate interesting Call
Give access to Call details (can shorten eTendering phase)
View Call Details (Notices, Additional Documents)
Provide Additional Documents (within deadline for submission of Expression of Interest)
Visualise / Request Additional Documents
(OPTIONAL)
User Login
Submit Expression of Interest
Receive and store Proof Documents submitted before the submission deadline for Proof Documents
Open Proof Documents after their submission deadline
Evaluate Proof Documents and (if applicable) shortlist Candidates
Prepare (if appropriate) and publish Contract Documents
Invite selected Economic Operators to submit Tenders
Submit Tender
Receive and store Tenders submitted before the Tender submission deadline
Open Tenders after Tender submission deadline
Evaluate Tenders
Initiate eAuction
(OPTIONAL)
Participate in eAuction
Prepare Contract Award Notice
Dispatch Contract Award Notice to OJEU

2.2 Repetitive contracts

The EU public procurement legislation introduces two instruments to carry out repetitive purchases electronically, so-called Dynamic Purchasing Systems (DPS) and Framework Agreements. Both procedures aim to establish the terms governing contracts to be awarded over a given period of validity of up to four years, thus allowing contracting authorities to reduce the costs of organising recurrent purchases of standard goods and services.

Framework Agreements establish closed systems, under which contracts are awarded only to those economic operators who have been admitted to the agreement following an initial tendering procedure.

A Dynamic Purchasing System (DPS) provides a fully electronic tendering procedure which remains open to all economic operators throughout its entire period of validity.

In both cases, specific contracts advertised must comply with the terms set out in the Contract Notice or Contract Documents establishing the Framework Agreement or DPS.

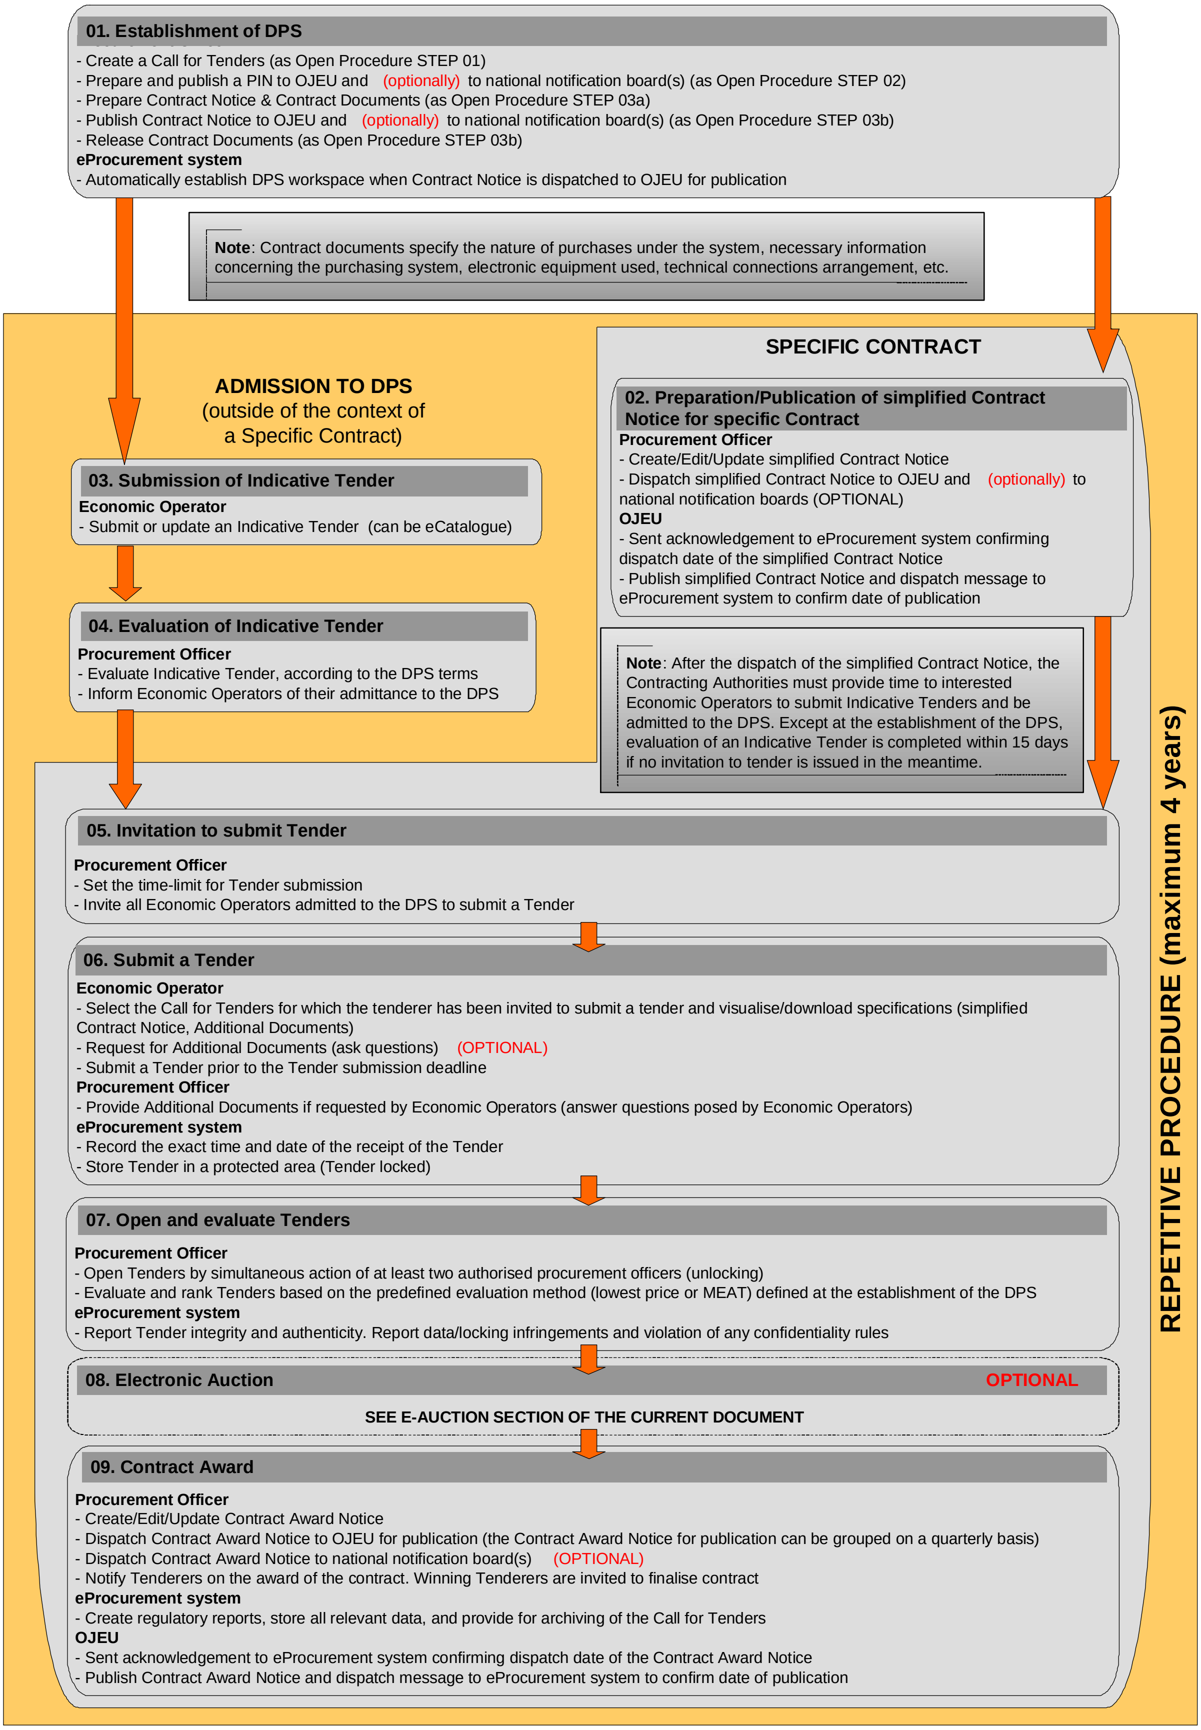
2.2.1 Dynamic Purchasing System (DPS)

The Dynamic Purchasing System (DPS) is a fully electronic process for contracting authorities to make commonly used purchases. A DPS is limited in duration (maximum of 4 years) and open throughout its validity to any Economic Operator satisfying the selection criteria and having submitted an indicative Tender compliant with the specifications for the DPS.

2.2.1.1 Information Flow Diagram

Figure 2-5 depicts the different steps for the establishment of a DPS, as well as, for the procurement of a specific contract under a DPS, focusing on the actions performed by all parties involved.

Figure 2-5: Information Flow Diagram for Dynamic Purchasing System



01. Establishment of DPS

- Create a Call for Tenders (as Open Procedure STEP 01)
- Prepare and publish a PIN to OJEU and (optionally) to national notification board(s) (as Open Procedure STEP 02)
- Prepare Contract Notice & Contract Documents (as Open Procedure STEP 03a)
- Publish Contract Notice to OJEU and (optionally) to national notification board(s) (as Open Procedure STEP 03b)
- Release Contract Documents (as Open Procedure STEP 03b)

eProcurement system

- Automatically establish DPS workspace when Contract Notice is dispatched to OJEU for publication

Note: Contract documents specify the nature of purchases under the system, necessary information concerning the purchasing system, electronic equipment used, technical connections arrangement, etc.

ADMISSION TO DPS
(outside of the context of a Specific Contract)

03. Submission of Indicative Tender

Economic Operator

- Submit or update an Indicative Tender (can be eCatalogue)

04. Evaluation of Indicative Tender

Procurement Officer

- Evaluate Indicative Tender, according to the DPS terms
- Inform Economic Operators of their admittance to the DPS

SPECIFIC CONTRACT

02. Preparation/Publication of simplified Contract Notice for specific Contract

Procurement Officer

- Create/Edit/Update simplified Contract Notice
- Dispatch simplified Contract Notice to OJEU and (optionally) to national notification boards (OPTIONAL)

OJEU

- Sent acknowledgement to eProcurement system confirming dispatch date of the simplified Contract Notice
- Publish simplified Contract Notice and dispatch message to eProcurement system to confirm date of publication

Note: After the dispatch of the simplified Contract Notice, the Contracting Authorities must provide time to interested Economic Operators to submit Indicative Tenders and be admitted to the DPS. Except at the establishment of the DPS, evaluation of an Indicative Tender is completed within 15 days if no invitation to tender is issued in the meantime.

05. Invitation to submit Tender

Procurement Officer

- Set the time-limit for Tender submission
- Invite all Economic Operators admitted to the DPS to submit a Tender

06. Submit a Tender

Economic Operator

- Select the Call for Tenders for which the tenderer has been invited to submit a tender and visualise/download specifications (simplified Contract Notice, Additional Documents)
- Request for Additional Documents (ask questions) (OPTIONAL)
- Submit a Tender prior to the Tender submission deadline

Procurement Officer

- Provide Additional Documents if requested by Economic Operators (answer questions posed by Economic Operators)

eProcurement system

- Record the exact time and date of the receipt of the Tender
- Store Tender in a protected area (Tender locked)

07. Open and evaluate Tenders

Procurement Officer

- Open Tenders by simultaneous action of at least two authorised procurement officers (unlocking)
- Evaluate and rank Tenders based on the predefined evaluation method (lowest price or MEAT) defined at the establishment of the DPS

eProcurement system

- Report Tender integrity and authenticity. Report data/locking infringements and violation of any confidentiality rules

08. Electronic Auction OPTIONAL

SEE E-AUCTION SECTION OF THE CURRENT DOCUMENT

09. Contract Award

Procurement Officer

- Create/Edit/Update Contract Award Notice
- Dispatch Contract Award Notice to OJEU for publication (the Contract Award Notice for publication can be grouped on a quarterly basis)
- Dispatch Contract Award Notice to national notification board(s) (OPTIONAL)
- Notify Tenderers on the award of the contract. Winning Tenderers are invited to finalise contract

eProcurement system

- Create regulatory reports, store all relevant data, and provide for archiving of the Call for Tenders

OJEU

- Sent acknowledgement to eProcurement system confirming dispatch date of the Contract Award Notice
- Publish Contract Award Notice and dispatch message to eProcurement system to confirm date of publication

2.2.1.2 Functional requirements for a DPS

The section presents the functional requirements emerging from the legislation for the realisation of eProcurement systems capable to support a DPS.

Step 01. Establishment of DPS

This step comprises the creation of a suitable workspace for the whole "life" of the DPS. All functional requirements for the creation of a Tender workspace of the open procedure are also applicable to the DPS.

- **Functional Req. 1: User registration**
- **Functional Req. 2: User profiling**
- **Functional Req. 3: User authentication**
- **Functional Req. 4: User authorisation**
- **Functional Req. 5: Tender workspace creation**

Furthermore, an eProcurement system supporting DPS needs to be in a position to automatically or semi-automatically generate reports for the DPS

Functional Req. 23. DPS reporting

The DPS workspace effectively constitutes an "umbrella" for the procurement of specific contracts within it. Hence, authorised Procurement Officers may be provided with the possibility to produce DPS reports, not only reporting details of its establishment (i.e. when it was established, who created it, information of the Contract Notice, etc.), but also information about specific contracts procured within it (i.e. the list of tenderers admitted to the DPS, number of specific contracts procured through the DPS, etc.)

Step 02. Preparation/Publication of a simplified Contract Notice for specific contract

This step comprises the creation of a suitable workspace for the procurement of a specific contract within a DPS. In this step, the contracting authority needs to create and publish a simplified Contract Notice, making publicly available its intention to procure a contract under an established DPS.

The procedure for creating and publishing a simplified Contract Notice through the DPS is identical to the one for creating/publishing a PIN and/or Contract Notice. Hence, **Functional Req. 8: "Publication of a Prior Information Notice"** and **Functional Req. 11: "Interface with the OJEU"** are also applicable here.

The simplified contract notice for the procurement of a specific contract must detail the time-limit for the receipt of Indicative Tenders for admittance to the DPS. This time-limit can not be less than 15 days from the date on which the simplified Contract Notice is sent. Contracting authorities should not proceed with inviting tenderers to submit Tenders for the specific contract, until all Indicative Tenders received by that deadline are evaluated. This process must allow sufficient time for new Economic Operators to be admitted in the DPS and participate in the competition for the specific contract within DPS.

An eProcurement system supporting DPS needs to permit authorised Procurement Officers to create specific contract workspaces for storing necessary information about a specific contract, similar to the open procedure.

Functional Req. 24. Creation of specific contract workspaces within DPS workspace

An eProcurement system can allow the creation of as many specific contract workspaces within the DPS workspace as required by the contracting authority. When creating a specific contract, certain properties of the specific contract must be pre-set as defined in the DPS workspace (like Contract Documents and Tender evaluation methodology). A workspace for a specific contract within the DPS may function in a similar way to the workspace of the open procedure (**Functional Req. 5: "Tender workspace creation"**). It can permit Procurement Officers to store all contract specific information within the workspace, while all Tenders submitted for the specific contract can also be securely stored in this virtual area. Furthermore, an eProcurement system supporting DPS must ensure the confidentiality of all information stored within a specific contract workspace, for example with regard to authorised users of another specific contract workspace of the same DPS.

Step 03. Submission of Indicative Tender

During this step, Economic Operators can submit an Indicative Tender, in order to be admitted to the DPS. All public information about the DPS, comprising the Contract Notice and Contract Documents, are made available to all interested parties to obtain access to. Any Economic Operator may submit a Tender without prior invitation by the contracting authority.

Furthermore, Economic Operators already admitted to the DPS may update their Indicative Tenders.

An Indicative Tender may take the form of an eCatalogue.

Functional Req. 25. Indicative Tenders in the form of electronic catalogues (eCatalogues)

An Indicative Tender may take the form of an eCatalogue. The contracting authority may define the format an eCatalogue should have.

An eProcurement system may assist contracting authorities in defining the format of an electronic catalogue. Furthermore, the system may provide the necessary support for allowing Economic Operators to create their Indicative Tenders in the required format, and/or allow Procurement Officers to visualise eCatalogues in a user-friendly format. Advanced search capabilities, multimedia support (e.g. images, sounds, etc.) and/or tools for comparing eCatalogues from different Economic Operators may also be offered. An eCatalogue is possible to also be used for forming a Tender for an Individual Contract competition. Nevertheless, the eCatalogue needs to confirm to the specifications of the Call for Tender.

Other functional requirements which can assist in the process and are already described in previous eProcurement procedures comprise:

- **Functional Req. 14: Visualise/Download Call for Tenders specifications**
- **Functional Req. 15: Request for Additional Documents**
- **Functional Req. 16: Automated Notifications**
- **Functional Req. 17: Submission of Tenders**
- **Functional Req. 19: Tender Confidentiality**

Step 04. Evaluation of Indicative Tender

During this step, Procurement Officers open Indicative Tenders and evaluate them according to the awarding criteria (price or MEAT) set out in the terms of the DPS. The contracting authority evaluates which of the Indicative Tenders meet the pre-defined criteria for admittance in the DPS, and which do not. New Economic Operators that meet the admittance criteria are admitted to the DPS.

Contracting authorities may be assisted in evaluating Indicative Tenders by an eProcurement system, according to the functional requirements for evaluation under the open procedure.

- **Functional Req. 19: Tender Confidentiality**
- **Functional Req. 20: Tender Evaluation**
- **Functional Req. 25: Indicative Tenders in the form of electronic catalogues (eCatalogues)**

Step 05. Invitation to submit Tender

Once the Invitation to Tender date is reached, as defined in Step 02, Procurement Officers prepare and send "Invitations to Tender" to all Tenderers admitted in the DPS. The invitation defines the time-limit for receiving Tenders, the format of eCatalogues, as well as the evaluation criteria to be used for the evaluation of Tenders. Where applicable, these criteria may be formulated more precisely, in line with the specifications set out for the DPS. Procurement Officers may be assisted in this process by an eProcurement system satisfying the following functional requirements:

- **Functional Req. 12: Publication of Contract Documents**
- **Functional Req. 22: Invitation to Tender**

Step 06. Submit a Tender

All Tenderers admitted in the DPS are invited to provide a Tender for a specific contract. Tenderers interested to participate in the specific contract submit a Tender (based on their initial Indicative Tender or a revised Indicative Tender) before the Tender submission deadline, as defined by the contracting authority in the previous step.

An eProcurement system may assist in the process by satisfying functional requirements described in previous eProcurement procedures:

- **Functional Req. 14: Visualise/Download Call for Tenders specifications**
- **Functional Req. 15: Request for Additional Documents**
- **Functional Req. 16: Automated Notifications**
- **Functional Req. 17: Submission of Tenders**
- **Functional Req. 18: Four-eye Principle**
- **Functional Req. 19: Tender Confidentiality**
- **Functional Req. 25: Indicative Tenders in the form of electronic catalogues (eCatalogues)**

Step 07. Open and evaluate Tenders

All Tenders received for the specific contract are opened and evaluated according to the criteria laid out in the Contract Notice for the establishment of the DPS. An eProcurement system may assist in the process by satisfying functional requirements described in previous eProcurement procedures:

- **Functional Req. 18: Four-eye Principle**
- **Functional Req. 19: Tender Confidentiality**
- **Functional Req. 20: Tender Evaluation**

Step 08. Electronic Auctions

In case the specifications of the DPS, defined during its establishment, state the use of eAuction as an evaluation mechanism, a contracting authority may choose to conduct an electronic auction prior to awarding the specific contract. The eAuction shall be conducted according to the terms defined for the establishment of the DPS. In this case, tenderers are given the opportunity to improve aspects of their Tenders through a repetitive bidding mechanism, increasing their chances of winning the competition.

The details regarding the steps involved in the execution of electronic auctions, as well as, related functional requirements are discussed in section 2.3.

Step 09. Contract Award

Following the steps necessary for concluding a specific contract within a DPS, a contracting authority shall create and publish a Contract Award Notice. The Contract Award Notices for specific contracts under a DPS may be grouped and published on a quarterly basis. In addition, the contracting authority needs to create regulatory reports. An eProcurement system may assist contracting authorities in preparing Contract Award Notices, especially grouped notices, as well as in preparing the required regulatory reports (similar to **Functional Req. 6: "Preparation of a Prior Information Notice"**) and **Functional Req. 21: "Creation of Mandatory Reports"**.

2.2.1.3 Dynamic Purchasing System Activity Diagram

Figure 2-6 presents at granular level the establishment of a DPS, the admission of Economic Operators in the DPS, as well as, the procurement of a specific contract under the DPS. The figure clearly displays all activities that are performed by the main actors (procurement officers, economic operators and an eProcurement system) in the different eProcurement phases: eNotification, eTendering, and eAwarding. The activity diagram groups in phases and serialises all activities that need to be performed in the whole procurement process. Some tasks are subject to legislated time-constraints that need to be respected by Contracting Authorities. Thus, the whole procurement process for the establishment of a DPS and/or a specific contract within a DPS may require significant time.

User Login
Evaluate Indicative Tender
Submit Indicative Tender
Inform EO whether admitted in DPS

2.2.2 Framework Agreements

A framework agreement is an agreement between one or more contracting authorities and one or more Economic Operators, the purpose of which is to establish the terms governing contracts to be awarded during a given period, in particular with regard to price and, where appropriate, the quantity envisaged.

For the purpose of concluding a framework agreement, contracting authorities shall follow the rules for procuring an individual contract for all phases up to the awarding of contracts. The parties to the framework agreement shall be chosen by applying the award criteria set in the Contract Notice or Contract Documents of the Call for Tenders.

The term of a framework agreement may not exceed four years, save in exceptional and duly justified cases.

Contracts awarded under a framework agreement shall comply with the terms set out for that framework agreement.

2.2.2.1 Information Flow Diagram

Figure 2-7 depicts the different steps involved in the establishment of a framework agreement, as well as, in the procurement of an individual contract within a framework agreement, focusing on the actions performed by all parties involved.

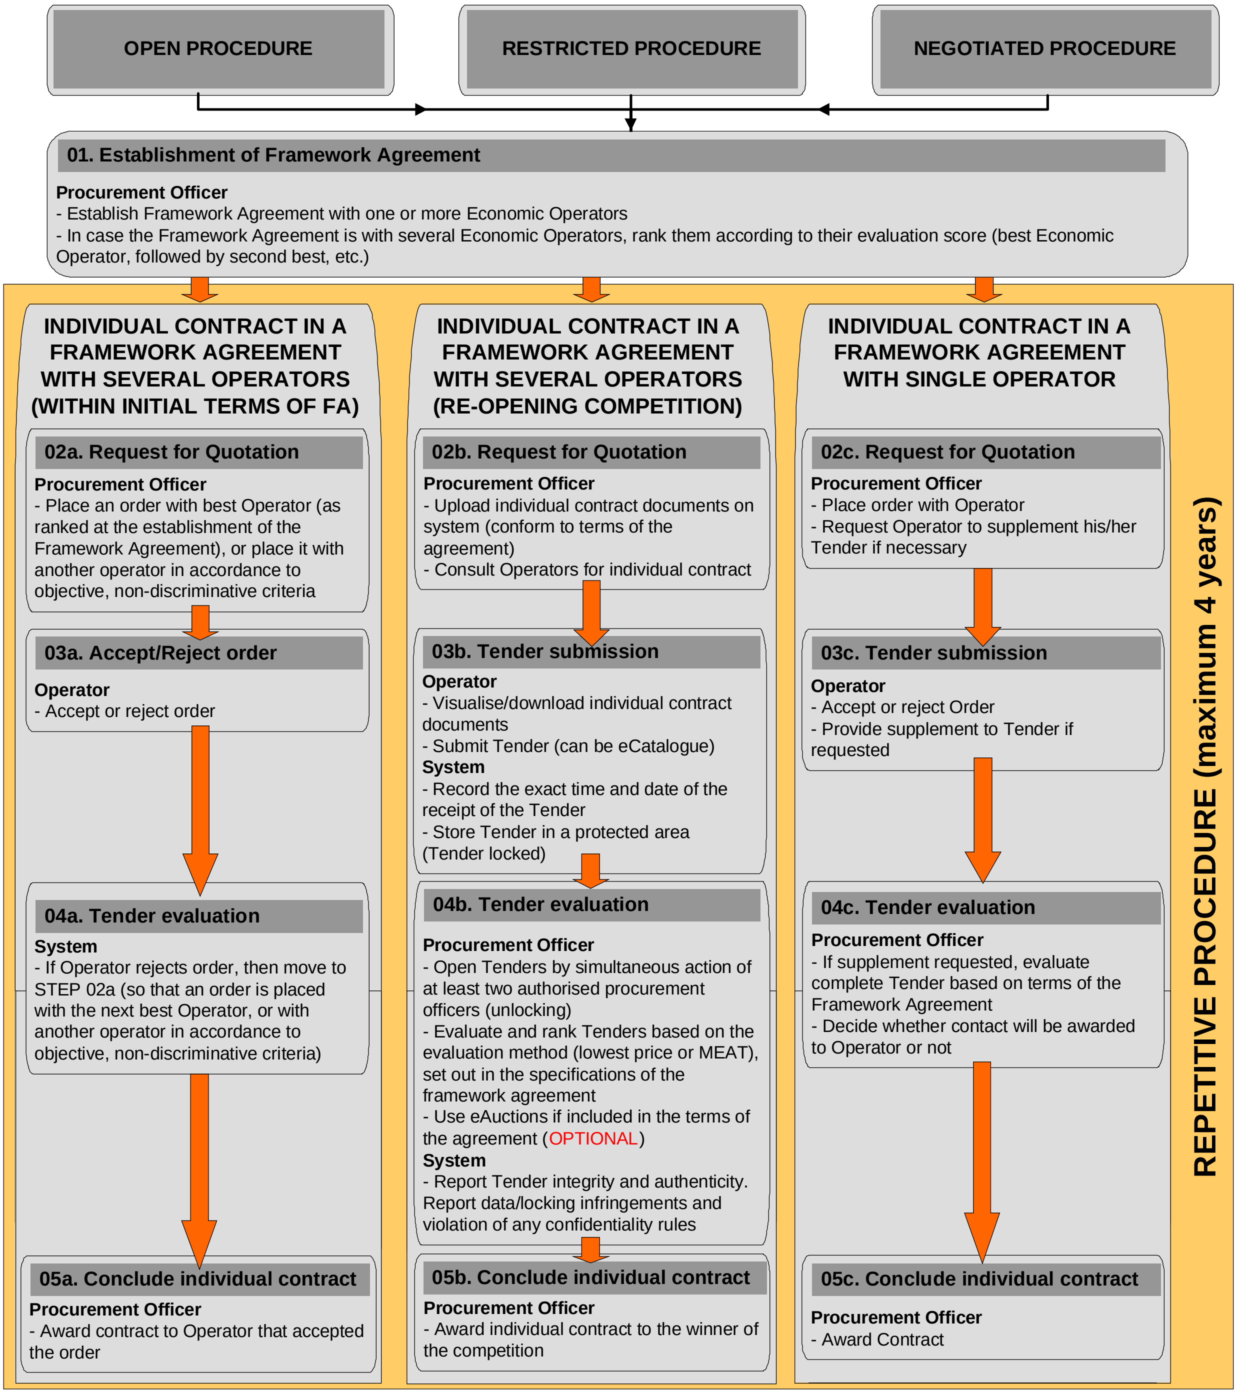
As mentioned above, a framework agreement may be concluded with one or more Economic Operators. In the former case, individual contracts procured within a framework agreement shall be awarded within the limits of the terms laid down in the framework agreement. In the latter case, the Economic Operators must be at least three in number. Individual contracts procured within a framework agreement with three or more economic operators shall be awarded either by application of the terms laid down in the framework agreement, or by re-opening competition.

A re-opening of competition shall be conducted on the basis of the terms laid down in the framework agreement or, where appropriate, more precisely formulated terms. Such terms shall be in accordance with the new EU public procurement legislation.

Figure 2-7 demonstrates the information flow diagrams for the establishment and use of framework agreements for:

- Framework agreement with more than one operator (without a re-opening of competition)
- Framework agreement with more than one operator (with a re-opening competition)
- Framework agreement with one operator

Figure 2-7: Information Flow Diagram of the Framework Agreement



OPEN PROCEDURE

RESTRICTED PROCEDURE

NEGOTIATED PROCEDURE

01. Establishment of Framework Agreement

Procurement Officer
- Establish Framework Agreement with one or more Economic Operators
- In case the Framework Agreement is with several Economic Operators, rank them according to their evaluation score (best Economic Operator, followed by second best, etc.)

REPETITIVE PROCEDURE (maximum 4 years)

INDIVIDUAL CONTRACT IN A FRAMEWORK AGREEMENT WITH SEVERAL OPERATORS (WITHIN INITIAL TERMS OF FA)

02a. Request for Quotation

Procurement Officer
- Place an order with best Operator (as ranked at the establishment of the Framework Agreement), or place it with another operator in accordance to objective, non-discriminative criteria

03a. Accept/Reject order

Operator
- Accept or reject order

04a. Tender evaluation

System
- If Operator rejects order, then move to STEP 02a (so that an order is placed with the next best Operator, or with another operator in accordance to objective, non-discriminative criteria)

05a. Conclude individual contract

Procurement Officer
- Award contract to Operator that accepted the order

INDIVIDUAL CONTRACT IN A FRAMEWORK AGREEMENT WITH SEVERAL OPERATORS (RE-OPENING COMPETITION)

02b. Request for Quotation

Procurement Officer
- Upload individual contract documents on system (conform to terms of the agreement)
- Consult Operators for individual contract

03b. Tender submission

Operator
- Visualise/download individual contract documents
- Submit Tender (can be eCatalogue)

System
- Record the exact time and date of the receipt of the Tender
- Store Tender in a protected area (Tender locked)

04b. Tender evaluation

Procurement Officer
- Open Tenders by simultaneous action of at least two authorised procurement officers (unlocking)
- Evaluate and rank Tenders based on the evaluation method (lowest price or MEAT), set out in the specifications of the framework agreement
- Use eAuctions if included in the terms of the agreement (OPTIONAL)

System
- Report Tender integrity and authenticity. Report data/locking infringements and violation of any confidentiality rules

05b. Conclude individual contract

Procurement Officer
- Award individual contract to the winner of the competition

INDIVIDUAL CONTRACT IN A FRAMEWORK AGREEMENT WITH SINGLE OPERATOR

02c. Request for Quotation

Procurement Officer
- Place order with Operator
- Request Operator to supplement his/her Tender if necessary

03c. Tender submission

Operator
- Accept or reject Order
- Provide supplement to Tender if requested

04c. Tender evaluation

Procurement Officer
- If supplement requested, evaluate complete Tender based on terms of the Framework Agreement
- Decide whether contact will be awarded to Operator or not

05c. Conclude individual contract

Procurement Officer
- Award Contract

Framework Agreements with a single Economic Operator are not further analysed in the current document, as their operation is similar to Framework Agreements with several Economic Operators (within Terms).

2.2.2.2 Functional requirements for a Framework Agreement system

The current section presents the functional requirements for the realisation of eProcurement systems capable to support framework agreements.

Step 01. Establishment of Framework Agreement

A framework agreement can be established between the contracting authority and one or more operators, following an open, restricted or, where available, negotiated procedure. Therefore, there are no new functional requirements for this step.

*Several Operators, Individual Contract is **WITHIN TERMS** of Framework Agreement*

Step 02a. Request for Quotation

If the contracting authority wishes to award an individual contract without re-opening competition, it may either place an order with the best placed operator within the framework agreement, as ranked at the establishment of the framework agreement ('cascade') or chose the operator best suited for this individual contract. The requirements for this step can be fulfilled by **Functional Req. 22: "Invitation to Tender"**.

Step 03b. Accept/Reject Order

This step involves the operator accepting or rejecting the order. The requirements for this step can be fulfilled by **Functional Req. 17: "Submission of Tenders"**.

Step 04a. Tender Evaluation

If the operator accepts the order, the contracting authority proceeds to the next step and concludes the individual contract. If the operator rejects the order, the contracting authority may select the next best operator (based on the ranking of Tenders at the establishment of the framework agreement), and place the order with him/her. Following this the contracting authority may continue the process in Step 02a, inviting the new operator to accept or reject the order.

Step 05a. Conclude Individual Contract

In this step the contracting authority concludes the individual contract with the operator who accepted the order. After publishing a Contract Award Notice for the initial conclusion of the framework agreement, there is no need to publish Contract Award Notices for individual contracts within the framework agreement. The requirements for this step can be fulfilled by **Functional Req. 16: "Automated Notifications"** for informing the operator of the results of the evaluation, and **Functional Req. 21: "Creation of Mandatory Reports"** for automatically or semi-automatically creating the necessary reports.

*Several Operators, Individual Contract awarded by **RE-OPENING COMPETITION***

Step 02b. Request for Quotation

This step involves a re-opening of competition for all operators within the framework agreement. The contracting authority creates the Contract Documents for the individual contract to be procured. These shall conform to the terms of the agreement. An Invitation to Tender shall then be sent to all operators within the agreement. The requirements for this step can be fulfilled by **Functional Req. 12: "Publication of Contract Documents"** and **Functional Req. 22: "Invitation to Tender"**.

Step 03b. Tender Submission

The operators to the framework agreement submit a Tender for the re-opened competition. The requirements for this step can be fulfilled by the functional requirements of Step 04 of the open procedure, comprising:

- **Functional Req. 14: Visualise/Download Call for Tenders specifications**
- **Functional Req. 15: Request for Additional Documents**
- **Functional Req. 16: Automated Notifications**
- **Functional Req. 17: Submission of Tenders**

Step 04b. Tender Evaluation

The contracting authority evaluates the Tenders submitted in response to the re-opened competition. The evaluation of Tenders is based on the evaluation mechanism defined at the establishment of the framework agreement. The requirements for this step can be fulfilled by the functional requirements of Step 05 of the open procedure, comprising:

- **Functional Req. 18: Four-eye Principle**
- **Functional Req. 19: Tender Confidentiality**
- **Functional Req. 20: Tender Evaluation**

Step 05b. Conclude Individual Contract

The contracting authority concludes the individual contract with the winner of the re-opened competition. After publishing a Contract Award Notice for the initial conclusion of the framework agreement, there is no need to publish Contract Award Notices for the individual contracts awarded within a framework agreement. The requirements for this step can be fulfilled by **Functional Req. 16: "Automated Notifications"** for informing participating operators of the results of the evaluation, and **Functional Req. 21: "Creation of Mandatory Reports"** for automatically or semi-automatically creating the necessary reports.

2.2.2.3 Framework Agreement Activity Diagram

Figure 2-6 presents at granular level the establishment of a framework agreement, as well as, the procurement of an individual contract within the framework agreement. The figure clearly displays all activities that are performed by the main actors (procurement officers, economic operators and an eProcurement system) in the different eProcurement phases: eNotification, eTendering, and eAwarding. The activity diagram groups in phases and serialises all activities that need to be performed in the whole procurement process. Some tasks are subject to legislated time-constraints that need to be respected by Contracting Authorities. Thus, the whole procurement process for the establishment of a Framework Agreement and/or a specific contract within a Framework Agreement may require significant time.

Yes
Accept or reject order
Submit Tender
No
Order accepted?
Yes
Receive and store Tenders submitted before the Tender submission deadline
Specific Contract eAwarding
Open Tender after Tender submission deadline
Evaluate Tender(s)
Initiate eAuction, if stated in the Contract Notice of the establishment of the Framework Agreement (OPTIONAL)
Participate in eAuction
Conclude Contract

2.3 Extensions

2.3.1 Electronic Auctions

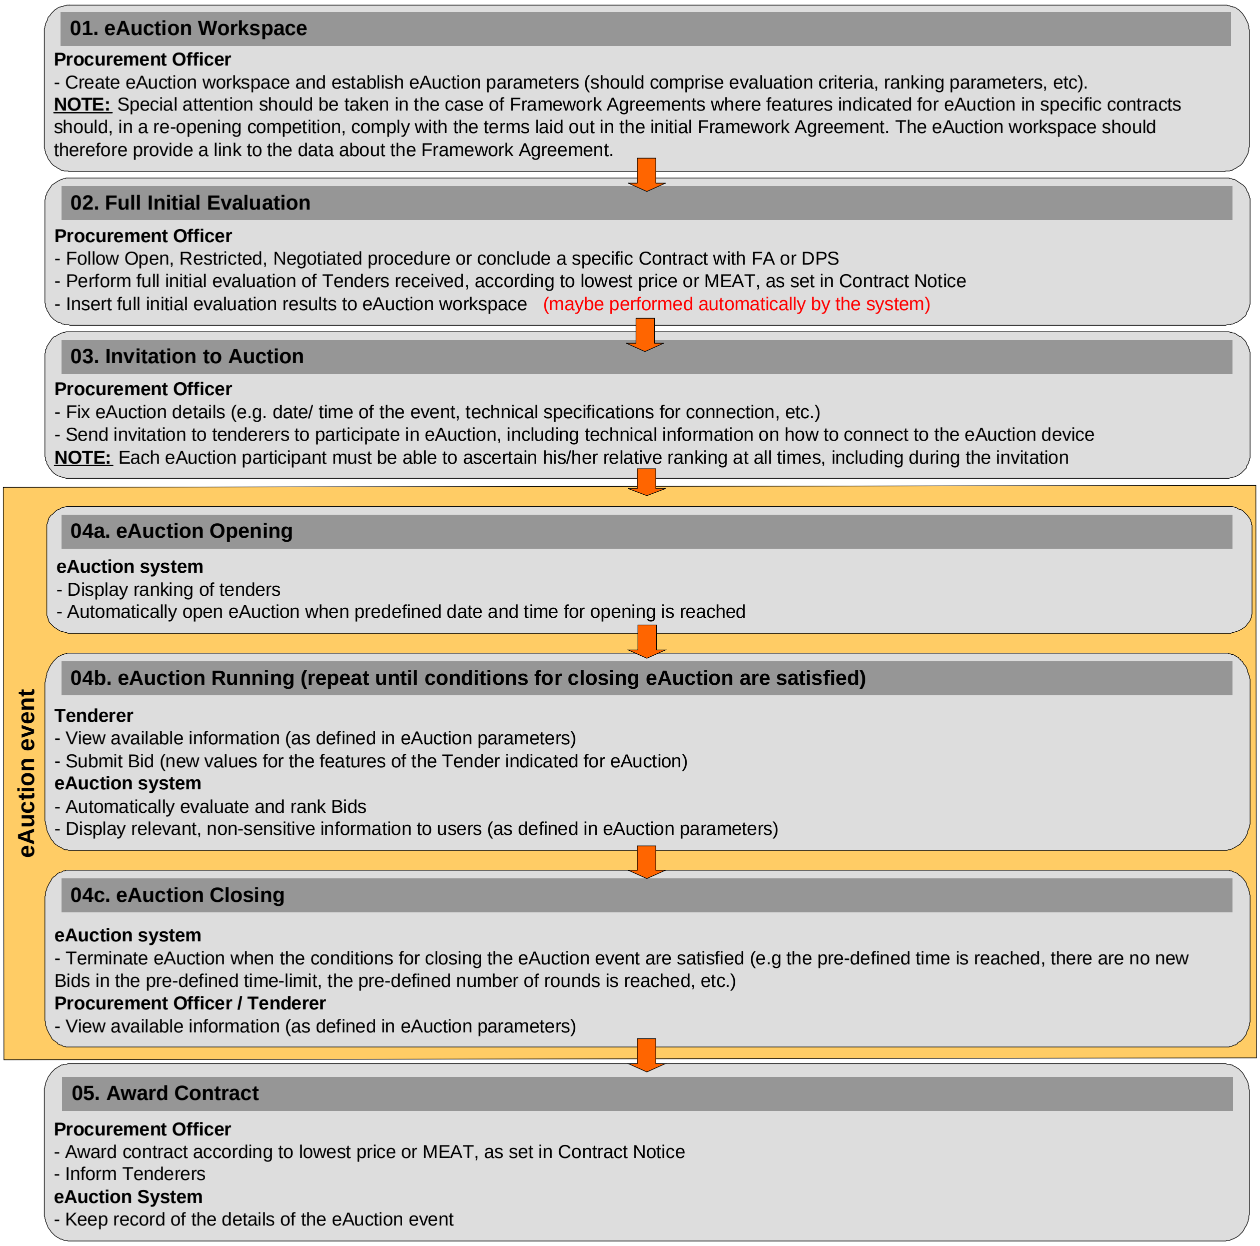
An electronic auction is a repetitive process involving an electronic device for the presentation of new prices, revised downwards, and/or new values concerning certain elements of Tenders. This process occurs after an initial full evaluation of Tenders of a particular Call, enabling them to be ranked using automatic evaluation methods. Electronic auctions are part of the awarding phase of a competition, and do not constitute on their own a full eProcurement procedure for awarding contracts.

Each time the parameters for evaluating a Call for Tenders can be defined with precision, the contracting authority has the possibility to award a public contract through an electronic auction. This fact must be stated in the Contract Notice for the Call for Tenders. eAuctions cannot be used in works or services contracts having intellectual performances for their subject-matter.

2.3.1.1 Information Flow Diagram

Figure 2-9 depicts the different steps of an eAuction procedure, focusing on the actions performed by all parties involved.

Figure 2-9: Information Flow Diagram for Electronic Auctions



01. eAuction Workspace

Procurement Officer

- Create eAuction workspace and establish eAuction parameters (should comprise evaluation criteria, ranking parameters, etc).

NOTE: Special attention should be taken in the case of Framework Agreements where features indicated for eAuction in specific contracts should, in a re-opening competition, comply with the terms laid out in the initial Framework Agreement. The eAuction workspace should therefore provide a link to the data about the Framework Agreement.

02. Full Initial Evaluation

Procurement Officer

- Follow Open, Restricted, Negotiated procedure or conclude a specific Contract with FA or DPS
- Perform full initial evaluation of Tenders received, according to lowest price or MEAT, as set in Contract Notice
- Insert full initial evaluation results to eAuction workspace (maybe performed automatically by the system)

03. Invitation to Auction

Procurement Officer

- Fix eAuction details (e.g. date/ time of the event, technical specifications for connection, etc.)
- Send invitation to tenderers to participate in eAuction, including technical information on how to connect to the eAuction device

NOTE: Each eAuction participant must be able to ascertain his/her relative ranking at all times, including during the invitation

eAuction event

04a. eAuction Opening

eAuction system

- Display ranking of tenders
- Automatically open eAuction when predefined date and time for opening is reached

04b. eAuction Running (repeat until conditions for closing eAuction are satisfied)

Tenderer

- View available information (as defined in eAuction parameters)
- Submit Bid (new values for the features of the Tender indicated for eAuction)

eAuction system

- Automatically evaluate and rank Bids
- Display relevant, non-sensitive information to users (as defined in eAuction parameters)

04c. eAuction Closing

eAuction system

- Terminate eAuction when the conditions for closing the eAuction event are satisfied (e.g the pre-defined time is reached, there are no new Bids in the pre-defined time-limit, the pre-defined number of rounds is reached, etc.)

Procurement Officer / Tenderer

- View available information (as defined in eAuction parameters)

05. Award Contract

Procurement Officer

- Award contract according to lowest price or MEAT, as set in Contract Notice
- Inform Tenderers

eAuction System

- Keep record of the details of the eAuction event

2.3.1.2 Functional requirements for Electronic Auctions

This section presents the functional requirements emerging from the legislation for the realisation of eProcurement systems capable to support eAuctions. All functional requirements are associated with one or more steps of **Figure 2-9**.

Step 01. eAuction workspace

In this step, Procurement Officers fix the parameters of running the eAuction, including the definition of the evaluation mechanism as discussed in **Functional Req. 10: "Tender Evaluation Mechanism"**. Specific functional requirements relate to the establishment of an eAuction workspace and preparing and communicating to Tenderers the parameters and, at a later stage, the details of the eAuction.

Functional Req. 26. Creation of eAuction workspace and establishing eAuction parameters

This functional requirement covers the creation of a virtual workspace, where all eAuction related information can be stored. This virtual workspace should only be accessible to authorised users; eAuction parameters should be established and fixed within it. Subsequent eAuction activities, such as tenderers' placing of Bids and displaying of the ranking of Tenders may be performed within this virtual eAuction workspace or using the services of an external eAuction provider.

eAuction parameters comprise the bidding fields, the eAuction opening and closing conditions, the type of the eAuction, etc. The parameters for the full initial evaluation and the features for auction and their evaluation mechanism should be defined prior to launching the procedure and be published in the eAuction specifications alongside with the Contract Notice.

Step 02. Full Initial Evaluation

The full initial evaluation is performed according to the procurement procedure chosen by the contracting authority. Hence, for an individual contract the contracting authority may perform the full initial evaluation following the open, restricted or, where available, negotiated procedure. For an individual contract within a DPS or framework agreement, the contracting authority shall follow the rules of a DPS or FA, as discussed in previous sections.

The use of an eAuction is allowed only if the technical specifications to be evaluated can be established with precision. The auction itself can only be on some or all of those features established with precision, therefore these must be quantifiable (otherwise the auction cannot be run obviously). The Award criteria must be given a precise weighting. This means that the initial evaluation must attribute a specific value to a feature, not a range of values, to make these suitable for auction.

Also, in this step the eAuction device is provided with information on the tenderers which will compete in the auction event. This task may be performed automatically by the eProcurement system and eAuction device, or manually by Procurement Officers. Under any circumstance, the data must remain fully confidential.

Step 03. Invitation to Auction

Once the definition of the eAuction details (such as time and date of the auction, information about connection to the auction device) is complete, Procurement Officers dispatch invitations to tenderers, in order to invite them to participate in the auction event. This requirement can be fulfilled by **Functional Req. 16: "Automated Notifications"**. The invitation for each participating Tenderer shall be accompanied by the outcome of the full initial evaluation of his/her offer.

Step 04a. eAuction opening

At this step, tenderers connect to the eAuction device. Adding to or displaying the invitation for the auction, the device can provide tenderers with information about their relative ranking, as concluded by the full initial evaluation. This information must be kept fully confidential. Also, tenderers may access details of the auction event, including specifications on how the event will be run, which and how the Bid evaluation mechanism will be used, when the auction will be closed etc.

The aforementioned requirements can be fulfilled by minor modifications of **Functional Req. 12: "Publication of Contract Documents"**.

Step 04b. eAuction running

In this step, tenderers participate in the eAuction event by submitting successive improved Bids. The eAuction device, based on the defined evaluation mechanism, automatically calculates the relative ranking of all tenderers. The requirements related to submission of Bids can be satisfied by **Functional Req. 17: "Submission of Tenders"**. Also, the eAuction device constantly checks whether the conditions for closing the eAuction event are satisfied or not.

If the pre-defined conditions for closing the auction are satisfied, the eAuction device concludes the eAuction event, automatically progressing to the next step. The conditions for closing an eAuction event can be stored in an eAuction workspace, as discussed in **Functional Req. 26: "Creation of eAuction workspace and establishing eAuction "**.

Step 04c. eAuction closing

Once the eAuction event is concluded, the eAuction device performs a final ranking of all Bids according to the pre-defined evaluation mechanism. The aforementioned functional requirements of eAuctions can also satisfy requirements for this step.

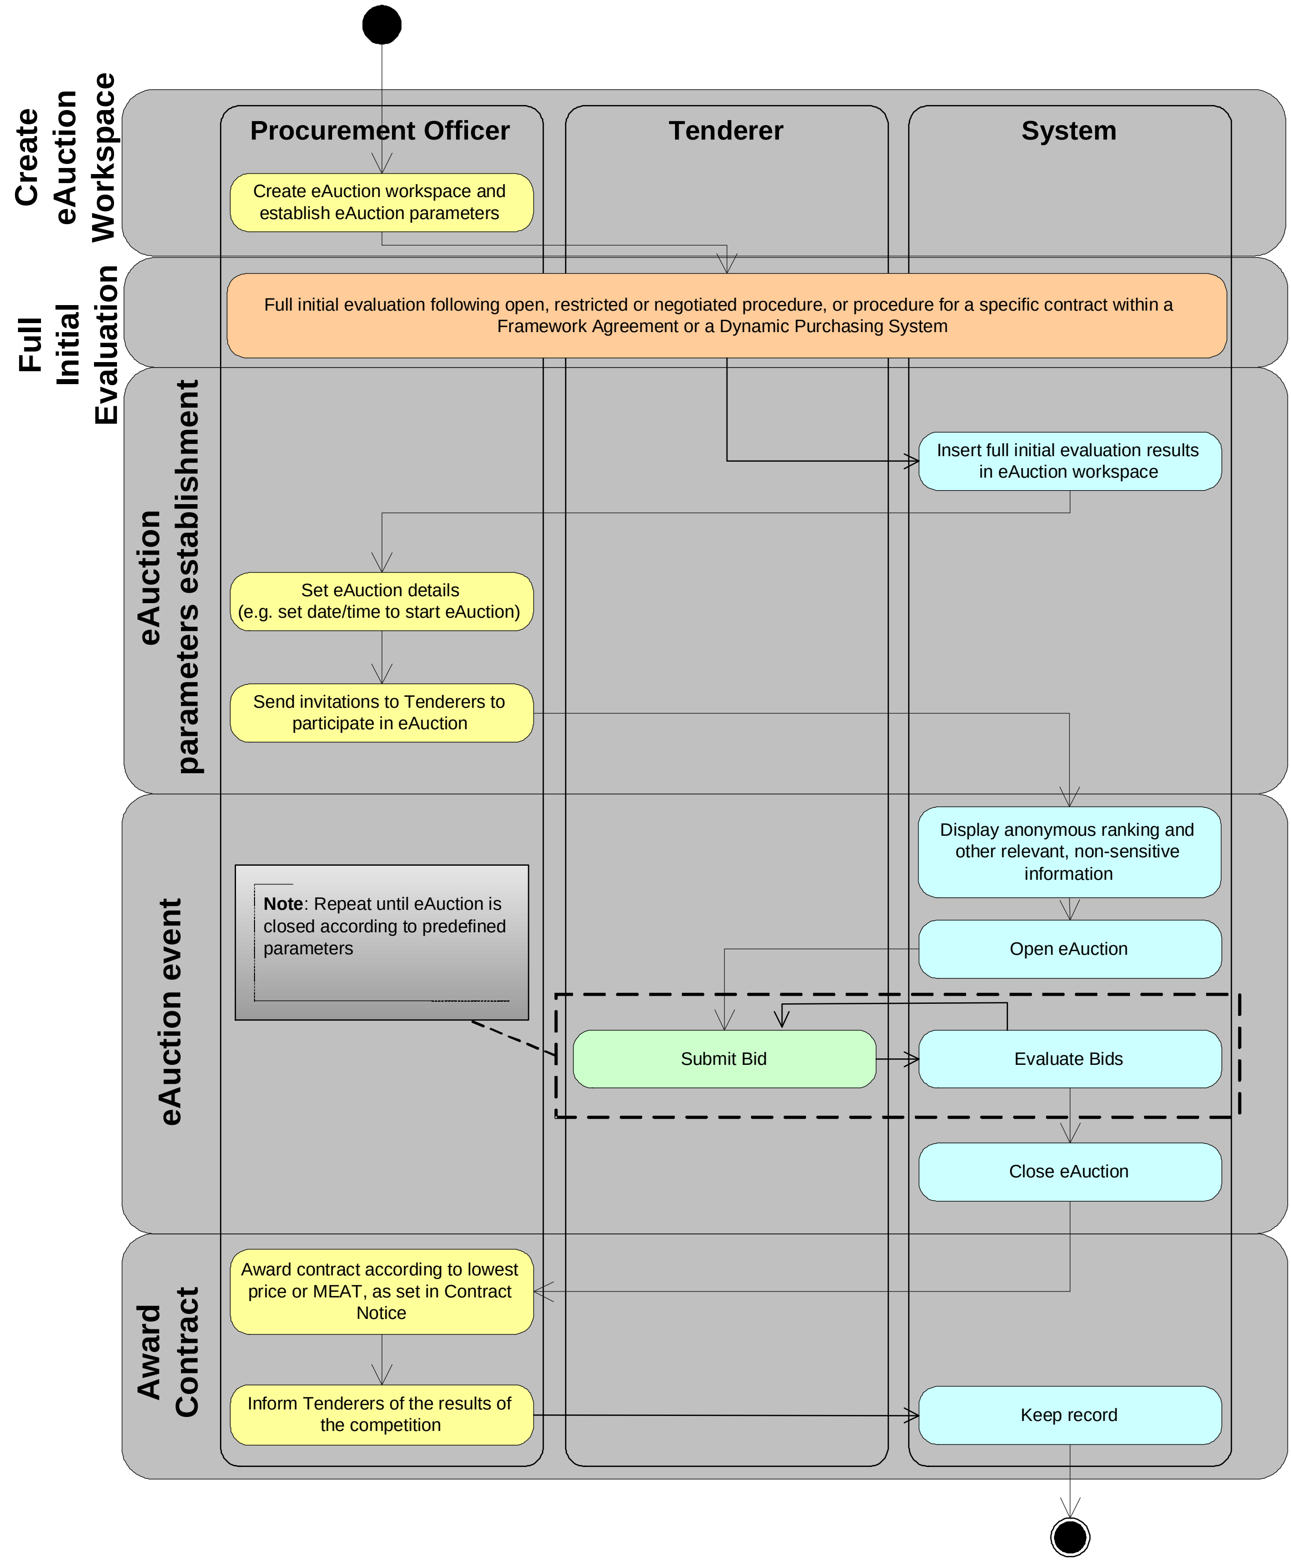
Step 04. Award Contract

Following the conclusion of an eAuction event, contracting authorities identify the winner(s) and award the contract according to the terms of the competition and the full initial evaluation procedure.

2.3.1.3 Electronic Auctions Activity Diagram

Figure 2-10 presents at granular level the various activities of an eAuction. The figure clearly displays all activities that are performed by the main actors (procurement officers, economic operators and an eProcurement system) in the different eAuction phases. The activity diagram groups in phases and serialises all activities that need to be performed in the whole procurement process. Some tasks are subject to legislated time-constraints that need to be respected by Contracting Authorities. Thus, the whole procurement process for a contract and/or a specific contract with eAuction may require some time.

Figure 2-10: Activity Diagram for eAuction



Create eAuction Workspace
Full Initial Evaluation
eAuction parameters establishment
eAuction event
Award Contract
Procurement Officer
Tenderer
System
Create eAuction workspace and establish eAuction parameters
Full initial evaluation following open, restricted or negotiated procedure, or procedure for a specific contract within a Framework Agreement or a Dynamic Purchasing System
Insert full initial evaluation results in eAuction workspace
Set eAuction details (e.g. set date/time to start eAuction)
Send invitations to Tenderers to participate in eAuction
Display anonymous ranking and other relevant, non-sensitive information
Note: Repeat until eAuction is closed according to predefined parameters
Open eAuction
Submit Bid
Evaluate Bids
Close eAuction
Award contract according to lowest price or MEAT, as set in Contract Notice
Inform Tenderers of the results of the competition
Keep record

2.4 Summary of Functional Requirements

The following table summarises the Functional Requirements presented in this chapter.

Table 1 – List of Functional Requirements

#	Functional Requirement	Prerequisites
1	User Registration	None
2	User Profiling	#1
3	User Authentication	#1
4	User Authorisation	#2
5	Tender workspace creation	#2
6	Preparation of a Prior Information Notice	#4, #5
7	Use of the Common Procurement Vocabulary (CPV) classification standard	#4, #5, #6
8	Publication of a Prior Information Notice	#4, #5
9	Nomenclature of Territorial Units for Statistics (NUTS) classification standard	#4, #5, #6
10	Tender Evaluation Mechanism	#4, #5
11	Interface with the OJEU	#4, #5, #8
12	Publication of Contract Documents	#4, #5
13	Search Calls mechanism	None
14	Visualise/Download Call for Tenders specifications	#5
15	Request for Additional Documents	#5
16	Automated Notifications	#1
17	Submission of Tenders	#4, #5
18	Four-eye Principle	#4, #5
19	Tender Confidentiality	#4, #5
20	Tender Evaluation	#4, #5, #10
21	Creation of Mandatory Reports regulated by the legislation	#4, #5
22	Invitation to Tender	#4, #5
23	DPS reporting	#4, #5
24	Creation of specific contract workspaces within DPS workspace	#4, #5
25	Indicative Tenders in the form of electronic catalogues (eCatalogues)	#4, #5
26	Creation of eAuction workspace and establishing eAuction details	#4

3 TECHNICAL GUIDELINES FOR IMPLEMENTING EPROCUREMENT PROCEDURES

This chapter provides technical guidelines that can be employed for the implementation of an eProcurement system for supporting the different procedures described by the new directives. All functional requirements identified in the previous chapter are considered for further analysis. For each functional requirement, various technical solutions are elaborated, also providing information on issues related to their implementations.

3.1 Technical Solutions for Functional Req. 1 – User registration and Functional Req. 3 – User authentication

These two functional requirements are related to the process for registering users to the eProcurement system, as well as for identifying users when they access the eProcurement system. The technical implementation followed for these two functional requirements are closely related.

1. *User credentials*: when users access the system, they must authenticate themselves using a combination of email, username, password, and/or other personal information (i.e. Personal Identification Number, etc.).

   Additionally, the use of a secret ID number may be requested by the system for validating the identity of a user, every time the user performs a "sensitive" activity (create a Call for Tenders, submit a Tender, etc.). The submission of user credentials is completed using a secure SSL connection via HTTPS.

   Users can be logged out when they explicitly request this activity by the system or when they close the application on their personal workstations (e.g. the web-browser). Furthermore, for security purposes, a user can be automatically logged out when there are no user activities on the system for a certain period of time.

   ⚠ *The use of User Credentials is the simplest technical implementation for user authentication in terms of effort and cost. It forms the basis for ensuring security, interoperability, and transparency. However, it does not satisfy advanced security requirements, which may be desirable in an eProcurement system. Also, depending on the area an eProcurement system may operate in, national, regional or local legislation may require more advanced security provisions than User Credentials.*

2. _Digital certificate (software)_**:** an eProcurement system may require the use of digital certificates in order for users to be authenticated. Digital certificates are issued by an official Certification Authority (CA), and may be issued to a person. Effectively, the CA guarantees to third-parties (and as such to an eProcurement system) that the user is indeed who he/she claims to be. The digital certificate, also called “software authentication solution”, refers to a file issued by a CA that is stored locally in a user’s workstation, and can be used for proving his/her identity.

   For a user to be authenticated via this method, the eProcurement system must “trust” the CA that issued the digital certificate of that user. In this case, the CA effectively verifies the authenticity of the certificate. Otherwise, the user cannot log in to the system.

   > ⚠ *This solution offers a higher level of security compared to User Credentials; it involves, however, a compromise regarding the interoperability aspects of the system.*
   >
   > *An eProcurement system usually “trusts” a limited number of CAs. The trusted CAs are commonly within the borders of the country the system operates in. Furthermore, the issuing of user digital certificates usually requires the physical presence of the user to the CA offices, and may take some time in order for the CA to perform identification / validity checks. Hence, although the use of digital certificates increases the security level of a system, it can significantly reduce its cross-border interoperability.*

3. _PKI infrastructure (hardware)_**:** this solution, similar to software digital certificates, also involves digital certificates. However, in this instance user digital certificates are stored in smart cards. A smart card requires a device (reader) for reading the certificate stored on the card. The smart card needs to be issued by a CA, in a similar way to the software digital certificates described above.

   > ⚠ *The use of smart cards is considered even more secure, in comparison to the software solution, as digital certificates are stored in safer medium (i.e. smart card), and not on a workstation which can be more vulnerable. However, it introduces additional limitations, as a smart card reader becomes an additional hardware requirement for participating in competitions. Furthermore, the cross-border interoperability limitations, as described in the software digital signatures, also apply to this implementation.*

3.2 Technical Solutions for Functional Req. 2 – User profiling and Functional Req. 4 – User authorisation

This functional requirement is related to providing the ability to users to store necessary personal information in the system, as well as, potentially storing their preferences when using the system. Also, when a user accesses the system, the system needs to be in a position to identify what data the user may have access to, and also what activities may be performed by that user.

User profiling and authorisation involves the management of user profiles. The former is related to a secure storage area of user personal details, while the later models the different roles a user can undertake within an eProcurement system. Each role may be constructed by a set of access rights. For each user activity, a specific user right is assigned by the application. In this way, the application can determine the activities that each user can perform within the system.

The technical solutions for implementing these two functional requirements comprise:

1. *Relational Database*: User profiles can be stored in a relational database. All users are associated with records in database tables, which define the access rights the user has been assigned for the various modules and services of an eProcurement system. An efficient and maintainable solution comprises a Users table to be related to User Roles table, which in turn is related to Access Rights table. Furthermore, the Users table needs to be related to an Access Rights table, in order to enable the overwriting of the default user roles and rights. Regarding personal information, the User table may incorporate all necessary database fields for storing such information.

   ⚠ *This solution is recommended for an easy to maintain user authentication mechanism, which is relatively simple to model and to implement.*

2. *LDAP server*: User profiles may be stored and managed via an LDAP server. The hierarchy of users and users profile rights is contained within the LDAP directory, under a structure similar to the one for relational databases.

   ⚠ *This solution is recommended for best performance. Additional licensing and maintenance costs may be related to the installation/operation of an LDAP server.*

3.3 Technical Solutions for Functional Req. 5 – Tender workspace creation

This functional requirement is related to the creation of a virtual workspace, where all Call related information (data, users, documents, etc) is stored. The technical solutions for creating a tender workspace comprise:

1. *Collaborative environment:* A collaborative environment can offer significant benefits to users of an eProcurement system. The eNotification phase necessitates the preparation of documents, usually created/updated/approved/published by different users. Through a collaborative environment, an eProcurement system can assist procurement officers in the Call for Tenders preparation process, offering document templates, automated document versioning, multilingual support, document approval workflows, etc. The subsequent eProcurement phases require multi-user coordination, which can be achieved through customisable workflows

This solution can improve efficiency, as tasks are coordinated by the system, exploiting the benefits of online preparation and management of documents. This solution may require a significant investment by contracting authorities, but is considered as the implementation model easiest to maintain.

2. *File system:* Call related documents are prepared offline, and stored in a structured file system. Permissions and access right configurations are set up at the operating system level, in order to ensure security.

Data/document management is performed by authorised users, who are also required to maintain document versioning and control. Security settings need to be set up by computer literate personnel, while the full eProcurement implementation is most probably conditioned by specific operating systems, file systems, etc. This solution can offer a low implementation cost, but high maintenance cost.

3.4 Technical Solutions for Functional Req. 6 – Preparation of a Prior Information Notice

This functional requirement is related to the creation of a Prior Information Notice (PIN). A good technical implementation allows for the creation of any official Notice supported by the Official Journal of the European Union (OJEU). Apart for the technical solutions available below for online preparation of a PIN, contracting authorities can create PINs using offline (PDF) forms, available at the EU Publications Office website. Technical solutions for the creation of Notices comprise:

1. *Internal form filling tool for creating Notices*:* Procurement Officers can complete Notices entirely online, using web based forms. The eProcurement system and the internal form filling tool are integrated, so that one may pass information to the other. For instance, when creating a Contract Notice, the form filling tool can obtain already pre-defined information from the Call workspace, including its name of the Call, its description, its estimated value, etc. A tool for supporting the online preparation of Notices may provide functionalities for:

    a. Creation of notices

    b. Visualisation and printing options of the Notices, either in Microsoft Word or Adobe Acrobat PDF format

    c. Visualisation and validation of a Notice prior to its submission to OJEU (all fields can be checked against pre-defined values defined by the legislation)

    d. Use of CPV codes

    e. Use of UTF-8 character encoding to support multilingualism

    f. Temporary storage of Notices for further editing

    g. Electronic submission of a Notice to OJEU

    h. Electronic confirmation of dispatch and of publication from OJEU

This solution offers a user friendly mechanism for Procurement Officers to create Notices. It is integrated to the eProcurement system, so that information can be passed back and forth between the two applications. Automated validity checks, together with advanced utilities for guiding users on preparing Notices can be provided to increase efficiency.

This implementation requires some investment by contracting authorities.

2. *External form filling tool for creating Notices*: Establish an interface with compliant external services that provide the complete functionality for the online creation of notices. A mechanism may be implemented in order to pass information between the eProcurement system and the external form filling tool.

> ⚠ *A good implementation of this solution may benefit from the realisation/maintenance of an internal form filling tool. Appropriate messages (probably in the form of XML), complying with the API of the external tool, can achieve such communication.*
>
> *Such implementation may initially avoid large implementation costs by a contracting authority. However, subscription fees for utilising such external service may be required.*

3. *Offline form filling tool for creating Notices*: Procurement officers use an offline application installed in their local environment. The offline tool supports all the aforementioned functionalities and creates the necessary file(s) for officially publishing Notices. The offline tool can be implemented in such way that information can automatically or semi-automatically be obtained by the eProcurement system.

> ⚠ *This solution offers flexibility, as this offline tool can operate as an autonomous application or be integrated with the eProcurement system. The downside is that Procurement Officers may need to obtain and install such tool in their workstation, while specific software may be required for the application to become operational. Tool versioning and upgrades may be difficult to maintain.*

3.5 Technical Solutions for Functional Req. 7 – Use of the Common Procurement Vocabulary (CPV) classification standard and Functional Req. 9 – Nomenclature of Territorial Units for Statistics (NUTS) classification standard

This functional requirement is related to the use of the CPV and NUTS codes in Notices. Both CPV codes and NUTS codes are updated and made available by the Publications Office.

In the creation of Tender workspace phase, an eProcurement system may prompt Procurement Officers to specify the CPV codes of the goods/services/works to be procured, as well as, the location of the contract in the form of NUTS codes. Two plain text boxes can prompt Procurement Officer to fill the required CPV and NUTS codes. A more advanced solution can be provided in the form of a look-up table, where users can perform a textual search through the CPV or NUTS codes, and select the ones applicable for the contract. When Notices are created, the mechanism used for the creation of Notices can automatically utilise the CPV and NUTS information provided by Procurement Officers during the Tender workspace creation.

> ⚠ *The inclusion of CPV and NUTS codes in the details of a Call are simple to implement and can significantly assist Economic Operators in locating interesting Calls for Tender.*

3.6 Technical Solutions for Functional Req. 8 – Publication of a Prior Information Notice

This functional requirement is related to the publication of a PIN, and other types of Notices. The technical solutions for this requirement are discussed in section 3.8.

3.7 Technical Solutions for Functional Req. 10 – Tender Evaluation Mechanism

This functional requirement is related to the establishment of an evaluation mechanism for Tenders of a Call. Contracting authorities shall establish the evaluation mechanism they will use for evaluating Tenders prior to the publication of the Contract Notice, and detail this mechanism either in the Contract Notice or Contract Documents. The information on the evaluation mechanism shall include conditions for participation, as well as the criteria to be used (either in weighted form or in descending order of importance if the Tender evaluation is based on MEAT).

The list of conditions for participation and awarding criteria can be made available for display in a commonly acceptable format (e.g. TXT, RTF, PDF, WORD, EXCEL, XML, JPEG, etc.) to all interested parties. The tool used for generating the list of awarding criteria can provide an expert utility, which supports any of the above formats. The technical solutions for defining the conditions for participation and awarding criteria comprise:

1. _Application based_**:** The use of forms enables the definition and visualisation of the awarding criteria in a hierarchical structure (i.e. levels and sub-levels of criteria). The awarding criteria can be stored in the file system as XML files, or in a relational database. If weighted criteria are used, an evaluation mechanism can be used for automatically or semi-automatically calculating the final score for each Tender. If criteria are stated in descending order of importance, contracting authorities shall define the exact algorithm to follow for concluding the winner of the competition.

   > ⚠ *This solution offers flexibility and allows for the automated or semi-automated evaluation of Tenders, both with regard to the conditions for participation, and for the awarding criteria. In a system that supports the restricted and/or negotiated procedures, the definition of objective selection criteria may also be supported.*

2. *Back office system*: Procurement Officers can use the functionalities provided by a back-office system (e.g. ERP), in order to create a form that contains all contract awarding criteria (including the necessary hierarchical structure).When Tenders are evaluated, Procurement Officers can manually complete the defined forms for each tenderer, in order to enable the automated or semi-automated evaluation of Tenders.

> ⚠ *This solution can be very effective for organisations that already operate a back-office system, and use such functionality. Also, the creation of contracts between the contracting authority and the winner(s) of a competition can be simplified by automatically or semi-automatically passing on information to the back-office system.*

3.8 Technical Solutions for Functional Req. 11 – Interface with the OJEU

This functional requirement is related to the establishment of an interface with the OJEU for the automated publication of Notices. An interface can be established between the eProcurement system or form filling tool (section 3.4) and the OJEU, for submitting notices, as well as, for receiving confirmation of publication. The technical solutions for interfacing with the OJEU comprise:

1. *OJEU communication protocol*: The communication with OJEU (send notice/receive confirmations) can be established via XML documents, using the specifications described under DTD version 1.4 of the Publications Office. An asynchronous API must be established between the eProcurement system or form filling tool and OJEU, in order to exchange XML messages

> ⚠ *This solution requires the development of a communication interface between an eProcurement system or form filling system and the OJEU. All Notices can be established in the required XML format.*
>
> *The communication can accommodate three types of messages:*
>
> - *Message from eProcurement system or form filling tool to OJEU, containing the details of the Notice to be published*
> - *Confirmation message from OJEU to eProcurement system or form filling tool, confirming the dispatch date of a Notice, as well as, whether it is accepted by the OJEU or whether it is incomplete*
> - *Confirmation message from OJEU to eProcurement system or form filling tool, confirming the publication date of a Notice*

3.9 Technical Solutions for Functional Req. 12 – Publication of Contract Documents

This functional requirement is related to the creation and publication of Contract Documents. A Contract Document to be created and published probably needs to go through an approval workflow, which depends on the internal procedures of a contracting authority. This process can be modelled by a collaborative environment, as discussed in section 3.3. The technical solutions for creating and publishing a Contract Document, and any other official document of a Call, comprise:

1. *Offline preparation:* Contract Documents should be available in a commonly acceptable format (e.g. TXT, RTF, PDF, WORD, EXCEL, XML, etc). Procurement Officers can prepare Contract Documents offline, using tools they are familiar with. When the Contract Documents are completed, Procurement Officers can upload them onto the eProcurement system. In case a document is uploaded in XML format, it must be associated with an appropriate XSL/XSLT template, for correct visualisation.

> ⚠ *This solution offers flexibility, as users are not bound by specific applications for generating documents. However, this solution may introduce interoperability limitations to users, as interested parties are required to have the necessary software for accessing/reading a specific document.*

2. *Online forms:* Procurement Officers complete several web forms online, which contain all necessary information about the Contract Documents. The system may allow users to upload several types of files (e.g. image, chart, diagram, etc.). The eProcurement system can be flexible in order to allow Procurement Officers to define the Contract Documents, as they would normally do in an offline approach. Web forms need to be highly customisable, as Contract Documents may vary for different Calls for Tenders, depending on the goods/services/works procured and other parameters of the competition

> ⚠ *This solution offers high interoperability, as customisable forms may provide the best medium for all users to access/read Contract Documents and other types of official documents. This implementation can integrate with a collaborative environment, automatically catering for document versioning, approval workflows, multilingual support, etc.*
>
> *It can also allow for the automated or semi-automated creation of Contract Documents, obtaining information from the eProcurement system. Also, data verification, correct formatting of images, paragraphs, sections, titles, etc. can be accommodated.*
>
> *The creation of appropriate online forms can however be difficult to achieve, and potentially involves high costs of implementation and maintenance.*

3.10 Technical Solutions for Functional Req. 13 – Search Calls mechanism

This functional requirement is related to the provision of an end-user service facilitating the searching of Calls for Tenders. An eProcurement system can host large number of Calls and there can be a mechanism allowing users to search through those Calls in a timely, accurate and simple manner. The technical solutions for performing Call searches comprise:

1. *Internal search engine*: An internal search mechanism can allow users to search for interesting Calls for Tenders through searching meta-data, as well as its content. This search functionality may comprise the following options:
   a. Simple search forms*:* Users can use these forms for conducting a simple text-based search for specific Calls of interest to them. This kind of search is likely to produce a bulky result list
   b. Advanced search forms: Users can use these forms for conducting more advanced searches for Calls of interest to them by providing additional information

regarding the Call(s) they are interested in, narrowing down the results returned by the system to the most relevant ones

c. Query By Example (QBE): Users can construct custom terms, based on a predefined list of supported attributes (list needs to be supplied) where logical or arithmetic operations apply, and link them together with AND, NOT and OR

> *This solution is simple to adopt and can provide adequate functionality to users to locate interesting Calls. The search mechanism can be adopted accordingly to be used for other data searches, like users, authorities, etc.*
>
> *It requires relatively low implementation cost.*

2. *External search mechanism*: Alternatively, the system may utilise an external search engine so as to take advantage of the features offered by a specialised search engine, such as support for UTF-8 character encoding, content-based search, support for searching content stored within several types of documents (doc, xls, pdf, plain text, etc.), etc.

> *This solution most probably comes at additional cost because of the effort required to integrate the external search engine with the eProcurement application. Additionally, licensing fees may be required.*

3.11 Technical Solutions for Functional Req. 14 – Visualise/Download Call for Tenders specifications

This functional requirement is related to the provision provided to users of an eProcurement system for viewing and downloading the specifications of the Call for Tenders. The specifications may comprise many documents of various types. The technical solution for allowing the viewing and downloading of Call for Tender specifications comprise:

1. *Web-pages*: The eProcurement system may allow users to access and download documents comprising the specifications of a Call via an Internet web-site. The HTTP (HyperText Transfer Protocol) protocol may enable users to transfer files across the Internet. Where security provisions are necessary, the HTTPS protocol (HTTP Secure) may instead be utilised.

> *This solution is simple to implement and can satisfy this functional requirement in an efficient manner. It requires an HTTP client program for users (an Internet web-browser), and an HTTP server for the eProcurement system (a web server). Users may easily and at no cost obtain an HTTP client program, while some licensing/maintenance costs may be required on behalf of a contracting authority for operating an HTTP server.*

2. *e-mail/secure e-mail*: e-mail, using simple SMTP (Simple Mail Protocol) or secure e-mail, using protocols such as Microsoft's SMIME (Secure Multipurpose Internet Mail Extensions) as a more secure method, can be used in order to accommodate this requirement.

> This solution can be easily employed, however it should not introduce unequal treatment for Economic Operators. Economic Operators should be provided with an easy and accessible mechanism (preferable electronic) for requesting such e-mails to be sent to them, in a prompt and reliable manner.

3. *Internet download site (FTP/SFTP)*: Apart from HTTP/HTTPS discussed above, FTP (File Transmission Protocol), the commonly used Internet protocol for exchanging files on top of TCP/IP, or SFTP (Secure FTP), can be used in order to allow users to download documents comprising the specifications of a Call for Tenders.

> ⚠ *Similarly to the first technical solution, this solution is simple to implement and can efficiently provide the necessary functionality to users to download Call specifications. It requires an FTP client program for users, and an FTP server for the eProcurement system. Users may easily and at no cost obtain an FTP client program, while some licensing/maintenance costs may be required on behalf of a contracting authority for operating an FTP server.*

3.12 Technical Solutions for Functional Req. 15 – Request for Additional Documents

This functional requirement is related to the functionality offered by an eProcurement system to users for submitting requests for additional documents. Once the Contract Notice for a Call is published, Economic Operators are usually provided with the opportunity to request additional documents (i.e. ask questions) about the Call. Contracting authorities shall provide such additional documents (i.e. provide answers) to all interested parties, preserving the “equal treatment” principle of the legislation. This phase is commonly referred to as the “Question & Answers session” The technical solutions for requesting additional documents comprise:

1. *Online form*: An appropriate online form may be offered by the system to users for submitting online their requests for additional documents. The technical implementation of online forms is discussed in Section 3.9
2. *e-mail*: Users may send their requests for additional documents via e-mail. This technical solution is discussed in section 3.13
3. *SMS*: Short Messaging Service (SMS) can be supported by the system, allowing users to submit their requests to the system via their mobile phones. Section 3.13 provide information regarding this technical implementation

> ⚠ *The technical solution provided for this functional requirement is primarily dependant on technical solutions employed for **Functional Req. 12:*** "**Publication of Contract Documents”** *and **Functional Req. 16:*** **“Automated Notifications”**

3.13 Technical Solutions for Functional Req. 16 – Automated Notifications

This functional requirement is related to the provision of user notifications in an automated or semi-automated manner. After significant user interactions with the system, an automated response may inform users of the current status of their activities (e.g. user registration, uploaded documents, etc). Furthermore, notifications may be triggered by time events (e.g. tender submission period expired). The technical solutions for automated notifications comprise:

1. _e-mail:_ Users receive automated notification via email. These messages can inform users both for activity-driven events (e.g. publications of an Additional Document), as well as, time-driven events (e.g. notification that the opening of Tenders following the four-eye principle will commence on a specific date and time).

   > ⚠ *This solution may be used both for activity-driven and time-driven notifications. Nevertheless, e-mail is an insecure method of communication with users; therefore e-mails may not include confidential information. The delivery of e-mails is not guaranteed, so an eProcurement system may facilitate other means of notifications, provided the principle of equal treatment of all Economic Operators is maintained.*

2. _Secure e-mail:_ Another option is the implementation of secure e-mail. An automated notification mechanism employing protocols like Microsoft SMIME may be implemented, in order to provide for more secure user notification environment in contrast to SMPT (i.e. simple e-mail protocol). However this technical solution will introduce software prerequisites for receiving automated notifications, thus reducing the interoperability of the system.

   > ⚠ *Just like the previous technical solution, this solution may be used both for activity-driven and time-driven notifications. Through this solution, the security of e-mails is increased; however the interoperability of the system is reduced, as users will require prerequisite software in order to receive notifications.*

3. _SMS messages:_ Short Messaging Service (SMS) is a mobile phone service widely offered by service/network mobile providers. An eProcurement system may take advantage of this service to notify users of activities taking place in the system. The technical implementation for utilising this service is relatively simple, as numerous SMS providers offer tools for automated notifications.

   > ⚠ *Similar to e-mail, SMS can be used for notifying users of activity-driven or time-driven events taking place in the system. Additional costs may be related to the use of such service. SMS is not secure and the delivery of such notifications is not guaranteed, however users can be notified for events even when not using their workstations (where they would normally access either the eProcurement system or their email)*

4. _Application confirmation pages:_ When a user completes a significant activity (e.g. uploading a document, submitting a Tender, creating a Call for Tenders workspace), the eProcurement system may inform the user of the results of his/her actions. Through this mechanism users can be notified whether their activities have been performed, or whether there were any errors/problems which might have caused their activities to be aborted. Application confirmation pages may also be used for activities which take significant time to complete, for instance when a user uploads a large document in the system.

   > ⚠ *Application confirmation pages can be used for informing users of the results of their activities. Such pages can be easily created in any application, without significant implementation effort.*

3.14 Technical Solutions for Functional Req. 17 – Submission of Tenders

This functional requirement is related to the activities of Economic Operators for the preparation and submission of Tenders for a Call. The technical solutions for the preparation and updating of tender responses by tenderers comprise:

1. *Offline preparation*: An offline preparation tool can be used for creating and submitting Tenders. This tool can be technically implemented as described in section 3.9

2. *Online preparation*: An online preparation tool can be used for creating and submitting Tenders. This tool can be technically implemented as described in section 3.9

3. *Tender preparation tool*: Economic Operators can be provided with a specific tool for the preparation and submission of Tenders. The Tender preparation tool presents a number of offline electronic forms, which are completed by Economic Operators. Tenders can be validated by the Tender preparation tool before being submitted to the eProcurement system, guaranteeing that a Tender is compliant with the Tender specifications. Such validation checks may validate the correctness of specific fields, number of documents attached to the Tender, etc. Once the validation check of a Tender is performed successfully, an Economic Operator may submit his/her Tender to the eProcurement system. Therefore, Economic Operators can only upload Tenders that conform to the Call for Tenders specifications. The tool can also foresee printer friendly utilities, so that the tenderer can view and validate a Tender prior to its submission.

> ⚠ *A tender preparation tool allows Economic Operators to prepare their Tenders offline, through the completion of forms specific to the Call for Tenders. Such a tool can support advanced validation facilities, allowing for the validation of Tenders before their submission, also guaranteeing that all Tenders submitted are compliant with the Call specifications. Also, guidance can be provided to Economic Operators on how to prepare their Tender.*
>
> *Such mechanism can increase the control a contracting authority is given in terms of specifying how a Tender should be constructed. However, there can be significant implementation costs with such a tool to make it customisable, depending on the details of each Call for Tenders.*

4. *Tender XML schema:* Economic Operators are provided with the opportunity to download a Tender XML schema, functioning as an XML template on how Tenders should be constructed. Such a schema may contain the exact structure of a Tender, allowing for the easy insertion of Tenders to a back-office system (e.g. ERP). Contracting authorities are provided with tools to re-define the Tender XML schema depending on the details of a particular Call for Tenders.

> ⚠ *This solution offers flexibility, as the Tender XML schema can be easily created by Procurement Officers to reflect the Call for Tenders specifications, before being distributed to Economic Operators.*
>
> *This solution requires however significant design and implementation costs, as a tool for creating the XML template must be realised, assisting Procurement Officers in defining Tender XML schemas. Also, such a tool may need to be distributed to Economic Operators, assisting them in preparing their Tenders.*

3.15 Technical Solutions for Functional Req. 18 – Four-eye Principle

This functional requirement is related to the secure storage of Tenders until their pre-defined opening time, as well as, to the implementation of the four-eye principle, requiring at least two Procurement Officers to perform simultaneous action for unlocking Tenders.

The storage of tender responses must be secure-proof, for all system users (Procurement Officers, Economic Operators, etc.), as well as, administrators of the eProcurement system.

The technical solutions for the secure storage of uploaded Tenders comprise:

1. *Data encryption and fragmentation of encryption keys:* encryption of Tenders can be performed by the tenderer, based on cryptographic keys communicated by the contracting authority prior to the Tender submission, or by the system upon Tender submission. The same keys may be used by Procurement Officers for the decryption of Tenders. Keys can be automatically fragmented and distributed to various Procurement Officers. Only at the designated opening time, Procurement Officers may combine their respective keys in order to re-construct the initial key for the decryption of a Tender.

> ⚠
>
> *This solution can fully satisfy the four-eye principle, as only the simultaneous action of at least two Procurement Officers can unlock Tenders.*
>
> *Contracting authorities may consider additional "procedural" requirements for further enforcing the four-eye principle, for instance the procedure followed if Tenders are not unlocked at the designated opening time, if Procurement Officers provide wrong decryption keys, etc.*

2. *Tender file fragmentation:* Tenders are constructed by Tender files. On submission, such files can be automatically fragmented and different parts be distributed to different designated Procurement Officers. To enhance security, the parts of the fragmented files can also be encrypted, as described above. Only at the designated opening time, Procurement Offices can decrypt their relative parts and re-combine them in the eProcurement system, for reconstructing the original Tender files.

> ⚠
>
> *This solution, similarly to the previous technical solution, can satisfy the four-eye principle.*
>
> *This mechanism requires more significant design and implementation effort in relation to the fragmentation of encryption keys. However, it offers an even more advanced implementation of the four-eye principle, as Tenders apart from being fragmented, their various parts are further encrypted by the encryption keys of different Procurement Officers.*

3.16 Technical Solutions for Functional Req. 19 – Tender Confidentiality

This functional requirement is related to preserving the confidentiality of Tenders after their opening. Tenders should be securely opened following the four-eye principle. After their opening, Tenders remain confidential data, and should be accessible only to authorised users. This functional requirement can be satisfied by user authorisation issues, discussed in section 3.2.

3.17 Technical Solutions for Functional Req. 20 – Tender Evaluation

This functional requirement is related to the automated or semi-automated evaluation of Tenders. Contracting authorities should evaluate Tenders according to the Tender evaluation mechanism, discussed in section 3.7. This process is internal to the Contracting Authority.

The technical solutions for evaluating Tenders comprise:

1. *Online Evaluation*: Tenders are evaluated according to the evaluation criteria (as pre-stated in the Contract Notice), and ranked according to their score. For Calls for Tenders where the evaluation mechanism is "lowest price", ranking is based on the price values of the Tenders. On the other hand, for Calls for Tenders that the evaluation mechanism is based on MEAT, ranking is performed according to the scores of each Tender, based on the pre-stated MEAT criteria and evaluation function. The online evaluation may allow the automated or semi-automated evaluation of Tenders. It primarily depends on how the Tenders are constructed and submitted by tenderers (discussed in section 3.14). For instance, if a Tender preparation tool is used, certain aspects of the Tender are completed in specific fields and can be used for a fully-automated evaluation.

   > ⚠
   >
   > *This mechanism can offer a very efficient and transparent mechanism for automatically or semi-automatically evaluating Tenders. However, the exact technical details can be established only after a contracting authority has decided the mechanism for the submission of Tenders. Depending on that mechanism, Tenders may be evaluated automatically or semi-automatically.*
   >
   > *In the first case, all significant aspects of the Tender are completed in a form that the eProcurement system can automatically receive and process (e.g. the model, quantity and product price for a Tender are given within specific fields of an electronic form).*
   >
   > *In the second case, Procurement Officers may be provided with electronic evaluation forms. Through these forms, Procurement Officers are given the functionality to store information about the Tenders linked to a specific Call for Tenders. Based on that information, the eProcurement system can calculate the final ranking.*

2. *Offline Evaluation*: The evaluation of Tenders is performed manually outside the context of the eProcurement system. The eProcurement system offers functionality for Procurement Officers to input the final ranking of the Tenders, as concluded by the offline evaluation. This functionality can be offered so that the system registers the final results and uses these for subsequent steps (e.g. the creation of the Contract Award Notice), as well as, audit trailing purposes.

   > ⚠
   >
   > *Offline evaluation is obviously less transparent in comparison to the online evaluation. However, as contracting authorities may need to invest significant effort for implementing an efficient and flexible online evaluation mechanism, the offline evaluation may be appropriate as an initial step towards building a system which can support all procedures and phases of eProcurement.*

3.18 Technical Solutions for Functional Req. 21 – Creation of Mandatory Reports

This functional requirement is related to the various types of reports an eProcurement system should be in position to generate. The EU public procurement legislation requires for contracting authorities to be able to provide reports, detailing the different aspects of an eProcurement competition. As such, an eProcurement system may assist contracting authorities by providing a flexible reporting mechanism, allowing the automated or semi-automated generation of various reports.

Additionally, the system may also provide the capability to procurement officers to create customised reports, not only for regulated reporting, but also for statistical analysis and other internal activities of the contracting authority.

To accommodate this requirement, a system needs to be capable to obtain and store the necessary data for the production of reports. The technical solutions for the creation of reports comprise:

1. *Internal statistical/reporting tool*: A statistical tool of the eProcurement system can automatically produce reports satisfying the requirements of the legislation. For this reason the statistical module can store and retrieve data, and dynamically perform computations to generate the reports.

> ⚠ *This solution is flexible, as adding/modifying a statistical capability to the statistical tool, in order to satisfy new reporting requirements, simply consists of relatively minor modifications to the existing tool. The adoption of this technical solution may introduce some maintenance costs.*

2. *Integration with back-office statistical tool*: Functionality offered by a back-office statistical tool (e.g. SPSS, SAS) can be utilised by the eProcurement system for the purpose of creating reports.

> ⚠ *This solution can be very effective for organisations that already operate a back-office statistical tool, and can utilise such functionality. The integration of the eProcurement system with the back-office system, for the exchange of information between the two, will require some implementation effort, however a contracting authority can then benefit from the use of only one system for reporting purposes, avoiding additional training for its personnel.*

3. *External reporting tool*: An external reporting tool such as Seagate's Crystal Reports and Sybase® InfoMaker® may also be used. The reporting tool should be capable of directly accessing the data of the eProcurement system. This will probably be the fastest and most convenient method for creating various types of reports. However, unless there is a third party reporting tool capable of directly accessing the data stored in the eProcurement system, it will be required to export the data from the system into files and then import it on the external reporting tool. This process can be automated or semi-automated, depending on the exact requirements of a contracting authority.

⚠ *This solution can take advantage of the sophisticated reports an external reporting tool can generate, without necessitating implementation costs. Customised reports can be easily created by end-user, while the generation of reports can also be scheduled and initiated automatically.*

Some licensing costs may be required, while the transfer of data from the eProcurement system to the external reporting tool may prove difficult to establish, depending on the technical infrastructure of the contracting authority.

3.19 Technical Solutions for Functional Req. 22 – Invitation to Tender

This functional requirement is related to sending invitations to Tender following the selection of tenderers in the restricted or negotiated procedure. However, such functionality may be used for other similar activities, like placing an order within a framework agreement, inviting all tenderers admitted to a DPS to submit a Tender for a specific contract, etc. The technical solution for this step can be implemented similarly to solutions for automated notifications, discussed in section 3.13. Obviously, the technical solution "Confirmation Application pages" described in the aforementioned section is not applicable in this instance, as only asynchronous notification mechanisms (user not required to be logged in the system) are necessary for this functional requirement.

3.20 Technical Solutions for Functional Req. 23 – DPS reporting

This functional requirement is similar to **Functional Req. 21: "Creation of Mandatory Reports"** as discussed in section 3.18. However, an eProcurement system may cater for advanced reports concerning a Dynamic Purchasing System (DPS). The reporting functionality of the system may also allow for reports concerting specific contracts within a DPS. Hence, reports may concern information of Tenderers admitted to a DPS, number of specific contract procured, total cost of specific contracts procured within a DPS, etc.

The technical solutions discussed for **Functional Req. 21: "Creation of Mandatory Reports"** are also applicable for this requirement.

3.21 Technical Solutions for Functional Req. 24 – Creation of specific contract workspaces within DPS workspace

This functional requirement refers to the creation of workspaces for specific contracts within a Dynamic Purchasing System (DPS). Each specific contract workspace must be associated with a DPS workspace, so that one workspace functions as the "parent" workspace (DPS workspace) and the others as "child" workspaces (specific contract workspaces within a DPS). The technical solutions for the creation of a specific contract workspace within DPS can be achieved by the technical solutions discussed for **Functional Req. 5: "Tender workspace creation"**. The only difference is that one workspace may have a logical or physical link to another workspace, permitting the "parent-child" relationship of workspaces to be achieved.

3.22 Technical Solutions for Functional Req. 25 – Indicative Tenders in the form of electronic catalogues (eCatalogues)

Where the submission of Tenders takes the form of electronic catalogues, the contracting authority may define eCatalogue specifications (i.e. XML schema, commodity attributes, acceptable formats, etc.) and templates to be used by Economic Operators for creating and submitting eCatalogues. These should be stated at the latest in the Contract Notice and possibly be made available to Economic Operators to ensure non-discrimination and wide participation. The templates should be capable to validate the data provided by Economic Operators, and need to be in a generally available and commonly acceptable format. The technical solutions for accepting a Tender in the form of eCatalogues comprise:

1. *Spreadsheets*: Economic Operators complete their Tenders based on spreadsheet eCatalogues. The Contracting Authority may specify the Tender attributes to be completed by Economic Operators (i.e. fields of the spreadsheet) in the eCatalogue. Economic Operators can use widely available applications (e.g. MS Excel, Lotus Quattro Pro) for completing their Tenders and save them in files, which can be submitted to the eProcurement system. Pre-defined spreadsheet templates can be made available to Economic Operators, which may include all required fields, guidelines for completion, and validation rules.

   ⚠ *A simple solution for creating Tenders in an eCatalogue format is by utilising spreadsheets. Contracting authorities may define templates for the eCatalogues to be completed. Also, if contracting authorities specify an application to be used by Economic Operators in order to design their eCatalogues, it needs to be generally available.*

   More sophisticated tools of the contracting authority may involve tools for verifying whether an eCatalogue submitted complies with the required format, and/or support for the uploading of an eCatalogue to the eProcurement system, permitting Procurement Officers to visualise it.

2. *Portable databases*: Economic Operators may be asked to complete their eCatalogues in portable database format, using generally available portable database applications (e.g. MS Access, Paradox, etc). Such database applications can create files containing both the database structure and data, which can subsequently be easily uploaded by Economic Operators onto the eProcurement system. Similar to the previous solution, contracting authorities can make available pre-defined database templates, which can guide Economic Operators into creating their eCatalogues utilising validation rules. This solution can offer more flexibility in comparison to the previous one, as database applications provide advanced functionality and data control. Furthermore, this solution can allow the use of images and other multimedia features, further enhancing the usability and efficiency of eCatalogues.

> ⚠ *A relatively advanced solution for creating Tenders in an eCatalogue format is by utilising portable database files. Such files contain not only the structure of a database, but also its data. Contracting authorities may define the desired structure of an eCatalogue for a particular Tender. Subsequently, Economic Operators may fill the database with their product details and upload onto the eProcurement system.*
>
> *This approach is slightly more advanced in comparison to spreadsheets. Advanced tools can also be provided for validating an eCatalogue. Also, better visualisation and functionality for comparing eCatalogues can be provided.*

3. *Text-based eCatalogues*: eCatalogues can be created in flat text files, separating each commodity attribute (i.e. product field) by a pre-defined special character (i.e. comma character, tab, etc.), or fixed length. This is the more simplistic method for constructing eCatalogues, which offer high interoperability, as almost any system can read/write text files. The creation of text-based eCatalogues can however be cumbersome, unless a supplier uses appropriate tools, which can automatically export data to the pre-defined structure. Text-based eCatalogues cannot support advanced features, as the previous two solutions do.

> ⚠ *Text-based eCatalogues are very interoperable, as they do not depend on the operating system, application and/or version of the application the Economic Operators is using. Tools may be made available to Procurement Officers to upload a text-based eCatalogue in an application, where advanced searching and user-friendly visualisation can be achieved.*

4. *XML-based eCatalogues*: The structure of an electronic catalogue can be represented by an XML schema that is used by Economic Operators, in order to exchange data about products and services. XML files can be based on:

   a. Existing commercial XML vocabularies (e.g. Electronic Business XML - ebXML, Commerce XML - cXML), which describe the structure and semantics for exchanging data about commodities. Such vocabularies are not yet fully standardised, thus posing a limit to the interoperability capabilities that an XML schema should normally offer

   b. Customised XML schemas defined by contracting authorities to model their specific needs

> ⚠ *XML-based eCatalogues may be used for the automated communication between Economic Operators systems and an eProcurement system. This implementation requires minimum effort by both Economic Operators and Procurement Officers in order for an eCatalogue to be imported into the eProcurement system. However, contracting authorities shall ensure non-discrimination of smaller Economic Operators by making this the only way to provide eCatalogues.*
>
> *For an Economic Operator to produce an eCatalogue of this sort, it usually prerequisites some IT expertise, as well as, the existence of a back-office system. This can limi for the participation of a large number of Economic Operators, and particularly of SMEs*

3.23 Technical Solutions for Functional Req. 26 – Creation of eAuction workspace and establishing eAuction

This functional requirement is related to the creation of a virtual workspace where all eAuction related data can be stored. An eAuction workspace should support all requirements of a Tender workspace, as discussed in section 3.3.

4 NON-FUNCTIONAL REQUIREMENTS

The new EU public procurement directives, in addition to describing the functional requirements (as conceptualised in section 2 and analysed in section 3), impose also a set of non-functional requirements. These requirements are primarily concerned with usability and security aspects, for ensuring accessibility, transparency, equal treatment, security, and other principles of the EU legislation. Furthermore, a number of non-functional requirements that are not required by the legislation are presented in this chapter. While these are of a more implicit nature, they can significantly assist contracting authorities in establishing effective Public eProcurement systems.

The analysis and presentation of non-functional requirements for eProcurement systems is based on the IBM Rational Unified Process. RUP is a process platform for software development that supports a wide range of project types, ranging from custom business applications to commercial-off-the-shelf (COTS) program implementations.

RUP captures functional requirements as “use cases” and ties non-functional requirements to use cases wherever possible. RUP considers requirements which cannot be tied to use cases or domain concepts as general requirements and lists them as supplementary requirements. Non-functional requirements originate from system properties, such as environmental or implementation constraints (e.g. remote access should be provided, software must run on various operating systems) and qualities of the system, such as the ones analysed in this section:

- Usability
- Reliability
- Interoperability
- Scalability
- Security

In the current chapter, a limited number of specific products/technologies are mentioned as examples for better describing concepts of non-functional requirements. As described in page 2 of the current report, any reference to specific products, technologies, processes and/or services does not constitute or imply its endorsement, recommendation or favouring by the European Commission.

4.1 Usability

4.1.1 User Support Requirements

One of the primary objectives of the new EU public procurement legislation is to support suppliers to successfully participate in public procurement competitions. Advanced eProcurement systems, built according to the highest GUI standards, significantly assist users, and in particular suppliers, to understand the eProcurement process, thus reducing the need for user support. However, Contracting Authorities may also envisage user support operations providing adequate support to users if and when required. Table 2 demonstrates a number of methods to achieve the desired user support.

Table 2 - Methods for supporting users

Type	Details
Help Desk	Provide support to users through the use of a Help Desk, facilitating: • **Application support and problem reporting:** allows users to report all system errors and application defects to the Contracting Authority. This operation involves the investigation and resolution of incidents and problems. The Help Desk must be in a position to assess the criticality of a system error, and either provide information to users as to how to resolve the error by themselves, or transmit the issue to the corresponding IT department for resolution • **System Monitoring:** monitors the operation of the eProcurement system, identifying potential problems caused by increased user activity and assist in the necessary monitoring for the identification of potentially illegal activities • **User Assistance:** allows users to communicate directly with an employee of the Contracting Authority and obtain answers to questions regarding system functionality. Problems of a general nature should be communicated to all users • **Feedback/comments collection centre:** allows users to provide feedback and comments to the Contracting Authority about the system, regarding current functionality, or functionality which should be made available through the system. This allows the Contracting Authority not only to identify areas of the system that need potential modifications, but also define the scope of future development phases for the system
User education and training	Offer user training sessions to help procurement officers and suppliers to fulfil their roles when using functions and services of the system. eLearning demonstrators and testing environments (simulating the operation of the real system) can assist users to better understand the complete functionality of the eProcurement system
Documentation & technical authoring	Provide documentation to assist users to understand the details of eProcurement, as well as the exact functionality of the system. eProcurement guides, user manuals, walkthrough/training manuals, system online help, in-context help, are types of means which can effectively offer the desired user support

4.1.2 Application Graphical User Interface (GUI)

eProcurement systems are not in principle used on an “everyday” basis. Procurement Officers of a Contracting Authority utilise such systems only when creating a Call for Tenders, or when managing their existing Calls. Depending on the size/type of a Contracting Authority, and the frequency of its purchases, the utilisation of the system can be as rare as a few times every year, while Economic Operators use such systems only when participating in a particular Call for Tenders, which may also occur very rarely.

A public eProcurement system should therefore be widely accessible and based on generally available means. The user interface of such a system needs to be operational in all geographic regions, while technical prerequisites for their accessibility shall not impose significant limitations to suppliers. Additionally, functionality made available to users, is recommended to be implemented in a self-explanatory manner and assistance should be offered at all times, helping to understand the steps they need to follow, taking advantage at the same time of all functionality offered by the system.

The current section elaborates on the GUI requirements of a Public eProcurement system.

4.1.2.1 Graphical User Interface (GUI) Interoperability

The technology used for GUI implementation of an eProcurement system needs to be chosen primarily based on a single criterion; the level of accessibility. In the last few years, several state-of-the-art GUI implementation techniques have emerged, allowing system developers to implement GUIs in a simpler and/or more efficient way. Nevertheless, not all new technologies have set standards, or may not be supported in exactly the same way by Web-browsers, Operating systems, etc. This obviously is an undesired effect, which substantially reduces the level of accessibility.

It is therefore recommended that the GUI of eProcurement systems is based on widely accepted technologies. For instance, all commonly used Web-browsers support the HTML 4.01 standard. Therefore, a GUI of an eProcurement system constructed in HTML 4.01, reduces accessibility considerations to other, non-functional issues (“Security” in section 4.5 and “Availability” in section 4.4.1).

In particular for Web-based solutions, the EC is utilising “10 golden rules” for any Web-based applications implemented in the Europa Web-site (http://europa.eu.int/). These guidelines can also be utilised for the implementation of the GUI of an eProcurement system (http://europa.eu.int/comm/ipg/).

4.1.2.2 Search functions

Advanced search facilities should be provided to all users of a public eProcurement system. They should allow all users (including anonymous, non-logged-in users) to use the search functionality for all available Calls for Tenders, and to identify the potentially interesting ones.

A predefined set of the most important data in a Call for Tenders, (including its name, CPV codes, NUTS codes, etc.) can be made available as search criteria, as well as the option for end users to combine these criteria. Advanced Boolean logic operations (AND, OR, and their precedence) may also be provided, allowing users to execute refined searches.

The system can allow users to define the fields used for displaying the results of a search and the sorting parameters used. Furthermore, users can be given the possibility to select a particular Call from the search results, and view its details. Depending on the details and status of a particular call, Economic Operators can be presented with the appropriate activities to perform. Table 3 presents the set of activities per procurement type, as they result from the Use Case analysis presented in section 5.2.

Table 3 - Economic Operator activities on a particular Call for Tenders

Type	**Status**	Activities
All	eNotification (prior to Tender submission)	• View Call Details • View Contract Notice (if published) • View Contract Documents (if published)
Open	eTendering (submission of Tenders)	• View Call Details • View Contract Notice • View Contract Documents • View/Request Additional Documents • Submit a Tender
Restricted	eTendering (submission of Tenders)	• View Call Details • View Contract Notice • View Contract Documents • View Additional Documents • View/Request Additional Documents • Submit Expression of Interest • Submit a Tender (if invited)
All	eAwarding (evaluation of Tenders)	• View Call Details • View Contract Notice • View Additional Documents
All	Archived	• View Call Details • View Contract Notice • View Additional Documents • View Contract Award Notice

Apart from presenting search results on screen, advanced features comprise the following functionality in relation to results:

- printing results
- storing results as HTML, Excel, PDF, etc. files
- displaying and/or storing results as structured files (e.g. XML, CSV, etc.)

4.1.2.3 Online help

eProcurement systems are not used on an everyday basis, and therefore their GUIs need to be as simple and self-explanatory as possible. Advanced online help can be offered, providing assistance at any time to users performing activities in the system. "In-context" sensitive help, user manuals, wizards, walkthroughs, and online demonstrators can significantly assist users to understand the functionalities of the services offered by the system. Online help documentation, glossary, and FAQ (Frequently Asked Questions) can provide fast and easy access to clear definitions for all the fields used (what they represent, what they measure, etc.). User guides can explain in detail the GUI of the eProcurement, for example using screen-shots and detailed textual descriptions. The FAQ can provide answers to questions that are expected to be most commonly asked by the users of the system.

A successful eProcurement process depends heavily on the correctness of the data submitted by users of the system. The validity of all data submitted by users through completed Web forms can therefore be checked. This can be done at both the server and the client sides:

- **Server side**: when the validity of data provided by a user is verified on the server side and the values are invalid in any way, users can be prompted to access the same entry form again, with descriptive warning messages next to the field(s) improperly completed.
- **Client side**: when the validity of data provided by the user is verified on the client side, the browser uses business logic in order to locate and explain the errors to the user. This check does not add more load on the server. With this check, error messages need to be shown to the users. In Web-based technologies, this implementation may however create interoperability issues, as JavaScript or other client-based scripting languages will need to be enabled.

eProcurement systems may also inform users performing "significant" activities (i.e. create a Call, submit a Tender, etc.) using informative/confirmation pages and automated notification mechanisms.

All online help facilities can be made available in all languages supported by the system, as discussed in section 4.3.1.1.

4.2 Reliability

The degree of reliability of a system can be assessed in relation to the reliability of its components, allowing reliability requirements to be expressed at the component/unit level, rather than entire system level. Reliability requirements are related to the quality of a system, and are usually defined quantitatively. Typical requirements comprise values for:

- Mean time between failures (MTBF): measure of the average time between failures. As an example, if there are 8,760 hours per year (365 days x 24 hours per day) then the MTBF of the system can be divided by 8,760 to identify how long the system will run in years. A system with a rating of 30,000 MTBF, would on average run 3.42 years without a failure.
- Mean time to repair (MTTR): measure of the average time required to perform corrective maintenance on a system in the event of a system failure. As the value for MTTR approaches zero, the availability of the system increases to 100%.
- Probability of failure on demand (POFOD): measure of the likelihood that the system will fail when a service request is made. As an example, if POFOD equals 0.01, this means that 1 out of every 100 service requests results in a failure. This is relevant for eProcurement systems operating non-stop.
- Rate of fault occurrence (ROCOF): refers to the frequency of occurrence of unexpected behaviour. As an example, a ROCOF value of 0.02 means that 2 failures are possible every 100 operational time units.

Because some functionalities of an eProcurement system are more critical than others, reliability requirements may be restricted to the most important ones. For example, the reliability of Tender submission and Tender locking modules should typically be higher than the module used for creating a Contract Award Notice.

When defining the metrics for the reliability requirements, the Contracting Authority needs to specify the exact system conditions. For instance, the reliability of any IT system usually depends on the user request load, and may decrease when the number of simultaneous transactions/requests increases. Therefore, reliability and scalability (section 4.4) are closely related.

The new EU public procurement directives do not specify the exact reliability requirements of an eProcurement system. Nevertheless, an eProcurement system needs to be easily accessible, guaranteeing minimum disruptions to eProcurement competitions, not compromise confidentiality of data and security at any time and ensure transparency and non-discrimination at all times. These requirements can only be fulfilled by a highly reliable eProcurement system.

Contracting Authorities need to specify the exact reliability requirements according to their national, regional and/or local laws and estimated usage of the system. During the development phases, a wide range of testing techniques (including unit testing, integration testing, factory testing, stress testing, etc.), may be employed to ensure the good quality of the programming code. Moreover, apart from realising as highly-reliable systems as possible, Contracting Authorities are recommended to establish mechanisms for handling potential system disruptions, in the form of Business Continuity Plans and Disaster Recovery Plans.

4.3 Interoperability

Interoperability is one of the main principles imposed by the new EU public procurement legislation. The European Interoperability Framework distinguishes between organisational, semantic and technical aspects of interoperability. In the following, non-functional interoperability requirements are analysed according to these three levels.

The European Interoperability Framework document, can be obtained on the IDA web-pages http://europa.eu.int/ida/servlets/Doc?id=18063.

4.3.1 Organisational Interoperability

At the organisational level, interoperability issues refer to defining business goals and modelling business processes. The goal is to allow the collaboration between administrations that wish to exchange information but do not have a homogeneous internal organisation and structure. The requirements for pan-European eGovernment services should be determined by all participating administrations and then prioritised according to citizen demand. If pan-European eGovernment services are set up to cover life-event (situations involving human beings that trigger public services) and business episodes (situations involving companies and self-employed citizens that trigger public services or interactions with public authorities), public administrations responsible for implementing them should consider the business process and actors involved and agree on the necessary Business Interoperability Interfaces (BII). Through the BII, their business process can operate at a European level. If the provision of such services requires contributions from several public administrations across Europe, then a Service Level Agreement (SLA) should be formed and should at least consider the BII concerned, as well as agree on a common security policy.

4.3.1.1 Linguistic/Multi-lingual Requirements

An eProcurement system of a Member State should ideally be available in the official language(s) of the Member State, as well as, an additional European language, similarly to pan-European services “Your Europe” Portal (http://europa.eu.int/youreurope). Users may then be provided with the functionality to select their preferred language for the Graphical User Interface (GUI), from the supported languages, as well as, to easily switch from one language to another.

With regards to the User Interface and the language used, all descriptions should best be placed in an easily customisable and parameterised format (e.g. property file or database table), so that they can be translated if there is future need to export the User Interface to another language. Additionally, the fonts used in the application should use all the glyphs for all the official EU languages (20).

Apart from the GUI language however, data stored in the system may be in any of the EU official languages. A Contracting Authority may create the Contract Notice and Contract Documents of a Call for Tenders in any EU language, or possibly create the aforementioned documents in more than one language. Users can therefore be provided with the functionality to access the available documents in their preferred language. Through the provision of functionality for multi-lingual support a system conforms to aspects of the equal treatment principle.

In principle, two parts of the eProcurement system localisation should be considered:

- **Language:** the User Interface needs to be capable to display data in any of the EU languages supported by the system (if more than one language is provided) allowing users to set their preferred language from a user profile screen.
- **System character encoding:** system character encoding is the method for encoding text entered in any input fields. UTF-8 (Unicode) character encoding can be supported for non-Latin characters. The database might also need configuration for UTF-8 to work. For instance, previous versions of MySQL™ did not support Unicode, it was however possible to configure a JDBC driver to use Unicode when handling texts.

4.3.1.2 Collaboration Requirements

Throughout the stages of an electronic public procurement procedure, Contracting Authorities internally exchange documents, reports and messages. These processes are considered as an integral part of the whole electronic procurement functionality on the administration side. Automating these processes can considerably reduce administrative costs and use of resources. The bottlenecks introduced by common manual processes can be eliminated and the continuous automation flow can result in a more efficient procurement process.

To provide automation of processes within the administration, a collaboration tool can be adjusted and used. Integration of such a tool may be defined in several cases, such as the drafting/publication of documents, the circulation of participation requests within the administration, the opening and evaluation of documents, the exchange of internal reports, the application of hierarchical structure and multiple authorisations, etc.

A collaborative environment provides services like document management, knowledge management, advanced communication/collaboration tools and workflow services, which apart from capturing the internal processes of Contracting Authorities, can also provide for their improvement. Existing collaborative platforms which may be considered for enhancing eProcurement are CIRCA, Lotus Notes™, Microsoft Exchange®, Microsoft Sharepoint Server™, Livelink™, as well as, open source community tools such as the MERMIG tool (www.mermig.com). Web-based collaborative environment platforms provide on-line services for workgroups and committees, facilitating the effective and secure sharing of resources and documents, and modelling the processes internal to the administration into system workflows, enhancing internal collaboration and communication.

Typical services of a collaborative platform are:

- **Document Manager:** provides a multi-function repository, storing documents organised in a folder tree structure, supporting multi-lingual and multi-versioned documents (*can be used for the uploading of contract documents and Tenders by suppliers*)
- **Group Manager:** incorporates tools for the management of user accounts, and maintenance of personal information of members (*can be used for the definition of users and user roles*)
- **Calendar:** manages the meetings and events schedule of a workgroup through the preparation, announcement and administration of meetings and events. Synchronous communication mechanisms allow online meetings to take place (*can be used for time-relevant activities, like the opening of Tenders*)
- **Forum:** supplies the virtual area for discussions among members on various subjects of interest. Users can read and/or participate in discussions, while support for moderated forums usually requires all information that is displayed to be "approved" by an appointed member before it is made public (*can be used for an FAQ and Q&A section*)
- **Email & SMS:** offers access to email and the ability to send SMS messages (*can be used for automated notification*)

- **Workflow:** boosts team-working and cooperation between members of a workgroup, by supporting the execution of workflows, thus automating complicated procedures performed by team members, ensuring better communication and control of the team. Advanced features may encompass delivery of tasks in user email, and use of task deadlines (*can be used for following the Contracting Authority procedures for the preparation of documents, evaluation of Tenders, etc.*)
- **Workflow designer:** supports design of business processes and their dissemination
- **Search:** allows for searching through the workgroup data
- **On-line help:** presents detailed information for the activities supported by each service

4.3.2 Semantic Interoperability

Semantic interoperability is concerned with the integration of resources which were developed using different vocabularies and possibly different data perspectives. Systems are semantically interoperable when they are capable of exchanging data in a way which makes the precise meaning of the data readily accessible. This means any eProcurement system should be able to translate the data into a form it understands. All data elements exchanged through Contracting Authorities and Economic Operators operating on a pan-European level should be interoperable. Subsequently, some requirements need to be satisfied by the administrations responsible:

- publish information about the data elements involved in the exchange
- draft proposals for and agreement on the data and related data dictionaries required on a pan-European level
- draft proposals for and agreement on tables with multilateral mappings between national and pan-European data elements

For semantic interoperability to be meaningful, the linguistic equivalence in approved directives and regulations needs to be taken into account when these are used in the delivery of e-Government services. XML vocabularies may be developed taking into account agreed e-Government data elements. Semantic interoperability is an area which affects eProcurement and is currently addressed by IDA through the XML Study project and other initiatives.

4.3.3 Technical Interoperability

On the technical level, interoperability refers to the technical issues involved in linking computer systems and services (open interfaces, interconnection services, data integration and middleware, security services, etc.). Technical interoperability of pan-European networks, applications and services requires that Member States administrations, EU institutions and/or agencies develop and use common guidelines. These guidelines should follow the IDA guidelines and be updated regularly, also taking into account results and guidelines from technological research and development programs as well as Community programs such as IST, eTen and eContent. They should be based on open standards.

Multilingualism adds technical interoperability requirements if citizens shall be provided with mechanisms allowing them to submit requests and to obtain information in more than one language. This requires the use of machine translation software that will enable users to understand requests in other languages and respond accordingly.

4.3.3.1 Application Interfaces

In light of the importance of technical interoperability aspects in an eProcurement environment, it is recommended that an eProcurement system should have appropriate open application interfaces to support the interaction between various operational systems, as well as systems and applications under development. An eProcurement system can be realised in a way which enables interoperability with existing legacy systems, allowing the re-use of existing systems and minimising the costs for public administrations.

The European Interoperability Framework emphasises that the interoperability of eGovernment services on a pan-European level is very beneficial. eProcurement systems can enable their integration with existing Enterprise Information Systems (EIS). To address the interoperability requirements, eProcurement systems may employ several strategies:

- **Service Oriented Architecture (SOA):** SOA is concerned with the independent construction of services which can be combined into meaningful, higher level business processes within the context of an organisation. SOA describes several aspects of services existing within an organisation:
  - The detail ('granularity') and types of services (granularity refers to the size or extent of a functionality in a given interaction).
  - How services are constructed
  - How services are combined together
  - How services communicate on a technical level
  - How services interoperate on a semantic level.

  By applying the SOA paradigm to the design of the core components, system implementers can ensure a significant improvement in system flexibility, while at the same time business components are re-used. This consideration needs to be taken into account during the system design phase.

- **XML based communication protocols (SOAP and XML-RPC):** XML-based communication protocols can be utilised when cross-platform interaction is required. Furthermore, SOAP and XML-RPC are standard components of almost all environments, constituting two protocols to enable remote cross-platform communication in a standardised and convenient way

- **Integration capabilities depending on the specific development framework used:** depending on the development framework used, Contracting Authorities may design their applications so that future interoperability capabilities are enhanced through the adoption of the appropriate standards. The J2EE Connector Architecture (JCA) for the J2EE framework for instance, can assist in establishing an environment for secure system interoperability. JCA defines and enables a standard way for connecting J2EE based applications to heterogeneous EIS. EIS systems comprise Enterprise Resource Planning (ERP) systems, database systems and various legacy applications. Furthermore, JCA offers a set of scalable, secure, and transactional mechanisms to enable connectivity to EIS and there is a huge marketplace of JCA adapters to simplify integration of enterprise applications.

Widely used architectural methods for solving interoperability issues comprise:

- **Java/J2EE based applications:** depending on the deployment architecture of the existing application, two means of accessing services, objects, and servers in a platform-independent manner are available; Simple Object Access Protocol (SOAP), and the Remote Method Invocation (RMI). SOAP protocol uses an HTTP connection, and can thus be used to access applications behind a firewall, or having other security provisions preventing usage of other protocols. RMI provides a slightly more advanced solution (in terms of performance), and can be used for accessing existing applications in a pure J2EE manner (getting objects references via JNDI). However, this solution cannot be easily used for accessing applications that are behind firewalls (to get across firewalls, RMI makes use of HTTP tunnelling by encapsulating RMI class, within an HTTP POST request).
- **Microsoft-based applications (C++, ASP, .NET, etc):** applications based on Microsoft technologies can be accessed through SOAP. The .NET framework, as well as, other Microsoft technologies have strong SOAP support and are capable of exchanging SOAP messages with various systems. .NET SOAP capabilities allow components on other platforms to exchange data messages with .NET components. However, .NET is proprietary and while some of its elements, such as SOAP and its discovery and lookup protocols are provided as public specifications, the core components of the framework (IL runtime environment, ASP+ internals, Win Forms, etc.) are not disclosed by Microsoft. Hence, Microsoft is the only provider of complete .NET development and runtime environments.
- **Mail servers:** mail servers (Microsoft Exchange, sendmail, etc.) provide access through standardised POP3 and SMTP protocols
- **Python:** Python-based applications provide a large set of functionalities and can usually be easily connected with other applications. Some of the existing functionalities supply SOAP access, while for others it is feasible through extensions developed in Python or another programming language (e.g. Java)
- **Perl:** there are Perl-based applications and extensions providing SOAP interface which can easily be plugged into existing applications
- **Mainframes with APIs:** existing mainframes may provide a connection API. Such APIs usually provide a SOAP-enabled interface that can be used for data exchange
- **Mainframes without APIs:** if the mainframe application vendor does not provide connection APIs, it might still be possible to access some part or parts of the system (most likely permanent storage – database system) through ODBC/JDBC drivers. However, if this possibility is not available, the connection can most probably not be established
- **Relational database systems:** most of the existing Relational Database Management Systems come with vendor supplied connection drivers, which can be used by an application to directly access data stored in the RDBMS. An ODBC/JDBC connection is not the only way to access such systems. If it is architecturally possible and justified, the system can also be accessed through the EJB (Enterprise Java Bean) layer or via DLLs. If the server is located behind a firewall, SOAP access (with vendor supplied or in-house developed components enabling SOAP) can be used

4.3.3.2 Time-stamping

A secure and reliable time-proofing mechanism can be used for dealing with issues such as whether a Tender was submitted before the Tender submission deadline, etc. An eProcurement system needs to be in a position to record the exact time for all activities taking place and also to obtain that time from an official source.

Time can be obtained using the Time-Stamp Protocol (TSP) and a Time-Stamping Authority (TSA) issuing time-stamps associating a unique date and time with any action in the eProcurement system. The digital time-stamp can be used to prove that an electronic document was transmitted properly to the procurement server at the time stated on its time-stamp. eProcurement servers of a system can continuously synchronise with a TSA, through the reception of broadcasted time signals. Through this mechanism the audit trailing module of an eProcurement system can use an accurate time-stamp to record all activities performed.

All documents can be time-stamped on the server side immediately after the completion of their transmission from the client site. Electronically signed documents can be associated with a strong cryptographic time-stamp, if sent to the TSA, which stamps documents with a (legally) valid date and time.

All eProcurement servers, apart from time synchronisation capabilities, can also be equipped with an internal clock and a sequence of security functions capable of providing high accuracy, even in cases when the time signal fails or is tampered with.

4.3.3.3 Synchronous Communication

Synchronous communication methods allow two-way communication to take place in various forms in ‘real-time’. This type of communication removes geographical barriers and allows Contracting Authorities to inform Economic Operators about important events, activities, etc. and to provide clarifications regarding Calls for Tenders in a more efficient manner. An eProcurement system can incorporate functionalities allowing synchronous communication between the Contracting Authorities and Economic Operators to take place, making the eProcurement process more efficient.

For instance, synchronous communications utilising “real-time chat”, through commonly used Internet chatting facilities, can allow the real-time exchange of messages facilitating the Questions and Answers sessions of a Call for Tenders. Through this facility, a contracting authority can publish connection details for a “live” Questions and Answers session, to which Economic Operators can openly connect to and participate in. The contracting authority must however ensure that all tenderers are being informed equally and at the same time.

4.3.3.4 Asynchronous Communication

Asynchronous communication does not take place in real-time, meaning that parties can communicate outside a specific time window. This is important when eProcurement takes place on a European scale where Public Administrations and Economic Operators from different time-zones and locations need to interact. E-mail and electronic bulletin boards are examples of asynchronous communication. Asynchronous communication methods remove temporal barriers and can be employed for notifying users that are not logged-in to the system of events, activities, information, etc. The following asynchronous communication functionality can be considered when implementing an eProcurement system:

- **Threaded discussion forums**: refers to the functionality for capturing the exchange of messages over time, sometimes over a period of days, weeks, or even months. Threaded discussion forums are organised into categories so that messages and responses exchanged are grouped together and are easy to find. This functionality is well suited to support Questions and Answers sessions.
- **Internal e-mail**: refers to the functionality for supporting electronic mail that can be read or sent from within the system. This functionality enables messages to be sent or read exclusively within the system; alternatively, the tools provided enable links to external email addresses of those using the system so that contacting users is facilitated. Internal email may include an address book and some address books are searchable. This functionality makes the eProcurement system more secure as messages will be sent and read exclusively within the system. Also, it can also be used for online notifications.

4.4 Scalability

Software systems should be designed to meet significantly larger transactional load than what is estimated prior to their development. The efficiency in which this can be done, in terms of cost, time, quality, etc., can determine the scalability of a system. Good scalability for a system can be achieved through effective software architecture and/or adequate hardware components. In this section, two aspects of scalability are considered: system availability and system performance.

4.4.1 Availability Requirements

During the eProcurement lifecycle, there are a number of critical events, which are strictly regulated by the new EU public procurement legislation. It is therefore essential for Contracting Authorities to establish systems which remain constantly available, in order to guarantee the support for these and all other types of events.

Probably the most critical event is during the closing stages of Tender submission for a Call for Tenders (the eTendering phase). Before the end of eTendering, Economic Operators are required to access the system to submit their Tenders. However, it is common practice for Economic Operators to submit their Tenders towards the end of the Tender submission deadline. Additionally, depending on a specific Call, a Tender may be composed of several files. This in turn can result in megabytes of data that need to be transferred from the IT environment of the Economic Operator to the eProcurement system, and stored in the appropriate secure servers. The combination of these parameters signifies that the eTendering closing period for each Call can potentially cause failures due to volume capacity problems.

Furthermore, an eProcurement system may be harmed by disruptive events, including internet connection failures, malicious attacks, power failures, system software/hardware failures, etc. System implementers must ensure that their systems can handle all failures they can possibly envisage, while plans must be in place for handling critical failures, in the form of Business Continuity and Disaster Recovery Plans.

For establishing the exact availability requirements for an eProcurement system, future users of the system could be interviewed, in order to determine their real needs and expectations. This interview can form the basis of a Service Level Agreement (SLA) between the technology provider of the service and contracting authorities.

The availability of an eProcurement system can be improved through identification of the system components. If one component is prone to failure, the entire system will be prone to failure too. An eProcurement system is usually composed of three elements:

- One or more servers, where most of the data is processed and stored.
- A client, making requests to the server
- The network, which allows for the communication between the client and the server

All three elements can be broken down into components, such as hardware, software, processes, procedures, etc. All these components need to be checked for their reliability, in order to guarantee the availability of the system.

More specifically, the hardware making up the system includes, among others, the following components that need to be checked:

- Central Processing Unit
- Storage devices
- Input devices (keyboards, serial ports, mice, etc.)
- Output devices (monitors, printers, etc.)
- Cables

The software running in the system generally includes the following components, all of which need to be reliable:

- Firmware embedded in the hardware (BIOS) to allow it to communicate with the operating system
- Operating systems, such as Windows™, Linux, etc.
- Programs used by administrators or maintenance stuff for performing control functions and data housekeeping
- Applications performing specific tasks or operations depending on the user
- Middleware programs supporting communication or data exchange

The processes needed to run the system will typically include:

- Power-up and system initialisation
- Network management and operation
- System monitoring
- Backup/restore and archiving
- User managements, including security
- System shutdown

When all relevant system components are identified, the following approaches can reduce the risks associated with critical components, i.e. those that are a single-point of failure for the system:

- Reduce frequency the system is not operational by looking for ways to prevent outage from happening to critical components
- Minimise the duration the system is not operational by trying to prevent outage from happening to critical components and reducing the number of critical components that may be affected by an outage
- Reduce the parts of the system that are potentially affected by an outage

System developers can quantitatively measure availability, by following certain approaches and at regular intervals calculating values for the degree of availability achieved, in order to set targets for improving the availability values.

An indicative calculation for quantitatively measuring availability is provided below:

- **Hours the system should be available in a month:** 24 hours per day x 7 days x 4.33 weeks per month (on average) ≈ 720 hours / month
- **Hours the system was down in a month:** Consider 5 hours due to corrective maintenance (e.g. correction of software defect), 3 hours due to perfective maintenance (e.g. hardware upgrade), 1 hour due to hard disk failure, totalling 9 hours of unavailability
- **Net availability:** ((720 – 9) / 720) * 100% = 98.75%
- **High availability:** 3 out of the 9 hours were due to perfective maintenance activities and only 6 hours (5 + 1) were due to failures. Therefore, high availability is ((720-6)/720)*100% = 99.16%

4.4.2 Performance Requirements

A system that can handle and respond promptly to any user request, can not only accelerate the eProcurement activities, but also assist users to better understand the different functionalities offered by the system.

Naturally, there may be activities which inevitably require significant time (e.g. uploading of documents). In such cases, system implementers need to ensure that users are informed of the progress of their requests, avoiding events such as users cancelling their activities or being unsure of the status of their actions.

Obviously the performance requirements of an eProcurement system are dependant on the envisaged number of users and Calls. System implementers need to plan for software/hardware scalability and establish systems which can achieve the predefined performance goals.

The following definitions are commonly used for measuring performance:

- **Simple Query:** a query accessing a single database table or a join of two tables
- **Complex Query:** a join of three or more database tables
- **Report:** a report ready to be printed, produced by PDF generation on the server, reporting tool plug-in or any other technology applicable
- **Document Management:** uploading, downloading and opening of a document to/from the document library of the system to the client workstation
- **Active User:** a user of the application performing constantly typical operations
- **Response Time:** the period of time from the moment the user initiates an action (e.g. by clicking on a button or a link) until the moment a Web-page with the requested information or update confirmation message is completely downloaded and displayed on the screen of the user. Response times can be effected by Internet latency, therefore response time is commonly tested in a Local Area Network (LAN) environment.

Example performance goals can be:

- 50 concurrent active users with maximum response time
- Up to 200 concurrent active users with 10% increase in maximum response time
- Maximum response times that return up to 200 result rows is X. For every additional 100 results, the maximum response time may increase for up to X seconds.

Maximum response times (in a LAN environment) can be:

(1) 90% of simple queries to have a maximum response time of 2 seconds.
(2) 99% of simple queries to have a maximum response time of 5 seconds.

(3) 95% of complex queries to have a maximum response time of 5 seconds
(4) 99% of complex queries to have a maximum response time of 10 seconds

(5) 95% of reports to be generated in less than 6 seconds.
(6) 99% of reports to be generated in less than 15 seconds.

(7) 95% of document management activities to have a maximum response time of 5 seconds
(8) 99% of document management activities to have a maximum response time of 8 seconds.

The response times for testing the performance of an eProcurement system must be measured in a database that has pre-loaded a considerable amount of data, simulating the performance of the system in real conditions. In addition, actual use of the system will have to be simulated including concurrent data uploads and downloads.

4.5 Security

Security mechanisms provide a secure communication interface, mainly for the exchange of documents between procurement authorities and Economic Operators. Standards constituting adequate and acceptable security need to be provided for the implementation of services during each stage of the procurement process. The required specifications need to be provided for ensuring adequate authentication, digital signature, non-repudiation, data integrity and encryption. Distribution and management of digital certificates, either directly from the different Contracting Authorities, or indirectly through outsourcing to accredited Certification Authorities need to be analysed and presented. The resulting analysis will provide the different Member States with the required certification standards, as well as, identify the PKI technology standards that all the public procurement components must comply with. This should ensure that public procurement components are PKI “enabled”, promoting interoperability.

The main objectives considered for the creation of a secure environment are the following:

- **Authentication**: guarantees that the service is only accessible to users with a verified identity.
- **Authorisation**: guarantees that authenticated users can only access services or data matching their role and access rights.
- **Confidentiality**: guarantees that the data exchanged between the person requesting it and the provider cannot be intercepted or accessed by a third non-authorised party.
- **Integrity**: guarantees that data exchanged between the person requesting it and the provider has not been modified or tampered with by a third non-authorised party.
- **Non-repudiation**: guarantees that the sender of the message cannot deny, at a later point in time, that s/he sent it.

These objectives can be achieved through:

- **Audit trailing facility**: allows system managers to monitor activities on the network of the eProcurement system. These include all activities performed by users, either successful of unsuccessful (such as attempted but failed logons). Audit trails need to be archived indefinitely in case security incidents or disputes need to be investigated (thus providing for non-repudiation).
- **Firewalls:** used as a hardware line of defence when connecting trusted networks to non-trusted networks, such as the LAN/Intranet of an organisation to the Internet. Firewalls are highly configurable. They can be set to allow or deny access to certain machines, IP addresses, network services, servers, protocols and port numbers in either direction.
- **Secure communication (data transfer) with the client (user or third party system/application):** as a Web-based application, one of the most vulnerable parts is the communication with its users or clients. The eProcurement system can provide a high level of security, such as HTTPS, avoiding any unauthorised access to sensitive information.
- **Encoding stored data:** since the eProcurement system deals with sensitive information, it is recommended to encrypt stored data in its various modules (database, LDAP or file system) via proven encryption algorithms (TripleDES, AES, BLOW FISH, etc.). Such a feature increases system security and protects data even in case that an unauthorised person has physical access to the hosting server(s). By applying this solution, it is not possible to read data that is stored on the eProcurement system without applying the appropriate decoding algorithms.
- **Digitally signed documents:** for the management of documents, the eProcurement system can consider all material that is transferred through the system. In this respect, e-mail messages, SMS messages, and Chat transcripts can be considered as documents. By incorporating a Certification Authority functionality, allowing the CA to operate as part of a Public Key Infrastructure (PKI), it is ensured that the user identity is certified, thus guaranteeing at the same time the non-repudiation of the documents.

4.5.1 Communication

A security framework based on the general principles (confidentiality, non-discrimination, non-repudiation, etc) supported by the PKI infrastructure can be implemented to support the needs of an eProcurement system. This security framework enables the management of Public Key certificates for identifying the user and for securing the communication between the users of the application and the servers that host the application environment (Web Server) and the corresponding business logic (Application Server) as shown in **Figure 4-1**.

Figure 4-1: A security communication framework for an eProcurement system

Database
File System

In **Figure 4-1**, Economic Operators and Procurement Officers communicate with the Web-server of the eProcurement system through the firewall. More specifically, "server certificates" can be used for supporting secure communication over an encrypted SSL session, between internet users (Economic Operators and Procurement Officers) and the Web Server of the eProcurement system. This certificate can either be obtained from a commercial certification service provider, or issued by an internal Certification Server of the PKI. The security provided can be based on server authentication and encryption of the documents exchanged over an SSL session. In addition, authenticated e-mails can be transmitted by the e-mail server to Procurement Officers and Economic Operators of the eProcurement system.

The Demilitarised Zone (DMZ) in **Figure 4-1** refers to the part of the network situated between two networks (the internal network and the Internet). It is neither part of the internal network nor directly part of the Internet.

In principal, the security framework implemented for supporting eProcurement can incorporate authentication mechanisms, user authorisation to restricted application services and resources (user roles and distinct access rights) and the security of the system on the storage level may be based on the local implementation of time–stamping operations, in order to implement a type of non-repudiation service.

4.5.2 Storage

During the analysis of the modules and services required for the provision of an adequate level of security, the following fundamental requirement was established:

For to ensure secure storage of documents and bids uploaded to the system, the documents shall not be accessible in a usable form until the start of the eAwarding phase.

Cryptographic keys (not including public keys) generated by the security module should not be stored in clear-text on the same host as the bid documents, in order to prevent unauthorised decryption by individuals with local access.

4.5.3 The “4-eyes Principle”

The new EU public procurement directives prescribe the application of the 4-eyes principle during the opening of Tenders, in order to ensure that the opening of Tenders is the result of the simultaneous actions of multiple users. The legislation does not impose a specific Tender opening procedure. Therefore, Contracting Authorities may model the four-eyes principles as it is deemed most appropriate according to their local legal requirements and internal administrative procedures.

When creating a new Call for Tenders, a number of procurement officers may be associated with the Call, and be responsible for opening the Tenders when the pre-specified time is reached. It should be possible to authorise the opening of Tenders only after the Tender opening time is reached (as specified at the creation of the Call), and only after the simultaneous action of two or more procurement officers.

4.5.4 Reporting, Logging and Monitoring

Monitoring of the entire electronic procurement procedure needs to be performed by the administrative personnel. This can be accomplished by analysing the system logs and statistics that the platform provides on a regular basis. All stages that are not currently traced and logged by the system, such as tender key administration and final awarding can be logged manually, in order to provide an integrated trace-log for the complete procedure. Moreover, reports and statistics can be generated based on these logs to be used for internal or external auditing.

Log files need to be generated throughout the user interaction with the eProcurement services and all log files should be viewed and examined only by authorised administrators. It should be possible to retrieve the log files by applying several search criteria, such as date ranges, number of log entries, etc.

It should be possible to use all criteria to automatically query the system log file entries (stored on the server) and to extract information on all actions performed by users. The auditing service needs to be enhanced during the eTendering implementation in order to comply with the legal requirements of the current EU legislation. Extensive auditing can be provided for every electronic procurement activity performed through the system (e.g. track tender uploading/downloading, versioning, approvals). Inspection of auditing logs can provide information to effectively detect attempts of intrusion, for example tampering with the tender documents by an authorised user after the submission deadline.

4.5.5 User profiling

An eProcurement system allows users to execute several different actions and to obtain access to various data. Due to the highly confidential nature of the data stored in such systems, all users need to have a unique user account, associated with a specific user role. User roles can form the required medium, mapping user accounts to access rights, defining which users can access what data, and what actions they can perform on that data. Through this method, system administrators are not required to define specific access rights for each user account. Instead, they can define the user roles of the system (i.e. Call for Tender administrators, Tender Opening Staff, Tender Evaluating Staff, etc.), with pre-defined access rights, and associate users to these roles.

The exact user roles defined in an eProcurement system depend on the complexity of the system, the size of the Contracting Authority, the number of system users, etc.

5 OVERVIEW OF TECHNICAL SPECIFICATIONS

The current section provides an overview of proposed technical specifications for the design of an eProcurement system capable of supporting the core functionalities required by the new legislation. It comprises a conceptual model and an associated schema and description, as well as, high-level Use Cases.

The conceptual model constitutes a set of abstract objects (i.e. concepts) and their relationships according to a technology-independent method, which can be used for modelling a system. The conceptual description, apart from offering further details for all conceptualised objects, also demonstrates the hierarchy of objects in an Object-Oriented implementation approach.

The high-level Use Case analysis presents the main actors of an eProcurement system, while the main functionalities for each actor are identified. In-depth analysis of the Use Cases presented is provided in the second volume of the report (FReq Volume II).

5.1 Conceptual Model

The conceptual model presented in **Figure 5-1** focuses on a possible implementation of the core business context of an eProcurement system. This model should not be considered as complete from a technical point of view, as new entities can be added to satisfy all specific functional requirements of an eProcurement system. It attempts to propose to interested parties software components/objects that can be defined, as well as, their static relationships, for implementing a fully integrated eProcurement system, capable to support all procedures/instruments discussed in chapter 2 of the current document.

The conceptual schema of **Figure 5-1** is described below in terms of the entities it comprises and the existing associations between these entities.

Table 4 - Description of Conceptual Schema Entities

Entity	Description
Economic Operator /Tenderer	A specialisation of a **User**
Procurement Officer	A specialisation of a **User**
Users	A generalisation of a **Procurement Officer** or Economic Operator/**Tenderer** (or other types of users). A **User** can take up certain **Roles** and belongs to a **Group** of Users with a common interest (e.g. Tenderers associated with a particular Call For Tenders)
Role	A **Role** is associated with one or more **Permissions** to perform **Operations** in the system (e.g. evaluating staff for received Tenders)
Permissions	A **Permission** is a collection of rights given to a particular **Group**, which alllows each group member to perform certain activities
Group	A certain number of **Users** with a common interest (e.g. Economic Operators/ Tenderers interested in a particular Call for Tenders) that have the same **Permissions** allowing them to perform certain **Operations** in the system (e.g. Evaluating Staff of a particular Call for Tenders can access/download Tenders received)
Call For Tenders	A virtual workspace for **Call for Tenders**
Individual Contract	A specialisation of a **Call for Tenders**
Framework Agreement	A specialisation of a **Call for Tenders** that also groups individual contracts and serves as a specification and container for those.
Dynamic Purchasing System	A specialisation of a **Call for Tenders** that also groups specific contracts and serves as a specification and container for those.
Phase	The different procedural phases associated with a **Call for Tenders** (e.g. eNotification)
Stage	The **different stages** of an eProcurement **Phase** (e.g. technical evaluation of Tenders within eAwarding **Phase**)
Documents	Any **Document(s)** related to a **Call For Tenders**
Operations	Any **Operation(s)** that can be performed by a **Group** of **Users**, involved in a particular **Call for Tenders** (e.g. unlock Tenders can be performed by Opening Staff of a particular Call for Tenders)

Main Associations:

- A ***User*** can take up one or more ***Roles***
- ***Roles*** are associated with certain ***Permissions***
- ***Users*** belong to a ***Group*** of Users with a common interest (e.g. Procurement Officers, Economic Operators/Tenderers)
- A ***Group*** has certain ***Permissions***
- A ***Group*** of Users with common interest (e.g. Procurement Officers, Economic Operators/Tenderers) performs certain ***Operations*** (e.g. Create a Call for Tenders, Submit a Call for Tenders)
- An ***Operation*** depends on the particular ***Call for Tenders*** (Phase and Stage of the Call for Tenders)
- A ***Call for Tenders*** is in/goes through a ***Phase*** of the procurement cycle (e.g. eNotification, eAwarding, etc.)
- An **Individual Contract** is considered a **Call for Tenders**
- A **Framework Agreement** is considered a **Call for Tenders**
- A **Dynamic Purchasing System** is considered a **Call for Tenders**
- A **Framework Agreement** includes **Individual Contracts**
- A **Dynamic Purchasing System** includes **Individual Contracts** (i.e. specific contracts)
- A ***Document*** (e.g. Contract Notice, Contract Documents) is related to a ***Call for Tenders***

5.2 High level Use Case model

This section provides a so-called “high-level Use Case Model” analysis, summarising the in-depth Use Case analysis presented in the Functional Requirements - Volume II. The purpose of this section is to present the main actors of the system, and the main functionality made available for each actor.

Use cases are a technique for capturing the functional requirements of a system, and describe the typical interaction between users and the system, or between system components, providing a narrative of how a system is used. The main actors of a Public eProcurement system are:

Table 5 - Main actors of a Public eProcurement system

Actor Type	Actor	Notes
Guest	Anonymous	The three types of anonymous users can perform the same actions in a Public eProcurement system. The functions of the “Economic Operator (not logged in)” and the “Procurement Officer (not logged in)” are identical to the Anonymous role
	Procurement Officers (not logged in)	
	Economic Operators (not logged in)	
Procurement Officers	Administrative staff	The main responsibilities of “Administrative staff” are: § creation/management of Calls for Tenders § establishment of DPS and FA § creation/management of specific contracts within DPS and FA § definition of eAuction parameters
	Opening staff	The Procurement Officers who perform the role of “Opening staff” are responsible for the opening (or unlocking) of Tenders for a Call or of a specific contract within a DPS or FA
	Evaluating staff	The main responsibilities of “Evaluating staff” are: § evaluation of Tenders for a Call § evaluation of Indicative Tender for a DPS § evaluation of Tenders for specific contracts in a DPS or FA § admitting Tenderers to a DPS § inviting tenderers to participate in eAuction § concluding Calls or specific contracts
Economic Operators/Tenderers	Economic Operators (logged in)	The main responsibilities of “Tenderers” are: § creating and submitting Tenders § creating and submitting Indicative Tenders § participating in eAuctions
System	System	The eProcurement system occasionally needs to automatically perform certain actions, triggered either by user activities, or by the system on a certain date/time

5.2.1 Guest

The *Guest* role is taken up by any non-authenticated user of the system. If a user does not have a user account with the system, or is not signed into the system, s/he is only given access to publicly available information. Furthermore, s/he is provided with limited functionalities which allow for searching running or past Calls for Tenders, as well as, the functionality to sign in or create a user account. The main functionality available to the *Guest* user of an eProcurement system should be:

- **Registration:** allows users to provide their personal information to the system and create a new user account
- **Sign in:** allows users that have user accounts with the system to provide their username and password and authenticate themselves, in order to use additional specific functionalities of the system depending on the user rights
- **Browse Notices/Call for Tenders:** allows users to provide search criteria, and view Notices/Calls for Tenders that match these criteria
- **Document/Notice Visualisation:** allows users to view the details of a document or Notice
- **Visualisation and posting of request for Additional Documents:** allows users to view the Additional Documents (questions and answers) for a particular Call for Tenders, or post requests for new Additional Documents (post a question)
- **Document Downloading:** allows users to download one or more documents
- **Browse for Specific Contracts within DPS/Simplified Contract Notices:** allows user to search through the specific contract within a DPS
- **Browse for Specific Contracts within FA:** allows users to search through the specific contract within a Framework Agreement

Anonymous users cannot define, participate or monitor the progress of an eAuction event.
There are not specific Use Cases for the this type of user for eAuctions

5.2.2 Procurement Officer - Administrative Staff

Users performing the role of *Procurement Officer Administrative staff* are responsible for the creation and management of Calls for Tenders. All their actions should be traceable in the system. The main functionalities available to the *Procurement Officer Administrative staff* user of an eProcurement system should be:

- **Sign out:** allows users authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually invoked by users after completion of their actions (e.g. create a Call for Tenders, or change the details of a Call) and prompts users to inform the system that they no longer need to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be automatically performed when the user closes his/her browser or when the user session is timed-out
- **Creation of a new Call for Tenders:** allows the user to create a new Call for Tenders
- **Administration of an existing Call for Tenders:** allows users to view the details of an existing Call for Tenders and to modify its details. It should not be possible to modify certain details of a Call, depending on the exact phase of the Call for Tenders and user access rights. For instance, when a Call is in the Tender Evaluation phase, the system does not allow users to modify the details of the Contract Documents
- **Preparation of the Awarding Criteria:** allows users to define the awarding criteria for the Call for Tenders. These criteria are used in the Tender Evaluation phase, when all received Tenders are evaluated

- **Drafting/Preparation/Publication of Notices:** allows users to create and publish a Prior Information Notice, Contract Notice or Contract Award Notice
- **Visualisation and Publication of Additional Documents:** allows users to view all published Additional Documents for a Call (i.e. questions and answers), as well as, to view new requests for Additional Documents. In addition, this functionality allows users to provide Additional Documents (i.e. give answers to posted questions)
- **Visualisation of Reports:** allows users to view reports related to a Call
- **Create a Specific Contract within a DPS:** allows users to create specific contracts within a DPS
- **Create a Specific Contract within a FA:** allows users to create specific contracts within a Framework Agreement
- **Establishing and fixing eAuction parameters:** allows users to parameterise and specify the exact operation of the eAuction device for an eAuction event

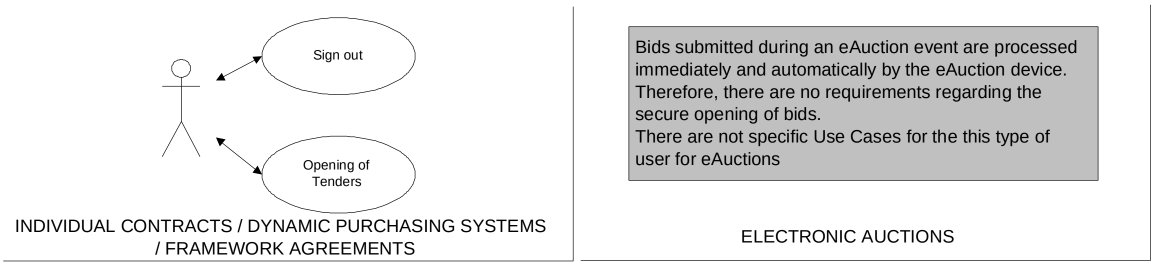
5.2.3 Procurement Officer - Opening Staff

Users performing the role of *Procurement Officer Opening staff* are responsible for the opening (or unlocking) of Tenders for a Call. The main functionalities available to the *Procurement Officer Opening staff* user could be:

- **Sign out:** allows users authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually performed by users after completion of their actions (e.g. accessing confidential details of a Call, or authorising the opening of Tenders) and prompts users to inform the system that they no longer need to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be performed automatically when the user closes his/her browser or when the user session is timed-out
- **Opening of Tenders:** allows users to authorise the opening of Tenders for a particular Call for Tenders, and to proceed to the opening of the tenders themselves These activities can only be performed once the pre-defined Tender opening time has been reached

Figure 5-4: Use Cases for the *Procurement Officer Opening Staff* User



Sign out
Opening of Tenders
INDIVIDUAL CONTRACTS / DYNAMIC PURCHASING SYSTEMS / FRAMEWORK AGREEMENTS
ELECTRONIC AUCTIONS

Bids submitted during an eAuction event are processed immediately and automatically by the eAuction device. Therefore, there are no requirements regarding the secure opening of bids.
There are not specific Use Cases for the this type of user for eAuctions

5.2.4 Procurement Officer - Evaluating Staff

Users performing the role of *Procurement Officer Evaluating staff* are responsible for the evaluation of Tenders for a Call, as well as, the conclusion of a competition by selection of the winner(s) and publication of the Contract Award Notice. The main functionalities available to the *Procurement Officer Evaluating staff* user of an eProcurement system should be:

- **Sign out:** allows users authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually performed by users after completion of their actions (e.g. accessing confidential details of a Call, or evaluating a particular Tender for a Call) and necessitates users to inform the system that they no longer require to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be performed automatically when the user closes his/her browser or when the user session is timed-out
- **Creation of short-listing:** allows users to select and invite Tenderers to participate in a particular Call for Tenders. This functionality is available only in the restricted procedure. Once the Expression of Interest submission period is complete, Procurement Officers access the supporting documentation of all Tenderers (i.e. proof documents), and evaluate their compliance with the Conditions for Participation. Following the evaluation, Procurement Officers create Tenderers short-listing, and conclude on the tenderers invited to submit a Tender. For the restricted procedure at least 5 Economic Operators must be selected

- **Evaluation and ranking of Tenders:** allows users to evaluate the Tenders received for a particular Call for Tenders, and to create Tender rankings. This functionality can only be performed once all Tenders are accessible to authorised officers. Users are required to provide scores for all evaluation criteria, before ranking the Tenders according to the pre-defined evaluation function
- **Drafting/Preparation/Publication of Notices:** allows users to create and publish a Prior Information Notice, Contract Notice or Contract Award Notice
- **Visualisation of Reports:** allows users to view reports related to a Call for Tenders
- **Admittance of Tenderers in a DPS:** allows users to admit into the DPS Tenderers that have submitted qualifying Indicative Tenders
- **Send eAuction invitation to tenderers:** allows users to specify the exact date/time for an eAuction event to start, to select the tenderers to invite to the event and to create an appropriate notification for the invitation to auction
- **Visualisation of eAuction event:** allows users to visualise the eAuction event, ensuring they can monitor the good operation of the eAuction device

5.2.5 Tenderer

The main functionalities available to the *Economic Operator or Tenderer* of an eProcurement system should be:

- **Sign out:** allows users authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually invoked by users after completion of their actions (e.g. submit a Tender for a Call, or view the details of an existing Tender) and necessitates users to signify to the system that they no longer require to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be automatically invoked when the user closes his/her browser or when the user session is timed-out
- **Request to Participate:** allows users to express their interest to participate in a Call for Tenders. This functionality is only available for Calls running under the restricted or negotiated procedure
- **Tender submission:** allows users to create and submit a Tender for a particular Call for Tenders. For Calls running under the open procedure, this functionality is available as soon as the Contract Notice is published, and until the Tender submission deadline (also referred to as Tender closing time). For Calls running under the restricted procedure, Tenders can be submitted by Economic Operators which have been invited by the Contracting Authority to submit a Tender (i.e. Economic Operators first need to submit an expression of interested, and only if they are invited by the Contracting Authority, they can submit a Tender)
- **Browse for Specific Contracts within DPS:** allows users to search specific contracts within a DPS
- **Browse for Specific Contracts within DPS:** allows users to search specific contracts within a FA
- **Enter eAuction room:** allows user to access the relevant virtual eAuction room in order to visualise and participate to the eAuction event
- **Bid submission:** allows users to create and submit a bid during an eAuction event

5.2.6 System

The eProcurement system occasionally needs to automatically perform certain actions, either triggered by user activities, or by the system on a certain date/time. The main functionalities performed by the *System* should be:

- **Audit Trailing/Logging:** all user activities and system events must be logged (i.e. recorded) to designated secure areas, which can assist in the regulatory reporting requirements of the legislation, as well as, the identification of infringements
- **Automatic Document Validation:** when Tenders submit a document, the system must perform certain validation checks, in order to ensure the documents compliance with the system specifications. For instance, if a system requires documents to be signed electronically before submitted, the document validation mechanism must ensure that all documents are signed, as well as, that the electronic signature of a document is valid
- **Locking of Tenders:** when Tenders are received for a given Call, the system must ensure that they remain locked and inaccessible until authorised personnel (opening staff) proceed to their opening, which can only be performed after the pre-defined Tender opening time
- **Automatic Activity Reminder (i.e. notification based on time events):** when time events take place (i.e. the time for unlocking Tenders for a Call is reached), the system must automatically inform the associated users
- **Automatic Notification of winners of a competition (i.e. notification based on user events):** when user events take place (i.e. conclusion of a Call for Tenders), the system must automatically or semi-automatically inform the associated users

- **eAuction opening:** when the pre-defined date/time is reached, the system must automatically open the eAuction event, inform the related users, and allow tenderers to submit bids
- **eAuction closing:** when the pre-defined conditions are met, the system must automatically close the eAuction event, inform the related users, and not allow tenderers to submit new bids
- **Score calculation:** when a new valid bid is submitted, the system must automatically apply the pre-defined score calculation formula, in order to calculate the score of the submitted bid, and subsequently rank all received bids accordingly

6 OPEN ISSUES RELATED TO PUBLIC EPROCUREMENT

In discussions that took place in several fora amongst Commission services, Member State IDA experts, public administrations, private companies and the contractor, several questions where identified regarding the EU public procurement legislation and the technical solutions possible for being used. Some of the questions raised constitute "open issues" that need to be further discussed, analysed, and/or researched, in order to provide state-of-the-art solutions to real problems encountered in implementing public eProcurement systems. The solution to some of these issues will depend on the implementation method chosen by national authorities.

This chapter summarises such "open issues" related to public eProcurement to stimulate discussion. They are classified under the following categories:

- Legislative aspects
- Technical aspects
- Business development aspects

6.1 Legislative aspects

"Open issues" related to legislative aspects of Public eProcurement comprise:

- Individual Contracts
  - How can appeal procedures be incorporated in the workflow? What are the legal requirements for appeals?
- Repetitive Purchases
  - What products/services/works can a contracting authority buy through a DPS? Can a CA establish a DPS covering a broad range of products/services/works or shall DPS be restricted to specific products/services/works?
  - How can a contracting authority better define the terms of a specific contract within a DPS or FA? Shall a Contracting Authority foresee all terms which will govern specific contracts when establishing the DPS or FA? DPS or FAs can last up to 4 years. What happens if during the creation of a specific contract inside a DPS or FA, the CA needs to update the initial terms, for instance due to technological developments.
  - How can a Contracting Authority establish evaluation criteria for a DPS or FA, which are also used for specific contracts within the DPS and FA?
- Electronic Auctions
  - What should happen in an eAuction event, when a tenderer submits a wrong bid (e.g. negative prices, abnormally low prices, etc.)? Can Contracting Authorities restrict the possible admitted values for a bid or it is the Tenderer's responsibility to submit correct bids?
  - What should happen in an eAuction event conducted in rounds, in case a bidder does not place a bid in one round?
  - Who is the winner of a competition if at the end of an eAuction event two or more bidders have placed the same bid?

6.2 Technical aspects

This section describes “Open issues” that are related to technical aspects for realising eProcurement systems compliant with the EU public procurement legislation. These comprise:

- Global issues related to all eProcurement procedures
  - What security architecture should Member States adopt, in order to ensure high security without violating the principle of interoperability? Are there minimum requirements guaranteeing the secure operation of an eProcurement system fully compliant with the EU legislation?
  - What systems can an eProcurement system be integrated with, and what benefits such integration can offer? Are there any workflows or is there a standard procedure to follow in order to perform eInvoicing?
  - How can an accreditation methodology/system be established, allowing existing eProcurement systems to be evaluated against the EU eProcurement legislation?
  - What XML standards should be adopted in order to ensure interoperability?
  - What exception procedures need to be followed by an eProcurement system and/or a Contracting Authority in case of system failures, document viruses, document illegible formats, unknown certification authorities, etc?
- Repetitive Purchases
  - How should eCatalogues be constructed and used? What is the definition of an eCatalogue? What standard for eCatalogues should be followed?
  - How can integration with supplier systems be achieved, preserving the equal treatment principle? SMEs may be disadvantaged if such an integration will be decided by a Contracting Authority. What is the acceptable investment an SME should be required to make for performing such integration?
- Electronic Auctions
  - What should happen if, during an eAuction event, a bidder loses his/her connection to the eAuction device? What are the recovery procedures that must be put in place and how the eAuction event is affected?
  - Should eAuction bids be signed before accepted by the eAuction device?
  - How can MEAT evaluation for eAuctions be performed? What are the rules for placing bids containing more than one field?

6.3 Business development aspects

“Open issues” related to the business development of eProcurement comprise:

- Economic Operators
  - How can suppliers be sensitised to and trained in the new Public eProcurement rules?
  - How can supplier adoption be achieved, preserving the equal treatment principle?
- Contracting Authorities
  - How can national-level systems be created/maintained at low cost, allowing a great number of different Contracting Authorities in a Member State to utilise them?

7 CONCLUSIONS

Adopted on 30 April 2004, the new EU public procurement directives should be transposed into national law by Member States by 31 of January 2006 at the latest. In this context, the present report identifies the different steps required to implement a fully integrated electronic Public Procurement system that would be compliant with the legal framework. It provides an analysis of the eProcurement procedures at different levels:

- transcription of the new directives into a comprehensive conceptual view
- detailed description of the main eProcurement procedures and phases in the form of information and activity flow diagrams
- deduction of functional requirements
- identification of potential technical implementations for the deduced functional requirements
- deduction of non-functional requirements
- description of a technical conceptual model, capable to support core eProcurement functionalities
- identification of main actors
- conclusion of Use Case analysis
- documentation of "open issues" related to Public eProcurement, as discussed in several public expert fora

The eProcurement analysis carried out in the present report is based exclusively on the regulatory framework established by the EU public procurement directives. Depending on national, regional and/or local legislation, a contracting authority may be required to consider additional functional and non-functional requirements for an eProcurement system.

The above analysis provides the ground for identifying alternative technical solutions available for the various eProcurement procedures, phases and steps. Description of these technical solutions is carried out at a functional level, while the advantages and disadvantages of each technical solution are also presented where appropriate.

The non-functional requirements discussed in the current report comprise requirements for usability, reliability, interoperability, scalability and security. The new EU procurement directives do not impose specific non-functional requirements, hence the non-functional requirements presented in this document should only be considered as guidelines.

The work carried out has revealed a number of critical decision points and alternative technical implementation scenarios, which contracting authorities should decide upon before implementing an eProcurement system. Such decisions may have an impact on several functional and non-functional aspects of a new eProcurement system. Some of these decision points, especially with regard to security and interoperability, are already being analysed at European level.

To further assist contracting authorities, standardisation bodies, and any other interested party to fully understand the new EU public eProcurement legislation, this report is further complemented by static and dynamic demonstrators, developed in the context of the same project, in order to simulate a fully functional eProcurement system, compliant with the EU legislation. Volume II of the report contains details for interested parties to access and experiment with these demonstrators. More information about the demonstrators can be found at the Internet address **http://europa.eu.int/idabc/eprocurement**. The demonstrators are also accessible at **http://delos.eurodyn.com/idaeproc/**.

These demonstrators cover the required functionality for individual contracts, framework agreements, DPS, and eAuctions. They aim to:

- provide a medium for experimentation and review of the required eProcurement workflows
- trigger discussion on the directions and technical approaches to follow for the implementation of eProcurement systems, in line with underlying eProcurement legislative aspects
- train procurement officers and economic operators on the functionalities required by the current directives

The analysis presented in the current report can provide the basis for administrations or vendors developing eProcurement systems, in full compliance with the new directives. It is envisaged that this analysis should result in a more focused development of software and, possibly, savings for administrations, since they will be in position to describe more accurately to contractors the desired functionality, rather than being forced to accept and customise generic solutions offered by existing commercial eProcurement systems.

On the technical implementation level, the analysis has shown that technology is not a restrictive factor, as a wide selection of alternative technical solutions is available for the implementation of different functional requirements. Therefore, the key aspect for administrations is to model appropriately the eProcurement procedures they need to automate and make decisions on the technical solutions to implement, by applying their specific requirements. This will allow administrations to select solutions more appropriate to their existing infrastructure, available budget, specifications, and the scope of their eProcurement project.

Most eProcurement procedures can been viewed as extensions or minor alterations to the open procedure as many steps of different eProcurement procedures can be implemented through the same mechanisms (e.g. implementation of official publication, submission of tenders, opening of tenders, etc.). This can result in considerable cost savings via re-utilisation of software modules.

FUNCTIONAL REQUIREMENTS FOR CONDUCTING ELECTRONIC PUBLIC PROCUREMENT UNDER THE EU FRAMEWORK

VOLUME II

JANUARY 2005

Produced by EUROPEAN DYNAMICS S.A.

1 INTRODUCTION

This document constitutes Volume II of the Functional Requirements (FReq) report, discussing technical aspects related to the design and implementation of eProcurement systems. The current document includes information deduced from the conclusions of all three development iterations of the IDA Public eProcurement project, encompassing the completion of all static and dynamic Demonstrators for Individual Contracts, Repetitive Purchases and eAuctions.

The following chapters present a Use Case analysis for an eProcurement system supporting the procurement of Individual Contracts and Repetitive Purchases, as well as, eAuctions as an extension to other procedures. Furthermore, the last chapter presents detailed steps interested parties may follow in order to experiment with the Dynamic Demonstrators, developed in the context of the current project.

2 USE CASE ANALYSIS FOR INDIVIDUAL CONTRACTS

This section presents the main actors and functionality of an eProcurement system supporting the procurement of Individual Contracts.

The main actors of a Public eProcurement system supporting Individual Contracts are:

Table 2-1 - Main actors of a Public eProcurement system

Actor Type	Actor	Notes
Guest	Anonymous	The three types of guest users can perform the same actions in a Public eProcurement system. Therefore, the functions of the "Economic Operator (not logged in)" and the "Procurement Officer (not logged in)" are identical to the Anonymous role
	Procurement Officers (not logged in)	
	Economic Operators (not logged in)	
Procurement Officers	Administrative staff	Procurement Officers which perform the role of "Administrative staff" are responsible for the creation and management of Calls for Tenders
	Opening staff	Procurement Officers which perform the role of "Opening staff" are responsible for the opening (or unlocking) of Tenders for a Call
	Evaluating staff	Procurement Officers which perform the role of "Evaluating staff" are responsible for the evaluation of Tenders for a Call, as well as, the conclusion of a competition by selecting the winner(s) and publication of the Contract Award Notice
Tenderers	Economic Operators (logged in)	For a Call for Tenders under the open procedure, the Tenderer can create and submit a Tender. For a restricted or negotiated procedure competition, the Tenderer must first submit his/her Expression of Interest and following invitation form the Contracting Authority, he/she can submit a Tender
System	System	The eProcurement system occasionally needs to automatically perform certain actions either triggered by user activities, or by the system on certain date/time

2.1 Guest

The role *Guest* is assumed by any non-authenticated user of the system. If a user does not have a user account with the system, or is not signed in the system, he/she is only given access to publicly available information. Furthermore, he/she is provided with limited functionality which allows for searching existing or concluded Calls for Tenders, as well as, the functionality to sign in or create a user account. The main functionality available to the *Guest* user of an eProcurement system should be:

- **Registration:** allows users to provide their personal information to the system and create a new user account
- **Sign in:** allows users that have user accounts with the system to provide their username and password and authenticate, in order to use functionality of the system depending on the user rights
- **Browse Notices/Call for Tenders:** allows users to provide search criteria, and view Notices/Call for Tenders that match these criteria
- **Document/Notice Visualisation:** allows users to view the details of a document or Notice for a Call for Tenders
- **Visualisation and posting of request for Additional Documents:** allows users to view the Additional Documents (questions and answers) for a particular Call for Tenders, or post requests for new Additional Documents (post a question)
- **Document Downloading:** allows user to download one or more documents

Figure 2-1: Use Cases for the *Guest User* for a system supporting Individual Contracts

Document/Notice Visualisation

2.1.1 Registration

REGISTRATION	
Version:	1
Context:	Allows user to register to the system and create a user account
Priority:	High
Frequency:	Often
Primary Actor:	Guest
Preconditions:	User does not have a user account with the system
Basic Flow:	1. User visits the registration page of the application and supplies all requested information 2. System validates the supplied information (email, mandatory fields, existence of same username), records the action in the audit trail, automatically signs in the user and displays an appropriate confirmation message
Alternative Flow:	2a. If not all mandatory fields are completed: 2a1. System redirects to the registration page 2a2. System highlights all registration fields that have not been filled in correctly 2b. If the requested username is already used: 2b1. System redirects to the registration page 2b2. System informs user of the failure through an appropriate message, and proposes alternative usernames
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.1.2 Sign in

SIGN IN	
Version:	1
Context:	Allows user to identify himself to the system
Priority:	High
Frequency:	Very Often
Primary Actor:	Guest
Preconditions:	User has not authenticated with the system
Basic Flow:	1. User visits the login page of the application and supplies his credentials (username and password) 2. System validates user credentials, records the action in the audit trail, and displays the an appropriate confirmation message or allows user to perform activities that only a signed in user can (based on his user access rights)
Alternative Flow:	2a. If a non-authenticated user attempts to directly access an application page, for instance by clicking on a URL embedded in an email communication: 2a1. System redirects to the login page 2a2. User fills in the username and password 2a3. Upon validation of credentials system redirects to the original requested URL 2b. If user credentials are wrong: 2b1. System re-displays the login page with the appropriate error message requesting the user to supply again his credentials
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.1.3 Browse Notices/Call for Tenders

BROWSE NOTICES/CALL FOR TENDERS	
Version:	1
Context:	Allows user to search through published Calls for Tenders
Priority:	High
Frequency:	Very Often
Primary Actor:	Guest
Preconditions:	None
Basic Flow:	1. User visits the search page of the application and supplies his preferred search criteria 2. System executes a database query, based on user’s search criteria, and displays the results of the query
Alternative Flow:	2a. If the query does return any records that match user’s search criteria: 2a1. An appropriate message is displayed to the user 2b. If the query returns too many records: 2b1. User is requested to provide more “tight” criteria
Special Requirements:	None
Unresolved Issues:	None

2.1.4 Document/Notice Visualisation

DOCUMENT/NOTICE VISUALISATION	
Version:	1
Context:	Allows user to view the Contract Documents and Contract Notice of a Call
Priority:	High
Frequency:	Very Often
Primary Actor:	Guest
Preconditions:	None
Basic Flow:	1. User visits the details page of a Call, and requests to view the Contract Documents and/or Contract Notice of the Call 2. System displays requested documents
Alternative Flow:	2a. If the Contract Documents and/or Contract Notice are in the form of files: 2a1. System displays all files which comprise the Contract Documents and/or Contract Notice 2a2. User selects the files to download (and visualise on his desktop) 2b. If the system does not support the creation of Contract Notices (i.e. takes place in an external form filling system): 2b1. System provides link to user in order to interconnect with OJEU and visualise the Contract Notice on that system
Special Requirements:	None
Unresolved Issues:	None

2.1.5 Visualisation and posting of request for Additional Documents (i.e. posting questions)

VISUALISATION AND POSTING OF REQUEST OF ADDITIONAL DOCUMENTS	
Version:	1
Context:	Allows user to view the Additional Documents of a Call (i.e. questions and answers). Also user can post his own requests for Additional Documents (i.e. post a question)
Priority:	High
Frequency:	Very Often
Primary Actor:	Guest
Preconditions:	None
Basic Flow:	1. User visits the details page of a Call, and requests to view the Additional Documents 2. User accesses the page for submitting a request for Additional Documents 3. User signs in or supplies a minimum number of personal details (i.e. email, name, company) and submits a request for Additional Documents
Alternative Flow:	3a. If user sign in fails: 3a1. section 2.1.2 3b. If the validation of minimum number of personal details fails (i.e. email already exists in system, or is not a valid address): 3b1. User is redirected on previous page, where an appropriate error message informs him of the reason for the failure of the request
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.1.6 Document Downloading

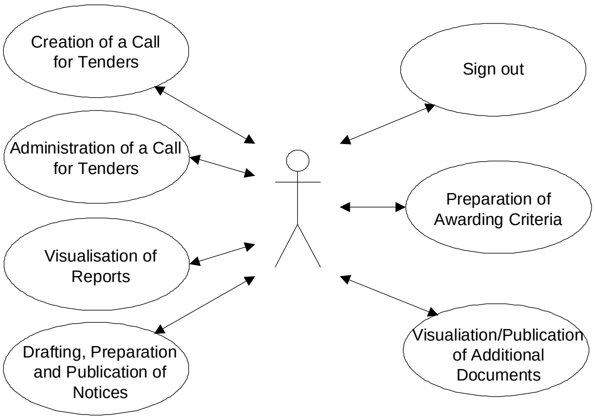
DOCUMENT DOWNLOADING	
Version:	1
Context:	Allows user to download documents (i.e. Contract Documents, Contract Notices, Additional Documents, etc.)
Priority:	High
Frequency:	Very Often
Primary Actor:	Guest
Preconditions:	None
Basic Flow:	1. User views a list of files comprising the documents of a Call 2. User selects one or more documents and requests to download them 3. System initiates the downloading process and informs user on progress
Alternative Flow:	3a. If user interrupts downloading process before completion: 3a1. System cancels the downloading request
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.2 Procurement Officer – Administrative Staff

Users performing the role of *Procurement Officer Administrative staff* are responsible for the creation and management of Calls for Tenders. The main functionality available to the *Procurement Officer Administrative staff* user of an eProcurement system should be:

- **Sign out:** allows users that are authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually invoked by users when they have completed all actions they wished to, which necessitate for the user to be authenticated (like create a Call for Tenders, or change the details of a Call) and want to signify to the system that they no longer need to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be automatically invoked when user closes his/her browser or when the user session is timed-out
- **Creation of a new Call for Tenders:** allows user to create a new Call for Tenders
- **Administration of an existing Call for Tenders:** allows user to view the details of an existing Call for Tenders and modify its details. Some Call details should not be possible to be modified, according to the exact phase of the Call. For instance, when a Call is in the Tender Evaluation phase, the system does not allow users to modify the awarding criteria
- **Preparation of the Awarding Criteria:** allows users to define the awarding criteria for the Call for Tenders. These criteria are used in the Tender Evaluation phase, when all received Tenders are evaluated according to the pre-stated criteria
- **Drafting/Preparation/Publication of Notices:** allows users to create and publish a Prior Information Notice, Contract Notice, Contract Award Notice, etc
- **Visualisation and Publication of Additional Documents:** allows users to view all published Additional Documents for a Call (i.e. questions and answers), as well as, view new requests for Additional Documents. Also, this functionality allows users to provide Additional Documents (i.e. give answers to posted questions)
- **Visualisation of Reports:** allows users to view reports related to a Call

Figure 2-2: Use Cases for the *Procurement Officer Administrative User* for a system supporting Individual Contracts



Creation of a Call for Tenders
Sign out
Administration of a Call for Tenders
Preparation of Awarding Criteria
Visualisation of Reports
Drafting, Preparation and Publication of Notices
Visualiation/Publication of Additional Documents

2.2.1 Sign out

SIGN OUT	
Version:	1
Context:	Allows user to sign out of the system
Priority:	High
Frequency:	Very Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system
Basic Flow:	1. User initiates the sign out process 2. System signs out user, and displays an appropriate message or displays the homepage of the *Guest* user
Alternative Flow:	2a. If user closes Web browser or does not perform any activities on the system for a certain period of time: 2a1. System uses a time limit of inactivity. If the session of a certain user is idle for longer than the predefined time limit, system automatically signs the user out.
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.2.2 Creation of a new Call for Tenders

CREATION OF A NEW CALL FOR TENDERS	
Version:	1
Context:	Allows user to create the necessary workspace and provide all information for a new Call for Tenders
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system
Basic Flow:	1. User requests the creation of the necessary workspace for a new Call for Tenders 2. User supplies the basic information for the creation of the Call (i.e. title, CPV/NUTS codes, type of contract, estimated value, procedure type, opening/closing dates, etc.) 3. User submits request 4. System validates all supplied information and on acceptance creates the Call
Alternative Flow:	4a. If user does not provide valid information for all mandatory fields: 4a1. System redirects to the Call creation page 4a2. System highlights all mandatory fields that have not been filled in correctly
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.2.3 Administration of an existing Call for Tenders

ADMINISTRATION OF AN EXISTING CALL FOR TENDERS	
Version:	1
Context:	Allows the User to administer an existing Call for Tenders
Priority:	High
Frequency:	Very Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system
Basic Flow:	1. User updates the basic information of a Call of Tenders 2. User performs various Call administrative activities like associating Procurement Officers to a Call, uploading Contract Documents, providing Additional Documents, etc. 3. User submits updates 4. System validates all supplier information and on acceptance updates the Call
Alternative Flow:	4a. If user does not provide valid information to all mandatory fields: 4a1. System redirects to the page for updating the Call 4a2. System highlights all mandatory fields that have not been filled in correctly
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.2.4 Preparation of the Awarding Criteria

PREPARATION OF THE AWARDING CRITERIA	
Version:	1
Context:	Allows user to define all parameters for automatically ranking all Tenders (when the evaluation of Tenders phase will take place)
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system
Basic Flow:	1. User accesses the page for defining the evaluation method 2. User defines the Conditions for Participation 3. User defines the Selection Criteria (only in case of restricted or negotiated procedure) 4. User specifies whether contract is to be awarded to the lowest price or MEAT 5. In case of MEAT, user specifies whether weighted criteria will be used, or whether the criteria will be defined in descending order of importance 6. In case of weighted criteria, user defines the criteria and their weights 7. User submits the evaluation method and system validates all information
Alternative Flow:	7a. When using weighted criteria, system must ensure that the sum of all criteria weights is 100. If the sum is different to 100: 7a1. System redirects to the user to the criteria and weights definition page, and displays an appropriate message to the user
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.2.5 Drafting/Preparation/Publication of Notices

DRAFTING/PREPARATION/PUBLICATION OF NOTICES	
Version:	1
Context:	Allows user to create notices
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system
Basic Flow:	1. User accesses page which allows the creation of Notices (can be PIN, Contract Notice, Contract Award Notice) 2. User supplies all necessary information and submits it to OJEU 3. System generates appropriate XML message, which is securely sent to OJEU 4. System receives confirmation or rejection from OJEU
Alternative Flow:	1a. The eProcurement system can integrate to an external form filling system, which can be used for creating and publishing Notices on OJEU. If that is the case: 1a1. On request, eProcurement system automatically redirects user to the external form filling system 1a2. eProcurement system sends to the external form filling system all already defined information related to the Call 1a3. User is provided with the functionality to fill in the empty fields of the forms displayed by the form filling system, and submit the Notice to OJEU 4a. If OJEU rejects a Notice: 4a1. System displays appropriate message to user 4a2. System allows user to access the page for creating Notices, for correcting the incorrect information
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.2.6 Visualisation and Publication of Additional Documents (i.e. answering to questions)

VISUALISATION AND PUBLICATION OF ADDITION DOCUMENTS	
Version:	1
Context:	Allows user to view existing Additional Documents (i.e. existing questions and answers), as well as, provide new Additional Documents based on submitted requests (i.e. provide new answers)
Priority:	High
Frequency:	Very Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system
Basic Flow:	1. User accesses the Additional Documents of a Call (i.e. accesses the questions and answers section of a Call) 2. User accesses the details of an Additional Document (i.e. view the details of a question) 3. User views the requests for new Additional Documents (i.e. view new questions) 4. User supplies the new Additional Documents based on existing requests (i.e. provide an answer to a new question)
Alternative Flow:	None
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.2.7 Visualisation of reports

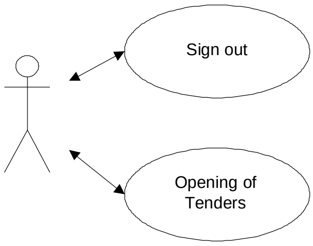
VISUALISATION OF REPORTS	
Version:	1
Context:	Allows user to view the reports of a competition
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system
Basic Flow:	1. User requests from system to create a report (i.e. contract award report, score justification report, winner report, etc.) 2. System generates a report
Alternative Flow:	None
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	None

2.3 Procurement Officer – Opening Staff

Users performing the role of *Procurement Officer Opening staff* are responsible for the opening (or unlocking) of Tenders for a Call. The main functionality available to the *Procurement Officer Opening staff* user of an eProcurement system should be:

- **Sign out:** allows users that are authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually invoked by users when they have completed all actions they wished to, which necessitate for the user to be authenticated (like access confidential details of a Call, or authorise the opening of Tenders for a Call) and want to signify to the system that they no longer need to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be automatically invoked when user closes his/her browser or when the user session is timed-out
- **Opening of Tenders:** allows users to authorise the opening of Tenders for a particular Call. This activity can only be performed once the pre-defined Tender opening time has been reached

Figure 2-3: Use Cases for the *Procurement Officer Opening Staff User* for a system supporting Individual Contracts



2.3.1 Sign out

The Use Case of this action of the current user is similar to the Use Case presented in section 2.2.1.

2.3.2 Opening of Tenders

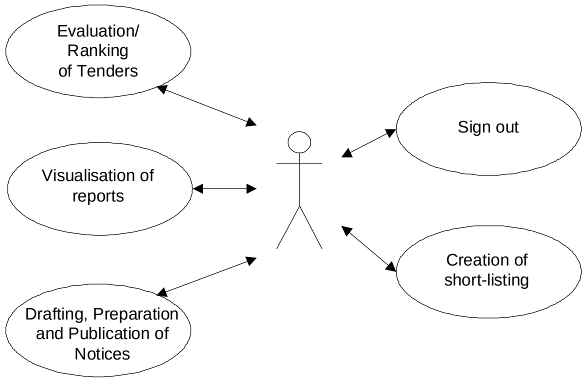
	OPENING OF TENDERS
Version:	1
Context:	Allows user to authorise the opening (unlocking) of Tenders
Priority:	High
Frequency:	Very Often
Primary Actor:	Procurement Officer – Opening Staff
Preconditions:	User is signed in the system.
Basic Flow:	1. User accesses the page which allows user to authorise the opening of Tenders within a pre-specific time limit 2. User submits his approval for opening Tenders 3. System checks whether the minimum number of Opening Staff users have authorised the opening of Tenders. If the minimum number is reached, the Tenders are unlocked, otherwise they remain locked 4. System displays a confirmation page to the user
Alternative Flow:	1a. If the minimum number of Officers has already authorised the opening of Tenders before the user submits his approval: 1a1. System simply displays that Tenders are already unlocked 1b. If the user has already approved the opening of Tenders: 1b1. System does not allow user to re-approve the opening of Tenders 1c. If the pre-specified time limit is expired: 1c1. System does not allow the opening of Tenders 1c2. Tender Administrative staff must access the Call and schedule another time for such activity (reports and other administrative activities may need to take place first)
Special Requirements:	None
Unresolved Issues:	None

2.4 Procurement Officer – Evaluating Staff

Users performing the role of *Procurement Officer Evaluating staff* are responsible for the evaluation of Tenders for a Call, as well as, the conclusion of a competition by selecting the winner(s) and publication of the Contract Award Notice. The main functionality available to the *Procurement Officer Evaluating staff* user of an eProcurement system should be:

- **Sign out:** allows users that are authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually invoked by users when they have completed all actions they wished to, which necessitate for the user to be authenticated (like access confidential details of a Call, or evaluate a particular Tender for a Call) and want to signify to the system that they no longer need to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be automatically invoked when user closes his/her browser or when the user session is timed-out
- **Creation of short-listing:** allows users to select Tenderers to invite for participating in a particular Call for Tenders. This functionality is available only in the restricted and negotiated procedures. Once the Expression of Interest submission period is complete, Procurement Officers access the supporting documentation of all Tenderers (i.e. proof documents), and evaluate their compliance with the Conditions for Participation. Following the evaluation, Procurement Officers create Tenderers short-listing, and conclude on the tenderers to be invited to submit a Tender. For the restricted procedure at least 5 Economic Operators must be selected, while for the negotiated procedure at least 3 Economic Operators are required
- **Evaluation and ranking of Tenders:** allows users to evaluate the received Tenders for a particular Call, and create Tender rankings. This functionality can only be performed once all Tenders are made accessible by authorised officers. Users are required to provide scores to all evaluation criteria, before ranking the Tenders according to the evaluation function
- **Drafting/Preparation/Publication of Notices:** allows users to create and publish a Prior Information Notice, Contract Notice, Contract Award Notice, etc
- **Visualisation of Reports:** allows users to view reports related to a Call

Figure 2-4: Use Cases for the *Procurement Officer Evaluating Staff User* for a system supporting Individual Contracts



2.4.1 Sign out

The Use Case of this action of the current user is similar to the Use Case presented in section 2.2.1.

2.4.2 Creation of Short-listing

Creation of Short-listing	
Version:	1
Context:	Allows user to short-list Tenderers (only applicable for the restricted and negotiated procedures)
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Evaluating Staff
Preconditions:	User is signed in the system.
Basic Flow:	1. User accesses the proof documents and is given the opportunity to evaluate all Tenderers according to the Conditions for Participation and Selection criteria (see Use Case 2.2.4) 2. System ensures that there is a value for each criterion for all Tenderers 3. System automatically disqualifies candidates that do not meet the Conditions for Participation 4. System automatically ranks candidates according to the selection criteria
Alternative Flow:	None
Special Requirements:	None
Unresolved Issues:	None

2.4.3 Evaluation and ranking of Tenders

EVALUATION AND RANKING OF TENDERS	
Version:	1
Context:	Allows user to evaluate and rank all Tenders
Priority:	High
Frequency:	Very Often
Primary Actor:	Procurement Officer – Evaluating Staff
Preconditions:	User is signed in the system.
Basic Flow:	1. User accesses the technical offers of all Tenders and is given the opportunity to evaluate them according to the technical criteria (see Use Case 2.2.4) 2. System ensure that there is a value for each technical criterion for all Tenderers 3. User accesses the financial offers of all Tenders and is given the opportunity to evaluate them according to the financial criteria (see Use Case 2.2.4) 4. System ensure that there is a value for each financial criterion for all Tenderers 5. System automatically ranks Tenders according to the evaluation function of criteria scores and weights (C1xW1 + C2xW2 + … + CnxWn)
Alternative Flow:	1a. If the evaluation of Tenders is based on the lowest price 1a1. User provides the price of each Tender 1a2. System sorts Tenders in ascending order of their price 5a. If the evaluation of Tenders is based on MEAT with criteria stated on descending order of importance: 5a1. System compares the most important criterion of all Tenders 5a2. If there is a Tender with the higher score than the others, that Tender is ranked first 5a3. If two or more Tenders have the same score, the next more important criterion is compared, to conclude which Tender is ranked higher
Special Requirements:	None
Unresolved Issues:	None

2.4.4 Drafting/Preparation/Publication of Notices

The Use Case of this action of the current user is similar to the Use Case presented in section 2.2.5.

2.4.5 Visualisation of Reports

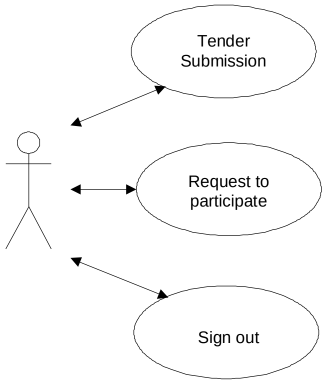
The Use Case of this action of the current user is similar to the Use Case presented in section 2.2.7.

2.5 Tenderer

For Calls for Tenders under the Open Procedure, *Tenderers* or *Economic Operators* are responsible for creating and submitting a Tender. For a Restricted or Negotiated Procedure competition, the *Tenderers* or *Economic Operators* first submit their Expression of Interest and following invitation by the Contracting Authority, they can submit a Tender. The main functionality available to the *Economic Operator* or *Tenderer* of an eProcurement system should be:

- **Sign out:** allows users that are authenticated by the system (i.e. signed in), to sign out of the system. This operation is usually invoked by users when they have completed all actions they wished to, which necessitate for the user to be authenticated (like submit a Tender for a Call, or view the details of an existing Tender) and want to signify to the system that they no longer need to act as authenticated users (i.e. return to the access rights of a Guest User). This operation can also be automatically invoked when user closes his/her browser or when the user session is timed-out
- **Request to Participate:** allows users to express their interest to participate to a Call for Tenders. This functionality is only available for Calls running under the restricted or negotiated procedure
- **Tender submission:** allows users to create and submit a Tender for a particular Call. For Calls running under the open procedure, this functionality is available as soon as the Contract Notice is dispatched to the OJEU, and until the Tender submission deadline (also referred to as Tender closing time). For Calls running under the restricted or negotiated procedure, Tenders can be submitted only be Economic Operators which have been invited by the Contracting Authority to submit a Tender (i.e. Economic Operators first need to submit expression of interested, and only once they are invited by the Contracting Authority, they can submit a Tender)

Figure 2-5: Use Cases for the *Tenderer* for a system supporting Individual Contracts



2.5.1 Sign out

The Use Case of the Sign out action of the current user, is similar to the Use Case presented in section 2.2.1.

2.5.2 Request to participate

	REQUEST TO PARTICIPATE
Version:	1
Context:	Allows user to express interest to a Call (only for the restricted and negotiated procedure)
Priority:	High
Frequency:	Often
Primary Actor:	Tenderer
Preconditions:	User is signed in the system.
Basic Flow:	1. User accesses the details of a Call 2. User uploads all required proof documents (i.e. comprise documents for meeting the Conditions for Participation and for Pre-Qualification selection) 3. Tenderer digitally signs proof documents (optional) 4. User submits his expression of interest
Alternative Flow:	None
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates). When uploading documents, a document validation mechanism checks the validity of the Tender (see section 2.6.2)
Unresolved Issues:	None

2.5.3 Tender submission

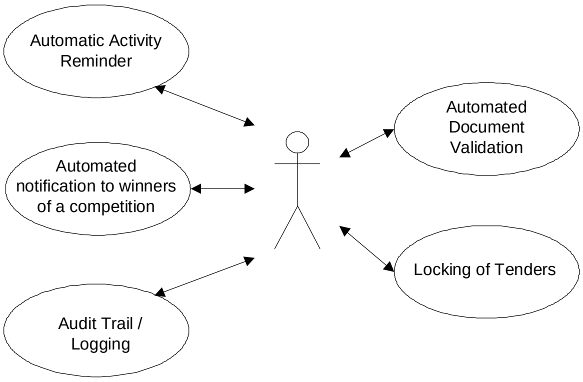
TENDER SUBMISSION	
Version:	1
Context:	Allows user to submit a Tender
Priority:	High
Frequency:	Very Often
Primary Actor:	Tenderer
Preconditions:	User is signed in the system. In case of restricted and negotiated procedures, Tenderer must be invited to submit a Tender
Basic Flow:	1. User accesses the details of a Call 2. User uploads his Tender comprised by his technical and financial offer 3. Tenderer digitally signs Tender documents (optional) 4. User submits his Tender
Alternative Flow:	None
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates). When uploading documents, a document validation mechanism checks the validity of the Tender (see section 2.6.2)
Unresolved Issues:	None

2.6 System

The eProcurement system occasionally needs to automatically perform certain actions, either triggered by user activities or by the system on certain date/time. The main functionality performed by the *System* should be:

- **Audit Trailing/Logging:** all user activities and system events must be logged (i.e. recorded) to designated secure areas, which can assist in the regulatory reporting requirements of the legislation, as well as, the identification of infringements
- **Automatic Document Validation:** when Tenders submit a document, the system must perform certain validation checks, in order to ensure the documents compliance with the system specifications. For instance, if a system requires documents to be signed electronically before submitted, the document validation mechanism must ensure that all documents are signed, as well as, the electronic signature of a document is valid
- **Locking of Tenders:** when Tenders for a Call are received, the system must ensure that they remained locked and inaccessible until appointed personnel (opening staff) authorise their opening, which can only be performed after the pre-defined Tender opening time
- **Automatic Activity Reminder (i.e. notification based on time events):** when time events take place (i.e. the time for unlocking Tenders for a Call is reached), the system must automatically inform the associated users
- **Automatic Notification to winners of a competition (i.e. notification based on user events):** when user evens take place (i.e. conclusion of a Call for Tenders), the system must automatically inform the associated users

Figure 2-6: Use Cases for the *System* for a system supporting Individual Contracts



Automatic Activity Reminder
Automated Document Validation
Automated notification to winners of a competition
Locking of Tenders
Audit Trail / Logging

2.6.1 Audit Trailing/Logging

AUDIT TRAILING/LOGGING	
Version:	1
Context:	Records every user and system activity
Priority:	High
Frequency:	Very Often
Primary Actor:	System
Preconditions:	None
Basic Flow:	1. System tracks every user events, and every system events triggered by time 2. System records all activities in secure system logs
Alternative Flow:	None
Special Requirements:	System logs are accessible only by authorised personnel, who can create activity reports and produce statistical analysis based on the logs
Unresolved Issues:	None

2.6.2 Automatic Document Validation

AUTOMATIC DOCUMENT VALIDATION	
Version:	1
Context:	Verifies the validity of submitted documents, comprising the proof documents or Tender of a Tenderer
Priority:	High
Frequency:	Very Often
Primary Actor:	System
Preconditions:	None
Basic Flow:	1. System performs documents virus check 2. System performs document corruption check 3. System checks that document is digitally signed (if digital signatures are used) 4. System verifies the validity of the digital signature of the Tenderer against the Certificate Authority' revocation list (if digital signatures are used) 5. System encrypts document
Alternative Flow:	5a. If the document validation fails: 5a1. System automatically sends appropriate notification to user 5a2. System displays appropriate error message to user 5a3. System rejects the document submission of the Tenderer
Special Requirements:	All communication in this Use Case should be carried-out in encrypted mode. Furthermore, the system should guarantee the integrity of the data as well as the identity of both the client and the server. This shall take place outside the application (SSL-based with both client and server certificates).
Unresolved Issues:	The system implementers must realise an interoperable method for the document validation mechanism, especially when performing the digital signature verification (step 4). A non-interoperable method may unjustifiably reject valid Tenders.

2.6.3 Locking of Tenders

LOCKING OF TENDERS	
Version:	1
Context:	Locks received Tenders until their pre-specified opening time is reached, and the Opening Staff authorise their opening
Priority:	High
Frequency:	Often
Primary Actor:	System
Preconditions:	None
Basic Flow:	1. As soon as a Tender is received, it is encoded and stored in a safe area of the system. No user can gain access to the Tender 2. Unlock Tender according to Use Case of section 2.3.2
Alternative Flow:	None
Special Requirements:	None
Unresolved Issues:	None

2.6.4 Automatic Activity Reminder

AUTOMATIC ACTIVITY REMINDER	
Version:	1
Context:	System automatically sends notifications to users for pending critical events they need to perform, when certain deadlines are reached
Priority:	High
Frequency:	Very Often
Primary Actor:	System
Preconditions:	None
Basic Flow:	1. System automatically creates deadline for sending notifications to users (i.e. set deadline of when notifications need to be sent for reminding users to unlock Tenders within a pre-specified time frame) 2. When deadline is reached, system sends notifications to interested users
Alternative Flow:	None
Special Requirements:	All communications for notifications are based on asynchronous means (i.e. email, SMS, etc.). Security considerations needs to be taken into account when realising the automated notifications systems
Unresolved Issues:	None

2.6.5 Notification to winners of a competition

NOTIFICATION TO WINNERS OF A COMPETITION	
Version:	1
Context:	System automatically or semi-automatically sends notifications to winners of a competition
Priority:	High
Frequency:	Very Often
Primary Actor:	System
Preconditions:	None
Basic Flow:	1. System sends notifications to interested users
Alternative Flow:	None
Special Requirements:	All communications for notifications are based on asynchronous means (i.e. email, SMS, etc.). Security considerations needs to be taken into account when realising the notifications systems
Unresolved Issues:	None

3 USE CASE ANALYSIS FOR DYNAMIC PURCHASING SYSTEMS

This section presents the Use Cases for an eProcurement system capable to support Dynamic Purchasing Systems (DPS). Such a system can be viewed as an extension to an eProcurement system supporting Individual Contracts; hence the Use Cases presented in this section are complementary to the ones presented for Individual Contracts.

The main actors of a Public eProcurement system supporting a DPS are:

Table 3-1 - Main actors of a Public eProcurement system

Actor Type	Actor	Notes
Guest	Anonymous Procurement Officers (not logged in) Economic Operators (not logged in)	The three types of guest users can perform the same actions in a Public eProcurement system. Therefore, the functions of the "Economic Operator (not logged in)" and the "Procurement Officer (not logged in)" are identical to the Anonymous role
Procurement Officers	Administrative staff	Procurement Officers which perform the role of "Administrative staff" are responsible for the creation and management of a DPS and specific contracts within it
	Opening staff	Procurement Officers which perform the role of "Opening staff" are responsible for the opening (or unlocking) of Indicative Tenders for a DPS and Tenders for Specific Contracts within a DPS
	Evaluating staff	Procurement Officers which perform the role of "Evaluating staff" are responsible for the evaluation of Indicative Tenders and Tenders. They are also responsible for admitting tenderers in a DPS, rejecting tenderers from a DPS, and conclude specific contracts within it
Tenderers	Economic Operators (logged in)	To establish a DPS, the Tenderer is responsible to create and submit an Indicative Tender. For a specific contract within the DPS, the Tenderer can create and submit a Tender.
System	System	The eProcurement system occasionally needs to automatically perform certain actions either triggered by user activities, or by the system on certain date/time

3.1 Guest

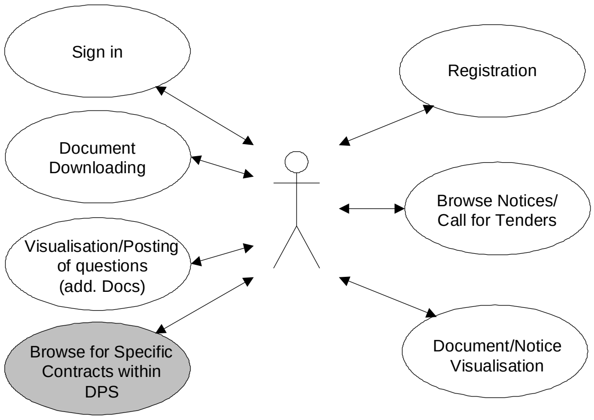
The role *Guest* is assumed by any non-authenticated user of the system. The following Use Cases detailed in the Individual Contracts section are also applicable for DPS:

- Register
- Sign-in
- Browse Notices/Call for Tenders (i.e. Calls for DPS)
- Visualise Documents/Notices
- Visualise of / request for Additional Documents
- Download documents

The following Use Case is also required for DPS:

- Browse for Specific Contract within DPS/Simplified Contract Notice

Figure 3-1: Use Cases for *Guest User* for a system supporting DPS



Sign in
Registration
Document Downloading
Browse Notices/ Call for Tenders
Visualisation/Posting of questions (add. Docs)
Browse for Specific Contracts within DPS
Document/Notice Visualisation

3.1.1 Browse for Specific Contracts within DPS/Simplified Contract Notices

BROWSE FOR SPECIFIC CONTRACT WITHIN DPS/SIMPLIFIED CONTRACT NOTICE	
Version:	1
Context:	Allows user to search through published Specific Contract within a DPS
Priority:	High
Frequency:	Very Often
Primary Actor:	Guest
Preconditions:	None
Basic Flow:	1. User visits the search page of the application and enters preferred search criteria 2. System executes a database query, based on user’s search criteria, and displays the results of the query, including the details of Specific Contracts within the DPS defined in the system
Alternative Flow:	2a. If the query does return any records that match user’s search criteria: 2a1. An appropriate message is displayed to the user 2b. If the query returns too many records: 2b1. User is requested to provide more “narrow” criteria
Special Requirements:	None
Unresolved Issues:	None

3.2 Procurement Officer – Administrative Staff

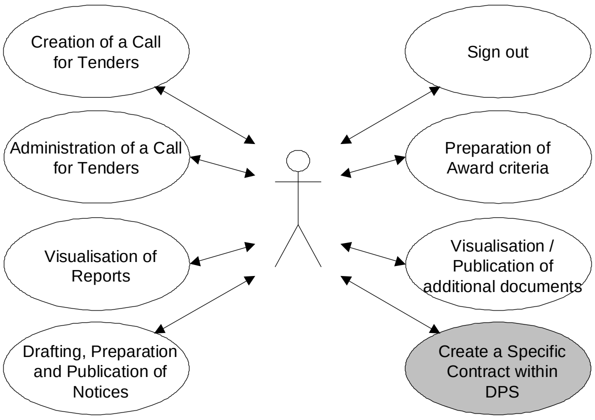
Users performing the role of *Procurement Officer Administrative staff* are responsible for the creation and management of Calls for Tenders (i.e. establishing DPS), as well as, Specific Contracts within DPS. Similarly to the Individual Contracts, the following Use cases are applicable for *Procurement Officer Administrative staff* for a DPS system:

- Sign-out
- Create new Call for Tenders (for establishing a DPS)
- Administer an existing Call for Tenders (for establishing a DPS)
- Prepare Awarding Criteria (for the DPS and its Specific Contracts)
- Draft/Prepare/Publish Notices (for establishing a DPS)
- Visualise and publish Additional Documents (for the DPS)
- Visualise reports (for the DPS)

Additionally, the following Use Case is also required for DPS:

- Create a Specific Contract within a DPS

Figure 3-2: Use Cases for the *Procurement Officer Administrative User* for a system supporting DPS



Creation of a Call for Tenders
Sign out
Administration of a Call for Tenders
Preparation of Award criteria
Visualisation of Reports
Visualisation / Publication of additional documents
Drafting, Preparation and Publication of Notices
Create a Specific Contract within DPS

3.2.1 Create a Specific Contract within a DPS

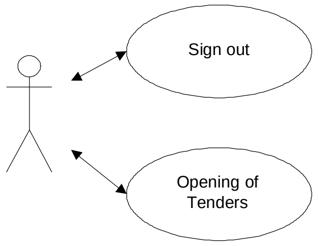
CREATE SPECIFIC CONTRACT WITHIN A DPS	
Version:	1
Context:	Allows user to create a Specific Contract within a DPS
Priority:	High
Frequency:	Very Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system There is at least one published DPS
Basic Flow:	1. User accesses the details of an existing published DPS 2. User specifies the information for the Specific Contract (i.e. title, CPV/NUTS codes, estimated value, opening/closing dates, etc) 3. User uploads Contract Documents for the Specific Contract if necessary (to better define requirements) 4. User publishes simplified Contract Notice
Alternative Flow:	2a. User enters CPV/NUTS codes which are not a subset of the CPV/NUTS codes of the DPS: 2a1. An appropriate message is displayed to the user
Special Requirements:	The award criteria of the DPS must be also applied as award criteria for the Specific Contract within the DPS
Unresolved Issues:	None

3.3 Procurement Officer – Opening Staff

Users performing the role of *Procurement Officer Opening staff* are responsible for the opening (or unlocking) of Indicative Tenders for entering a DPS, as well as Tenders for Specific Contracts within a DPS. The main functionality available to the *Procurement Officer Opening staff* user is identical to those for Individual Contracts:

- Sign out
- Opening of Tenders

Figure 3-3: Use Cases for the *Procurement Officer Opening Staff User* for a system supporting DPS



3.4 Procurement Officer – Evaluating Staff

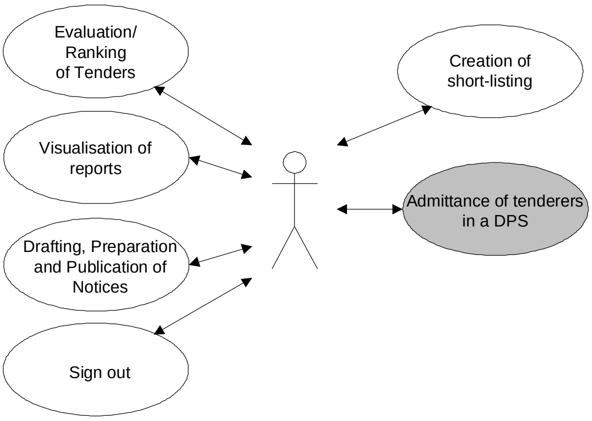
Users performing the role of *Procurement Officer Evaluating staff* are responsible for:

- Evaluation of Indicative Tenders
- Admittance of Tenderers in a DPS
- Evaluation of Tenders for a Specific Contract
- Conclusion of Specific Contract

All above responsibilities, with exception to the following two can be accommodated by the system using the "Evaluation and ranking of Tenders" Use Case, described in Individual Contracts. Only the following two responsibilities require new Use Cases, for being electronically supported by an eProcurement system:

- Admittance of Tenderers in a DPS
- Exclusion of Tenderers from a DPS

Figure 3-4: Use Cases for the *Procurement Officer Evaluating Staff User* for a system supporting DPS



Evaluation/
Ranking
of Tenders

Drafting, Preparation
and Publication of
Notices
Sign out

3.4.1 Admittance of Tenderers in a DPS

Admittance of Tenderers in a DPS	
Version:	1
Context:	Following evaluation of Indicative Tenders, this Use Case allows users to admit Tenderers in a DPS
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Evaluating Staff
Preconditions:	User is signed in the system There is at least one published DPS The evaluation of Indicative Tenders is completed
Basic Flow:	1. User selects the Tenderers to be admitted into the DPS 2. User submits to the system the list of Tenderers to be admitted in the DPS 3. System makes the selected Tenderers part of the DPS 4. System automatically or semi-automatically dispatches notification message to successful Tenderers
Alternative Flow:	None
Special Requirements:	None
Unresolved Issues:	None

3.5 Tenderer

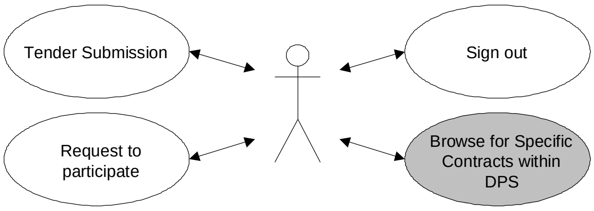
For Calls for Tenders under the DPS, *Tenderers* or *Economic Operators* are responsible for submitting Indicative Tenders (in order to be admitted into the DPS) and submitting Tenders for Specific Contracts within a DPS. The following Use Cases for *Tenderers* presented for Individual Contracts are also applicable in the case of DPS:

- Sign out
- Tender submission

Additionally, the following Use Case is required for implementing a system supporting DPS:

- Browse for Specific Contracts within DPS

Figure 3-5: Use Cases for the *Tenderer* for a system supporting DPS



Tender Submission
Sign out
Request to participate
Browse for Specific Contracts within DPS

3.5.1 Browse for Specific Contracts within DPS

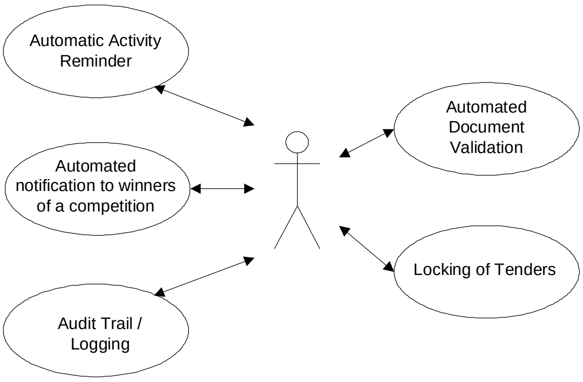
BROWSE FOR SPECIFIC CONTRACT WITHIN DPS	
Version:	1
Context:	Allows user to search through published Specific Contract within DPS
Priority:	High
Frequency:	Very Often
Primary Actor:	Tenderer
Preconditions:	None
Basic Flow:	1. User visits the search page of the application and supplies his preferred search criteria 2. System returns all DPS, as well as, the Specific Contracts within all DPS which satisfy the search criteria 3. User views details of a DPS 4. User views details of a Specific Contract within DPS 5. User submits Indicative Tender for being admitted in the DPS
Alternative Flow:	5a. Tenderer already admitted in the DPS 5a1. User submits Tender for Specific Contract
Special Requirements:	None
Unresolved Issues:	None

3.6 System

The eProcurement system occasionally needs to automatically perform certain actions, either triggered by user activities, or by the system on certain date/time. The main functionality performed by the *System* is the same as those presented for Individual Contracts:

- Audit Trailing/Logging
- Automatic Document Validation
- Locking of Tenders
- Automatic Activity Reminder
- Notification to winners of a competition

Figure 3-6: Use Cases for the *System* for a system supporting DPS



Automatic Activity Reminder
Automated Document Validation
Automated notification to winners of a competition
Locking of Tenders
Audit Trail / Logging

4 USE CASE ANALYSIS FOR FRAMEWORK AGREEMENTS

This section presents the Use Cases for an eProcurement system capable to support Framework Agreements (FA). Similarly to DPS, such system can be viewed as an extension to an eProcurement system supporting Individual Contracts; hence the Use Cases presented in this section are complementary to the ones presented for Individual Contracts.

The main actors of a Public eProcurement system supporting Framework Agreements are:

Table 4-1: Main actors of a Public eProcurement system

Actor Type	Actor	Notes
Guest	Anonymous Procurement Officers (not logged in) Economic Operators (not logged in)	The three types of guest users can perform the same actions in a Public eProcurement system. Therefore, the functions of the "Economic Operator (not logged in)" and the "Procurement Officer (not logged in)" are identical to the Anonymous role
Procurement Officers	Administrative staff	Procurement Officers which perform the role of "Administrative staff" are responsible for the establishment of Framework Agreements and specific contracts within it
	Opening staff	Procurement Officers which perform the role of "Opening staff" are responsible for the opening (or unlocking) of Tenders for the establishment of a Framework Agreement and of Tenders for specific contracts within it
	Evaluating staff	Procurement Officers which perform the role of "Evaluating staff" are responsible for the evaluation of Tenders for the establishment of a Framework Agreement and of Tenders for specific contracts within it.
Tenderers	Economic Operators (logged in)	To establish a Framework Agreement, the Tenderer is responsible to create and submit a Tender. For a specific contract within the DPS, the Tenderer can create and submit a Tender.
System	System	The eProcurement system occasionally needs to automatically perform certain actions either triggered by user activities, or by the system on certain date/time

4.1 Guest

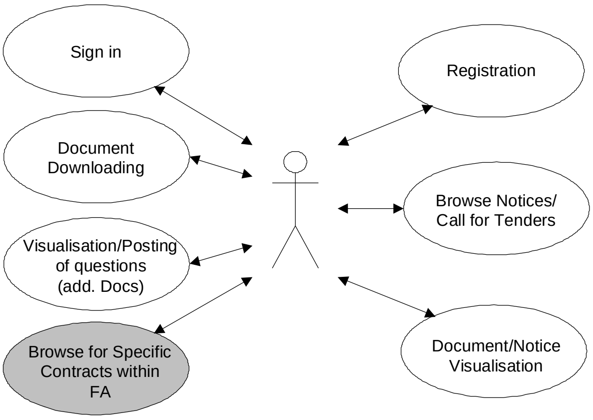
The role *Guest* is assumed by any non-authenticated user of the system. The following User Cases details in the Individual Contracts section are also applicable for FA:

- Register
- Sign-in
- Browse Notices/Call for Tenders (i.e. Calls for FAs)
- Visualise Documents/Notices
- Visualise Additional Documents
- Request for Additional Documents
- Download documents

The following Use Case is also required for FA:

- Browse for Specific Contract within FA

Figure 4-1: Use Cases for *Guest User* for a system supporting FA



Sign in
Registration
Document Downloading
Browse Notices/ Call for Tenders
Visualisation/Posting of questions (add. Docs)
Browse for Specific Contracts within FA
Document/Notice Visualisation

.

4.1.1 Browse for Specific Contracts within FA

BROWSE FOR SPECIFIC CONTRACT WITHIN FA	
Version:	1
Context:	Allows user to search through published Specific Contract within FA
Priority:	High
Frequency:	Very Often
Primary Actor:	Guest
Preconditions:	None
Basic Flow:	1. User visits the search page of the application and enters preferred search criteria 2. System returns all FA that satisfy the search criteria.
Alternative Flow:	None
Special Requirements:	The system should return Specific Contracts within an FA only if the user is a member of the FA. In the current Use Case the user is non-authenticated, so even if the user is a Tenderer who belongs to the FA, s/he is still not authenticated by the system, and therefore is not presented with its Specific Contracts
Unresolved Issues:	None

4.2 Procurement Officer – Administrative Staff

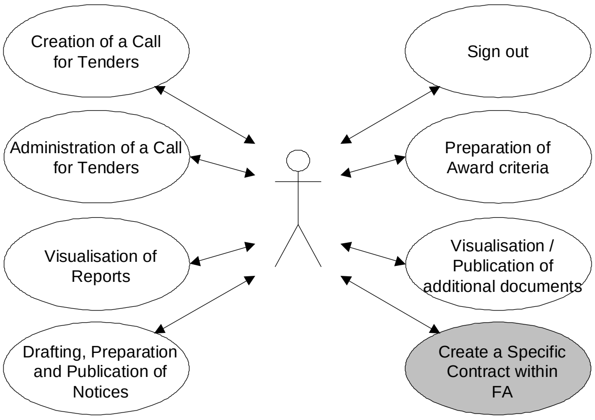
Users performing the role of *Procurement Officer Administrative staff* are responsible for the creation and management of Calls for Tenders (i.e. establishing FA), as well as, Specific Contracts within FA. Similarly to the Individual Contracts, such user may:

- Sign-out
- Create new Call for Tenders (for establishing a FA)
- Administer an existing Call for Tenders (for establishing a FA)
- Prepare Awarding Criteria (for the FA and its Specific Contracts)
- Draft/Prepare/Publish Notices (for establishing FA)
- Visualise and publish Additional Documents (for the FA)
- Visualise reports (for the FA)

The following Use Case is also required for FA:

- Create a Specific Contract within a FA

Figure 4-2: Use Cases for the *Procurement Officer Administrative User* for a system supporting FA



Creation of a Call for Tenders
Sign out
Administration of a Call for Tenders
Preparation of Award criteria
Visualisation of Reports
Visualisation / Publication of additional documents
Drafting, Preparation and Publication of Notices
Create a Specific Contract within FA

4.2.1 Create a Specific Contract within a FA

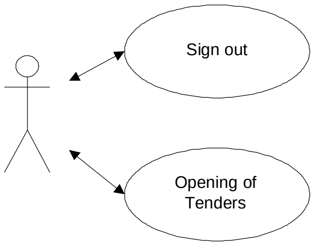
CREATE SPECIFIC CONTRACT WITHIN A FA	
Version:	1
Context:	Allows user to create a Specific Contract within a FA
Priority:	High
Frequency:	Very Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system There is one concluded FA
Basic Flow:	1. User accesses the details of a concluded FA 2. User initiates procedure for creating Specific Contract 3. a) If FA is established with a single operator, user places order with that operator b) If FA is established with multiple operators, user selects whether Specific Contract is “within terms” of the FA, or whether “re-opening competition” will be used
Alternative Flow:	3b. Multiple operators – Specific contract within terms of FA 3b1. User places an order with the “best” operator 3b. Multiple operators – Re-open competition 3b1. User uploads contract documents for Specific Contract 3b2. User invites all operators participating in the FA to submit a Tender for the Specific Contract
Special Requirements:	In case of a Specific Contract with single operator, or a Specific Contract with multiple operators “within terms” of the FA, the award criteria of the FA must also be applied as award criteria for the Specific Contract. In case of a Specific Contract with multiple operators, using “re-opening competition”, the award criteria may be refined.
Unresolved Issues:	None

4.3 Procurement Officer – Opening Staff

Users performing the role of *Procurement Officer Opening staff* are responsible for the opening (or unlocking) of Tenders for a Call (i.e. FA), as well as, opening Tenders for Specific Contracts within a FA, following the "re-open competition". The main functionality available to the *Procurement Officer Opening staff* user is identical to those for Individual Contracts:

- Sign out
- Opening of Tenders

Figure 4-3: Use Cases for the *Procurement Officer Opening Staff User* for a system supporting FA



Sign out
Opening of Tenders

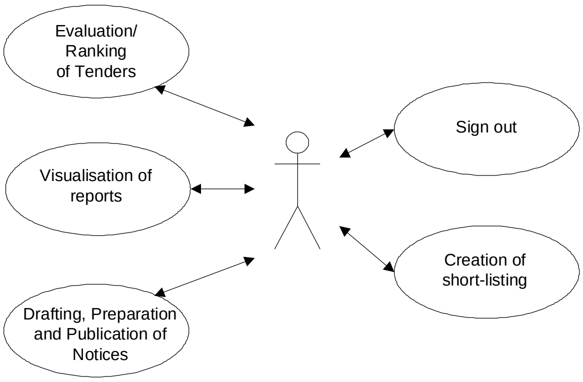
4.4 Procurement Officer – Evaluating Staff

Users performing the role of *Procurement Officer Evaluating staff* are responsible for:

- Evaluation of Tender
- Conclusion of a FA
- Evaluation of Tenders for a Specific Contract
- Conclusion of a Specific Contract

All above responsibilities can be accommodated by the system using the "Evaluation and ranking of Tenders" Use Case, described in Individual Contracts.

Figure 4-4: Use Cases for the *Procurement Officer Evaluating Staff User* for a system supporting FA



Evaluation/ Ranking of Tenders
Sign out
Visualisation of reports
Creation of short-listing
Drafting, Preparation and Publication of Notices

4.5 Tenderer

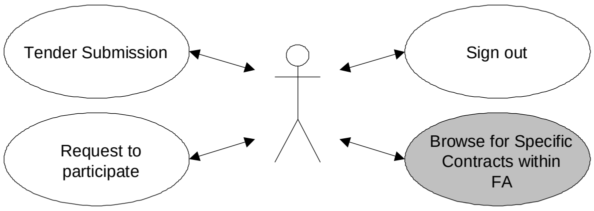
For Calls for Tenders under the FA, *Tenderers* or *Economic Operators* are responsible for submitting Tenders (in order to be included into the FA) and creating/submitting a Tender for Specific Contracts within a FA. The following Use Cases for *Tenderers* presented for Individual Contracts are also applicable in the case of FA:

- Sign out
- Tender submission

Additionally, the following Use Case is required for implementing a system supporting FA:

- Browse for Specific Contract within FA

Figure 4-5: Use Cases for the *Tenderer* for a system supporting FA



Tender Submission
Sign out
Request to participate
Browse for Specific Contracts within FA

4.5.1 Browse for Specific Contracts within FA

BROWSE FOR SPECIFIC CONTRACT WITHIN FA	
Version:	1
Context:	Allows user to search through published Specific Contract within FA
Priority:	High
Frequency:	Very Often
Primary Actor:	Tenderer
Preconditions:	None
Basic Flow:	1. User visits the search page of the application and enters preferred search criteria 2. System returns all FA 3. User views details of a FA 4. User views details of a Specific Contract within FA
Alternative Flow:	4a. User is single operator in FA 4a1. User views all Specific Contracts within FA 4b. User is one of many operators in FA 4b1.User views all Specific Contracts for which "re-opened" competition was used. Also, user views all Specific Contracts for which the Contracting Authority placed an order directly with that User (using the "within terms" method) 4a. User is not member of FA 4a1.User does not view Specific Contracts within FA
Special Requirements:	None
Unresolved Issues:	None

4.6 System

The eProcurement system occasionally needs to automatically perform certain actions, either triggered by user activities, or by the system on certain date/time. The main functionality performed by the *System* is the same as those presented for Individual Contracts:

- Audit Trailing/Logging
- Automatic Document Validation
- Locking of Tenders
- Automatic Activity Reminder
- Notification to winners of a competition

Figure 4-6: Use Cases for the *System* for a system supporting FA

5 USE CASE ANALYSIS FOR ELECTRONIC AUCTIONS

This section presents the main actors and functionality of an eProcurement system supporting the procurement of contracts utilising eAuctions as an extension to the chosen procedure.

The main actors of a Public eProcurement system that supports eAuctions are:

Table 5-1 - Main actors of a Public eProcurement system

Actor Type	Actor	Notes
Procurement Officers	Administrative staff	The Procurement Officers which perform the role of “Administrative staff” are responsible for definition and fixing of eAuction parameters
	Evaluating staff	The Procurement Officers which perform the role of “Evaluating staff” are responsible for the evaluation of Tenders for a Call, the invitation of tenderers to eAuctions, as well as, the conclusion of a competition by selecting the winner(s) and publication of the Contract Award Notice
Tenderers	Economic Operators (logged in)	For eAuction, tenderers are the parties that supply bids to the system, in order to improve aspects of their tenders submitted during the full initial evaluation
System	System	The eProcurement system for eAuction (referred to as the Auction device) is responsible for the automated opening and closing of the eAuction event, as well as, the automated calculation of scores and ranking of tenderers during the eAuction event

5.1 Procurement Officer – Administrative Staff

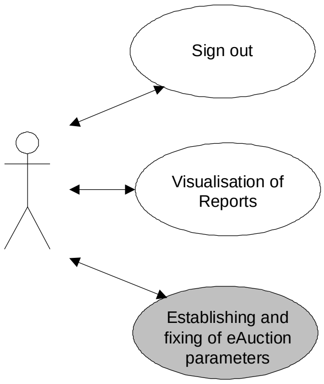
For eAuctions, *Procurement Officers – Administrative Staff* are responsible for establishing and fixing the eAuction parameters prior to the commencement of the eAuction event. The following Use Cases for *Administrative Staff* presented for Individual Contracts are also applicable in the case of eAuctions:

- Sign out
- Visualisation of Reports

Additionally, the following Use Case is required for implementing an eProcurement system supporting electronic auctions:

- Establishing and fixing eAuction parameters

Figure 5-1: Use Cases for the *Procurement Officer – Administrative Staff* for a system supporting electronic auctions



5.1.1 Establishing and fixing eAuction parameters

ESTABLISHING AND FIXING EAUCTION PARAMETERS	
Version:	1
Context:	Allows user to parameterise the eAuction device in order to run the required eAuction event
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Administrative Staff
Preconditions:	User is signed in the system. The evaluation mechanism for the Full Initial Evaluation is defined (lowest price or most economically advantageous tender)
Basic Flow:	1. User specifies whether the eAuction will run in rounds or time, and specifies all requested time periods 2. User defines (in case of lowest price evaluation mechanism): a. Currency b. Starting price c. Minimum difference between bids 3. Specify visibility options for information to be made available to tenderers and procurement officers 4. Specify any other parameterisation options (depending on the exact functionality of the eAuction device)
Alternative Flow:	2a. User defines (in case of most economically advantageous tender evaluation mechanism): 2a1. which of the criteria specified for the full initial evaluation are quantifiable 2a2. minimum and maximum value for each quantifiable criterion 2a3. the weight to be used for the bid score calculation 2a4. for each criterion whether a large value (i.e. close to the maximum value) constitutes a good bid or not
Special Requirements:	None
Unresolved Issues:	None

5.2 Procurement Officer – Evaluating Staff

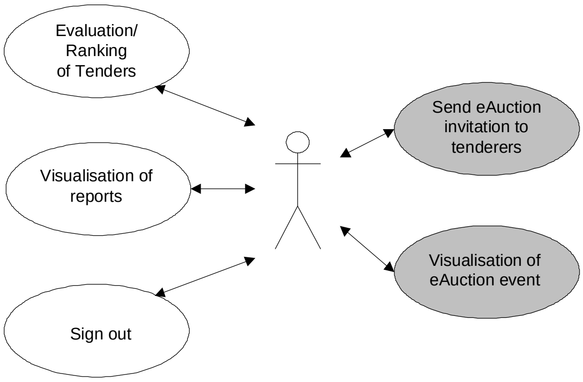
For eAuctions, *Procurement Officers – Evaluating Staff* are responsible for conducting the full initial evaluation (using Use Case "Evaluation and ranking of Tenders" of the Individual Contracts), and inviting tenderers to participate in an eAuction event. Additionally, they are responsible for the conclusion of a competition using electronic auctions. The following Use Cases for *Evaluating Staff* presented for Individual Contracts are also applicable in the case of eAuctions:

- Sign out
- Evaluation and ranking of Tenders
- Visualisation of Reports

Additionally, the following Use Cases are required for implementing an eProcurement system supporting electronic auctions:

- Send eAuction invitation to tenderers
- Visualisation of eAuction event

Figure 5-2: Use Cases for the *Procurement Officer – Evaluating Staff* for a system supporting electronic auctions



Evaluation/
Ranking

reports
Visualisation of
eAuction event
Sign out

5.2.1 Send eAuction invitation to tenderers

SEND EAUCTION INVITATION TO TENDERERS	
Version:	1
Context:	Allows user to invite tenderers to participate in eAuction
Priority:	High
Frequency:	Often
Primary Actor:	Procurement Officer – Evaluating Staff
Preconditions:	User is signed in the system. The Full Initial Evaluation is performed and the tenders are ranked accordingly
Basic Flow:	1. User selects the tenderers to invite to the eAuction 2. User defines the exact date/time to start the eAuction 3. User writes the message to be send to the tenderers, to invite them to the eAuction event 4. User uploads/attaches documents to be sent to the tenderers, to explain how the eAuction event will run, all related terms/conditions, all technical requirements for the connection/participation to the eAuction and any other important information
Alternative Flow:	None
Special Requirements:	The date/time for the beginning of the eAuction should allow sufficient time for tenderers to review the details of the eAuction and understand how the event will run
Unresolved Issues:	None

5.2.2 Visualisation of eAuction event

VISUALISATION OF EAUCTION EVENT	
Version:	1
Context:	Allows user to visualise the eAuction event
Priority:	Medium
Frequency:	Often
Primary Actor:	Procurement Officer – Evaluating Staff
Preconditions:	User is signed in the system. The Full Initial Evaluation is completed and the invitations to participate in the eAuction event are sent to the selected tenderers.
Basic Flow:	1. User access the eAuction room 2. The eAuction room displays to the user relevant information about the eAuction event, including best bid, tenderer ranking, time/rounds remaining for the closure of the eAuction, etc.
Alternative Flow:	None
Special Requirements:	The tenderer identities are not disclosed to procurement officers during the eAuction event. The identities can only be disclosed after the eAuction event is complete. The whole operation of the eAuction is fully automated and there is no manual intervention by procurement officers
Unresolved Issues:	None

5.3 Tenderer

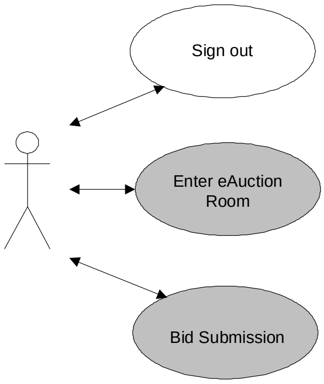
For eAuctions, *Tenderers* are responsible for entering the eAuction room and participating in eAuction events by placing bids. The following Use Case for *Tenderers* presented for Individual Contracts is also applicable in the case of eAuctions:

- Sign out

Additionally, the following Use Cases are required for implementing an eProcurement system supporting electronic auctions:

- Enter eAuction Room
- Bid Submission

Figure 5-3: Use Cases for the *Tenderer* for a system supporting electronic auctions



5.3.1 Enter eAuction Room

ENTER EAUCTION ROOM	
Version:	1
Context:	Allows user to accept the invitation to participate in an eAuction event
Priority:	Medium
Frequency:	Often
Primary Actor:	Tenderer
Preconditions:	User is signed in the system and is invited to participate in an eAuction event.
Basic Flow:	1. User accesses the relevant page for accessing the eAuction room 2. eAuction device registers that the tenderer has accepted the invitation to participate in eAuction
Alternative Flow:	None
Special Requirements:	Depending on the exact specifications of the eAuction device and the requirements of the contracting authority, a tenderer may be able to accept the invitation to participate in an eAuction event only before the beginning of the eAuction.
Unresolved Issues:	None

5.3.2 Bid Submission

BID SUBMISSION	
Version:	1
Context:	Allows users to submit a bid during the eAuction event
Priority:	High
Frequency:	Often
Primary Actor:	Tenderer
Preconditions:	User is signed in the system, has received an invitation to participate in the eAuction event and has accepted this invitation. The eAuction event is underway.
Basic Flow:	1. eAuction device displays to the user the relevant form for providing his/her bid 2. User fills in the bid submission form and submits it to the system 3. System accepts the new bid
Alternative Flow:	2a. User provides a bid which does not meet the bid specifications (e.g. a bidding values are above the maximum value allowed by the contracting authority): 2a1. System rejects new bid and informs user of the error 2b. User submits a bid to the eAuction device after the closure of a round, or after the closure of the eAuction event: 2b1. System rejects new bid and informs user of the error
Special Requirements:	None
Unresolved Issues:	None

5.4 System

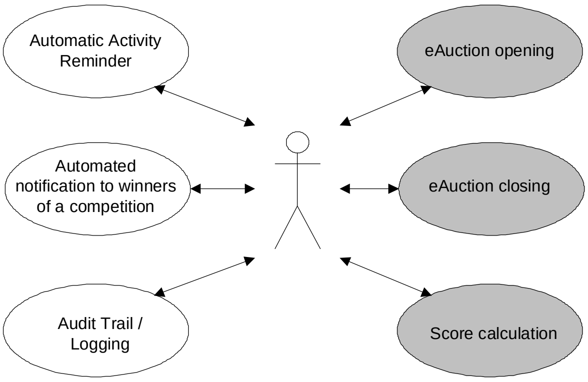
For eAuctions, *System* is responsible for all automated actions to be performed during the eAuction. These comprise the automated opening of the eAuction event, its automated closure, as well as, the automated score calculation for all bids submitted during the eAuction. The following Use Cases for *System* presented for Individual Contracts are also applicable in the case of eAuctions:

- Audit Trailing/Logging
- Automated activity reminder
- Notification to winners of a competition

Additionally, the following Use Cases are required for implementing an eProcurement system supporting electronic auctions:

- eAuction opening
- eAuction closing
- Score calculation

Figure 5-4: Use Cases for the *System* for a system supporting electronic auctions



Automatic Activity Reminder
eAuction opening
Automated notification to winners of a competition
eAuction closing
Audit Trail / Logging
Score calculation

5.4.1 eAuction opening

EAUCTION OPENING	
Version:	1
Context:	eAuction device automatically starts the eAuction event when the pre-defined date/time is reached
Priority:	High
Frequency:	Often
Primary Actor:	System
Preconditions:	The Full Initial Evaluation of Tenders is completed and tenderers are invited to participate in the eAuction event.
Basic Flow:	1. System constantly monitors whether the pre-defined date/time for the initiation of the eAuction event is reached 2. System initiates eAuction event
Alternative Flow:	None
Special Requirements:	Depending on the exact specifications of the eAuction device and the requirements of the contracting authority, a tenderer may be able to accept the invitation to participate in an eAuction event only before the beginning of the eAuction (see Use Case “Enter eAuction room”)
Unresolved Issues:	None

5.4.2 eAuction closing

EAUCTION CLOSING	
Version:	1
Context:	eAuction device automatically stops the eAuction event when the pre-defined conditions are met
Priority:	High
Frequency:	Very Often
Primary Actor:	System
Preconditions:	An eAuction event is underway
Basic Flow:	1. System constantly monitors whether the pre-defined conditions are met for stopping the eAuction event 2. eAuction stops the eAuction event
Alternative Flow:	None
Special Requirements:	In case of an eAuction event running in rounds, this mechanism needs to constantly monitor the closure of each round. The closing of the final round constitutes the closure of the eAuction event itself. In case of an eAuction event running in time, this mechanism needs to constantly monitor whether the pre-specified date/time is reached. The eAuction device may allow for the eAuction time period to be automatically extended in case a bid is received at the closing minutes of the eAuction event.
Unresolved Issues:	None

5.4.3 Score Calculation

SCORE CALCULATION	
Version:	1
Context:	Allows the eAuction device to automatically evaluate and rank bids according to the predefined bidding fields and evaluation formula
Priority:	High
Frequency:	Often
Primary Actor:	System
Preconditions:	An eAuction event is underway. A valid bid is submitted to the eAuction device
Basic Flow:	1. eAuction device accepts the new bid 2. eAuction device applies the predefined evaluation formula to the various bids and calculates the bid score 3. eAuction device ranks tenderers according to the new bid score received (in case of lowest price the ranking is in ascending order, while in case of the most economically advantageous tender is in descending order) 4. eAuction device discloses details of the received bids to tenderers and procurement officers according to the pre-defined visibility of options (see Use Case “Establishing and fixing eAuction parameters”)
Alternative Flow:	None
Special Requirements:	None
Unresolved Issues:	None

6 Scenarios for using the Dynamic Demonstrators

This section provides a proposed scenario for each eProcurement procedure supported by the Dynamic Demonstrators, developed in the context of the current project. It is aimed to assist users to easily experiment with the Dynamic Demonstrators and better comprehend the concepts of the Use Case analysis, as well as, the functional requirements, as described in the FReq Volume I.

The Dynamic Demonstrator User Manual provides more elaborate information for interested parties to more easily experiment with the demonstrators. Interested parties can gain access to the Dynamic Demonstrators at the URL: **http://europa.eu.int/idabc/eprocurement**.

6.1 Open Procedure

STEP. 1. Login as ***jsmith01 (procurement officer – administrative staff)***

STEP. 2. Create a new Call for Tenders

STEP. 3. Provide details similar to the ones below:

Field	Text
Title	GR – CCTV Video film
Contract Type	Supplies
NUTS	GR000
Notice Involves	Public Contract
Short Description	The Ministry of Public Order wishes to purchase CCTV video film supplies for a number of security network installations in the country.
CPV Codes	25330000
Estimated Value	450000
Currency	EURO
Duration of FA	2 years
Type of Procedure	Open
Previous Publications	-
Internal Reference No	376925
Electronic transmission of CN	YES
Electronic availability of CDs	YES
Estimated date for CN	09/12/2004
Number of days for opening	0

STEP. 4. Create Evaluation Forms

STEP. 5. Provide details similar to the ones below:

Details
Personal Situation Country of registration evidence Non-convinction evidence Economic and Financial Capacity Latest balance sheet or extracts
MEAT
No eAuction
Price (0.4) Quality Assurance (0.2) Quantity (0.3) Delivery (0.1)

STEP. 6. Upload Contract Document “Technical Specifications”

STEP. 7. Publish Contract Notice

STEP. 8. Logout

STEP. 9. Login as ***NvanBout (tenderer)***

STEP. 10. Go to “New”

STEP. 11. Access the Call for Tenders

STEP. 12. Click on “Create Tender”

STEP. 13. Submit Tender

STEP. 14. Logout

Perform steps 9-14 also for tenderer users *KSchneid, MPeroto5,* and *ATsolias*

STEP. 15. Login as ***SVeryard (procurement officer – opening staff)***

STEP. 16. Go to “My Calls”

STEP. 17. Access the Call for Tenders

STEP. 18. Click “DEMO OPEN”

STEP. 19. Go to “My Messages”

STEP. 20. Access relevant page

STEP. 21. Unlock tenders

STEP. 22. Logout

STEP. 23. Login as ***JMoratti (procurement officer – evaluation staff)***

STEP. 24. Go to "My Messages"

STEP. 25. Read message about evaluation

STEP. 26. Select the winner of the competition

STEP. 27. Public Contract Award Notice

STEP. 28. View report

6.2 Dynamic Purchasing System

STEP. 1. Login as ***jsmith01 (procurement officer – administrative staff)***

STEP. 2. Create a new Call for Tenders

STEP. 3. Provide details similar to the ones below:

Field	Text
Title	IT – Workwear accessories
Contract Type	Supplies
NUTS	IT500
Notice Involves	DPS
Short Description	The Ministry of Development establishes a DPS for the purchases of workwear and accessories in the Italy Centro region.
CPV Codes	1814000
Estimated Value	400000
Currency	EURO
Duration of FA	4 years
Type of Procedure	-
Previous Publications	-
Internal Reference No	376928
Electronic transmission of CN	YES
Electronic availability of CDs	YES
Estimated date for CN	09/12/2004

STEP. 4. Create Evaluation Forms

STEP. 5. Provide details similar to the ones below:

Details
Economic and Financial Capacity Latest balance sheet or extracts
Lowest price
No eAuction
Stated in Contract Notice

STEP. 6. Upload Contract Document “Technical Specifications”

STEP. 7. Publish Contract Notice

STEP. 8. Logout

STEP. 9. Login as ***NvanBout (tenderer)***

STEP. 10. Go to “New”

STEP. 11. Access DPS

STEP. 12. Click on “Create Indicative Tender”

STEP. 13. Submit Indicative Tender

STEP. 14. Logout

Perform steps 9-14 also for tenderer users *KSchneid, MPeroto5* and *ATsolias*

STEP. 15. Login as ***SVeryard (procurement officer – opening staff)***

STEP. 16. Go to “My Calls”

STEP. 17. Access DPS

STEP. 18. Click “DEMO OPEN”

STEP. 19. Go to “My Messages”

STEP. 20. Access relevant page

STEP. 21. Unlock tenders

STEP. 22. Logout

STEP. 23. Login as ***JMoratti (procurement officer – evaluating staff)***

STEP. 24. Go to Call to “I – Construction Workwear Accessories”

STEP. 25. Access tab Tenders

STEP. 26. Perform evaluation. Disqualify tenderer ***NvanBout (Flandra Constructions)***

STEP. 27. Include the three in the DPS

STEP. 28. Provide justification: “The three tenderers that have submitted indicative tenders meeting the DPS specifications are admitted in the DPS”

STEP. 29. Logout

STEP. 30. Login as ***jsmith01 (procurement officer – administrative staff)***

STEP. 31. Access DPS

STEP. 32. Access Specific Contracts

STEP. 33. Create a new Specific Contract

STEP. 34. Provide details similar to the ones below:

Field	Text
Title	Safety visors
NUTS	Select a sub-category of the NUTS
Short Description	Provide safety visors, as detailed in the simplified contract notice
CPV Codes	Select a sub-category of the CPV
Estimated Value	25000
Currency	EURO
Contract Duration	3 months and 15 days
Type of Procedure	Open
Reference Number	376929
Opening date for receipt of Indicative Tenders	09/12/2004
Closing date for receipt of Tenders	24/12/2004
Opening date for receipt of Tenders	26/12/2004
Closing date for receipt of Tenders	31/12/2004
Number of days for opening	0

STEP. 35. Publish simplified contract notice

STEP. 36. Logout

Tenderers *KSchneid, MPeroto5* and *ATsolias* already part of the DPS

Tenderer *NvanBout* has submitted an Indicative Tender but was not admitted

STEP. 37. Login as ***NvanBout (tenderer)***

STEP. 38. Go to “New”

STEP. 39. Access specific contract *(create a tender button is disabled because user is not part of the DPS)*

STEP. 40. Access "My Indicative Tender" *(submitted previously)*

STEP. 41. Update my Financial Offer

STEP. 42. Submit Indicative Tender

STEP. 43. Logout

Tender *RParihon* has not yet submitted an Indicative Tender

STEP. 44. Login as ***RParihon (tenderer)***

STEP. 45. Go to "New"

STEP. 46. Access specific contract

STEP. 47. Create Indicative Tender

STEP. 48. Submit Indicative Tender

STEP. 49. Logout

STEP. 50. Login as ***SVeryard (procurement officer – opening staff)***

STEP. 51. Go to "My Calls"

STEP. 52. Access DPS

STEP. 53. Click "DEMO OPEN"

STEP. 54. Go to "My Messages"

STEP. 33. Close the three tenderer windows and continue with the window of ***jmoratti (procurement officer – evaluation staff)***

STEP. 34. Select to award contract

STEP. 35. Select one winner. Justification: “Winner selected based on the best bid during the eAuction”

STEP. 36. Publish Contract Award Notice

STEP. 37. View Report

IP/05/1248

Brussels, 11 October 2005

Public procurement: Commission promotes online advertising of public contracts EU-wide

The European Commission has moved to make it easier to advertise large public contracts on the Internet. It has adopted new standard forms for such notices mainly for use online. This is part of a wider EU strategy on computerising public procurement procedures in the EU. The forms will be available in all EU languages by the end of October at the SIMAP website at: www.simap.eu.int.

Internal Market and Services Commissioner Charlie McCreevy said: *"This is an example of better regulation which will make it easier for companies to find out about the thousands of public contract opportunities across the EU. Public authorities also benefit not just from greater competition but also from a shorter streamlined procedure with one single set of online notice forms which can save them valuable time in the procurement process."*

The procurement Directives require that contracts above certain thresholds must be advertised EU-wide in the Supplement to the Official Journal of the European Union providing all relevant information for a given call for tender. Currently, public authorities use for this the standard forms contained in Directive 2001/78/EC. These will be replaced by the new forms that take into account elements introduced by the new procurement Directives (2004/18/EC and 2004/17/EC), e.g. framework agreements, electronic reverse auctions and dynamic purchasing systems.

The greatest advantage of the new forms comes however with online use. If submitted electronically, notices can be published on TED, the EU Tenders Electronic Daily within five days of being sent instead of the former twelve days. In addition, this is expected to reduce significantly administrations' paper handling costs and to facilitate the processing of tender information.

The regulation on the new standard forms enters into force on 21 October 2005 and is directly applicable in all Member States. Contracting authorities may continue to use the existing standard forms until the end of January 2006 if the new public procurement Directives have not been implemented into national law by then. The new forms will be available online in a structured XML format by the end of October at *www.simap.eu.int*.

The new forms follow the same structure as the existing ones, while simplifying and streamlining them. The conditions and rules for the use of the new notices are explained in a Commission staff paper on electronic public procurement issued in July 2005 (available at
http://europa.eu.int/comm/internal_market/publicprocurement/e-procurement_en.htm -
see IP/05/948).

The revised standard forms are one of the actions envisaged by the Commission's 2004 "Action Plan for the implementation of the legal framework for electronic public procurement". This Action Plan aims to take all necessary steps over a three-year period to ensure that electronic public procurement in Europe is implemented as smoothly as possible.

COMMISSION OF THE EUROPEAN COMMUNITIES

COMMISSION STAFF WORKING DOCUMENT

PROPOSAL FOR AN ACTION PLAN FOR THE IMPLEMENTATION OF THE LEGAL FRAMEWORK FOR ELECTRONIC PUBLIC PROCUREMENT

EXTENDED IMPACT ASSESSMENT

TABLE OF CONTENTS

1. Introduction 3

2. Purpose and structure of the impact assessment 4

3. What issues is the Action Plan expected to tackle? 4

   3.1. The current use of electronic means in the procurement process 4

   3.2. The main issues - is the Community intervention justified? 10

   3.3. Conclusions 17

4. Policy objectives and actions for implementing electronic public procurement across Europe 18

   4.1. Policy objectives 18

   4.2. Policy options 18

5. What are the impacts – positive and negative – expected from the different options 23

   5.1. The impact on markets, trade and investment flows 25

   5.2. The direct and indirect costs for businesses 26

   5.3. The impact on innovation 26

   5.4. Administrative requirements on businesses 26

   5.5. Impact on labour market and employment 27

   5.6. The consequences for public authorities and governance 27

   5.7. The impacts on specific regions and sectors 28

   5.8. Potential overall economic impact of the proposal 28

6. Monitoring and implementation of e-procurement Action Plan 29

7. Results of the stakeholder consultation 30

   7.1. Which stakeholders were consulted, at which stage of the process and for what purpose? 30

   7.2. Results of the consultations 31

8. Commission proposal and justification 33

9. Annexes 34

   9.1. Annex I: List of references 34

   Annex II: The issues at stake and driving forces 36

   9.2. Annex III: Results of the interactive policy making survey 41

1. INTRODUCTION

The *e*Europe Action Plan[1] called on the Council and the European Parliament to adopt as quickly as possible the legislative package on procurement Directives and on Member States to carry out a significant part of public procurement electronically by end of 2005.

The first target was met in April 2004[2] by the entry into force of the new procurement Directives. Member States are due to transpose them into national law at the latest by 31st January 2006. Some Member States are well placed to reach the second target. However, the full potential of electronic public procurement remains largely untapped. This is not surprising given the complexity of the issues involved: the correct implementation of the legal framework, development of operational electronic procurement systems that are in line with the new legislation, modernisation of the operational environment, re-engineering of practices and streamlining of processes involved. Successful implementation of electronic public procurement will require considerable effort in the Member States in order to put all the pieces of the puzzle together and modernise the way procurement is conducted nationally and at regional level.

The legislative package introduced for the first time detailed provisions on the use of electronic means in the public procurement process. It sets the necessary legal guarantees for carrying procedures electronically in an open, transparent and non-discriminatory way across Europe and introduces the use of modern innovative purchasing techniques based on electronic means of communication.

This report presents the outcome of the research and consultations carried out by the Commission services in order to assess whether and what type of additional Community action is necessary to support the implementation of the legal framework for electronic public procurement.

The report is based on an in depth review of electronic public procurement across Europe. Consultations and specific studies were carried out by the Commission in order to assess the state of development of electronic public procurement, to review technical solutions and developments in the different Member States and to identify potential problems which may either raise barriers to the Internal Market or hinder the uptake of electronic public procurement in the near future if no action is taken. These studies will be available to all interested parties.

[The conclusion of the impact assessment is that Community action would strengthen national efforts to implement electronic public procurement and should produce substantial benefits for both buyers and suppliers in the EU]. [*Brackets to be removed after adoption of the proposal by the College*]

[2] Legislative package of procurement Directives adopted on 31 March 2004 and entered into force on 30 April 2004; Directive 2004/17/EC of the European Parliament and of the Council coordinating the procurement procedures of entities operating in the water, energy, transport and postal services sectors; Directive 2004/18/EC of the European Parliament and of the Council on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts

2. PURPOSE AND STRUCTURE OF THE IMPACT ASSESSMENT

The starting point for the impact assessment is the adoption of the legal framework setting out the rules for using electronic means in public procurement covered by the Directives and the deadline of 31st January 2006 for implementing Community rules at national level in the EU's 25 Member States. The main policy question to be addressed by the impact assessment is whether the adoption and forthcoming transposition of the EU rules at national level provides an adequate framework for moving public procurement online rapidly and smoothly or whether additional measures are required in order to avoid barriers to the Internal Market and to achieve efficiency in public procurement.

This impact assessment does not consider the merits and advantages of electronic public procurement and of the specific new EU legal framework but rather the difficulties and risks of achieving the objectives of the Internal Market and the general policy objectives set out in the *e*Europe action plan.

The analysis of the current trends and risks are considered in section 3. Section 4 analyses the different options considered and section 5 the potential impacts of a Community Action Plan.

3. WHAT ISSUES IS THE ACTION PLAN EXPECTED TO TACKLE?

The research and studies accompanying this report provide a wealth of information on the state of development of electronic public procurement in the 25 Member States.[3] It shows that the uptake of electronic public procurement has been slow in Europe, as the absence of political commitment, a clear legal framework and technical and organisational problems have delayed progress in this direction.

An analysis on the issues at stake and driving forces for e-procurement can be found in Annex II.

3.1. The current use of electronic means in the procurement process

Analysis of the background information[4] points to a rather fragmented landscape and uneven development of operational electronic public procurement systems in Europe. In most Member States electronic public procurement is still at an initial state of development. In addition, the levels of sophistication and available functionalities vary enormously. Some Member States operate parts of their procurement electronically, in particular at central government level. In countries such as the United Kingdom, Denmark, Finland, Italy and France, fully operational systems exist for advertising and tendering procurement contracts electronically. In others, the effort was concentrated on developing portals which provide information for public authorities and economic operators along with some basic directory and search services. Pilot projects are also underway in different countries mostly for contracts below the EU thresholds, as public authorities are trying to acquire experience and experiment with the novel tools offered by ICT.

[3] The detailed analysis and comparison of the e-procurment situation in 25 EU Member States is presented in Part 1: Baseline analysis of the "Impact Assessment of an Action Plan on electronic public procurement", *Ramboll Management, December 2004. This chapter presents only the main conclusions.*

[4] Majority of the analysis in this chapter is based on the report done by *Ramboll Management in the* "Impact Assessment of an Action Plan on electronic public procurement"*, December 2004;*

National strategies and organisational structures

Introduction of electronic means in public sector procurement is pursued most often at national level in the framework of long term plans to modernise government and administrative practices. Interviews with Member States' experts show that governments' main incentive for introducing electronic public procurement is to achieve public savings. This effort is mainly driven by the central level of government, while other stakeholders in the public and private sector are often only marginally involved in this process. Most noticeably, the European dimension of this process does not seem to occupy a high rank on the administrations' policy agenda, despite the importance of ensuring an open and competitive EU public sector procurement market.

The degree of detail in national strategies on electronic public procurement varies considerably. Some have developed rather elaborate strategies while others have formulated brief, overall strategic statements concerning electronic public procurement without allocating specific resources for funding the transition from paper to electronic procurement.

Implementation of the new procurement rules should enable contracting authorities to use electronic means exclusively in the procurement process. In practice, however, it can be expected that paper based procedures and electronic means will co-exist for some time. This entails higher costs and can give rise to inefficiencies and errors. The sooner public authorities will be able to switch to the exclusive use of electronic means, the higher the benefits will be for both buyers and suppliers.

At institutional and organisational level, two trends can be observed: on the one hand public procurement is primarily organised in a decentralised way, as individual authorities are having responsibility for their own purchases and financial management. On the other hand, new structures are being put into place in order to introduce electronic public procurement and use electronic means effectively which tend to centralise responsibility for the management of procedures and purchases. In many cases, central purchasing bodies have taken the lead in trying to introduce electronic means in the public procurement process.

Differences can also be observed in the way electronic public procurement services to contracting authorities and suppliers are financed. Some Member States have committed significant funds for the realisation and operation of their *e*-procurement initiatives, offering the services to all parties free of any charge, achieving a return on investment from cost savings achieved in the public sector. On the other hand, some administrations charge fees to both contracting authorities and suppliers for using their e-procurement services. The latter may exclude suppliers or administrations which may not be ready to pay such fees for carrying their tenders electronically or managing their contracts with the public sector.

Legal and technical framework

National laws transposing the EU rules on the use of electronic means in public procurement are in the pipeline. Member States are planning to transpose the legal framework during 2005-2006. In some Member States some of the tools foreseen by the Directives have already been regulated (e.g. e-auctions, electronic receipt of offers). However, no Member State has yet transposed the complete set of rules on electronic public procurement. In any case, as the purchasing cycle covers a wider range of activities, in establishing the rules for electronic public procurement, Member States will have to take into account other pieces of Community legislation which regulate issues such as data protection, electronic invoicing, e-commerce, electronic signatures etc. The transposition of the EU provisions on electronic means should help eliminate a great deal of the legal risks encountered at present. It should provide the basis for a systematic spread of electronic means in public sector procurement; in particular, for building capacity among public sector entities and re-engineering traditional public procurement processes.

The Directives do not limit the definition of electronic public procurement to a given technology or a particular process; they rather opt for an open and technologically neutral definition which simply puts electronic means on a par with traditional paper based procurement. Their aim is to facilitate the efficient introduction of different solutions on the condition that they respect the safeguards and meet the procedural requirements set out by the Directives. The transposition of the new directives does not require the creation of a uniformly standardised environment. Different approaches may co-exist, as conditions and needs vary in the different countries and among different types of buyers.

The translation of the legal provisions into operational terms and technical specifications can create difficulties of interpretation which may result in diverging requirements, the application of incompatible standards and the use of different terminologies. A review of some of the most important operational systems carried out under the IDA programme confirms that none of the systems reviewed supported fully the functionalities prescribed by the new Directives[5]. Due to varying public procurement needs as well as laws and priorities in the different Member States, authorities appear to have privileged the digitisation of different procedures and processes. In addition, there exist significant divergences in the development of systems that model the tender reception process as prescribed by the Directives, the associated internal business processes of public administrations, as well as the use of CPV codes and security aspects.

Most existing systems were conceived, designed, and implemented prior to the adoption of the new public procurement directives. They are therefore based on national rules which are not necessarily aligned to the new legal framework. In practice, however, most applications are based on existing commercial marketplace products offered by vendors with minimal customisation. Although this approach can initially facilitate the timely launching of systems with relatively small investments, it results in electronic public procurement systems that are software-driven rather than legislation-driven and present limited interoperability across Europe. This trend may create barriers to the functioning of the Internal Market to the extent that future technical solutions may not reflect the EU requirements imposed by the procurement legislation.

Potential difficulties may arise from implementing security for electronic transactions and communications. In moving procurement online, developers need to consider various issues: for example, the secure transmission and safe storage of data, integrity and confidentiality of offers and authentication of users. Authorities and developers have often followed different approaches depending on their perception of security risks and obligations resulting from national legislation. At present, in some case existing systems require “basic” user authentication through credentials (e.g. user names and passwords), while other systems support “strong” authentication by imposing the use of advanced electronic signatures. Strong security measures may make systems difficult to access and use, leading to the exclusion of

[5] State of the Art report, Volumes 1 and 2, European Dynamics, December 2004; study financed under the IDA programme

potential suppliers. This is particularly the case with the use of advanced qualified electronic signatures (qualified signatures)- imposed in some systems in order to accept tenders submitted electronically by economic operators - due to technical and organisational problems which at present limit the mutual recognition of such signatures across borders (3.2; security and electronic signatures).

Use of electronic means in different phases of the procurement process

In the absence of systematic statistical data on the performance of public procurement markets it is very difficult to draw quantitative figures on the current level of use of electronic means in public procurement.

E-procurement in the *private sector* seems much more widespread than among public authorities. Generally, it is concentrated in two phases: sourcing (finding suppliers and products via internet) and payments. In 2003, 19% of European companies made online sales (employee weighed figures). This can be seen as an indicator of the 'e-maturity' of the supplier base. There is virtually no difference in figures for online selling between small, medium and large enterprises: 16% (0-49 employees), 22% (50-249 employees) and 18% (250+ employees). The share of European companies that procure online ('procurement of at least some of their direct or indirect production inputs) is considerably higher than the share of online sales: 50% in 2003 (employment weighed figures). This figure is lower for small enterprises (36%) compared to large businesses (61%). It should be noted that these figures include all companies that confirm that they procure/sell at least some of their goods online. It does therefore not necessarily mean that they have substantial online procurement or sales[6].

An analysis of 36 *public sector e-procurement systems* shows that the two first phases in the

Figure 1: Phases covered by electronic procurement systems in EU Member States

Procurement phase	**Electronic system**	**%**
Notification/Advertising of tenders	33	92%
Publication of tender documents	17	47%
Management of receipt/submission of tenders	9	25%
Evaluation of tenders	3	8%
Ordering	8	22%
Invoicing	1	3%
Total	**36**	**100%**

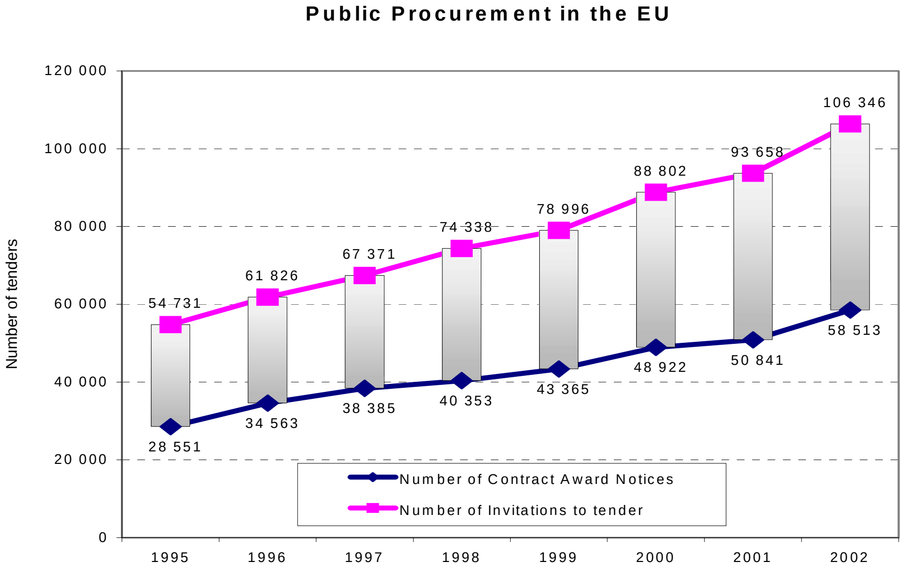
[6] "Impact Assessment of an Action Plan on electronic public procurement", *Ramboll Management, December 2004;* from E-Business Watch: The European e-Business Report – A portrait of e-business in 15 sectors of the EU economy, 2003 edition

procurement process, i.e. the electronic notification and publication of tenders have most often moved online at national level (figure 1). Despite this progress, the notification and advertising of contract opportunities at national level is very little integrated with the advertising at European level, thus resulting in the duplication of efforts at national and European level despite higher costs and lower efficiency.

Judging by the number of procurement portals and the electronic publication of tenders, the trend in using electronic means in public procurement is pointing rather upwards. Indeed, public procurement portals with some minimum functionality such as notification about tenders and publication of tender documents are established in 16 of the 25 Member States. As shown in Figure 2, the number of notices published electronically on TED has also been growing steadily. In 2002, 106,346 invitations to tenders and 58,513 contract award notices were published. This represents an increase in the share of EU covered procurement from 8.4% in 1995 to 16.2% in 2002 in the EU's 15 Member States.

Most operational electronic public procurement systems focus on the procurement of standard goods rather than more complex purchases such as services and works. The volume of tendering and ordering procedures carried out electronically today is probably rather small. According to IT vendor estimates, approximately 100 public institutions at national, regional or local level have currently implemented e-tendering or e-ordering procurement systems. The use of these systems remains unclear, though. IT vendors estimate that they probably represent less than 1% of orders and less than 5% of public procurement value. The potential group of users of electronic public procurement is, however, certainly much larger. The main target group for e-procurement systems (tendering and ordering) in Europe can be estimated at approximately 1.000 public institutions (ministries, regional authorities etc.) to which should be added some larger government agencies, health sector institutions (hospitals), educational bodies (Universities) and the utility sector.

Figure 2: Transparency in public procurement and use of electronic means



Source: "*A report on the functioning of public procurement markets in the EU: benefits from the application of EU directives and challenges for the future*", *Commission staff working document, 3 February 2004*

A small number of public authorities has been testing and experimenting with some more sophisticated tools such as electronic catalogues, electronic market places (including dynamic purchasing systems) and electronic auctions, which are some of the most innovative elements of the public procurement legislative package. In some countries, authorities have already decided to promote actively the use of electronic auctions. To this end, they have issued appropriate guidelines and put in place operational solutions enabling purchasing authorities to use such tools.

Savings and performance

To date only scattered and anecdotal evidence exists on realised savings from electronic means in the procurement process. Figure 3 compiles some figures given by public authorities on savings achieved on administrative costs and purchasing prices due to the use of electronic means in public purchases.

Figure 3: Savings from electronic public procurement on purchasing prices and administrative costs

Public Body	**Purchasing price**	**Administrative costs**
General Delegation for Armament, Ministry of Defence, France[7]		31% decrease in administrative costs
OGCbuying Solutions, UK (e-purchasing)		28-90£ savings per procurement transaction
CONSIP, Italy[8] (e-purchasing)	36% estimated average savings when buying online	-
DOPI, Denmark[9] (e-auctions	18% realised savings	-
National e-Procurement Program, Portugal (e-auction)	25% savings in the purchase of paper supplies for a month	-
Essex Marketplace[10] (e-auction)	53 % realised savings on goods 26% saving on IT consumables[11] 25% saving on stationery[12]	-
NHS Purchasing and Supply Agency (e-auction)	31% savings from IT hardware	-
Wales Health Supplies[13] (e-auction)	10% lower price - projected savings of £600,000 over three years	-

It shows that the use of electronic public procurement in appropriate circumstances and depending on the type of purchases may result in considerable savings. These can range between 10% - 50% on the initial purchasing price. Transaction cost reductions are equally important. Buyers, for example, can save up to 50-80% of such costs. The cost of processing a notice for publication on the Supplement of the EU Official Journal could be from €111 today, down to €57.5, if only electronic forms were used by contracting authorities. Major buying agencies in France and the United Kingdom also report significant administrative savings.

It has not been possible to identify empirical data on suppliers' savings as these are difficult to measure. Typically they relate to: easier access to public sector markets within and beyond national borders; reduction of market surveillance costs; time savings; lower tendering costs due to the reuse of electronically supplied information; more transparent evaluation of tenders; elimination of costs related to printing and shipment of tenders; reduced market entry costs.

3.2. The main issues - is the Community intervention justified?

The transformation of paper based procurement to electronic is a complex operation which requires actions and decisions at many levels beyond the simple transposition of the new rules at national level. Organisational, technical and institutional issues should be addressed in order to re-engineer existing processes for tendering and purchasing so as to be able to exploit the available ICT solutions and tools.

Adoption of the EU legal framework for the use of electronic means in the public procurement process was a first significant step in order to remove legal uncertainties and establish the required safeguards for open, transparent and non-discriminatory public procurement using electronic means.

The move from paper based to electronic procurement is not without risks. Incorrect application of the new EU rules and discriminatory technical solutions and practices can deter businesses from embracing electronic public procurement and effectively fragment the Internal Market. Correct and timely implementation of the new EU provisions on electronic public procurement will determine Europe's capacity to keep the market open for public procurement conducted electronically and reaching a critical mass of users (buyers and suppliers). Use of electronic means should guarantee in practice that any business in Europe with a PC and an internet connection can participate in a public purchase conducted electronically.

However, there are a number of risks and problems related to the use of electronic means in procurement. They can be identified in the following areas:

- legal environment;
- technical environment;
- administrative and organisational processes;
- businesses' access;
- knowledge, skills and awareness.

Legal environment

The first policy concern relates to the development and implementation of the *regulatory framework for electronic public procurement* across Europe. Member States are required to implement the new procurement Directives including the provisions on electronic public procurement by 31 January 2006 at the latest. Transposition of the new rules is underway in some EU countries. Past records suggest, however, that delays in transposition beyond the 31 January 2006 deadline are likely to occur. In the absence of a particular effort at national and Community level to accelerate national transposition and ensure that the new rules are transposed in time, the current state of fragmentation not only threatens to persist, but could be aggravated due to legal uncertainties for both buyers and potential suppliers.

The quality of the legal environment is equally important. The design and organisation of procurement systems as well as the standards that should be used are going to be influenced by the national legal framework. Erroneous or divergent interpretation of the new rules means that operational electronic public procurement solutions may not always comply with the EU rules thus giving rise to legal and technical barriers. These may not only affect cross-border trade and distort competition but can also slow down the use of electronic public procurement at national level. The analysis shows that there is already some divergence in the systems, tools and solutions currently applied in the Member States. Such divergences can become effective “e-barriers” if no particular effort is made to ensure compliance and convergence of electronic public procurement tools and systems with the EC Directives. A ‘letting a thousand flowers bloom’ situation - whereby electronic public procurement systems with diverging requirements, even minimal, proliferate across Europe - may appear conceptually attractive but in reality it would mean that costs for businesses to access the different systems would become unmanageable.

International obligations

The same risks exist at international level. The use of electronic means in public procurement is being developed worldwide while the existing plurilateral General Procurement Agreement (GPA) and bilateral agreements do not regulate their use. In the absence of international rules, legal and technical choices in electronic public procurement systems may reduce procurement opportunities for EU businesses in third countries, as well as restrict access of third country suppliers to the EU market. In light of these developments, it is necessary to make sure that barriers to international trade are effectively avoided.

Security and electronic signatures

One of the most significant barriers to cross-border tendering arises in relation to *security issues* and, in particular, to the use of electronic signatures. In line with current practice for tenders submitted in paper, the new public procurement Directives do not define which type of e-signatures should be used in electronic tendering. The choice is left to the Member States, provided they apply national laws implementing the e-signatures Directive 1999/93/EC correctly. As the legal concept is not the same in all Member States, the way e-signatures are implemented in electronic public procurement is critical. Potential difficulties relate in particular to the use of advanced electronic signatures based on a qualified certificate, which are created by a secure-signature-creation device (hereafter ‘qualified signatures’). Several Member States require or intend to require the use of such qualified signatures for the submission of offers and/or requests to participate. They consider that only such means guarantee unique and unmistakeable authentication of signatories and ensure that any change of the data to which the signature relates can be detected.

The existence of significant differences between qualified signatures, as required by some Member States, should be reason for great concern. In the absence of a mature European market for this type of signatures and in the light of interoperability problems encountered at present, despite the existence of standards, they pose real obstacles to cross-border electronic tendering[14]. There is a risk that these problems may persist, even if at a later stage they will become essentially of an organisational nature.

The use of qualified signatures in public procurement is expected to be the first generalised application whereby businesses may be required to use qualified signatures in transactions with public authorities in a Member State other than their home country. The Directives oblige any public purchaser in the EU to effectively recognize, receive and process tenders submitted, if required, with a qualified signature and their accompanying certificates, regardless of their origin within the EU or their technical characteristics, and even when they contain documents of different origins (i.e., from a consortium of suppliers) and possibly bear signatures of different levels from different sources (i.e., from different national authorities)[15]. This means two types of problems will have to be addressed: ensuring the mutual recognition and acceptance of qualified signatures, their accompanying certificates and messages, and ensuring unhindered technical reception of those signatures and certificates. It seems likely that the market will not provide for a mutual recognition system of qualified signatures (i.e. advanced signatures accompanied by a qualified certificate and created on the basis of a security creation device) in the near future. This can impact negatively on the Internal Market and investments in electronic public procurement.

Technical environment

The development and penetration of ICT is continuing to grow rapidly both in the private and in the public sector. Introduction of electronic means in public procurement is not threatened to be compromised by infrastructure problems. Although the *EU rules do not prescribe specific technical solutions* for implementing electronic procurement in the public sector, they set out specific functional requirements in order to ensure transparency, equality of treatment and fair competition when using electronic means in the procurement process. The functional requirements are either expressed in terms of specific conditions for means of communication, tools and devices used in the procurement process, or procedural rules to guarantee the respect of the principles of equal treatment, non-discrimination and transparency.

It is likely that differences in the architecture of systems, diverging technical specifications and standards, and the choice of particular tools can hinder businesses’ access to electronic public procurement systems, thus limiting competition and leading to discriminations against certain businesses.

[14] For an in-depth analysis on the implementation of Directive 1999/93/EC see “The legal and market aspects of electronic signatures”, Study for the European Commission, Interdisciplinary Centre for Law and Information Technology, Catholic University of Leuven, October 2003.

[15] This situation becomes all the more complex as the provisions of art. 5 of Directive 1999/93/EC need to be taken into account. It requires Member States to not deny legal effectiveness to electronic signatures that they have received.

Internet based tools provide an environment which most businesses are familiar with. For the basic electronic tendering functions foreseen by the Directives, careful design and application of Internet based tools can avoid most problems, that is, for advertising tender opportunities, accessing tender documents, communicating documents and information, and submitting offers electronically. Security requirements are a particular case. If they are not set too high and conditions of operation of e-procurement systems allow for various formats and capacities, businesses are not expected to face any particular difficulties in communicating effectively with contracting authorities and in tendering electronically.

Currently, there is no sign of a uniform standardised environment emerging for conducting more complex electronic public procurement operations. With the current fragmentation in key areas such as schemes for exchange of messages, electronic catalogues, classifications and qualified signatures, and in light of the pace of standardization work, development towards a common set of agreed standards will be very slow. As standardisation in the ICT sector is driven by the market and evolves very rapidly, it would not be feasible to agree on one common standard at EU level for carrying procurement electronically. This is why in the procurement Directive the accent is placed on *interoperability* in order to make sure that different solutions are made compatible.

The major e-procurement IT vendors are working on further integrating e-procurement solutions by facilitating the shift between e-sourcing, e-tendering, e-ordering and e-payments. In the mid-term, the move towards more integrated e-procurement solutions is likely to create interoperability problems and cross-border barriers as far as not all businesses are equipped to cope with this type of processes. For this type of more advanced e-procurement, there is a risk that small enterprises (in particular with less than 20 employees) will not be able to participate on an equal footing. This is due to a shortage of relevant skills and knowledge among SMEs but also to the difficulty of achieving a return on investment. These differences between the smaller companies on one side and larger companies on the other side might be reinforced as e-public procurement systems become more advanced with the continuous upgrading of e-procurement software.

The major IT-vendors intend to develop software for most of the procurement procedures provided by the procurement Directives as part of their IT offer, i.e. electronic auctions, electronic framework agreements and dynamic purchasing systems. Today, these players account for more than 50% of the market. It can be expected that this can provide some homogeneity in the development of electronic public procurement. Historically, *e*-procurement has been developed in the business-to-business electronic commerce environment. In order to provide efficient and attractive systems, the needs of both buyers and suppliers should be carefully evaluated and coherence between B2B and G2B applications should be maintained. The Directives operate with certain trade-offs in terms of efficiency of electronic procurement solutions and legal safeguards to ensure equality of treatment and non-discriminatory access. The application of these principles should not be compromised by ill-adapted technical solutions. Therefore, some mechanisms will be necessary to monitor compliance of the electronic systems with the legal requirements.

Administrative and organisational processes

It is no secret that public sector procurement involves a lot of paperwork and red tape. Success depends on the degree of transformation of off-line practices to fully fledged online services. This requires an intensive effort in re-thinking the service provided and re-engineering the different processes. In this respect, the development of horizontal e-government services should open the way to higher efficiencies in the procurement process. Laws and regulations require from potential tenderers to submit a sizeable amount of certificates and documents to prove their qualifications and capacity to provide the works and services public authorities intend to purchase. Most of such documents are only available in paper form today. Although the new rules allow tenderers to submit them in paper form when they are not available electronically, it is clear that it will not be possible to develop a fully integrated electronic public procurement system until such e-government services are available across Europe. Agreement on a minimum set of certificates and their development across all Member States would be necessary in order to gradually streamline processes and eliminate red tape in the procurement process. It is absolutely necessary that such services develop across all Member States because otherwise public authorities will be obliged to maintain a dual system of paper and electronic records even if only one Member State is lagging behind in the development of such e-government services.

Problems can be also expected *with e-invoicing and e-ordering* systems, as they continue to be used differently in each Member State. These are factors which will have a more negative influence on electronic public procurement across borders in Europe than on national markets, where some positive developments may occur.

The re-engineering of administrative systems and practices is essential, as asymmetries in the incentive structure for developing electronic public procurement and resistance to change can delay the use of electronic public procurement systems at national and regional level. Inefficiencies in electronic public procurement systems and failures to reduce transaction costs will naturally limit the scope and interest for moving procurement online. This is a serious risk for both buyers and suppliers. Figure 4 shows that the strongest incentives for electronic public procurement exist at the aggregate level (national and European level). Therefore in order to release, the full benefits from moving traditional procurement procedures online, a certain critical mass of users should be reached.

Figure 4: Basic incentive structure in public and private sector – aggregate level, institutional level, and individual level

Level of aggregation	**Benefit of electronic procurement**	**Cost of electronic procurement**
Entire public sector at European level	Very significant	Marginal
Entire public sector at national level	Significant	Marginal
Large purchasers	Moderate	Minor
Medium purchasers	Minor	Moderate
Small purchaser	Marginal	Significant
Large enterprise (250+ employees)	Significant	Marginal
Medium sized enterprise (50-249 empl.)	Moderate	Minor
Small enterprise (20-49 employees)	Minor	Moderate

Micro enterprise (<20 employees)	Marginal	Significant

Businesses' access

The underlying vision of the new Directives is that any business with a PC and an internet connection should be able to participate effectively to a call for tender organised electronically. To this end, the Directives require that the means and tools of communication should be generally available, non-discriminatory and interoperable with means and tools of general use. Successful implementation of electronic public procurement will depend on how such conditions are fulfilled in practice. So far the development of electronic public procurement has been software-driven. The challenge and risk for Member States and the administrations is to ensure that the IT-tools satisfy the conditions set out by the regulatory framework.

Hence, it is particularly important to guarantee the full participation of SMEs in the new markets. Most public procurement contracts are currently awarded to SMEs. As one would have expected, SMEs' access to contracts with local authorities is relatively easier. However, their chances of success in cross-border procurement are much lower. SMEs acting as subsidiaries of foreign firms still have a high rate of success, but the difference with respect to large enterprises is not very significant in statistical terms. Sectoral differences also have an important influence. SMEs are particularly well represented in the construction sector and less so in the business services sector.

The use of electronic public procurement can threaten the current balance if electronic public procurement is introduced in such a way that:

- costs for participation in electronic tendering and procurement are proportionately higher for SMEs compared to large businesses, as government agencies employ systems and tools which require adaptations and specific investments in IT not commonly used in day-to-day business from economic operators;

- the use of electronic public procurement is accompanied by excessive centralisation and standardisation of public sector purchases in a drive to consolidate the supplier base and standardise purchases, and thereby increase volumes and reduce unit costs; this has often been the approach of large multinationals in using e-procurement solutions.

- charges are levied on operators wishing to access tender information and to bid electronically despite the efficiency gains and savings realised in the public sector from moving public procurement online.

Such risks are not new. They exist also in paper based public procurement. Nevertheless the introduction of electronic means risks aggravating them. The *institutional set up and organisational structure* is therefore crucial in order to ensure the successful implementation of electronic public procurement. Some good practices already exist in the Member States as identified in the IDA state of the Art report. It could be expected that the different parties agree to share such type of information and that they share their experiences. This, however, cannot happen automatically. Some effort at national and Community level will be required to collect information on and spread awareness of such issues.

Knowledge, skills and awareness

It is expected that *knowledge* of electronic public procurement will increase in public institutions and in companies following adoption of e-business/e-procurement in the private sector[16] and the introduction of electronic means in public sector procurement. It can also be expected that there will be an ongoing upgrading of computer skills in both the public and the private sector. Concerning the need to upgrade skills and knowledge in the public sector, it seems likely that specific training will need to be envisaged by Member States in particular, where implementation of electronic public procurement results in organisational restructuring and staff redundancies, or reallocation of staff to more qualified tasks. The demand for training from both public and private stakeholders will most likely increase in the near future. The tendency seen today in the countries with relatively developed e-public procurement initiatives is that national authorities and organizations will provide different training and awareness programmes. It seems therefore realistic to expect that more initiatives of this kind will commence at national level across the Member States.

The translation of the legal provisions into operational terms and technical specifications can create difficulties of interpretation which may result in diverging requirements, the application of incompatible standards and the use of different terminologies. A review of some of the most important operational systems carried out under the IDA programme confirms that none of the systems reviewed supported fully the functionalities prescribed by the new Directives[17]. Due to varying public procurement needs as well as laws and priorities in the different Member States, authorities appear to have preferred the digitisation of different procedures and processes. In addition, there exist significant divergences in the development of systems that model the tender reception process, prescribed by the Directives, and the associated internal business processes of public administrations, and the use of CPV codes and security aspects.

3.3. Conclusions

The current state of play and analysis of developments and problems (parts 3.1 and 3.2 above) leads to the conclusion that a *“business-as-usual”* scenario, whereby no action at all is taken by the Commission further to the adoption of the legal package to support the implementation of electronic public procurement across Europe, involves considerable risks of market fragmentation and exclusion as well as of inefficiencies. Despite agreement on a common legal framework for moving public procurement online, at least during an initial transitional period, barriers to the Internal Market may remain and new could emerge, thus limiting the potential of operational electronic public procurement across Europe.

[16] Ministry of Industry of France, ”E-commerce Scoreboard Update”, April 2004, p. 54

[17] State of the Art report, Volumes 1 and 2, European Dynamics, December 2004; study financed under the IDA programme

4. POLICY OBJECTIVES AND ACTIONS FOR IMPLEMENTING ELECTRONIC PUBLIC PROCUREMENT ACROSS EUROPE

4.1. Policy objectives

The analysis presented in section three showed that the take-up of electronic public procurement in Europe has been slow so far. This is a significant weakness in the Community's quest for increased competitiveness. In addition, agreement on a common legal framework for moving procurement online would not be enough to avoid, at least during an initial transitional period, barriers to the Internal Market and to realise the full potential of operational electronic public procurement across Europe. In view of this situation, three objectives have been set:

- *To ensure a well functioning Internal Market in public procurement;*
- *To achieve greater efficiency in public procurement and to improve governance;*
- *To work towards an international framework for electronic public procurement.*

The aim of this *first objective* is not only to ensure the correct and timely implementation of the new legislative framework by 31 January 2006 and to complete it by the adoption of appropriate basic tools such as all-electronic forms and an up-to-date classification system but also to ensure that contracting authorities use generally available, non-discriminatory and interoperable means and tools of communication in compliance with the new legislation. These are essential prerequisites for avoiding 'e-barriers' and ensuring competition and effective use of e-procurement applications across Europe.

The *second objective* aims to ensure that electronic public procurement effectively becomes a lever for modernising public procurement more generally, through a more efficient procurement environment for buyers and more competitive procurement markets for suppliers; for example by encouraging the full computerisation of the national transactional environment for public procurement procedures, co-ordinating efforts to cut red tape, encouraging standardisation of the national procurement environment and of documents for the greatest number of users, encouraging automated data collection, promoting transparency, auditing and traceability of e-procurement operations and encouraging SME participation.

Finally, the *third objective* is already sufficiently operational in aiming at bringing the same level of safeguards and discipline in international public procurement trade to ensure EU suppliers' non-discriminatory access to third country markets and to promote e-procurement in an efficient and open way in international trade.

4.2. Policy options

In order to meet these objectives and address the risks and problems identified in section 3, the following policy options were considered:

1. "*Business-as-usual*" scenario, as described in the previous section;

2. The *“classic approach*”: that is, the use of legal instruments available at European level in a focused and limited number of actions in order to ensure the full and correct transposition of the new provisions in national laws, to prevent the emergence of legal barriers and to complete the legal framework by adopting specific instruments (e.g. fully electronic standard forms, updated CPV) including agreement on international disciplines for electronic public procurement.

3. The *“partnership approach*”: that is, to initiate actions across the board in close co-operation and in a coordinated way between the Community and Member States in order to prevent barriers, improve governance and achieve greater efficiency in public procurement markets. In fact, such a “partnership” approach would encompass the “classic approach”, but also complement it by taking initiatives and proposing measures which address specific problems identified in the administrative and technical working environments within which electronic public procurement is set to take place so as to fully exploit efficiencies in the procurement process.

4. The *“full standardisation”:* that is, to promote the development of centrally designed and conceived, and possibly managed, common tools accompanied by detailed descriptions of the desired architecture and functions, including the adoption through regulation of detailed technical standards for the different steps in the electronic public procurement process in a top-down approach, aimed at achieving a uniform technical environment across all Member States and guaranteeing 100% accessibility to e-procurement markets for all tenderers.

Screening of options

The *“business-as-usual”* scenario, or status quo, has already been presented above. This option would not be sustainable in the medium and long run as it bears considerable risks of market fragmentation, low effectiveness and inefficiencies.

Option 4, that is, the *“full standardisation”* of the electronic public procurement environment would also need to be discarded as it is not a viable solution. Although it would eventually create a more uniform technical environment - meaning 100% accessibility to EU procurement markets for all tenderers – its implementation appears unrealistic given market developments and the policy instruments available. Implementing electronic public procurement on the basis of a detailed Community design would have been beyond Community competencies and would conflict with the subsidiarity and proportionality principles. In addition, such a top down approach would be ineffective due to the considerable time and effort this would require in order to accommodate the different needs at sectoral and national level.

Options 2 and 3 could offer an effective response and meet the policy objectives, provided all the appropriate actions for their implementation are correctly identified and adequate means are allocated to their practical implementation.

Figure 5 lists the proposals for action retained for further evaluation and the corresponding objectives to which these actions respond. This list was established on the basis of consultations with the experts in the Member States and through detailed analysis of the different studies and contributions received by the Commission services. Starting from a rather broad list of possible actions, the number of actions was progressively reduced by eliminating those that were considered to either have negligible impact or that were less likely to meet the policy objectives established at the beginning of the exercise.

Some of the actions discarded were, for example, proposals for the simplification of national rules as this is incompatible with the current public procurement policy, whose aim is to co-ordinate procurement procedures rather than to harmonise national laws. Actions aiming at extending the scope of electronic means below the Community thresholds were also abandoned as they conflict with the principle of subsidiarity. The regulation of electronic means for such contracts is an issue for the Member States. Due to their low value such contracts are unlikely to impact on the functioning of the Internal Market. The idea of fixing uniform quantitative targets for Member States' use of electronic public procurement was also set aside. Conditions in the Member States vary considerably, making such initiatives impractical and counter productive.

Figure 5: List of retained actions and corresponding operational objectives

	Objective 1: a well functioning Internal Market		Objective 2: greater efficiency in public procurement			Objective 3: international framework

Comparison of retained options

On the basis of the list of actions presented in Figure 5, the two retained options were compared against the *"business-as-usual"* scenario in order to determine the scope of policy intervention.

Figure 6 summarises the main points from the comparison of the three potential scenarios. It shows that the *"partnership"* option offers the best prospects for successfully introducing electronic means in public procurement. The comparison of the three options shows that the incremental costs for additional measures, beyond the traditional legal approach, are outweighed by far by the potential positive effects that a coordinated approach would have in rolling out electronic public procurement.

Figure 6: General comparison of main scenarios

	Business-as-usual	Classic Approach	Partnership
Main positive impact	The new procurement Directives and the general trend towards use of IT in public administrations will contribute to the uptake of electronic public procurement at least in a limited number of leading countries and regions	Intensive efforts result in correct transposition and application of new rules. Major compliance problems are avoided and legal uncertainties are reduced.	Action plan addresses problems across the board. Correct transposition and application of rules, interoperability and clear objectives reduce Internal Market barriers and stimulate uptake of electronic public procurement
Main negative impact	Main problems and barriers remain unsolved to the detriment of the Internal Market and efficiency in public procurement markets. Uptake of electronic public procurement is limited	Resolution of legal issues only marginally manages to stimulate uptake of electronic public procurement. Technical and organizational difficulties continue to impact negatively on uptake of electronic public procurement and efficiency gains	Some barriers and problems remain mainly because it is impossible to address all the potential problems due to their diverse nature and structural characteristics.
Costs	No direct costs but many opportunity costs as potentials benefits remain unexploited along with important barriers to the Internal Market	Limited direct costs to ensure legal and practical compliance with Internal Market rules and principles. Efficiency gains remain largely untapped	The Action Plan implementation entails higher costs. In light of potential benefits these seem justified. Additionally, economies of scale are achieved due to concerted and coordinated effort at national and European level
Influence on main objectives: **IM** **Lisbon objective**	EU regulation provides limited impulse to moving procurement online. Member States accord priority to other IT applications due to the complexity in reforming markets for electronic public procurement. Lisbon objectives are not met as economic impact is watered down by barriers and limited uptake	Positive impact on the removal of barriers to the Internal Market but limited economic impact due to limited penetration of electronic public procurement and diseconomies in using electronic means. Generalised use of electronic public procurement is not achieved by 2010	Strong impact on the IM and the EU economy as a whole. Likely generalisation of electronic public procurement across Europe.

Source: Adapted from "Impact Assessment of an Action Plan on electronic public procurement", Ramboll Management, December 2004

The impact of policy intervention seems therefore strongest if legal, technical and organisational problems are tackled simultaneously and on the basis of Europe-wide collaboration between all the different stakeholders. Indeed it is materially very difficult to dissociate the legal effects from those of greater efficiency, improved governance and higher competitiveness.Their effects are mutually reinforcing and cumulative.

Such a comprehensive approach requires the close collaboration of the Community and Member States, in line with the principles of subsidiarity and proportionality which should apply in defining the exact measures and identifying the most appropriate actors. The intention is to design an effective policy combining national and Community efforts in a coordinated way so as to facilitate and eventually accelerate the introduction of electronic means in public sector procurement at national and regional level. A coordinated development with clearly defined operational objectives is most likely to maximise benefits for both the public and the private sector. This type of partnership is new in the public procurement area but it is essential; results risk to be delayed and will be unsatisfactory if each Member State tried to deal individually with the complex issues involved.

5. WHAT ARE THE IMPACTS – POSITIVE AND NEGATIVE – EXPECTED FROM THE DIFFERENT OPTIONS?

This section addresses in more detail the possible impact of the actions which the Commission has identified as suitable for the Action Plan on electronic public procurement as part of the combined *'partnership'* scenario.

Figure 7 below lists the detailed actions and evaluates the expected impact on transparency, competition and efficiency of the selected measures described above. Their impact over time is also considered, e.g. whether a measure is likely to become effective in the short-, mid- or long-term. The actions, described in more detail in the Commission proposal for the Action Plan, are linked to each other so as to form a coherent whole. While all actions may therefore be seen to have at least some effect on each of the three criteria, the table shows where the intended impact is thought to be particularly relevant.

Very generally, the common feature of the actions proposed is to help avoiding the transactional costs related to the non-implementation or incorrect implementation of operational e-procurement systems. If one goes into the detail of each group of actions, one can see that the measures retained under option 1 are predominantly geared to achieve greater transparency and, as a consequence, competition; also, they are likely to yield results relatively quickly (1-2 years). Applying a form of 'negative' integration, they aim at abolishing and preventing barriers to the Internal Market in electronic public procurement. In comparison, measures retained under option 2 are geared more towards enhancing efficiency and competition also in national electronic public procurement markets and taking actions towards 'positive' integration by establishing interoperable tools and standards. This process may take longer, with results expected to be visible rather in the mid-term (2-4 years).

Figure 7: Comparative potential impact of proposed Action Plan measures on transparency, competition and efficiency as well as over time

	Action	Transparency	Competition	Efficiency	Impact over time

Source: Assessment by the European Commission services

In terms of the two alternative options previously considered, Objectives 1 and 3 correspond to the "classic" approach, while the three objectives combined correspond to the "partnership" scenario.

The following sub-sections describe the impact of introducing electronic public procurement on the different market actors and sectors of the economy, assuming that all actions listed in Figure 7 are fully and correctly implemented.

5.1. The impact on markets, trade and investment flows

Specific measures in the action plan proposals aim at removing or preventing potential 'e-barriers' in order to avoid fragmentation of procurement markets and to maintain competitive pressure across Europe. Correct introduction of electronic means in the procurement process should indeed increase transparency and strengthen competition in public procurement markets thus providing incentives for higher productivity for both governments and for businesses. Incorrect introduction of e-procurement could result in lesser efficiency in the relations of buyers to suppliers than currently achieved through paper procedures.

The public sector purchases a vast array of goods, works and services. Not all sectors will be equally affected by the introduction of electronic means in the procurement process. Competitive pressure is likely to be bigger for standard off-the-shelf products and services compared to more complex contracts. However, increased transparency should level the field for new entrants who are often outpaced by incumbent players who may capitalise on their better knowledge of public sector markets. It should also impact positively on cross-border trade in public procurement which is today relatively low. The use of electronic means can facilitate cross-border market access for businesses. It should also make it easier for public purchasers to organise on a more international basis where synergies can make cross-border purchases more effective. Initiatives in this direction have been underway in the utilities sector and may be extended to other areas where such types of synergies are available.

It should also be noted that excessive reliance on framework agreements can also limit competition and new market access as such agreements are usually established for 3 or more years. Certainly, the introduction of electronic means in framework agreements could improve their management, in particular if use is made of the multi-supplier agreements which allow the reopening of competition among parties to the agreement. Dynamic purchasing systems offer a credible alternative with the same efficiencies to framework agreements within a much more open procurement environment.

Establishing a European procurement market endowed with modern tools and technologies is a pre-requisite for competing effectively in global markets which are increasingly moving online. The use of electronic means in public procurement is being developed worldwide among the EU's traditional partners such as the United States, Canada and Japan, and new players entering the world ICT market such as China, India and Brazil[18]. In light of current international developments, legal and technical choices in electronic public procurement systems may reduce procurement opportunities for EU businesses in third countries, as well as restrict access of third country suppliers to the EU market. Existing WTO agreements in procurement (General Procurement Agreement, GPA) and bilateral agreements do not regulate their use. In the absence of such regulation, increased share of electronic means in the procurement process could impact negatively on international public procurement trade.

5.2. The direct and indirect costs for businesses

Successful implementation of the Action Plan should have a positive impact on some of the direct costs for businesses involved in public procurement procedures. Public procurement markets are notorious for their red tape. Although precise estimates are not available on tendering costs for businesses, it is clear that economic operators, who could reallocate resources to more productive activities, will benefit from a reduction in the administrative burden.

Businesses can also benefit indirectly from improved management of public contracts and better governance. The scale of such effects depends on the conditions of procurement markets at the outset. The use of electronic means cannot work miracles. While the use of electronic means can help reduce corruption and unlawful practices, it may involve also higher risks for the confidential treatment of commercially sensitive information submitted by tenderers during calls for competition.

5.3. The impact on innovation

Transposition of the procurement Directives will encourage standard e-procurement systems based on existing technologies. The important factor will be to reach a critical mass of buyers and suppliers using e-tendering or e-procurement marketplaces. Whereas the cost side of implementing electronic public procurement is not expected to change significantly for the contracting authorities, the benefit side is expected to improve significantly along with an increasing uptake of electronic public procurement. If that scenario materialises demand for electronic public procurement, this should stimulate investment in ITC both within the administrations and among businesses. The introduction of new procurement procedures and requirements is expected to increase demand for certain IT applications, electronic auctions, e-signatures, decision support tools etc. to the benefit of vendors specialising in this area of services.

5.4. Administrative requirements on businesses

Implementation of electronic public procurement should not lead to an increase in administrative requirements for businesses. On the contrary, it should lead to a reduction in

[18] COM (2004) 757 final, "Challenges for the European Information Society beyond 2005"

the administrative burden and the associated compliance costs during the tendering process. Nevertheless, in certain countries where security requirements for tendering electronically have been set at a very high level, businesses may find themselves obliged to invest in specific solutions in order to be able to tender electronically. The same may happen if tendering is unnecessarily complicated due to the compulsory use of unsatisfactory standards and formats not generally used by industry for the submission of tenders or the inappropriate automation of procurement processes without taking account of industry standards and practices.

There is certainly a trade-off between more stringent requirements and an approach based on a pragmatic assessment of market conditions and the capacity of businesses to cope with public administrations' requirements. The issue of electronic signatures analysed in the previous chapters highlights perfectly these types of problems and their impact not only on domestic markets but also on electronic cross-border trade.

In the absence of pragmatic approaches and solutions, the impact on businesses and on the functioning of the Internal Market could be negative and increase the cost for businesses when carrying procurement procedures electronically.

5.5. Impact on labour market and employment

The resulting economic changes and better governance from electronic public procurement could raise the EU's growth potential by giving an additional stimulus to labour productivity and business dynamism. Implementation of the Action Plan is not expected to have an impact on the functioning of the labour market. However, it may positively affect the quality of labour in terms of the IT skills required from the move to online public procurement.

The deployment of electronic public procurement may only marginally lead to loss of employment insofar as certain larger purchasing authorities may find it necessary to streamline purchasing departments. The most likely scenario is that natural attrition and reallocation of tasks will absorb the excess workforce in public administrations.

It is more than likely that for a certain period electronic means will continue to be used parallel to traditional paper based procedures. The effect on employment for private businesses involved in public procurement contracts would therefore be neutral. Some reallocation of tasks and upgrading of jobs should be expected.

5.6. The consequences for public authorities and governance

Effective introduction of electronic public procurement requires action at the level of public purchasers. The Action Plan calls for governments and major purchasers to establish national and individual plans respectively in order to introduce electronic means in the procurement process. To be effective, such plans should include the allocation of specific funds in national budgets and within the different administrative bodies and agencies.

IT costs for implementing electronic procurement are likely to go down, since a maturing market for electronic public procurement solutions will provide more standard, out-of-the-box solutions which will mean cheaper technology/software. Thus, the cost of an e-public procurement is more significant at the buyer side as it involves the reengineering of existing processes and in many cases requires upgrades in existing hardware and software installations and specific interfaces to link with legacy systems. Thus, the total cost of electronic public procurement is not expected to be significantly lower than currently as the purely IT part only constitutes a relatively small fraction (10-20%) of the total costs. The costs for individual purchasing authorities will be proportional to the number of participants to an electronic public procurement system. Tools and platforms can be shared by many suppliers and agencies, which significantly reduces the costs for users. Many Member States are effectively planning to outsource or sometimes even develop such central platforms that can provide services to individual buyers.

The positive impact on the management of public contracts is evident. Electronic means offer enormous improvements for monitoring expenditure, improved compliance with rules and regulations and auditing of operations.

The modernisation of procurement environment from the introduction of electronic means will pay off for public administrations through better prices and quality of purchases and increased productivity. These savings are proportionately more important for larger administrations with large purchasing departments. Smaller contracting authorities may not at first hand have incentives to use electronic public procurement. An appropriate incentive structure should be found so that benefits are shared across all levels of government.

5.7. The impacts on specific regions and sectors

In organising public procurement electronically, care should be taken not to push for an excessive centralisation of purchases. Without a careful assessment of market conditions, centralisation of purchases can lead to distortions of competition by privileging larger businesses that usually are better positioned to compete for large contracts. Electronic public procurement represents a great potential for SMEs, as administrative burden and transaction costs are proportionately higher for them. SMEs traditionally supplying to the public sector or interested to enter this market will have to adapt to this new environment and learn how to use the new tools. There is danger, however, that the introduction of highly integrated and sophisticated electronic public procurement systems is not affordable for SMEs and could lead to their exclusion from procurement markets if applied too early in the process of switching to electronic public procurement. This became evident in some past marketplace projects which were terminated due to the lack of businesses' participation.

The development of electronic public procurement is usually associated with central government. It is, however, worth noting that many initiatives across Europe are already regionally based. This is an encouraging sign which proves that the economics of electronic public procurement have improved in recent years. In order to make sure that no region is left behind, national plans should encourage development of electronic public procurement at all levels of government. The Action Plan gives the less technologically mature countries and regions an opportunity to catch up with the leading players.

Some sectors are likely to feel the impact of electronic public procurement more strongly than others during the initial phase of development, as pointed out in different studies. At the initial stage, the use of electronic means can be very effective for the procurement of articles characterized by low value of each component and high order frequency. A closer look on the goods, works and services procured by public institutions in Europe shows that the proportion of such purchases in total procurement is rather limited.

5.8. Potential overall economic impact of the proposal

On the basis of the relatively conservative figures of 5% savings on the purchasing price and 50 EUR savings per invitation to tender in administrative costs, it is estimated that annual savings from full implementation of electronic public procurement will amount to almost € 19 billion by 2010, when full generalisation of electronic public procurement can be expected.

Figure 8: Estimated annual savings on purchasing price and administrative costs for buyers (based on 2002 figures for EU15)

Savings on purchasing price	**Savings on administrative costs (buyers)**
▪ Total value of public procurement in the EU15: 1,500 Billion EUR ▪ Value of e-public procurement at a 25% level uptake in the public sector in EU15: 375 Billion EUR ▪ Range of savings realized today: Between 10% - 53% ▪ Conservative estimate for savings on purchasing price: 5% ▪ Estimated total savings calculation: 375 Billion EUR / 5%	▪ Total annual number of public procurement transactions in the EU (above and below threshold): 665,000 ▪ Estimated number of e-public procurement transactions at a 25% level uptake: 166,000 ▪ Savings per invitation to tender: 31% realized (40 EUR – 130 EUR per transaction) ▪ Conservative estimate for savings on administrative costs per transaction: 50 EUR ▪ Calculation for estimated total savings on administrative costs: 166,000 X 50 EUR
Estimated total savings on purchasing price: **€ 18.75 billion per year (for EU15)**	**Estimated total savings on administrative costs:** **€ 8.3 million per year (for EU15)**

Source: *Impact Assessment study on electronic public procurement, Ramboll Management 2004*

The calculations above show that the potential savings seem to be considerable at the aggregate European level, even under a conservative estimate. Annual savings do not include figures from electronic ordering and invoicing nor savings for suppliers or due to increased efficiency and improved governance.

6. MONITORING AND IMPLEMENTATION OF E-PROCUREMENT ACTION PLAN

The Commission assisted by the Advisory Committee for Public Contracts will monitor overall progress in implementing the Action Plan. By the end of 2007, the Commission will review the situation and report on the results achieved. This assessment will concentrate on the progress achieved on the legal front, the development of the necessary infrastructures for carrying procurement electronically, the use of electronic means and progress achieved in implementing the Action Plan. An assessment of economic impacts would be rather premature as experience shows that benefits from such reforms take longer to materialise.

In terms of indicators, the Commission will use the following type of information to monitor progress:

- **Indicators for the implementation of the legal framework:** Transposition of all provisions on electronic public procurement in each member state; timely implementation of the directives; number of legal actions for failure of transposition into national legislation; date of transposition of the directives into national legislation.

- **Indicators for use of electronic means in public procurement process:** share of notices dispatched electronically by contracting authorities; share of tender documents accessible electronically; number and volume of dynamic purchasing systems; share of calls for tender using electronic auctions.

- **Economic indicators:** statistical information is already collected on public procurement markets; these will be progressively extended to cover electronic means such as the share of central purchasing and evolution of dynamic purchasing systems

7. RESULTS OF THE STAKEHOLDER CONSULTATION

7.1. Which stakeholders were consulted, at which stage of the process and for what purpose?

To complement the Impact Assessment and guarantee the widest input possible to the Action Plan, the Commission has consulted all parties involved in introducing electronic public procurement: Member States and public administrations (buyers); economic operators and business associations (suppliers) and providers of electronic public procurement systems. Findings from these consultations have been thoroughly examined and taken on board in the Action Plan.

Because of the very nature of public procurement, national governments have a key role in introducing electronic procedures. This is why the Commission has sought to work in close partnership with the Member States.

- As a first step, the Commission organised detailed discussions on an on-going basis with the ***Advisory Committee on Public Contracts*** and in particular, the ***Working Group on e-procurement*** set up under its auspices, in order to bring together legal and technical experts actively involved in the development of electronic public procurement in the Member States. Member States tabled specific proposals. Discussions in the group during 2004 allowed the Commission services to create a synthesis of the views expressed in the group and to put forward specific proposals for action at EU and national level.

  In the framework of the impact assessment study, the contractor also consulted national experts on the state of play in each Member State.

- In addition, members of the ***Consultative Committee for the Opening of Procurement Contracts (CCO)***, including procurement specialists from academia, business associations and trade unions as well as procurement practitioners examined the impact of the forthcoming legislative framework for conducting procurement electronically and the draft Action Plan in three consecutive meetings from December 2003 to November 2004.

- In May 2004, the Commission organised a one-day conference in Brussels via the IDA programme on the topic ***'Electronic public procurement: bringing down e-barriers'***. The conference gathered approximately 450 participants from national administrations, industry and standardisation bodies and discussed technical developments and interoperability questions raised by the implementation of electronic public procurement.

To ensure the practical relevance of its proposals for action, the Commission has equally sought constant exchange with representatives of business.

- Based on its 'Interactive-Policymaking' tool (IPM), the Commission conducted an ***online survey*** on the attitudes to e-procurement of businesses and business associations from 15 September to 15 November 2004. More than 400 participants from all EU Member States, including the new members, as well as of EFTA and other third countries responded to the voluntary survey on their experiences with and expectations towards e-procurement.

  While the survey may be positively biased towards those businesses and business associations that already have experience with the use of electronic means in conducting business with government, it captures a first picture indicating both trends and areas of concern for businesses across Europe.

- Individual contributions were received from UNICE (European employers' confederation), Eurochambers (Association of European Chambers of Commerce and Industry) and the Chamber of Commerce and Industry of Paris. E-procurement was also one of the main themes at the UNICE conference 'Public procurement: the new regime ahead' in Oslo from 29-30 September 2004.

- Finally, the Commission services pursued contacts with operational e-procurement systems providers, IT vendors and industry experts through bilateral meetings and in public conferences.

7.2. Results of the consultations

The consultations showed a relative convergence of views of the different actors involved. All parties welcomed the new legislation on e-procurement, with some, e.g. UNICE and Eurochambers, calling explicitly for action by the Commission to facilitate its implementation. At the same time, the contributions made clear that legislative and implementing measures should aim at setting the general framework and improving conditions for conducting public procurement electronically, whilst development of specific systems and software solutions should be left to the markets.

Member States

All Member States recognise the potential of e-procurement for increased savings and greater efficiency, and hence the beneficial impact of migrating rapidly to electronic procedures. In fact, many consider e-procurement as a lever to modernise their public procurement more generally. At the same time, Member States identified together with the Commission major risks of incorrect implementation. The Working Group's priority was to clarify in detail the legal and functional requirements of the Directives. It also concentrated on the potential objectives and scope for action.

In the discussions and written contributions, it was evident that implementation of the new Directives will need to be supported by specific additional measures and accommodate different needs arising from Member States' different legal traditions, as well as their varying state of advancement in setting up operational e-procurement systems, e.g. in addressing the question of how to best organise the transition from, and possibly co-existence of, paper-based and electronic procedures.

After a detailed discussion in the ePWG, Member States in the ACPC endorsed the thrust and general principles underlying the draft Action Plan and its overall content. While some countries anticipate potential difficulties in implementing the Action Plan within the proposed time-frame, they consider it would, however, be a very good reference and political support for action. National plans setting performance targets were accepted as the most appropriate instrument and incentive to achieve the objectives of the Action Plan in due time.

Industry and business associations

UNICE and Eurochambers strongly welcome the Action Plan. They are particularly aware of the Internal Market aspects of e-procurement and support a coordinated approach to avoid fragmentation of EU public procurement markets through new 'e-barriers'. The mutual compatibility of the technical systems of the bidding industry and public authorities is the prerequisite to achieve cross-border procurement and to make e-procurement an incentive for businesses to go and trade online. Echoing the concerns of individual businesses about transparency, security and interoperability of electronic procurement procedures, industry associations therefore call for common guidelines on functional requirements for e-procurement systems, and even for harmonising 'to the greatest extent' the requirements set within the individual Member States, as well as for using internationally recognized applications and standards.

They have identified specific points to be most urgently addressed, namely such that relate to the mandatory use of qualified electronic signatures in some Member States and the transparency of and procedural safeguards for electronic auctions, followed by rules on electronic archiving and data protection.

Finally, both the IPM survey as well as consultations of UNICE show that businesses expect e-procurement to yield advantages for SMEs, such as new market opportunities and lower bidding costs. These are thought to outweigh possible detrimental effects from greater competition by large-size companies.

Business IPM survey

Individual businesses favour the introduction of electronic public procurement but remain cautious regarding security and performance, probably due to lack of familiarity with the new tools and procedures.

Asked what was important for them in using electronic public procurement, over half of the businesses interviewed in the IPM survey said that it should involve less effort than procedures using paper-based means (63.9%); that it should be easy to use, with reliable IT tools (62.5%), and that transparency of the electronic tendering procedures should be ensured (63.2%). In contrast, costs for investment in IT tools or the issue of staff training were considered less important (33.7% and 14.4% respectively).

Today, it seems that many businesses have already used electronic means in the early stages of a public procurement procedure, and consider the experience useful. Thus, a majority of 89.8% of businesses interviewed welcomed the opportunity to download specifications and tender documents and to search for tender opportunities online. This reflects the importance of transparency and possibly the use of tools already available, not least via EU sites such as TED. In comparison, more advanced tools - many of which may not yet be generally available in practice - are viewed with greater caution, such as documents using XML-standards, electronic signatures or electronic auctions. Instruments familiar from electronic commerce transactions, in particular for carrying out financial transactions such as electronic payments, also seem to be considered relatively useful (70%).

According to the survey a great majority of businesses is favourable to the immediate or progressive introduction of electronic public procurement in the EU (31% and 59.6% respectively). The greatest role for the Commission is seen in standardisation activities, e.g., with regard to forms and documents (67.3%), but also to electronic tools (47%). Secondly, the Commission is expected to promote the use of simple and generally available tools for conducting e-procurement (60%).

8. COMMISSION PROPOSAL AND JUSTIFICATION

(Tentative conclusions to be confirmed when the Commission adopts its proposal)

After examination of the all above options, the evaluation of the available information and the extensive consultations of stakeholders, the Commission is of the opinion that the adoption of an Action Plan on electronic public procurement is the most effective way to ensure the smooth functioning of the Internal Market when implementing the legal framework for electronic public procurement, to achieve greater efficiency in procurement, and to improve governance and competitiveness.

This solution relies on close co-operation and partnership between the Commission and the Member States in order to exploit the available synergies and co-ordinate efforts among all the actors involved in implementing the Action Plan. This may appear as a weakness as compared to more orthodox tools of regulatory intervention and legal action. In this environment, however, such tools would have been ineffective in view of the complexity of implementing electronic public procurement. In addition, the chosen route is compatible with the subsidiarity and proportionality principles which should be guiding the Community policy.

The targets and actions foreseen in the Plan are scheduled to be implemented over a short period. The decision to fix a tight schedule is driven by needs on the ground and the 31st January deadline for transposition of the legislative package of EU public procurement Directives. The foreseen monitoring of the Action Plan will provide feedback on progress achieved and provide guidance in due course on any additional operational needs and possible adjustment of targets.

Annex II: The issues at stake and driving forces

The issues at stake

The implementation of the EU public procurement Directives agreed back in the 80s and 90s as part of the Single Market programme has increased cross-border competition and improved prices paid by public authorities[19]. Despite this progress, cross-border trade for procurement contracts remains low and advertising for business opportunities has not reached its full potential. In addition, the paper based processing and documenting of procurement information and transactions is slow, cumbersome and costly; in particular for SMEs[20],tendering costs can be disproportionately high as the same documentation and information is requested in different formats and must be submitted several times in order to participate in a call for tender. At macro level, lack of efficiency and barriers to trade in public procurement markets impact negatively on public finances and the control of public spending[21].

The possibilities offered by IT tools for improving cost efficiency and increasing competition in public procurement markets were already acknowledged in the *e*Europe Action Plan[22] which made electronic public procurement one of its priorities. Academics and practitioners all agree that if implemented correctly, electronic public procurement can:

- foster competition and improve cost effectiveness in public contracts, contributing to reducing fiscal expenditure and stimulating a more competitive supply base;
- generate savings of time and costs in the contract award process and improve the administration and implementation of contracts awarded;
- increase transparency and fairness in the award of contracts, contributing to stronger credibility and attractiveness of the public procurement market;
- contribute to better monitoring and auditing of contracts and hence improve compliance with rules and policies, thus minimising corruption and abuse;
- strengthen competitiveness with improved access to public sector markets and better opportunities for cross-border trade.

Figure 1 summarises these benefits for governments, suppliers and the public in general from the perspective of transparency and efficiency gains.

[19] As estimated in the Commission staff working paper on the functioning of public procurement markets in the EU[2], 10% savings in public procurement expenditure could have turned most of Member States' budget deficits in 2002 to surpluses while no euro zone Member State would have broken the 3% public sector deficit ceiling; "A report on the functioning of public procurement markets in the EU: benefits from the application of EU directives and challenges for the future", Commission staff working document, 3 February 2004 http://europa.eu.int/comm/internal_market/publicprocurement/studies_en.htm

Figure 1: Potential benefits from electronic public procurement

		Government	Suppliers	Public
Transparency		• Anti-corruption • Increased number of suppliers • Better integration and interaction between governments • Professional procurement monitoring • Higher quality of procurement decisions and statistics • Political return from the public	• Increased fairness and competition • Improved access to the government market • Open the government market to new suppliers • Stimulation of SME participation • Improved access to public procurement information • Government accountability	• Access to public procurement information • Monitor public expenditure information • "Have a say" in public sector purchases • Government accountability
Efficiency	***Costs***	• Lower prices • Lower transaction costs • Staff reduction	• Lower transaction costs • Staff reduction • Improved cash flow	• Redistribution of fiscal expenditure
	Time	• Reduction in fiscal expenditure • Simplification/ elimination of repetitive tasks • Communication anywhere/anytime • Shorter procurement cycle	• Simplification/ elimination of repetitive tasks • Communication anywhere/anytime • Shorter procurement cycle	• Communication anywhere/anytime

Source: *Electronic Government Procurement World Bank draft strategy, October 2003*

The overall positive effect on the economy in terms of competitiveness and improved allocation of resources from moving public sector procurement online is obvious. Electronic public procurement can lead to substantial productivity gains for both governments and for businesses as well as to important cost reductions and to price savings. The resulting economic changes should raise the EU's growth potential by giving an additional stimulus to labour productivity and business dynamism. Further, establishing a European procurement market endowed with modern tools and technologies is a pre-requisite for competing effectively in global markets which are increasingly moving online[23].

In social terms, the effects can also be positive not only due to higher growth and productivity but also to improved public sector performance in terms of services, public sector accountability and redistribution of fiscal expenditure.[24] Improved governance and reduced

[23] "Electronic Government Procurement World Bank draft strategy", October 2003;
"OECD Information Technology Outlook 2004"

[24] Although environmental concerns are not a key issue here, some reports have found a positive impact in terms of reduction in the use of paper as a result of digitisation of the procurement process. MOD/Industry Commercial Policy Group: "Defense e-Business – A guide to Commercial Issues". (2004)

opportunities for fraud and corruption can render public sector procurement more attractive. Indeed, the electronic documentation of procurement transactions can enhance management's information on spending and contracts' performance by encouraging possible savings and making governments more accountable in spending taxpayer's money. In addition, the electronic processing and documentation of procurement information and transactions, and the possibility to track down their detail at each stage of the procurement process, reduce opportunities and incentives for fraud. In the short term, certain adjustment costs should be foreseen in the public sector due to the need to reorganise purchasing activities and to reallocate responsibilities and tasks in departments which are responsible for the purchase of goods and services. However, the benefits from implementing electronic public procurement solutions outweigh such costs.

Benefits will not only be felt at the macro level. Inefficiencies and lack of transparency in public procurement markets impact on the costs and the quality of goods, works and services purchased by public authorities, affecting negatively both the value for taxpayers' money and the quality of services provided by the public sector. In addition, the administrative burden of complying with procurement procedures, the high transaction costs and the lack of transparency in contract opportunities often deter businesses from entering public procurement markets and from competing across borders or regions. The re-engineering of traditional paper based procedures required to operate electronic public procurement effectively can change this by, for example, automating repetitive and routine tasks and streamlining administrative processes. On the buyer side, the simplification and speeding up of procurement procedures can release resources currently tied up in performing bureaucratic tasks so as to improve the management, monitoring and performance of contracts. On the supplier side, businesses can also concentrate on improving their offer rather than focusing on compliance with administrative requirements.

Adoption of the EU legal framework for the use of electronic means in the public procurement process was a first significant step in order to remove legal uncertainties and establish the required safeguards for open, transparent and non-discriminatory public procurement using electronic means. The use of electronic means in the procurement process encompasses a broad range of solutions: the simple dispatch of notices for publication on electronic tender boards; the online access to tender documents and specifications; the exchange of messages and electronic submission of tenders and the evaluation and award of contracts including electronic auctions, and even fully fledged electronic systems for purchasing goods, services and works. But the use of electronic means is not limited to public procurement procedures only: it extends to the whole purchasing cycle from the stage of defining specifications up to billing and monitoring of contracts. Some of the most advanced IT applications developed by the market in e-business are used precisely in the ordering and invoicing stages of the purchasing cycle.

The transformation from paper based to electronic procurement is a complex operation which requires action and decisions at many levels beyond the simple transposition of the new rules at national level. Organisational, technical and institutional issues should be addressed in order to re-engineer existing processes for tendering and purchasing, so as to be able to exploit the available ICT solutions and tools.

The move from paper based to electronic procurement is not without risks. Incorrect application of the new EU rules and discriminatory technical solutions and practices can deter businesses from embracing electronic public procurement and effectively fragment the Internal Market. Correct and timely implementation of the new EU provisions on electronic public procurement will determine Europe's capacity to keep the market open for public procurement conducted electronically and reaching a critical mass of users (buyers and suppliers). Use of electronic means should guarantee in practice that any business in Europe with a PC and an internet connection can participate in a public purchase conducted electronically.

Spreading electronic public procurement across Member States and regions is a major challenge for most public authorities. Its effective use will determine the size of benefit for buyers, suppliers and the economy as a whole. Network effects are important in this area and therefore, achieving a balanced development across all Member States is crucial for releasing the full potential from moving public procurement online. Its speedy application in all Member States will be decisive for further raising Europe's competitiveness. The challenge for policy makers and public purchasers is to ensure that the legal and technical conditions do not raise barriers to the Internal Market and allow for effective, open and fair competition in public procurement across Europe.

The driving forces in introducing electronic public procurement and parties affected

Various factors will influence and determine the development of operational electronic public procurement. Figure 2 illustrates the main driving forces which are expected to influence the transformation from traditional paper based to electronic procurement. While there can be variations between Member States and differences in the importance of these forces, the model is rather generic and can be used for analysing alternative options for policy intervention in order to promote electronic public procurement across Europe.

The fundamental role of the *regulatory framework* is evident. The forthcoming transposition into national law of the EU procurement rules will provide the framework for the evolution of electronic public procurement in the coming years. The correct understanding of these rules, their timely implementation and uniform application will determine to a large extent the pace and quality of the environment for moving traditional public procurement procedures online.

The *institutional set up and organisational structures* put in place to operate public procurement electronically are one of the keys for the successful switch to electronic public procurement. They determine the relations of contracting authorities with different stakeholders, define their respective roles and responsibilities, and establish a framework for interaction between the authorities involved and private economic operators. There are numerous contracting authorities of different sizes and institutional character involved in the organisation of procurement competitions. There can be large government purchasing organisations (e.g. Ministries or central purchasing bodies), or small organisations, such as municipalities and local authorities. Similarly, on the supply side a wide range of businesses with different profiles and interests are involved. It is clear that administrations and businesses have a mutual interest in working together in order to benefit both from the opportunities offered by electronic means in the procurement process. However, incentives of the different stakeholders can vary enormously, therefore, in order to succeed in operating procurement electronically, the institutional and organisational set up should provide the right balance and the right incentives to all the stakeholders involved.

Human resources, knowledge and organisational capacity as well as ICT skills are capital in moving procurement online as they determine the readiness of the actors involved to employ new working processes and apply new technologies. In moving public procurement online, staffs both in the public and in the private sectors will need to become familiar with the new tools and procedures. Retraining staff to deal with more qualified tasks will also be necessary on both sides. Even if ICT technologies could fully automate the different stages in the purchasing process, human resources would remain central as they define the processes and programme, manage the IT systems and ultimately decide on actual purchases.

Finally, the *technology available* for electronic public procurement and the level of standardisation in solutions applied will determine the evolution and uptake of electronic procedures. The concept of *interoperability* stands out as a core element here, that is, the mutual compatibility of systems used by buyers and suppliers. Interoperability is important in the entire procurement process - from tendering to invoicing - to ensure that the move of public procurement online does not create new barriers to actors willing to participate in public procurement markets. A high degree of interoperability will increase participation in procurement carried out electronically whereas lack of interoperability will constitute an important barrier. *Security* is also an important issue. Some suppliers and buyers are concerned about using the Internet to transmit confidential information. Possible security flaws in transactions over the internet can decrease supplier confidence and trust in e-procurement, while too high security standards can generate barriers to electronic transactions if the solutions applied are not generally available.

9.2. Annex III: Results of the interactive policy making survey

k. Electronic payments:			
		Number of replies	**% of total**
	are not useful	6	(1.5%)
	make no difference	28	(6.8%)
	are useful	289	(70%)
	I don't know	19	(4.6%)
	I have no experience with this tool	68	(16.5%)

I. Documents using XML standards:			
		Number of replies	**% of total**
	are not useful	6	(1.5%)
	make no difference	12	(2.9%)
	are useful	177	(42.9%)
	I don't know	68	(16.5%)
	I have no experience with this tool	140	(33.9%)

Section 3			
Which, if any, significant problems or barriers have you encountered - or do you anticipate - when using electronic means whilst participating in public procurement in your own country? Please tick the appropriate box(es).			
		Number of replies	**% of total**
	Inappropriate design of tendering systems	181	(43.8%)
	Incompatible IT standards	123	(29.8%)
	Inappropriate security arrangements	106	(25.7%)
	Inadequate legal framework	97	(23.5%)
	Insufficient commercial benefits	86	(20.8%)
	High adjustment costs	66	(16%)
	Lack of IT skills	58	(14%)
	I don't know	52	(12.6%)
	No barriers encountered	50	(12.1%)
	My business is not suited for electronic trade	42	(10.2%)
	The necessity of reorganising our company	35	(8.5%)
	Other	21	(5.1%)

Which, if any, significant problems or barriers have you encountered - or do you anticipate - when using electronic means whilst participating in public procurement in other EU Member States? Please tick the appropriate box(es).

		Number of replies	% of total
	Linguistic barriers	141	(34.1%)
	Inappropriate design of tendering systems	135	(32.7%)
	I don't know	121	(29.3%)
	Incompatible IT standards	119	(28.8%)
	Inadequate legal framework	102	(24.7%)
	Inappropriate security arrangements	84	(20.3%)
	Insufficient commercial benefits	54	(13.1%)
	High adjustment costs	53	(12.8%)
	Lack of IT skills	52	(12.6%)
	My business is not suited for electronic trade	31	(7.5%)
	The necessity of reorganising our company	25	(6.1%)
	Other	21	(5.1%)
	No barriers encountered	14	(3.4%)

Which other factors do you think may limit the generalised use of electronic public procurement? Please tick the appropriate box(es).

		Number of replies	% of total
	Different rules in Member States	248	(60%)
	Complex rules in tendering procedures	212	(51.3%)
	Lack of information on how electronic tendering works	193	(46.7%)
	Fear of corrupt practices	131	(31.7%)
	Unsatisfactory rules on the security of data transmission	121	(29.3%)
	Lack of trust in electronic tools	118	(28.6%)
	Risks involved in doing business electronically	104	(25.2%)
	I don't know	20	(4.8%)
	Other	16	(3.9%)
	None of the above	15	(3.6%)

Are you aware that the recently adopted European Directives on public procurement introduce, for the first time, the use of electronic means in public procurement?			
		Number of replies	**% of total**
	Yes	221	(53.5%)
	No	145	(35.1%)
	I don't know	47	(11.4%)
Do you believe that the new rules on the use of electronic means in public procurement will resolve the concerns you mentioned earlier?			
		Number of replies	**% of total**
	Yes	48	(11.6%)
	No	62	(15%)
	I don't know	102	(24.7%)
In which fields do you think the European Commission should further undertake action in order to resolve the concerns you mentioned earlier? Please tick the appropriate box(es).			
		Number of replies	**% of total**
	Standardisation of forms and documents	278	(67.3%)
	Promotion of simple and generally available tools for procurement	249	(60.3%)
	Standardisation of electronic tools	194	(47%)
	Modernisation of the legal environment	182	(44.1%)
	Interoperability between electronic procurement systems	167	(40.4%)
	Environment for secure transactions	142	(34.4%)
	Remove obstacles to crossborder transactions	127	(30.8%)
	I don't know	20	(4.8%)
	Other	13	(3.1%)

Section 4			
Do you think that using electronic means in public procurement will make it easier to do business with the public sector?			
		Number of replies	**% of total**
	Yes	291	(70.5%)
	No	76	(18.4%)
	No opinion	46	(11.1%)
In your opinion, are there any substantial differences between trading with businesses electronically and doing electronic procurement with the public sector?			
		Number of replies	**% of total**
	Yes	209	(50.6%)
	No	127	(30.8%)
	No opinion	77	(18.6%)
The level of service is:			
		Number of replies	**% of total**
	worse	70	(16.9%)
	more or less the same	53	(12.8%)
	better	38	(9.2%)
	No opinion	36	(8.7%)
Procedures are:			
		Number of replies	**% of total**
	more or less the same	72	(17.4%)
	more unfair	55	(13.3%)
	fairer	37	(9%)
	No opinion	34	(8.2%)

Costs are:			
		Number of replies	% of total
	lower	63	(15.3%)
	higher	56	(13.6%)
	more or less the same	50	(12.1%)
	No opinion	26	(6.3%)
The level of trust is:			
		Number of replies	% of total
	more or less the same	82	(19.9%)
	lower	55	(13.3%)
	higher	35	(8.5%)
	No opinion	25	(6.1%)
Tendering systems are:			
		Number of replies	% of total
	more or less the same	71	(17.2%)
	No opinion	53	(12.8%)
	not reliable	36	(8.7%)
	reliable	35	(8.5%)
Tendering systems are:			
		Number of replies	% of total
	Complex to use	94	(22.8%)
	More or less the same	41	(9.9%)
	No opinion	35	(8.5%)
	Easy to use	28	(6.8%)

Section 4.1			
a. The use of electronic means in public procurement makes the process:			
		Number of replies	**% of total**
	more transparent	175	(42.4%)
	more or less the same	162	(39.2%)
	less transparent	42	(10.2%)
	No opinion	34	(8.2%)
b. Electronic means in public procurement provides:			
		Number of replies	**% of total**
	more or less the same security	218	(52.8%)
	more security	86	(20.8%)
	less security	57	(13.8%)
	No opinion	52	(12.6%)

c. The use of electronic means in public procurement:			
		Number of replies	**% of total**
	decreases transaction costs	266	(64.4%)
	more or less the same	82	(19.9%)
	No opinion	38	(9.2%)
	increases transaction costs	27	(6.5%)
d. Using electronic means in public procurement makes the process:			
		Number of replies	**% of total**
	faster	287	(69.5%)
	more or less the same	86	(20.8%)
	No opinion	31	(7.5%)
	slower	9	(2.2%)
e. The use of electronic means in public procurement makes it:			
		Number of replies	**% of total**
	easier to find information	300	(72.6%)
	more or less the same	58	(14%)
	No opinion	29	(7%)
	harder to find information	26	(6.3%)
f. Using electronic means in public procurement will help:			
		Number of replies	**% of total**
	competition to increase	215	(52.1%)
	more or less the same	136	(32.9%)
	No opinion	37	(9%)
	competition to decrease	25	(6.1%)

g. Using electronic means in public procurement creates:			
		Number of replies	**% of total**
	more business opportunities within the Internal Market	205	(49.6%)
	more or less the same	131	(31.7%)
	No opinion	47	(11.4%)
	less business opportunities within the Internal Market	30	(7.3%)
h. Using electronic means in public procurement:			
		Number of replies	**% of total**
	enhances international co-operation	77	(18.6%)
	more or less the same	33	(8%)
	No opinion	10	(2.4%)
	makes international co-operation more difficult	1	(0.2%)
h. Using electronic means in public procurement:			
		Number of replies	**% of total**
	allows easier access to new markets	272	(65.9%)
	more or less the same	88	(21.3%)
	No opinion	31	(7.5%)
	limits access to new markets	22	(5.3%)
Section 4.2			
How advanced is your country in the move from paper based means to electronic means in the area of public procurement?			
		Number of replies	**% of total**
	Electronic means are starting to be used in public procurement	262	(63.4%)
	I don't know	57	(13.8%)
	Procedures are all based on paper based means	56	(13.6%)
	Electronic means are generally used in public procurement	35	(8.5%)
	Procedures are all based on electronic means	3	(0.7%)

In what way do you think that electronic means should be introduced in public procurement within the EU?			
		Number of replies	**% of total**
	Progressively	246	(59.6%)
	Immediately	128	(31%)
	No opinion	19	(4.6%)
	Maybe in 5 years..	12	(2.9%)
	Never	8	(1.9%)
In which sectors do you think that the use of electronic means in public procurement will create most opportunities?			
		Number of replies	**% of total**
	Services	250	(60.5%)
	Trade	186	(45%)
	Construction	103	(24.9%)
	Manufacturing	96	(23.2%)
	No opinion	74	(17.9%)
In your opinion, how will a generalised use of electronic means in public procurement impact on SME's?			
		Number of replies	**% of total**
	SME's will have more opportunities to penetrate new markets	206	(49.9%)
	SME's will have lower bidding costs	151	(36.6%)
	The increase of competition will squeeze SME's margins	129	(31.2%)
	SME's risk loosing long-term business relationships	116	(28.1%)
	SME's are outcompeted by larger companies	89	(21.5%)
	I don't know	67	(16.2%)
	None of the above	12	(2.9%)
	Other	10	(2.4%)

Electronic Public Procurement in EU Member States: Country Reviews

Extract of the Extended Impact Assessment Study:
Action Plan on electronic public procurement
Part 1 Baseline Analysis

December 2004

Produced by Rambøll Management

Study commissioned by the EUROPEAN COMMISSION

1. Introduction

The Internal Market Strategy sets out the target by 2006, to carry out a significant part of public procurement on an electronic basis and by 2010, to ensure that electronic public procurement has been generalised to meet the Lisbon objectives. To meet the targets, the European Commission adopted an Action Plan on e-public procurement and conducted an Impact Assessment of the Action Plan. The Extended Impact Assessment study was carried out by RAMBOLL Management for the Internal Market Directorate-General.

As part of the report on the Extended Impact Assessment, the following sections contain the presentations of the current status of electronic public procurement in each of the EU Member States. Each section follows the same structure and includes descriptions of:

- The organizations and institutions responsible for implementing e-public procurement
- The national strategies and objectives for e-public procurement
- Legal framework
- Current usage of electronic means in public procurement
- Promotion of e-public procurement

The country reviews are based on two main sources of data:

- Desk research of official documents, strategy papers etc. in EU Member States, reports and analyses of e-public procurement and public procurement at country level and at European level and of the forthcoming European public procurement directives.
- Interviews and consultations with experts in Member States and representatives of governmental institutions responsible for or involved in public procurement and the development of e-public procurement in the country.

In this regard it should be noted that the reviews attempt to include use and experiences of e-public procurement systems at all levels of government in the Member States (national, regional, local), but does not uncover the vast total number of existing e-public procurement systems and primarily looks at the situation in a Member State seen from the perspective of the central level (due to the fact that the main data sources are key documents prepared at the national level and interviews with experts and representatives at the central, governmental level).

2. Austria

2.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Federal Chancellery (Bundeskanzleramt, www.bka.gv.at)
Responsible institution(s) for legal aspects	Federal Chancellery (Bundeskanzleramt, www.bka.gv.at) The "Länder" (regions, according to the Austrian Federal Constitution) regarding remedies procedures
Responsible institution(s) for technical solutions	Austrian Federal Economic Chamber (Wirtschaftskammer Österreich) has been dealing with the implementation of e-procurement in practice. It initiated the electronic public procurement service "er@t" which is now continued by the tender service company Auftrag.at ausschreibungsservice GmbH (www.auftrag.at). It contains all Austrian tenders as well as EU-wide tenders (TED). Austrian Standards Institute (www.on-norm.at) is currently working on a contractual standard for public e-procurement
Central procurement institution(s)	Federal Procurement Company Ltd. (Bundesbeschaffung GmbH, www.bbg.gv.at) organizes the field of procurement, excluding works at the national level. The Federal Procurement company is the purchasing service provider, mainly to the federal state administration and offers its services also to the regional governments and municipalities. Its responsibility lies in realizing a large number of enumerated services and supplies procurements for the federal state, whereas the regional and local levels do not have a central procurement facility and procurement is mostly done by the individual institutions.
Other important organisations	Chief Information Office (www.cio.gv.at) creates, coordinates and supports the implementation of e-government. ICT-Board is staffed by the federal chief information officer and one member of each Federal Ministry. It is the central department for consolidating the different IT-activities at the state level.
Type of coordination between different institutions	-

2.2 Strategy

Within the area of e-procurement there is no explicit strategy and no quantitative objectives due to lack of staff capacities within public procurement institutions to work with e-public procurement.

However, the overall federal Austrian e-government strategy is based on tight cooperation between all public stakeholders, which means the national level, regions, cities and municipalities as well as lobbies and major public institutions. Innovative e-government is therefore an important aim.

Another key element is to work for the adoption of uniform interfaces and for clear as well as open standards. This would avoid further adjustments between single parts of applications. Therefore, there is a need to define uniform standardized processes, data formats and specifications for all proceeding steps.

2.2.1 Statement of objectives

With the overall readjustment of the administration towards e-government, the Austrian government highly prioritizes its e-government efforts and with it e-public procurement.

There are no specific objectives on e-public procurement. However, the main objective hereby lies in the online provision of all federal administration services to the public by 2005.[1]

As public services are not excluded from the budgetary savings, the Austrian government is very motivated to extend its provision of e-government in order to realize financial savings of administrative costs that are expected to account to EUR 1.5 billion. Also, it emphasizes increasing efficiency. The government plans to create the most advanced European administration in the upcoming years.

Another overall objective is to implement the new procurement directives to facilitate e-public procurement and to create and transmit tenders electronically using electronic signature

2.2.2 Scope of strategy

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	A year of fulfilment has yet to be set

2.2.3 Existing guidelines

A special regulation for electronic procurement especially concerning e-offers, has been issued ("Verordnung der Bundesregierung betreffend die Erstellung und Übermittlung von elektronischen Angeboten in Vergabeverfahren – E-Procurement-Verordnung 2004")

[1] http://www.cio.gv.at/egovernment/strategy/Teil_I.html

2.3 Legal framework

2.3.1 Legal status of the use of electronic means in Public Procurement

So far, the areas "rules applicable to communication", "storage of data" and "the use of specific procedures, e.g. e-auctions" are regulated in the legal framework.

Austria was the first country to implement the Directive on Electronic Signatures with its Electronic Signature Act in 1999 (Signaturgesetz BGBl I 1999/1). The same day that the EU directive (e-signatures Directive, 1999/93/EC) became effective, the Austrian Electronic Signature Act was implemented as well.

According to national standards for the electronic exchange of data there are two norms in the field of works: Ö-Norm B 2063 and Ö-Norm B 2064.

2.3.2 Implementation of the Directives

The government expects that the forthcoming EU public procurement directives will be implemented in 2005.

2.3.3 Status of tools

Public procurement portals	There is no official central electronic public procurement portal in Austria so far. At present the Bundeskanzleramt is planning a portal which should be implemented in approximately two years. So far, the most important portal on national level is the portal "@-AVA" of the national railways company "Österreichische Bundesbahnen", www.oebb.at
	www.lieferanzeiger.at is an online database by the official Viennese newspaper and a private enterprise
	The construction industry has its own database Ausschreibung (www.ausschreibung.at) which offers tenders online. It has open as well as public tenders and offers information on the bidders as well.
Electronic signature	An advanced electronic signature based on qualified certificated has been introduced. The use of electronic signature is mandatory when participating in public calls for competition
Electronic catalogues	Pilot schemes of the implementation of e-catalogues have been outlined
Electronic auctions	On an experimental level, implementation of an e-auction system has been started
Dynamic Purchasing Systems	Pilot schemes of the implementation of dynamic purchasing systems have been outlined
Framework agreements	Below the threshold values the use of framework agreements is possible

2.3.4 Reference to the relevant legal acts

Use of electronic means is regulated by:

- E-Government-Gesetz, BGBl. I 2004/10: The government passed the e-government law in Februrary 2004 which regulates the electronic communication with public bodies. Accompanying the e-government law, the government passed the administration signature regulation (Verwaltungssignaturverordnung (VerwSigVO), BGBl. II 2004/159). It contains the security, technical and organisational relevant requirements for the administration signature.
- Bundesvergabegesetz (BVergG), BGBl I 2002/ 99: The law on Federal tender creates the legal conditions for electronic tender. Since-July 2003, it is possible to make overall invitations to tender for the state, regions and municipalities. Accompanying the BVergG a special regulation for electronic procurement has been issued (see above 1.2.3.)
- Bundesbeschaffung GmbH (BB-GmbH-Gesetz) BGBl I 2002/99: The Federal Procurement Company was created with the passing of the Law in 2002. This concentrated the task of federal procurement into one body.

2.4 Current usage of electronic means in Public Procurement

So far, there is very little experience with electronic means in public procurement. Nevertheless, the Federal Procurement company is running pilot projects in each field of the procurement phase and hopes to implement them shortly for regular use.

An international study found out that Austria is the country that had the highest growth in full electronic case handling in its e-government activities and in the field of e-public procurement in 2003. (Full electronic case handling means that the publicly accessible website offers the possibility to completely treat the public service via the website, including decision and delivery. No other formal procedure is necessary for the applicant via "paperwork"). Compared to 2002 it increased by 48 per cent to now 68 per cent in terms of percentage of services that offer a complete electronic case handling. This is the largest progress inside the EU and gives Austria a good standing at second place of the EU-wide study[2].

2.4.1 Which phases of procurement are covered?

The status for automating procurement phases in Austria is as follows:

- Notification about tender (to some extent)
- Publication of tender (to some extent)
- Management of receipt/submission of tenders (to a low extent today)
- Evaluation of tenders (to a low extent today)
- Ordering (to a low extent today)
- Invoicing (to a low extent today).

[2] Source: Cap Gemini Ernst & Young

2.5 Raising awareness & Promotion of electronic means

Austria is expecting that ‘buyer profile’ will be implemented by the end of 2005. At present some of the regions together with the Austrian confederation of municipalities (Gemeindebund) and the confederation of cities (Städtebund) participate in an electronic public procurement project “ANKÖ” (Auftragsnehmerkataster Österreich, www.ankoe.at). This is a supplier database of suitable contractors who fulfil the legal requirements for public tenders.

The Austrian municipalities have implemented a joint venture internet portal for the communal level which also contains tender information (www.kommunalnet.at).

Impact assessments of the introduction of e-procurement are of no major concern to the government. At present it is discussed whether to do it within the next three years.

3. Belgium

3.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Federal Steering Group on Joint E-Procurement (major federal organisms are represented)
Responsible institution(s) for legal aspects	Public Procurement Commission (Commission des marches publics)
Responsible institution(s) for technical solutions	Federal ICT Department (FEDICT)[3]
Central procurement institution(s)	A central procurement body called "Services contrat-cadre multi-SPF" (Multi-ministry framework contract service) organises grouped purchases (IT material, cars, office stationery, and furniture). Its services are being used by some federal authorities and are accessible through the federal Intranet.
Other important organisations	-
Type of coordination between different institutions	Other Belgian non-federal public entities such as the federated (regional and community) entities, local and parastatal authorities will be able to file orders and use the same applications as federal authorities. It is now possible for all these entities to sub-scribe to JEPP (see below). The Walloon Region has developed its own e-public procurement strategy and portal[4]. The Flemish and Brussels regions have not started own initiatives as yet.

3.2 Strategy

Although no overall strategy for e-public procurement has been designed yet, a working group will, on the basis of the consultation of businesses mentioned below, draft a strategic paper (*"plan d'informatisation"*) which will contain a business case, a calendar for implementation and a budget for 2005.

The first step of the Belgian e-procurement has been realised on a "buy a little, test a little field a little" strategy. This activity covers the e-publication phase and has been placed under the lead of the Ministry of Defence.
A second step (e-payment or e-tendering) is under consideration and initial coordination on the feasibility is ongoing.

[3] Technically, e-public procurement projects are conducted by line ministries in cooperation with and under the coordination of the Federal ICT Service (SPF FEDICT). Due to its large spending budget, SPF Défense (Federal Ministry of Defence) has been particularly involved in the activities. SPF Justice (Federal Ministry of Justice) has also been involved since it runs the official journal (Moniteur belge – Bulletin des adjudications)

[4] http://avis.marchespublics.wallonie.be/

The e-public procurement initiatives are embedded in the overall government strategy of administrative simplification and reduction of administrative burden as well as the government's e-government strategy.
There are also regional and local initiatives like by the walloon region (http://avis.marchespublics.wallonie.be/)

3.2.1 *Statement of objectives*

The main objective is to lower the administrative burden for enterprises. In terms of timeframe, the authorities involved have issued the aim of publishing all federal calls for competition by end of 2004.

3.2.2 *Scope of strategy*

Levels of government involved	Central government (federal)
Legal framework	EC directives and guidelines complemented by or translated into royal decrees (AR)
Allocated resources	-
Time frame	2006

3.2.3 *Existing guidelines*

Information unavailable

3.3 Legal framework

3.3.1 *Legal status of the use of electronic means in Public Procurement*

A royal decree (*arrêté royal*) of 18 February 2004 authorises the use of electronic means in all or part of the public procurement procedure. It contains rules applicable to communication, regulates storage of data, but does not cover specific procedures such as e-auctions. A special law on electronic signatures has been passed in 1999. While Belgian authorities will probably not be authorised to use electronic auctions, they may employ Dynamic Purchasing Systems and e-catalogues.

3.3.2 *Implementation of the Directives*

All existing and future applications are compliant with the European public procurement directives and it is expected that they will be fully implemented after formal endorsement of the relevant EC directives/regulations.
Status of tools

Public procurement portals	www.jepp.be – Joint Electronic Public Procurement (JEPP) is the instrument used by the Belgian federal government for electronic publication of calls for tender. JEPP was launched on 13 November 2002 and is available to companies since 6 January 2003. At the beginning only the Federal Ministry of Defence published in JEPP, other federal organisms follow suit. The objective is that, at least, all federal calls for tender are published in JEPP by end of 2004. As a first major evolution of the system it is the intention to generalize used of the JEPP portal to non-federal entities by end of 2005. JEPP is today providing the following services : the objective is to assist buyers in drafting their calls for tender and submit them electronically to the official publication organisms[5] A pyramidal structure of websites (a joint national portal, a portal for each public entity, and a site for each adjudicating authority) make the calls for tender and the terms of reference available online. A search engine assist is finding and downloading these documents. General data such as information on purchasing ser-vices or technical notes can be published as well. Enterprises have the faculty to subscribe to the JEPP system, which automatically notifies them by e-mail on new opportunities which correspond to the chosen criteria. Businesses can also choose to be automatically informed on errata on documents they have downloaded. The adjudicating authorities can use JEPP to notify contract awards, invitations to tender as well as other documents such as minutes of clarification meetings. It is foreseen that the JEPP joint portal will eventually become the official publication site of the Bulletin des Adjudications which will unify all Belgian public procurement publications, offering the private sectors services equivalent to those described above. Public entities can affiliate to JEPP in three different ways: The JEPP application is working within the installations of the concerned public entity. The successful tenderer will take upon itself the delivery and installation of the necessary software and hardware. The successful tenderer plays the role of an Application Service Provider (host). In this case the public entity only needs a simple browser. The public entity only acquires a user licence. It will have to install JEPP on its own responsibility.

[5] Official Journal of the European Union, Bulletin des Adjudications - Belgian official journal

	In order to reduce costs, several public entities can group together in order to file a joint order and install the application in a single spot. A federal grouped managed by the Federal ICT Service (FEDICT) allows each federal service and each parastatal under its authority to benefit from JEPP services.
Electronic signature	The introduction of qualified electronic signatures has been delayed, but certifying organisms are being established now. The signature will be based on the electronic identity card, a pilot project now being rolled out to all of Belgium and supposed to cover all citizens by 2007.
Electronic catalogues	Electronic catalogues are being used by the above-mentioned central purchasing agency *Services contrat-cadre multi-SPF*
Electronic auctions	No electronic auctions activities have been tested so far
Dynamic Purchasing Systems	No Dynamic Purchasing Systems activities have been initiated so far
Framework agreements	Framework contracts are being used by the above-mentioned central purchasing agency *Services contrat-cadre multi-SPF*

3.3.3 Reference to the relevant legal acts

Information unavailable.

3.4 Current usage of electronic means in Public Procurement

3.4.1 Practical use of electronic means in Public Procurement

Phase I of the e-public procurement project which was running from 2001 to 2002 led to the establishment of a central e-public procurement portal (JEPP[6]) at federal level, which was established at the beginning of 2003. It is operational, but it is not used yet by all federal public entities and covers only the publication phase of the tendering process. The aim is that all federal entities use the portal by end of 2004.

Concepts for other applications have been drafted; however, they have not been developed yet. Since the Belgian federal e-public procurement activities have been re-launched in January 2004, an inter-ministerial working group is preparing Phase II of the e-public procurement activities, going well beyond publication and covering the actual tendering process. Prior to updating the e-public procurement plan and to drafting a timetable and a budget, the group has launched a request (trough the Belgian Official Journal) for information to enterprises and organisations in order to allow for a stocktaking of current applications on the market. This will feed into the terms of reference for a tender on the new application.

[6] http://www.jepp.be

Different applications have been conceived at federal level, however apart from JEPP, none of these applications is operational yet, and most of them are still in the concept phase:

- JEPP: electronic publication (see above)
- E-Bid: electronic bidding (see below)
- E-registered mail (see below)
- E-File (see below)
- E-Cat: electronic catalogues (see below)
- E-Payable: electronic invoicing and payment (see below)

Currently no systematic assessment of the impact of e-public procurement is carried out or planned in Belgium. Evaluation is not yet integral part of the Belgian administrative culture, but some kind of assessment mechanism will form part of the strategic paper developed by the e-public procurement working group to be delivered by September 2004. Monitoring will take place at least on an annual basis.

3.4.2 Which phases of procurement are covered?

In Belgium, only the publication phase has been automated so far, all other phases are expected to be automated within 5 years. However, the Belgian federal services have already developed concepts for several modular but integrated and communicating applications for e-public procurement, and have ensured the possibility to connect with back office IT legacy such as logistical systems and budgetary data bases. The user will therefore only perceive a single system. The interface of the synchronised system will be an Enterprise Application Integration (EAI) which will manage this interchange based on the accepted W3C XML standard. This EAI will be sufficiently flexible in order to connect budgetary information systems of different federal public services to the same e-public procurement application (e.g. the federal e-catalogue).

3.5 Raising awareness & Promotion of electronic means

The Belgian federal government has launched its first e-public procurement activities under its public administration modernisation programme in the 1999-2003 legislatures, between 2001 and 2002. The current state of affairs in e-public procurement can be viewed on the Belgian government's web portal[7]. This initiative was then put on hold for a year. In January 2004 it was re-launched and put on top of the agenda again, when a federal Council of Ministers meeting decided to accelerate the development of e-public procurement activities.

[7] http://www.belgium.be/eportal/application?origin=navigationBanner.jsp&event=bea.portal.framework.internal.refresh&pageid=indexPage&navId=4603

Forthcoming initiatives:

Apart from JEPP, several applications have been conceived, but they are still in the concept phase:

E-Bid
The objective of this project is to allow public entities to receive bids and expressions of interest, to give them a time stamping, to control the validity of the digital signature and to keep these documents in a well-secured and widely accessible system. This phase is still in the market-survey and information gathering phase.

The launch of E-Bid depends on certain prerequisites, such as the adaptation of Belgian legislation on public procurement. The draft royal decree on the use of electronic means in public procurement has been approved by the Public Procurement Committee in March 2003 and follows its way. The difficulties in this process are related to proper implementation of agreed interoperable procedures and the availability of proven technologies.

E-File
In order to accelerate the public procurement procedures and to simplify administrative work, it is envisaged to completely digitalise the files handled by purchasing services. These digital files would circulate between the various authorities involved (e.g. Inspecteur des Finances – tax inspector) by means of an electronic workflow system.

Particular attention will be paid to the availability of an integrated tool to manage the evolution of these files and to the integration of this software within the other applications (logistical, budgetary or public procurement). This project will be implemented when the above projects will have succeeded.

E-Cat
Open markets are only useful when information flows well. Buyers must know possibilities of ordering, the adjudicating authorities wish to follow the progress of their calls, and tenderers demand administrative simplification. A catalogue accessible online, which is reliable and taking into account of the common rights and requirements of everybody involved, is therefore an indispensable tool to support the new model of federal grouped purchases.

The following functions are envisaged:

- Loading and updating of the catalogue
- Consultation of the catalogue
- Approval workflow
- Control of budgetary availability
- Drafting and sending of a letter to the successful bidder
- Confirmation of receipt by the bidder
- Confirmation of the order to the buyer

The other usual functions for e-catalogues (delivery request, billing etc.) are part of the E-Payable project since they have no particularities compared with a closed contract.

The two main difficulties for e-catalogues are the non-existence of universally accepted standards and the administrative burden of loading and controlling the catalogue. The solution envisaged in Belgium is to impose for the offers a normalised inventory in one or several commercially available and widely supported standards (e.g Excel or DTD XML) and to apply to the chosen bidder's inventory an automatic conversion and loading tool.

The feasibility study for this project has been closed, and it is planned to launch the project shortly to support the new purchasing model of the federal administration.

E-Payable

The area of E-Payable starts with the request of receipt and ends with the payment of the invoice. It aims at:

- giving the administration a powerful management tool
- allowing electronic invoicing
- allowing electronic settlement (invoice control), remittance and payment
- improving the information of winning tenderers
- accelerating payments and thus meeting tenderers expectation for a work well done.

4. Republic of Cyprus

4.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	The Public Procurement Directorate Treasury of the Republic of Cyprus
Responsible institution(s) for legal aspects	The Public Procurement Directorate Treasury of the Republic of Cyprus
Responsible institution(s) for technical solutions	The Public Procurement Directorate Treasury of the Republic of Cyprus
Central procurement institution(s)	Public Procurement Department is at the national level authorized to and responsible for the procurement of common used items for individual government and public institutions[8]
Other important organisations	-
Type of coordination between different institutions	Information unavailable

4.2 Strategy

The strategy for introducing and developing an electronic public procurement system for government and public institutions in The Republic of Cyprus is an integrated part of the Cyprus Government strategy on modernizing public procurement procedures.

4.2.1 Statement of objectives

An overall objective is to ensure that a large proportion of public procurements shall be awarded through electronic procurement procedures by 2008 In the endeavour of realizing this overall objective the Cyprus Government has set as objective to design an electronic system making government institutions capable for undertaking procurements by electronic means.

[8] Based on interview with Mr. Stelios Kountouris, Public Procurement Department, Treasury of the Republic of Cyprus

4.2.2 *Scope of strategy*

Levels of government involved	Central and local government are included
Legal framework	Information unavailable
Allocated resources	The government will spend EUR 100.000 on an assessment for the introductoion of electronic procurement and EUR 2.4 million over a period of three years with the purpose of implementing electronic procurement in all levels of state level authorities. The resources have been allocated to the following areas: • IT hardware: EUR 500.000 • IT software: EUR 1.700.000 • Training: EUR 200.000
Time frame	Implementation of an electronically based procurement system will take place during 2005 and is estimated to be fulfilled in year 2007

4.2.3 *Existing guidelines*

No specific guidelines guiding electronic public procurement have so far been issued.

4.3 Legal framework

4.3.1 *Legal status of the use of electronic means in Public Procurement*

Operational electronic procurement systems in Cyprus that are compliant with the requirements in the Directives do not presently exist. Specifically, the use of electronic means for communication in public procurement process is not regulated by national legislation.

4.3.2 *Implementation of the Directives*

The Cyprus Government estimates that the new EU public procurements directives will be implemented in January 2006.

It is considered by the government that all contracting authorities will have access to Electronic Auctions. Dynamic Purchasing Systems is expected to be used by central purchasing authorities for common used items.

4.3.3 *Status of tools*

Public procurement portal(s)	-
Electronic signature	Electronic signature does not exist but will be introduced
Electronic catalogues	Government authorities have no experience with e-catalogues
Electronic auctions	Government authorities have no experience with e-auctions
Dynamic Purchasing Systems	Government authorities have no experience with dynamic purchasing systems
Framework agreements	Framework agreements are not being used

4.3.4 *Reference to the relevant legal acts*

Information unavailable

4.4 Current usage of electronic means in Public Procurement

4.4.1 *Practical use of electronic means in Public Procurement*

Presently, no data on practical use of electronic means in Public Procurement are available. However, the Cyprus government is planning to do an assessment on the impact of introducing electronic public procurement.

The Cyprus Government expects that a system operating with an automated electronic public procurement cycle will be implemented within three years. The elements included in the procurement system are: notification about tender, publication of tender, management of receipt/submission of tender and evaluation of tender

4.4.2 *Which phases of procurement are covered?*

Information unavailable

4.5 Raising awareness & Promotion of electronic means

Since July 2003 the Treasury has worked with implementing suggestions from a study of e-commerce in Cyprus. The study concerned among other things assessment of the existing legal framework and suggestions for changes and recommendations on legal and institutional infrastructure for the promotion and operation of e-commerce in Cyprus.

With the purpose of stimulating the general use of electronic procurement in Cyprus the Government has made a proposal for the financing of a project through the Transition Facility Funds of the EU. This proposal includes objectives on implementing electronically procurement procedures for public institutions.

5. Czech Republic

5.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Ministry of Informatics (www.micr.cz) is in charge of policy formulation in the area of electronic public procurement
Responsible institution(s) for legal aspects	Ministry of Informatics (www.micr.cz) Ministry of Regional Development (www.mmr.cz)
Responsible institution(s) for technical solutions	-
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	At the national level, a central body is responsible for public procurement. Furthermore, selection of suppliers is a responsibility for the central procurement body. No individual public institutions are involved in selecting suppliers for procurements.

5.2 Strategy

Since 2002 the Government of the Czech Republic has had electronic public procurement as a political priority. At the moment the government considers the development of electronic public procurement as having a medium political priority.

Strategy and priorities on electronic public procurement are integrated in the overall strategy on the Information Society and E-government among others "State Information Policy (SIP)" (1999)

5.2.1 Statement of objectives

The overall objective is to promote an electronic marketplace used for repeated and bulk purchases in the whole field of the public administration.

The central body for the electronic market place is the Ministry of Informatics but just for office facilities including information and communication technology (under condition that it is lower than 2 millions czech crowns).[9]

[9] Based on information from David Kotris, Ministry of Informatics

5.2.2 *Scope of strategy*

Levels of government involved	The strategy on electronic public procurement includes the central government. Regional and local governments are at the moment not included in the strategy for electronic public procurement
Legal framework	-
Allocated resources	Information on amount of allocation is presently unavailable
Time frame	2002 – 2006

5.2.3 *Existing guidelines*

Special guidelines for electronic public procurement have been developed, but it is not obligatory to use them

5.3 Legal framework

5.3.1 *Legal status of the use of electronic means in Public Procurement*

National legislation regulates the use of electronic means in the public procurement process. The legislation concerns specific rules for the communication process related to the electronic procurement process.

5.3.2 *Implementation of the Directives*

The government has not yet formulated an exact time-schedule for implementing the new EU Directives on public procurement.

The government intends to introduce national standards for the electronic exchange of data in the electronic public procurement process.

According to the EU Directives the government expects that the use of both electronic actions and dynamic purchasing may be regulated by the use of Contracting Authorities. It is not expected that Contracting Authorities may publish tender-related information on a ‘buyer profile’.

5.3.3 *Status of tools*

Public procurement portals	A public electronic procurement portal for electronic procurements is expected to be functional within few years.
Electronic signature	An electronic signature has been introduced by the government. At the moment the signature is used to a medium degree. It is expected that the use of the signature will be obligatorily for actors participating in public calls for competition.
Electronic catalogues	Authorities have no experiences with systems for procurement involving catalogues
Electronic auctions	Authorities have no experiences with systems for procurement involving electronic auctions
Dynamic Purchasing Systems	Authorities have no experiences with systems for procurement involving electronic purchasing systems
Framework agreements	-

5.3.4 *Reference to the relevant legal acts*

5.4 Current usage of electronic means in Public Procurement

5.4.1 *Practical use of electronic means in Public Procurement*

There are no operational public procurement systems compliant with the requirements of the forthcoming European Public Procurement Directives in The Czech Republic presently.

The Czech Republic government has implemented an automated electronic public procurement system for procurements in the public sector. In this respect, procedures for notification about tender as well as publications about tender are integrated in the procurement cycle. This procurement phase has been automated to a large extent.

5.4.2 *Which phases of procurement are covered?*

Procedures for ordering and invoicing are integrated in the automated electronic procurement system. This procurement phase has been automated to some extent.

5.5 Raising awareness & Promotion of electronic means

Within the next three years the Government of the Czech Republic is planning to introduce regular assessments of the impacts expected to be related to the introduction of electronic public procurement.

6. Denmark

6.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	The Danish Competition Authority (www.ks.dk) under the Danish Ministry of Economic and Business Affairs (www.oem.dk) Ministry of Finance (www.fm.dk)
Responsible institution(s) for legal aspects	The Danish Competition Authority (www.ks.dk) under the Danish Ministry of Economic and Business Affairs (www.oem.dk)
Responsible institution(s) for technical solutions	The Agency for Governmental Management (www.oes.dk) under the Danish Ministry of Finance (www.fm.dk)
Central procurement institution(s)	National Procurement Ltd. (SKI, www.ski.dk) was established to ensure the highest possible procurement efficiency in public organizations. It has more than 8500 public organization subscribers, around 250 suppliers on framework agreements many with distributors and totalling more than 1200 order addresses in Denmark. SKI runs the e-tendering systems ETHICS, Netindkøb and Netkatalog.
Other important organisations	The Ministry of Science, Technology and Innovation (www.vtu.dk) and Local Government Denmark (KL, www.kl.dk), an association of Danish municipalities.
Type of coordination between different institutions	Procurement is organized as a mixture of a centralized and decentralized approach: • The main principle is that each individual public authority is responsible for procurement (award of contract) and arrangement of framework contracts • Each institution e.g. ministry or agency can organize procurement in a centralized or decentralized way • There is a central public procurement body, SKI which arranges framework contracts, which can be used by all public authorities in Denmark. However, the individual public authority is free to arrange individual framework agreements. • The total procurement through national framework contracts (SKI) is approximately 0.5 billion Euro per year. Figures for regional and local level are unknown.

6.2 Strategy

The national strategy on e-public procurement is part of the existing strategy for e-commerce from 2002

- "IT for everybody" (Ministry of Science, Technology and Innovation, 2002)
- "Strategy for e-commerce 2002" (Ministry of Science, Technology and Innovation, 2002)

A new strategy from the government and the coalition of municipalities includes guidelines for digitizing towards 2006 has been published:

- "Strategy for digital administration 2004-06" (The Digital Taskforce, 2004)

6.2.1 Statement of objectives

There are no specific objectives on e-public procurement as a whole. However, some overall objectives for all of the initiatives and strategies have been defined:

- to save money by centralizing the procurement process
- to make the public sector a leading force in electronic procurement and commerce
- to realize un-utilized economic potential within electronic commerce in both the public and private sector

6.2.2 Scope of strategy

The strategy has four core elements:

- Electronic public procurement: Promoting electronic communication in the relation between the private suppliers and public buyers. The strategy calls for a far more efficient public sector in close partnership with private businesses. Various initiatives have been made already. For example the establishment of the Public Procurement Portal (DOIP) in the beginning of 2002 (see below).
- Safety and increased knowledge on e-commerce: Technical and legal insecurity are main barriers for making use of the full potential for e-commerce. Various projects have been put in effect (see later).
- Legal and technical e-commerce infrastructure: Coordinating the effort concerning standardization of data exchange for example in the area of e-payment.
- International dimensions within e-commerce: A major part of e-commerce is cross-border trading. This has lead to a focus on customs barriers, etc. Various projects have been initiated in relation to European initiatives.

In addition, the regional and local players have a high priority on electronic commerce and digital government/administration. A new strategy (February 2004) from the Danish government and the coalition of municipalities includes guidelines for digitizing towards 2006.

Levels of government involved	National, regional and local government are included in the strategies.
Legal framework	No information
Allocated resources	Public investment has been made to introduce e-public procurement, but there is no available specification of the amount spent (or allocated).
Time frame	Year of fulfilment has not been specified

6.2.3 Existing guidelines

As part of its modernization program for the public sector (from 2003), a guide on public procurement was published including guidelines on electronic procurement. It is required that all state institutions use electronic procurement whenever possible and of economic advantage to the state.

- “The digital supplier” (Ministry of Science, Technology and Innovation, 2002)[10]: Specific guidelines on electronic public procurement for the private supplier. Recommends DOIP.
- “The digital buyer” (Ministry of Science, Technology and Innovation, 2002): Specific guidelines on electronic public procurement for the private and public buyer at all levels of administration. Recommends DOIP but is open to the fact that the buyer might also use other systems.
- “Public procurement Guidelines” (Ministry of Finance, 2003)[11]: General guidelines on public procurement in the national administration. The target group is buyers in the public sector. No recommendations on solutions.

6.3 Legal framework

6.3.1 Legal status of the use of electronic means in Public Procurement

According to National Procurement Ltd., ETHICS fulfils the requirements of the forthcoming EU public procurement directives. DOIP shouldn’t conflict with the directives either, but it remains to be seen when further guidelines, etc. will be published.

Buyer profiles to publish tender-related information on a ‘buyer profile’ are being used in systems such as DOIP, KMD and RAKAT.

6.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented in the beginning of 2005. Public procurement is regulated in national legislation, and follows the EU public procurement directives. Use of electronic means in the public procurement process falls within the general rules for entering into an agreement.

With the new EU directives, the Danish government will provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems. However, a restriction on electronic auctions is foreseen on works contracts.

[10] See www.videnskabsministeriet.dk

[11] See http://www.moderniseringsprogram.dk/visArtikel.asp?artikelID=5462

6.3.3 Status of tools

Public procurement portal(s)	www.doip.dk is provided by Gatetrade and was launched in 2002. The portal is a web-based system based on Oracle exchange software. The current version supports: e-auctions, e-catalogues and integration with back-office systems.[12]
	www.rakat.dk is run by the private company COMCARE. Functionalities are mainly e-purchasing (ordering and electronic invoice). Up to 40 regional and local authorities have selected RAKAT.
	KMD Webindkøb (www.kmd.dk) is run by the private company KMD. Functionalities are mainly e-purchasing (ordering and electronic invoice). Up to 70 regional and local authorities have selected KMD Webindkøb.
	ETHICS (http://ski.ethics.dk/), www.netkatalog and www.netindkøb is operated by National Procurement Ltd. Functionalities on these portals include e-tendering.
Electronic signature	An electronic signature has been introduced (www.digitalsignatur.dk), but not been used for electronic public procurement.
Electronic catalogues	Electronic catalogues are being used.
Electronic auctions	Electronic auctions are being used to a low extent.
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems.
Framework agreements	Framework agreements are used on national, regional and local level of government.

6.3.4 Reference to the relevant legal acts

Information unavailable since special rules do not exist.

6.4 Current usage of electronic means in Public Procurement

6.4.1 Practical use of electronic means in Public Procurement

Electronic public procurement is not being monitored specifically, but other data on e-commerce are available:

- 54% of state authorities use an e-procurement system.
- 63% of regional authorities use an e-procurement system.
- 34% of local authorities use an e-procurement system.

Source: ”*IT i praksis® 2003*”, RAMBOLL Management

Moreover, turnover at the Public Procurement portal (DOIP) increased to approximately 5 million Euro in 2003, which represented a significant increase.

[12] IDA ”State of the Art Report. Version 0.60” Brussels (2004)

6.4.2 Which phases of procurement are covered?

The following is the status for automating procurement phases in Denmark:

- Notification about tenders (to a large extent today)
- Publication of tenders (to some extent today, but a further increase the next three years is expected)
- Management of receipts/submission of tenders (to a low extent today, a further increase the next three years is expected)
- Evaluation of tenders (to a low extent today, a further increase the next three years is expected)
- Ordering (to some extent today, a further increase the next three years is expected)
- Invoicing (to a low extent today, a further increase the next three years is expected)

6.5 Raising awareness & Promotion of electronic means

Several initiatives have been started to provide free help-desk for public organizations, establish interest in e-commerce in smaller municipalities and counties through campaigns and workshops, set off pilot projects and collect best practice, and create a special award for best e-merchant every year.

Various projects have been put in effect in the area of safety and knowledge, including the e-brand ("E-handelsmærket"), to help small and medium-sized businesses start e-commerce.

Generally, international standards are followed, implemented and translated, e.g. EDI/EDIFACT and XML. Danish Standards Association has established a special working group on e-public procurement (Group 380 on e-business). Standard formats for all public contracting authorities on tendering or purchasing have not yet been issued.

The Danish Ministry of Science, Technology and Innovation has chosen XML as the core communication standard in the public sector (Source: Handlingsplan for e-handel 2002).

A XML project consisting of two main sub-projects was started:

- Standardizing public data. The main target to determine standards for exchanging data between public authorities and between public and private institutions/organizations.
- Establishment of the Infostructurebase has, as the key objective, to create a database with information on the content of public databases and how to access these data. (Source: http://www.oio.dk/XML). The main purpose and value is to support exchange and reuse of data related to public and private service delivery.

It is the vision that it will be possible from this website to look up all the above types of information from public and private organizations, and thus to collect information about what data are available and how data are accessed. An important part of the content will be standards approved by the Danish e-Government IT-architecture and XML committees. The formal status of content will be part of the metadata of the content. (Source: http://isb.oio.dk/info/)

In January Denmark became the first country to adopt an early version of OASIS Universal Business Language (UBL) as a standard for e-Commerce in the public sector. Following a 30-day public hearing, the Danish XML Committee decided to use UBL 0.7 to enable integration between systems controlled by state authorities and the Pub-lic Procurement Portal (DOIP). UBL provides an XML library of common business data components together with a set of standard business documents such as purchase orders and invoices that are assembled from the component library.

Another project on establishing standards for e-commerce in Denmark is translating the international UNSPEC coding initiated by the Ministry of Science, Technology and Innovation.

7. Estonia

7.1 Organisations and Institutions

There are only few core actors in the field of electronic public procurement in Estonia. It is mainly a State level initiative and it is in the phase of beginning.

Responsible institution(s) for public procurement policy	Ministry of Finance (www.fin.ee)
Responsible institution(s) for legal aspects	Ministry of Finance (www.fin.ee)
Responsible institution(s) for technical solutions	Ministry of Finance (www.fin.ee)
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	The selection of suppliers is the responsibility of the individual public institutions – there is no central procurement body which is responsible for framework agreements etc.

7.2 Strategy

Development of e-public procurement is a priority and a strategy on e-public procurement is expected to be formulated and introduced in 2005[13].

7.2.1 Statement of objectives

The process of drafting of new Public Procurement Act has been started to transpose the new directives. In the new Public Procurement Act the principles of e-public procurement will be provided[14]. By introducing e-public procurement achieving such objectives like additional transparency, lower transaction costs and more effective supervision are expected.

[13] Based on interview with Mr. Märt Kiisel, State Aid and Public Procurement Division, Financial Policy Department, Ministry of Finance

[14] Based on interview with Mr. Märt Kiisel, State Aid and Public Procurement Division, Financial Policy Department, Ministry of Finance

7.2.2 *Scope of strategy*

The content of the strategy has not been formulated.

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

7.2.3 *Existing guidelines*

Basic guidelines for using the electronic Public Procurement State Register have been issued. Guidelines are improved continually.

7.3 Legal framework

7.3.1 *Legal status of the use of electronic means in Public Procurement*

Public Procurement Act and Government Regulation establishing the Public procurement State Register cover rules for e-notifying via Public Procurement State Register. Rules for communication (e.g. e-mailing, using of e-signature) and moreover storage of data are regulated by other legal acts.

7.3.2 *Implementation of the Directives*

The new directives on public procurement are expected to be transposed by the end of 2005[15]. Issues concerning use of electronic means in e-public procurement are already regulated with different legal acts e.g. the electronic signature.

In course of transposing the principles of the new public procurement directives into national law no restrictions for using e-public procurement systems described in the directives have been planned (contracting authorities may use in the public procurement process all e-public procurement systems described in the directives - e-auctions, dynamic purchasing systems, e-catalogues etc.). In the area of standards no specific provisions have been planned.

[15] Based on interview with Mr. Märt Kiisel, State Aid and Public Procurement Division, Financial Policy Department, Ministry of Finance

7.3.3 *Status of tools*

Public procurement portal(s)	The Public Procurement State Register (established in 2001, http://register.rha.gov.ee/) is a simple e-public procurement portal, where all public procurement notices are published electronically. The register is using CPV standards in the catalogue, and all the information in the register is publicly accessible via internet free of charge.
Electronic signature	Electronic signature has been introduced, but is being used to low extent. However, it will be made mandatory to use the e-signature to participate in public calls for competition.
Electronic catalogues	No experience with e-catalogues.
Electronic auctions	No experience with e-auctions.
Dynamic Purchasing Systems	No experience with dynamic purchasing systems.
Framework agreements	Information unavailable.

7.3.4 *Reference to the relevant legal acts*

Public Procurement Act, Databases Act, Digital Signature Act, Administrative Procedure Act.

7.4 Current usage of electronic means in Public Procurement

7.4.1 *Practical use of electronic means in Public Procurement*

In 2003 the number of procurements advertised via Public Procurement State Register was 4,859 with the value declared of EUR 663 Million.

7.4.2 *Which phases of procurement are covered?*

Till now there is covered only publicising phase of the public procurement notices. Further impact of the use of electronic means in public procurement has not been assessed yet, but it is planned to measure impact of electronic public procurement in the future. The following aspects will be assessed: number of electronic transactions, types of purchases, transaction costs, effect on price and number of bidders.

7.5 Raising awareness & Promotion of electronic means

Information unavailable.

8. Finland

8.1 Organisations and Institutions

The main institutions in the field of electronic public procurement are:

- Ministry of Finance
- Ministry of Trade and Industry
- Ministry of Transport and Communication
- Hansel Ltd.

Responsible institution(s) for public procurement policy	Ministry of Finance[16]
Responsible institution(s) for legal aspects	Ministry of Trade and Industry[17]
Responsible institution(s) for technical solutions	Ministry of Finance Ministry of Trade and Industry
Central procurement institution(s)	Hansel Ltd.[18]
Other important organisations	The Finnish Association of Local Authorities Finnish Information Society Development Centre (Tieke)
Type of coordination between different institutions	Public Procurement in Finland is organized as a mixture of a centralized and decentralized approach: • There is a central public procurement body for state entities, Hansel Ltd (www.hansel.fi). Hansel is a government owned public procurement company. • It arranges framework contracts which can be used by all state authorities[19] in Finland. However, individual public authorities are free to arrange individual framework agreements (buying through or with help of Hansel is not compulsory). • Procurement (selection of suppliers) is a responsibility of the individual public authority.

[16] Ministry of Finance is responsible of policymaking with regard public procurement in general which includes eProcurement; the ministry is also responsible for development of electronic administration

[17] Ministry of Trade and Industry is responsible of legal framework for public procurement in general which includes also implementation of new electronic measures/procedures from new public procurement directives

[18] Hansel is a state owned central purchasing authority

[19] Municipalities are not allowed to buy direct (without competition) from Hansel. Hansel is central purchasing body only for state entities.

8.2 Strategy

The government procurement strategy was published in January 2004, and the government's "Information Society Programme" in April 2004.

Initiatives on e-public procurement are integrated in the government's overall strategy on public procurement. According to it utilization of information technology is one element when developing public procurement and its eProcurement policies and procedures. Pilot projects will be initiated to improve procurement procedures and utilization of information technology.

The municipalities are independent and the government procurement strategy does not apply to them. They do not have a common procurement or e-procurement strategy. However, municipalities are more and more cooperating when doing or developing procurement.

8.2.1 Statement of objectives

The overall objective is to take advantage of information technology to enhance effectiveness of public procurement

8.2.2 Scope of strategy

Levels of government involved	Procurement strategies cover only central government
Legal framework	Is at the moment under renewal. First draft of the new pp law shall be at the end of October 2004. Deadline for implementation is the end of 2005.
Allocated resources	Public resources are allocated but specific information concerning the size of the amount is unavailable
Time frame	-

8.2.3 Existing guidelines

A recommendation for electronic public procurement has been issued on electronic invoicing - another on electronic ordering is being prepared.

8.3 Legal framework

8.3.1 Legal status of the use of electronic means in Public Procurement

None of the current e-procurement systems are expected to fulfil the requirements of the forthcoming EU public procurement directives fully (e.g. systems for the entire procurement process and digital signature), but it remains to be seen when further guidelines etc. are published.

8.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented in 2005. Public procurement is regulated in national legislation, which follows the EU public procurement directives. Use of electronic means in the public procurement process falls within the general rules for entering into an agreement.

8.3.3 *Status of tools*

Public procurement portals[20]	www.ktm.fi/julma Responsible authority is Ministry of Trade and Industry and the portal is run by the private undertaking Edita Oy. Functionality includes information and notices concerning public procurement below the threshold value. www.credita.fi The portal contains information concerning publication of notices especially above the threshold value. It also provides information about public procurement. The portal is run by the private undertaking Edita Oy.
Electronic catalogues	Electronic catalogues are used when purchasing goods[21]
Electronic auctions	E-auctions are not being used
Electronic signature	An official electronic signature has been introduced in Finland, but so far it has not been used for electronic public procurement[22]
Dynamic Purchasing Systems	Dynamic purchasing systems are not being used
Framework agreements	The total procurement through national framework contracts is not known precisely, but it is estimated to be 5% or below.

8.3.4 *Reference to the relevant legal acts*

The Act on Public Procurement; the Act on Electronic Signatures.

8.4 Current usage of electronic means in Public Procurement

8.4.1 *Practical use of electronic means in Public Procurement*

The annual value of public procurement in Finland is about EUR 19 billion which is about 15% of the GDP. Electronic public procurement is not being monitored.

The most significant advantages from the introduction of electronic public procurement for public authorities are expected to be:

- Speeding up of procurement procedures
- Lower transaction costs
- Better procurement statistics and enhanced budgetary control.

[20] Hansel Ltd (www.hansel.fi) once operated a complete system for electronic tendering and procurement but due to lack of turnover, the system is no longer in operation.
[21] Catalogues are usually suppliers own
[22] Information is available at the internet (Population Register Centre): www.vaestorekisterikeskus.fi/vrk/home.nsf/pages/index_eng

Initiatives which are primarily focused on information and tools about electronic public procurement include:

- www.kilpanet.fi: Provides information and models concerning public procurement in the field of services. It is run by private local authorities owned undertaking Efectia Oy.
- www.hymonet.com: This includes information and models concerning environment issues in connection to public procurement. It is run by private local authorities owned undertaking Efectia Oy.
- www.kunnat.net: Provides much information on public procurement legal issues. It is the Finnish local authority portal.

8.4.2 Which phases of procurement are covered?

The status for automating procurement phases in the Finland is as follows:

- Notification about tenders (to a large extent today)
- Publication of tenders (to some extent today, but a further increase the next three years is expected)
- Management of receipt/submission of tenders (to some extent today, but a further increase the next three years is expected)
- Evaluation of tenders (to a low extent today, but a further increase the next three years is expected)
- Ordering (to a low extent today, but a further increase the next three years is expected)
- Invoicing (to a low extent, but a further increase the next three years is expected).

Notification is the phase of public procurement which has been automated the most via the Credita and Julma portals, whereas the more advanced stages of electronic procurement are only automated to a low extent. Most frequently used electronic tools are e-mail and internet based ordering.

8.5 Raising awareness & Promotion of electronic means

Electronic means will be promoted when implementing public procurement strategy for central government and Information Society Programme. A recommendation for electronic invoice has and will be promoted.

New projects have started also in municipal sector. It is worth to mention i.e. Juhk e–project, which has started on spring together with about 10 municipals and Finnish Association of Local Authorities, private enterprises etc stakeholders. The aim is to promote e-procurement’s implementation among municipals starting from guide lining e-invoicing, e-ordering partly even to tendering procedures. Target is not however to develop any new purchasing system.

9. France

9.1 Organisations and Institutions

The responsibility for the e-public procurement activities in France are shared between mainly two government bodies:

- the Agency for the Development of Electronic Administration (*Agence pour le Développement de l'Administration Électronique – ADAE*)[23], under the direct authority of the Prime Minister, which has drafted the electronic administration strategy and action plan (ADELE); and
- the Ministry for Economy, Finance and Industry.

Responsible institution(s) for public procurement policy	Ministry for Economy, Finance and Industry
Responsible institution(s) for legal aspects	Ministry for Economy, Finance and Industry, Legal Department
Responsible institution(s) for technical solutions	Agency for the Development of Electronic Administration
Central procurement institution(s)	Union de Groupements d'Achats Publics (UGAP) [24] which local, regional and national authorities can make use of, will allow bidders to submit tenders electronically through State solution.
Other important organisations	Ministry of Defence
Type of coordination between different institutions	The selection of suppliers, however, remains within the responsibility of individual public institutions

Within the ministry for Economy, Finance and Industry, a Mission for the Digital Economy (*Mission pour l'Economie Numérique*) (www.men.minefi.fr) has been created for five years to play a concertation role between the public and the private sector. It contributes to inter-ministerial initiatives to adapt the legal framework to the digital economy and prepares the French position in multilateral negotiations and at EU level. It is divided into working groups, of which group no. 7 "Dematerialisation of public procurement and of settlement of public expenditure"[25] works on these issues. Legal affairs are dealt with by the legal department of the ministry (*Direction des Affaires Juridiques*), while the development of e-public procurement solutions are coordinated between ADAE and the ministries (Defense will joint later as they have their own solution).

[23] See http://www.adae.gouv.fr

[24] See http://www.ugap.fr/

[25] *Dématérialisation des achats publics et de l'exécution de la dépense publique*; http://www.men.minefi.gouv.fr/webmen/groupetravail/g7.html

9.2 Strategy

E-public procurement enjoys medium priority in France as it is not promoted by a minister, but is the fruit of cooperation between several ministries[26]. The e-public procurement strategy of the French government is therefore twofold: It forms part of the e-government and information society initiatives made public at large scale, but is also part of efforts to generally modernise the national public procurement system. There is no separate strategy for e-public procurement.

- The governmental modernisation plan “Administration électronique 2004/2007” (ADELE), launched in February 2004 by the Prime Minister. The project is one of 140 measures which are part of the plan.

- Reforms of the Public Procurement Act (Code des marchés publics) in 2001 and 2004. This law includes the objective that all public entities have to accept electronic bids by 1 January 2005, whereas enterprises are free to use electronic means or paper. No obligation for businesses is introduced by the reforms.

9.2.1 Statement of objectives

Main objective is to publish all calls for tenders electronically by 2010. This objective is part of the project “100% Dématerialisation”, which covers the whole procurement chain including control, payment and archiving, is anticipated for 2007-2010).

Besides the development of electronic tools, the other objectives of the project are reengineering of process and training in order to professionalize the buyer function.

Another objective is introduction of e-tendering by 2005.

9.2.2 Scope of strategy

Levels of government involved	Central, regional and local government are included in the strategies for procurement. Also public enterprises are covered by the initiatives
Legal framework	Public Procurement Code
Allocated resources	Approximately EUR 2 million has been allocated for the introduction of operational electronic procurement at national level The Ministry of Defence has allocated approximately EUR 4 million over the last 3 – 4 years In 2005, EUR 1 million is earmarked for using on an inter-ministerial platform
Time frame	2004-2005 2005-2008

[26] In France called ‘dematerialisation of public procurement’

9.2.3 Existing guidelines

A guide for dematerialization will be published in September, 2004. It will be based on legal framework developed and interpreted through working group managed by Ministry of Economy and ADAE.

9.3 Legal framework

9.3.1 Legal status of the use of electronic means in Public Procurement

The use of electronic means for communication in the public procurement process are regulated by French national legislation, covering rules applicable to communication, storage of data and use of specific procedures. This was already done with the reform of the *Code des marchés publics* in 2001, however, the provisions have been formulated in a very open way, in order not to freeze the *status quo* and thereby prevent technological development and innovation.

9.3.2 Implementation of the Directives

The systems developed in France are very nearly compliant with the requirements of the forthcoming EU public procurement directives. While part of the directives requirements have already been taken into account for the 2001 and 2004 reform of the *Code des marchés publics*, it is expected that the directives will be fully implemented by autumn 2005. Electronic auctions are allowed in France and used, among others, by the Ministry of Defence. Dynamic Purchasing Systems are not allowed yet, but the directives' provisions will be implemented, as well as the ones on the "buyer profile". No national standards on electronic exchange of data will be introduced in order not to prevent evolution, and it is expected that standards will be developed at EU level.

9.3.3 Status of tools

Apart for State administration, there is no central e-public procurement portal for all national (and sub-national) public entities in France, so that local and regional authorities have launched their own activities, sometimes by joining forces where appropriate. They will nevertheless be able to access to State administration platform trough UGAP, customer of the same market.

Public procurement portals	The French Ministry of Defence has developed an electronic market place, called *Service public Défense*, consisting of two e-public procurement portals. • One of these portals relates to the purchase of current supplies and support material (www.achats.defense.gouv.fr) • whereas the other is specifically dedicated to the purchase of armament, ammunition and war material (IXARM) (http://www.ixarm.com) All prior information, tender and award notices are published on these websites which also contain a search engine as well as an alert system for businesses who register on the website. Also procurement contracts that do not have to be published feature on the ministry's portal, and terms of reference can be consulted online. There is a possibility for enterprises to present their services and products as well as available information on conclusion and settlement of public procurement contracts. Finally, companies can submit their expressions of interest and bids electronically, through a secured tendering system with time-stamping of the digital signature. The investment costs of the ministry's portals amount to EUR 4 million for the last three or four years.
	The French Ministry of Equipment, Transport, Housing, Tourism and Maritime Affairs offers it own public procurement portal, called "*Serveur d'appels d'offres et de marchés publics*" (SAOMAP) (http://saomap.application.equipement.gouv.fr/saomap_public). Businesses can search tender all over the French territory, consult tender material and communicate it to subcontractors. Twelve services of the ministry are already using the service which allows them to publish calls for tender, tender material and other information. It is expected that all service will do so before end of 2004
	All ministries are currently working, under the aegis of the Ministry of Economy, Finance and Industry and the Agency for the Development of Electronic Administration, on an inter-ministerial platform for e-public procurement. It will, for legal reasons, not be open to regional or local public entities except through Union de Groupements d'Achats Publics, but only for national ministries. The portal will be set up in third quarter 2004 and should be operational by 1st quarter 2005. The budget for this project is about EUR 1 million
	Several General Councils (at department level), for instance *Conseil general de la Moselle*[27], or Conseil général de l'Oise have established their own e-public procurement portals. An accompanying ministerial project for regional and local entities as well as public enterprises is designed to favour exchange of best practice between public authorities. The *Observatoire de l'Administration Electronique* identifies best practices in the field of e-public procurement among others and awards the Prix Hourtin to outstanding portals
Electronic signature	About 16 certificate families from the private sector have been referenced by the Ministry of Economy, Finance and Industry for use in general electronic procedures, among which e public procurement.

[27] http://marches-publics57.com

Electronic catalogues	The Ministry of Defence also has experience with electronic catalogues
Electronic auctions	The Ministry of Defence and certain local authorities have experience with using e-auctions.
Dynamic Purchasing Systems	Dynamic purchasing systems have not been used
Framework agreements	No framework contracts are being used for the time being since they are not permitted by law.

9.3.4 *Reference to the relevant legal acts*

Public procurement code

9.4 Current usage of electronic means in Public Procurement

9.4.1 *Practical use of electronic means in Public Procurement*

So far, only the Ministry of Defence has introduced e-public procurement on a wide scale, assessing in particular, the number of electronic transactions, the speeding-up of procurement procedures, transaction costs and e-procurement's share of the total public procurement volume. The reduction of costs for companies should also be included in the assessment. The Ministry of Equipment has also obtained interesting results reducing publishing costs.

No assessment is as yet planned for the inter-ministerial platform, but there will probably be a regular monitoring of activities. France expects that the introduction of e-public procurement will significantly lower transaction costs and prices through increased competition and reduction of the cost of public procurement for administration and businesses etc.

9.4.2 *Which phases of procurement are covered?*

So far, only the first phases in the public procurement cycle, i.e. notification and publication of tender, have been automated, at least to some extent. Pilot projects have been launched for dematerialisation of ordering and invoicing, and the management of receipt as well as the evaluation of tender is expected to be done automatically within 3 years.

9.5 Raising awareness & Promotion of electronic means

There are a number of initiatives at the state and local level as well as in the private sector to increase awareness of the benefits of e-public procurement.

10. Germany

10.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	The Ministry of Economics and Labour (www.bmwa.de) and the Ministry of the Interior (www.bmi.de) are the overall responsible authorities in the area of e-procurement.
Responsible institution(s) for legal aspects	Ministry of Economics and Labour (www.bmwa.de)
Responsible institution(s) for technical solutions	Ministry of the Interior (www.bmi.de)
Central procurement institution(s)	Procurement Office of the Federal Ministry of the Interior (Beschaffungsamt, www.bescha.bund.de) manages purchases for 26 different federal authorities, foundations and research institutions. It runs a pilot project called “Öffentlicher Eink@uf Online” (Public Purch@sing Online). The project sets out a path for electronic procurement. From February 1st it is possible to transfer the offers electronically (www.evergabe-online.de). Federal Office of Defense Technology and Procurement (Bundesamt für Wehrtechnik und Beschaffung) of the Federal Ministry of Defense (www.bmvg.de). Federal Customs Administration (Beschaffungsamt der Bundeszollverwaltung) of the Federal Ministry of Finance (www.bundesfinanzministerium.de)
Other important organisations	Several private providers offer either software products which support electronic procurement, e.g.: • www.beschaffen.de: Beschaffen.de is provided by the company Wegweiser and offers a platform for purchasers of the public authorities to find e-procurement solutions according to their needs. • www.ai-ag.de: Administration Intelligence AG (AI-AG) offers electronic pro-curement solutions for a public procurement law-conforming handling of public tenderings. • www.bos-bremen.de: bremen online services (bos) GmbH & Co. KG develop and implement eGovernment solutions for the German Federal Government, the federal states and local governments. ...or online databases for public as well as private purchasers, e.g. • www.vergabereport.de: offers two online databases with calls for tender. It serves also as an information portal. ...or both supporting products and online databases, e.g.: • www.cosinex.de: Cosinex.de has been the first private provider for electronic public procurement. It offers the public authorities support for the realization of a strategic management of procurement.

	• www.subreport.de: Subreport.de is the biggest platform for e-procurement. About 98% of all public tenders can be found. Subreport.de is the first Internet platform for a complete digital awarding of contract. A registration is required.
Type of coordination between different institutions	It is the responsibility of each of the 16 Länder to implement e-procurement strategies on the basis of a close co-ordination between the state, the other Länder and the Kommunen (local governments). So far each of the Länder are developing or already have developed and implemented a strategy (see www.deutschland-online.de/Links/links.htm). Some of the most advanced Länder as regards e-government strategies are Nordrhein-Westfalen, Baden-Württemberg, Bavaria, Lower Saxony and Bremen. Hamburg was the first to implement its e-procurement strategy[28]

10.2 Strategy

Electronic public procurement is highly prioritized in Germany. E-public procurement initiatives are part of an overall strategy to develop the information society and create e-government.

In September 2000 the initiative "BundOnline 2005" that also include e-procurement was started by Federal Chancellor Gerhard Schröder. More than 100 individual authorities and departments of the Federal Administration are taking part in the project.

To overcome the heterogeneous IT-landscape of Germany, the relevant players have agreed on a joint e-government strategy in June 2003 ("Deutschland-Online"). The aim of the joint "Deutschland-Online" e-government strategy is to develop integrated electronic services on all administrative levels as well as to create the standards and infrastructures which are necessary. In addition to this strategy, the government in autumn 2003 decided on the program of action "Information Society Germany 2006". The objective of this procurement-focused program is to have a Federal Government's contract-awarding procedure exclusively via a secure e-tendering system in line with legal requirements by the end of 2005.

10.2.1 Statement of objectives

Overall objectives are:

- Achieve greater efficiency and transparency, and cut costs in the tendering cycle
- Develop integrated electronic services on all administrative levels and create standards and infrastructures
- Secure e-tendering system by the end of 2005
- Public sector strives to be the pioneer in the field of e-business in Germany

[28] See http://fhh.hamburg.de/stadt/Aktuell/behoerden/finanzbehoerde/ausschreibungen/e-vergabe/start.html

10.2.2 *Scope of strategy*

Levels of government involved	The strategies include central government
Legal framework	-
Allocated resources	At state level, the public authorities allocate approximately EUR 4.5 million per year to introduce operational electronic procurement
Time frame	-

10.2.3 *Existing guidelines*

Public procurement portals	The official online database for public tendering on the Federal level is titled Bundesausschreibungsblatt online, www.bundesausschreibungsblatt.de
	"E-Vergabe", www.evergabe-online.de has been developed by the Ministry of Economics and Labour (BMWA) together with the Ministry of the Interior (BMI). E-vergabe is an online database with call for tenders. From February 1st it is possible to transfer the offers electronically.
	Several Länder own an online database with call for tenders, e.g. • Nordrhein-Westfalen (www.vergabe.nrw.de), • Hessen (www.had.de), • Brandenburg together with Berlin (www.ausschreibungen-brandenburg.de), • Hamburg (www.ausschreibungen.hamburg.de), • Bayern (www.bayerischer-staatsanzeiger.de), • Sachsen-Anhalt (www.ausschreibungsanzeiger.com), • Thüringen (www.ausschreibungsanzeiger-thueringen.de)
	Another leading electronic public procurement platform for public and private calls for tenders is www.ausschreibungs-abc.de
Electronic signature	Advanced qualified electronic signature has been introduced
Electronic catalogues	There exists an electronic catalogue on behalf of the Federal Ministry of the Interior and its Procurement Office, which is called "Öffentlicher Eink@auf Online".
Electronic auctions	E-auctions are not a legal possibility
Dynamic Purchasing Systems	Dynamic purchasing systems are not a legal possibility
Framework agreements	-

The Ministry of Economics and Labor has published a guide on electronic public procurement (www.bmwa.bund.de/Redaktion/Inhalte/Downloads/br-elektronische-vergabe-von-auftraegen,property=pdf.pdf). It is required that all state institutions use electronic procurement whenever possible and of economic advantage to the state. In December 2003 the Federal Government has taken a cabinet decision initiating an optimization of public procurement with the means of new information technology. The cabinet decision aims to realize a thorough digitalization of the procurement process and to establish a virtual marketplace (Kaufhaus des Bundes) on the basis of framework agreements.

10.3 Legal framework

10.3.1 Legal status of the use of electronic means in Public Procurement

Multiple legal acts regulated e-public procurement at present time (see below).

10.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented by the end of 2005. The storage of data is regulated by national legislation. With the new EU directives, Germany expects the government to provide that Contracting Authorities may use electronic auctions (with the possible exception of works contracts) and dynamic purchasing systems. Buyer profiles to publish tender-related information are being used by Contracting Authorities in Germany.

The use of an electronic signature will be made mandatory to participate in public calls for competition

10.3.3 Status of tools

Public procurement portals	The official online database for public tendering on the Federal level is titled Bundesausschreibungsblatt online, www.bundesausschreibungsblatt.de
	"E-Vergabe", www.evergabe-online.de has been developed by the Ministry of Economics and Labour (BMWA) together with the Ministry of the Interior (BMI). E-vergabe is an online database with call for tenders. From February 1st it is possible to transfer the offers electronically.
	Several Länder own an online database with call for tenders, e.g. • Nordrhein-Westfalen (www.vergabe.nrw.de), • Hessen (www.had.de), • Brandenburg together with Berlin (www.ausschreibungen-brandenburg.de), • Hamburg (www.ausschreibungen.hamburg.de), • Bayern (www.bayerischer-staatsanzeiger.de), • Sachsen-Anhalt (www.ausschreibungsanzeiger.com), • Thüringen (www.ausschreibungsanzeiger-thueringen.de)

	Another leading electronic public procurement platform for public and private calls for tenders is www.ausschreibungs-abc.de
Electronic signature	Advanced qualified electronic signature has been introduced and is presently used to some extent.
Electronic catalogues	There exists an electronic catalogue on behalf of the Federal Ministry of the Interior and its Procurement Office, which is called “Öffentlicher Eink@auf Online”.
Electronic auctions	E-auctions are not a legal possibility
Dynamic Purchasing Systems	Dynamic purchasing systems are not a legal possibility
Framework agreements	-

10.3.4 *Reference to the relevant legal acts*

At present the legal framework for e-public procurement is among other things based on:

- „Gesetz über Rahmenbedingungen für elektronische Signaturen (Signaturgesetz – SigG)“ of 16. May 2001 (BGBl. I S. 876)
- Signaturverordnung vom 16. November 2001 (BGBl. I S. 3074)
- Verordnung über die Vergabe öffentlicher Aufträge in der Fassung vom 11.Februar 2003 (BGBL I, S.169) – im Besonderen § 15 VgV.
- Anpassung der Verdingungsordnungen (VOL/A Abschnitt 1 und VOB/A[29]) (in order to implement directive2001/78/EC)
- "Gesetz zur Anpassung der Formvorschriften des Privatrechts und anderer Vorschriften an den modernen Rechtsgeschäftsverkehr" – Formvorschriften-Anpassungsgesetz. Implementation 1. August 2001 (BGBL I Nr. 35 vom 18. Juli 2001)

10.4 Current usage of electronic means in Public Procurement

10.4.1 *Practical use of electronic means in Public Procurement*

Every year, the approximately 600 awarding offices of the Federal Government buy products and services worth around EUR 63 billion.
In January 2004, nine federal authorities, as well as state and communal authorities, used eTendering.

Monitoring of the up-take and progress of e-public procurement is carried out on an annual basis by a questionnaire to a Working Committee of all government departments. The following aspects are watched: Transaction costs and the effect on prices.

[29] See http://www.bmwi.de/Navigation/Wirtschaft/Wirtschaftspolitik/Oeffentliche_20Auftr_C3_A4ge/vergaberecht-vorschriften.html

The resources allocated by public authorities to introducing operational public procurement are also monitored at national level. Other aspects which should be considered in the future are: Number of electronic transaction, e-public procurement's share of total public procurement volume, types of purchases, speeding up of procurement procedures, SME participation and number of bidders.

10.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Germany is as follows:

- Notification about tender (to a large extent)
- Publication of tender (to a large extent)
- Management of receipt/submission of tenders (to a large extent)
- Evaluation of tenders (not automated, but expected to be within two years)
- Ordering (to a large extent)
- Invoicing (to a large extent).

10.5 Raising awareness & Promotion of electronic means

At state level the public authorities allocate approximately EUR 4.5 mio per year to introduce operational electronic procurement. These resources are e.g. used for the development and implementation of software and the support of research dealing with e-public procurement.

Within 2004 it is planned that all electronic public tenders on Federal level will be published on the central portal of the State, www.bund.de

In Germany special advice centers (Auftragsberatungsstellen) impart practical experi-ence and information to enterprises that plan to tender for public contracts. www.abst.de lists every advice centre of each of the Länder. Some local governments have initiated portals, see e.g. Düsseldorf (www.duesseldorf.de/ausschreibung/index.shtml)

The German Association of Towns and Municipalities (www.dstgb.de) decided on electronic procurement regarding trade in co-operation with the Central Organization of German Trade (www.handwerk.de/dstgb). Together with the German Telecom the DSTGB also started an initiative with the goal to identify the chances of small and medium-sized towns regarding their potential to modernize, rationalize and initiate new projects[30].

The Federal Government, the Länder and the municipalities have developed a common architecture for e-government. The e-government standard is called SAGA (Standards and Architectures for e-Government Applications[31]). SAGA defines a series of uniform standards which must be used for the implementation of e-government applications. Furthermore SAGA is included in the "Interoperability Framework" of the IDA-program of the European Union. OSCI (Online-Services-Computer-Interface) as well as ISIS-MTT (Industrial Signature Interoperability and Mailtrust Specification) are two obligatory standards in the Federal Administration which are based on SAGA. Communication standards are XML, HTML and PDF.

[30] See www.dstgb.de/index_inhalt/homepage/index.html

[31] See http://www.kbst.bund.de/Anlage304417/Saga_2_0_en_final.pdf

Another existing e-procurement tool is the Vergabe@Governikus[32]. This is a software solution for the control of the communication and handling of public tenders via Internet. It is possible to publish digital announcements, provide data for placing of contracts by tender (Verdingungsunterlagen) and accept electronic offers.

Vergabe@Work is an electronic management solution for tendering. The control system is form-based and supports the handling of the entire internal process of contract awarding digitally and law-conforming. Vergabe@Work has been specially designed for the application within contracting authorities (www.ai-ag.de). Vergabe@Work is being used by the Ministry of Finance and the Ministry of Defence.

[32] See www.bos-bremen.de/produkte/kap2_6.html

11. Greece[33]

11.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	General Secretariat of Commerce, Ministry of Development
Responsible institution(s) for legal aspects	General Secretariat of Commerce, Ministry of Development
Responsible institution(s) for technical solutions	General Secretariat of Commerce, Ministry of Development
Central procurement institution(s)	General Secretariat of Commerce, Ministry of Development
Other important organisations	-
Type of coordination between different institutions	The selection of suppliers is typically the responsibility of a central procurement body. In some cases the Ministry of Development gives authorization to other ministries and bodies of public sector, to run their own auction. In these cases they are responsible for the selection of suppliers.

11.2 Strategy

In general the introduction of electronic public procurement has a high priority in Greece.

The strategy for the introduction of operational electronic public procurement is an integrated part of the overall strategy on e-government and the development of the information society.

The focus of the strategy is to obtain improved IT skills in public and private sector, speeding up procurement procedures, and to secure lower prices on public procures.

11.2.1 Statement of objectives

The overall objective is to introduce an operational electronic public procurement system in Greece by the end of 2007.

It is planned that about 30% of goods which are awarded from the Ministry of development will be awarded by electronic means by the end of 2008.

[33] This section is based entirely on information from Mr. Spatharis, Ministry of Development

11.2.2 Scope of strategy

Levels of government involved	Central government
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	2004 – 2010[34]

11.2.3 Existing guidelines

No special guidelines for e-public procurement have been issued.

11.3 Legal framework

11.3.1 Legal status of the use of electronic means in Public Procurement

The use of electronic means for communication in the public procurement process will be regulated by national legislation. The following aspects will be regulated: rules applicable to communication, storage of data, use of specific procedures e.g. e-auctions; dynamic purchasing system; open, restricted and negotiated procedures; notification about tender; publication of tender; management of receipt/submission of tender; and ordering.

Operational electronic procurement system does not exist in the public sector in Greece yet. However, a system in compliance with the requirement of the forthcoming directives will be introduced shortly.

11.3.2 Implementation of the Directives

The directives are expected to be implemented in 2006

[34] Estimated number of years for full migration in public procurement to electronic means is 6 years (Source: Based on information from Mr. Spatharis, Ministry of Development)

11.3.3 Status of tools

Public procurement portals	www.gge.gr is the public procurement portal (only in Greek) The portal has the following functionalities: Publication of legal framework of public procurement, guidelines on public procurement, central government annual programme of supplies, calls for tendering on monthly basis, contracts on monthly basis.
Electronic signature	Electronic signature has been introduced and is being used to a low extent. However, the use of electronic signature will be made mandatory to participate in public calls for competition.
Electronic catalogues	There is no experience with electronic catalogues
Electronic auctions	There is no experience with electronic auctions
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Framework agreements are not being used

11.3.4 Reference to the relevant legal acts

Information unavailable

11.4 Current usage of electronic means in Public Procurement

Currently, the uptake on electronic public procurement is not being monitored on a regularly basis in Greece.

Hence, there is no information available on the existing usage of electronic means in public procurement.

11.4.1 Which phases of procurement are covered?

Information unavailable

11.5 Raising awareness & Promotion of electronic means

Information unavailable

12. Hungary

12.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Council for Public Procurement (www.kozbeszerzes.hu)
Responsible institution(s) for legal aspects	Council for Public Procurement (www.kozbeszerzes.hu)
Responsible institution(s) for technical solutions	Electronic Government Centre, Office of the Prime Minister (www.magyarorszag.hu)
Central procurement institution(s)	Central Service Directorate is the central procurement body for public procurements at the national level .This institution has responsibility for the selection of suppliers for procurements in public institutions
Other important organisations	-
Type of coordination between different institutions	

12.2 Strategy

Electronic public procurement has been on the Hungarian government's agenda since 2001. At the present the development of an operational electronic public procurement system has a medium priority on the Hungarian government's agenda.

The strategy for introducing an operational electronic public procurement is included in the overall strategy on E-government and Information society among others "Hungarian Information Society Strategy" (HISS), 2002[35].

12.2.1 Statement of objectives

The government has specified overall objectives for introducing electronic public procurement. In a draft plan for secondary legislation these objectives are stipulated and are as follows:

- the harmonization and modernization of the law
- ease of use among wide range of participants
- transparency
- support of centralised procurement

[35] See http://www.ihm.hu/English/_20030211_1.html

12.2.2 *Scope of strategy*

There are different stages in the strategy for the implementation of e public procurement. The first stage concerns strategic procurement on obligatory basis in central government. The second stage is widening the scope toward voluntarily participants and non-strategic procurements.

Levels of government involved	The plan includes a strategy for e-procurement at different levels of the Hungarian public sector, including central-, regional- and local governments
Legal framework	
Allocated resources	Internal government figures exists but cannot be disclosed publicly
Time frame	Implementation of the plan will start in June 2004. Objectives are estimated to be realized in March 2005.

12.2.3 *Existing guidelines*

Specific and detailed guidelines for electronic public procurement are under preparation in Government Decree on the electronically supported activities allowed in public procurement and in special electronic procurement procedures.

12.3 Legal framework

12.3.1 *Legal status of the use of electronic means in Public Procurement*

No national legalization is presently regulating the use of electronic means for communication in the public procurement process. However, legalization is under preparation in *Government Decree on the electronically supported activities allowed in public procurement and in special electronic procurement procedures.*

12.3.2 *Implementation of the Directives*

The Hungarian Government expects that implementation of the forthcoming EU-public procurement directives will take place in 2005.

Future electronic procurement systems will be compliant with the requirements of the forthcoming European Public Procurement Directives. It is estimated that Contracting Authorities will be allowed to use Electronic Auctions according to the Directives. It is not expected that Contracting Authorities will be mandated to implement Dynamic Purchasing Systems. Electronic Auctions are assumed will be used for purchasing MRO goods (Maintenance, Repair and Operations goods) by central government institutions.

The Hungarian Government expects that buyer profiles will be used by Contracting Authorities. Moreover, the government intends to introduce national standards for the electronic exchange of data in the public procurement process. The standards considered relevant are XML and EDI - both EAN compatible.

12.3.3 *Status of tools*

Public procurement portals	So far a central electronic public procurement portal has been established at www.kozbeszerzes.hu. The website is public owned by the Advertising Agency of the Council of Public Procurement. On this site one can reach the relevant public procurement rules, the Hungarian Official Journal in public procurement and the tender notices, recommendations and information of the Council, information on the Council and its working structure (Secretariat), contact details, international related links.
Electronic signature	An electronic signature has been introduced, but currently the signature is used only to a low extent. It is expected that a full operational electronic signature will be ready for use in March 2005. It is expected that the use of the signature will be mandatory for participating in public calls for competition.
Electronic catalogues	E-catalogues are also used to some extent in order to gather information
Electronic auctions	E-auctions are being used below threshold for experimental purpose
Dynamic Purchasing Systems	Dynamic purchasing systems are not being used
Framework agreements	Framework agreements are not used at the moment.

12.3.4 *Reference to the relevant legal acts*

Information unavailable

12.4 Current usage of electronic means in Public Procurement

12.4.1 *Practical use of electronic means in Public Procurement*

At the moment there are no operational electronic procurement systems in Hungary that are compliant with the requirements of the forthcoming European Public Procurement Directives.

The Hungarian government expects to carry out assessments during the implementation of electronic public procurement. The activities which will be assessed include the number of electronic transactions and the speeding up of procurement procedures. Other activities for regular assessments are workflow atomization and the professionalism of the system for electronic public procurement.

12.4.2 *Which phases of procurement are covered?*

The Hungarian Government expects that a fully automated electronic public procurement system will be available within tree years. The system will include the central elements in electronic procurement: notification about tender, publication of tender, management of receipt/submission of tender, evaluation of tender and ordering. Within five years the government anticipates procedures for invoicing to be an integrated part of the electronic procurement system as well.

12.5 Raising awareness & Promotion of electronic means

Information unavailable

13. Ireland

13.1 Organisations and Institutions

The main institution is The Department of Finance, National Public Procurement Policy Unit. It is responsible for policy formulation and the legal framework for e-procurement.

Responsible institution(s) for public procurement policy	Public Procurement Policy Unit, Department of Finance
Responsible institution(s) for legal aspects	Public Procurement Policy Unit , Department of Finance
Responsible institution(s) for technical solutions	Public Procurement Policy Unit, Department of Finance Centre for Management and Organisation Development, Department of Finance Local Government Computer Services Board • A public sector organisation closely aligned with local government in Ireland • Main task is to provide local authorities with the best solutions to meet all their information and communication technology needs ICT bodies within the Health Sector
Central procurement institution(s)	Government Supplies Agency and Office of Public Works
Other important organisations	Information Society Commission
Type of coordination between different institutions	The selection of suppliers is typically a responsibility of the individual public institution. Some coordination exists in parts of the health sector and in third level educational institutions

13.2 Strategy

Strategies on e-public procurement are integrated in an overall strategy on modernising Public Procurement

- "Strategy for the Implementation of eProcurement in the Irish Public Sector" (2001)
- "Modernising Public Procurement" (2003) (See below)

Arising out of the Government's Action Plan on Implementing the Information Society in Ireland the Department of Finance, in conjunction with the Department of the Taoiseach, identified e-procurement as an essential element in eCommerce, having a role in both:

- Accelerating the transition of the Irish economy to an information society
- Contributing to the attainment of the Government objective of modernizing the public service through the development of new, innovative and more efficient procurement processes.

The government has a Strategy for the Implementation of e-Procurement in the Irish Public Sector approved by Government in April 2002. This strategy emphasized the need for procurement management reform, and points out four aspects to implementation of e-procurement in Ireland. These are:

- Capacity building: organisational capacity to strategically manage procurement effort in order to maximize measurable savings and benefits;
- Training and education developing for public sector staff through targeted procurement training and education to sustain measurable improvements in procurement performance;
- Aggregation: reducing costs by leveraging public sector demand in certain markets; and lastly
- e-procurement systems: improving efficiency through the use of cost effective technologies in support of various aspects of procurement.

13.2.1 Statement of objectives

The strategy contains a number of key targets to be achieved by the end of 2007. These include:

- Unit cost reductions of 2.5% of total expenditure on supplies and services and works (repairs and maintenance), arising from reductions in off-contract procurement and aggregation of procurement across agencies;
- Average transaction costs reductions of 5% for supplies services and works (repair and maintenance) as a result of standardisation, streamlining and automation;
- Unit cost reductions of 0.5% of total expenditure on capital works arising from savings in professional fees resulting from efficiency gains in the tender process and contract administration;
- Transaction cost related reductions of 0.25% in overall expenditure on capital works as a result of public sector administrative cost savings;
- 90% of tender competitions (above EU thresholds) carried out electronically;
- 80% of payments carried out electronically;
- 10% of all expenditures on supplies and services supported by electronic catalogue and ordering facilities.

13.2.2 *Scope of strategy*

Levels of government involved	All levels of government included in the national strategies on e-public procurement. Projects are planned for development of a separate e-procurement strategy for local and sector level
Legal framework	The two principal sources of regulation that impact on e-public procurement in Ireland are public procurement regulation and eCommerce regulation. • The public procurement legislative framework consists principally of the EC Treaty, the EU Public Procurement Directives (implemented by was of Statutory Instrument into Irish law) and the World Trade Organisation Agreement on Government Procurement. • The principal sources of eCommerce regulation are the Electronic Commerce Directive, the Electronic Signatures Directive and the Electronic Commerce Act, 2000. The Electronic Commerce Act implements the Electronic Signatures Directive and those parts of the Electronic Commerce Directive dealing with the formation of contracts.
Allocated resources	Approximately € 4 million annually from central allocation during implementation stage of national strategy. Some sectoral projects are funded by other sources
Time frame	The Strategy for the Implementation of eProcurement in the Irish Public Sector originally envisaged targets being achieved by end 2007 but this timeframe is currently being reviewed.

13.2.3 *Existing guidelines*

Public procurement guidelines setting out the steps to be followed in conducting an appropriate competitive process under EU and national rules have been issued. These guidelines encourage the use of the national public procurement website www.etenders.gov.ie.

Guides, help and resources are available on the website for awarding authorities and suppliers that wish to participate in e-procurement.

13.3 Legal framework

13.3.1 *Legal status of the use of electronic means in Public Procurement*

None of the current e-procurement systems presently fulfil the requirements of the EU public procurement directives fully, but the necessary investments are expected to be allocated at a later stage.

13.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented by 2005. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, and storage of data.

With the new EU directives it is expected that the Irish the government will provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems and that these will be generally available. Buyer profiles to publish tender-related information on a 'buyer profile' are expected to be used by Contracting Authorities in Ireland

It is also expected that Ireland will introduce national standards for the electronic ex-change of data in the public procurement process.

13.3.3 *Status of tools*

Public procurement portals	www.etenders.gov.ie is the central government procurement portal. It provides information and tools about electronic public procurement and advertises notices for EU and sub-EU threshold contracts for the Irish public sector including central government, local authorities, Health Boards and hospitals, universities and schools. Developments in 2004 will include an electronic "post-box" to facilitate the electronic transmission of tenders by suppliers; site forums for the different sectors involved in public procurement such as central government, local government, health and education; and more comprehensive guidance material. Other features planned for the duration of the current contract include a pilot online tender evaluation system; and a facility to conduct tender clarifications/discussions between buyers and vendors online. Ireland recently became the first country to have "national" eSender status. The etenders website has a facility for the online creation and submission of OJEU notices.
	www.tendersireland.com (Public Sector Tender Market in Ireland) is a website where all of the procurement opportunities advertised by Central and Local Government in Ireland (North and South) are published on the Tenders Ireland Web Site.
	www.go-source.com (Go-Source) is a webguide for doing business in the public sector in Ireland. Three private companies are responsible for this joint directory of public sector procurement opportunities.
Electronic signature	An official digital signature has not yet been introduced in Ireland and it is unclear when one will be introduced
Electronic catalogues	The public authorities have no experience electronic catalogues. Pilot initiatives on national level are recommended in the strategies, e.g. a pilot project on electronic ordering using electronic catalogues
Electronic auctions	The public authorities have no experience with e-auctions

Dynamic Purchasing Systems	The public authorities have no experience with dynamic purchasing systems
Framework agreements	The public authorities plan to set up broad based framework agreements.

13.3.4 *Reference to the relevant legal acts*

Electronic Commerce Act 2000:

- The purpose of the Act is to create a legal framework by providing a comprehensive piece of legislation which addresses many of the legal issues that have arisen as a result of electronic commerce and facilitate the growth of electronic commerce and electronic transactions in Ireland.
- The Electronic Commerce Act, 2000 provides for the legal recognition of contracts, electronic writing, electronic signatures and original information in electronic form in relation to commercial and non-commercial transactions and dealings and other matters, the admissibility of evidence in relation to such matters, the accreditation, supervision and liability of certification service providers and the registration of domain names, and provide for related matters.

13.4 Current usage of electronic means in Public Procurement

13.4.1 *Practical use of electronic means in Public Procurement*

The total non-payroll procurement spending in the non commercial public sector in Ireland is in the region of € 9 billion per annum of which Central government is responsible for approximately 2.4 billion € of procurement, education 1.4 billion €, health 1.9 billion €, and local authorities 3.1 billion € (2001 figures).

Monitoring of the up-take and progress of e-procurement is monitored regularly focusing on the number of users of the eTenders website and the extent of its usage. The site was launched on a pilot basis in March 2001 and three years of operation have seen its usage increase significantly. As of March 2004 there are close to 20,000 registered suppliers and over 1,700 registered Awarding Authority users (buyers). In 2003 close to 4,500 tender opportunities were advertised on the site.

The resources allocated by public authorities to introduce operational public procurement amounts to 4 million € per year at state level for the implementation of the national strategy, of which 2.5 million € are allocated for capital and 1.5 million € for administration, etc.

13.4.2 *Which phases of procurement are covered?*

The status for automating procurement phases in Ireland is as follows:

- Notification about tender (to a large extent today)
- Publication of tender (to a large extent today)
- Provision of contract documents for downloading electronically (to a large ex-tent today)
- Management of receipt/submission of tenders (to a low extent today)
- Evaluation of tenders (not automated, but a pilot system will be established)
- Ordering (to some extent)

- Invoicing (to some extent)

Generally, notification and publication and downloading of tender documents are the phases of public procurement which have been automated the most, whereas management and evaluation are not or only to a low extent automated.

There is generally little experience with electronic auctions and multi-supplier electronic purchasing systems yet. However, the first electronic catalogue, with information on current contract arrangements, has been developed and is expected to be online very shortly.

13.5 Raising awareness & Promotion of electronic means

In September 2003 a new report from the Information Society Commission was published. Modernising Public Procurement indicated that the Government could potentially save up to 1 EUR billion annually on public procurement. This new report was made because of the slow pace of progress since the former strategy was finalized at the end of 2001. It also acknowledges important developments following from among other things the establishment of the National Public Procurement Policy Unit (NPPPU) in the Department of Finance (in 2003). The key recommendations from the report are:

- Resource the National Procurement Strategy adequately
- Enhance the e-tenders website
- Examine alternative delivery models – including PPP
- Support SME adjustment in line with procurement reform.

Forthcoming initiatives:

A “signpost” website, the “Irish Public Procurement Portal”, will shortly be available and this site will contain links to all websites associated with public procurement in Ireland.

14. Italy

14.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	Prime Minister - Cabinet Office (http://www.governo.it) Ministry of Economic Affairs and Finance - MEF (www.tesoro.it) Local Administrations (for example Regions, Municipalities)
Responsible institution(s) for legal aspects	Prime Minister - Cabinet Office (http://www.governo.it) Ministry of Economic Affairs and Finance (www.tesoro.it) Ministry of Innovation and Technology (www.innovazione.gov.it)
Responsible institution(s) for technical solutions	Ministry of Economic Affairs and Finance (MEF) by means of Consip S.p.A. (www.acquistinretepa.it), a State owned company that operates exclusively to serve Public Administrations. The overall mission of Consip is to ensure that every Public Administration employee will be able to order different categories of goods and services online through web-based technologies. Consip (following the MEF guidelines) is responsible for the development and operation of e-public procurement solutions. Ministry of Innovation and Technology (www.innovazione.gov.it) defines/suggest guidelines to implement e-procurement systems. Local Administrations are able and authorized to develop and implement e-procurement systems.
Central procurement institution(s)	Consip S.p.A. (www.consip.it)
Other important organisations	Every Public Administration can develop and implement specific e-procurement systems
Type of coordination between different institutions	The organization of public procurement contains both centralized and decentralized elements: • There is a central public procurement body, but the establishment of procurement bodies at the regional level is planned . • Procurement (selection of suppliers) is the responsibility of the individual public authority.

14.2 Strategy

Since December 1999, the Italian Government has constantly developed and improved a program for public procurement in the Italian Public Administration. It places a high priority on the introduction of operational e-public procurement.

Strategy on e-public procurement is integrated in an overall plan of introducing e-government and integrated into the program of rationalizing public spending for goods and services e.g. “The Public Spending Rationalization Program” (2000) (Programma di Razionalizzazione della Spesa per Beni e Servizi della Pubblica Amministrazione).

This program deals with the following principles and guidelines:

- Defining purchasing strategies
- Drawing up competitive frame contracts for public administrations
- Delivering innovative e-procurement models
- Promoting the use of e-procurement within the public administration
- Providing purchasing monitoring tools to the public administration that use the framework contracts and other e-procurement systems.

14.2.1 Statement of objectives

The overall goals of the e-procurement program are to:

- Limit a potential "digital divide" across society;
- Reduce the expenses of goods and utilities, simplify the buying procedures and improve the transparency, efficiency and the effectiveness of public sector purchases;
- Provide a better service for both buyers and suppliers;
- Improve the transparency, the visibility and therefore accountability of public sector contracting;
- Reinforce the Italian government's commitment to the goals of e-Europe;
- Minimize transaction costs through standardization and to obtain scale economics in selected purchasing areas.
- Goods and services for EUR 12 billion purchased electronically (timeframe: 2000 – 2005).

14.2.2 Scope of strategy

Levels of government involved	Strategies cover all levels of government
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	2000 – 2005

14.2.3 Existing guidelines

Guidelines in support of the different areas have been issued as part of the strategy for e-government e.g. a special guideline for e-public procurement:

- Decree of Republic President n. 101/2002 (Rules to accede and utilize public administration market-places and electronic auctions, guidelines to adopt and utilize electronic advanced signatures).

14.3 Legal framework

14.3.1 Legal status of the use of electronic means in Public Procurement

	Date	N.	Argument
Legislative Decree	12th February 1993	39	Art.3 – Rules on automated informative systems of public administrations, as laid down in the art.2, co.1, let. mm) of the Law 23rd October 1992, n.421
Law	15th March 1997	59	Art.15, co.2 – Proxy to Government on granting functions to Regions and local Authorities about Public Administration reform and administrative simplification
Decree of the President of the Republic	10th November 1997	513	Regulation on procedures for documents registration and transmission with electronic systems, as laid down in the art.15, co.2, of Law 25th March 1997, n.59
Decree of the President of the Republic	20th October 1998		Rules on procedures on managing of electronic protocol by public administration
Prime Minister Decree	8th February 1999		Technical rules on registration, transmission, duplication, copying and approving of electronic documents
Law Decree	22nd May 1999	185	Implementation of the Directive 97/7/CE on consumer protection
Prime Minister Decree	28th October 1999		Electronic management of internal flow of information of Public Administration
Law	23rd December 1999	488	Financial act 2000
Prime Minister Decree	31st October 2000		Technical rules on electronic protocol - Decree of the President of the Republic 20th October 1998, n.428
Law	23rd December 2000	388	Financial act 2001
Decree of the President of the Republic	28th December 2000	445	Administrative procedure Act
Law	28th December 2001	448	Financial act 2002
Legislative Decree	23rd January 2002	10	Implementation of Directive 1999/93/CEE on the communitarian framework for electronic signature

	Date	N.	Argument
Decree of the President of the Republic	4th April 2002	101	Regulates online auctions and marketplace
Law	24th December 2003	350	Financial act 2004
Law Decree	12th July 2004	168	Amendments on Financial act

14.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2005. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, storage of data and use of specific procedures, e.g. e-auctions, e-catalogues and marketplaces. Others follow the Decree of Republic President n. 445/2002 on administrative documentation, technical rules on electronic advanced signatures and certificated mails.

14.3.3 *Status of tools*

Public procurement portals	The portal www.acquistinretepa.it (Acquisti in Rete[36]; AiR) is the Public government procurement portal. The goal of the e-procurement platform is to improve public procurement and efficiency. The platform facilitates the use of three main tools for public e-procurement: *Electronic Shops, Reversed on-line Auctions* and *The Marketplace.* Furthermore the platform provides information on e-procurement activities already started or about to start as well as to diffuse this information, it provides newsletters, best cases and community on e-procurement.
	Local public procurement portal: Intercent ER is a portal for e-sourcing, which belongs to the Emilia Romagna Region and local public authorities
	Local public procurement portal: Purchasing System Piedmont Region is a portal e-sourcing and e-catalogues, which is owned by the region of Piedmont and the local public authorities www.csi.it
	Local public procurement portal: Marketplace for the Municipality of Florence: http://news.comune.fi.it/cgi-bin/market/index.pl
Electronic signature	Electronic signature has been introduced. Nevertheless the use of a qualified electronic signature is compulsory in e-procurement.
Electronic catalogues	Public Administration procurement system and some Local Administrations uses high quality e-purchasing models such as electronic catalogues.
Electronic auctions	Electronic auctions have been a legal possibility since 2002 and there are numerous experiences both on national and local level.

[36] Translation: "Purchases on the Net"

Dynamic Purchasing Systems	For purchases under threshold, exists Market Place of Public Administration based on the principles of dynamic purchasing systems
Framework agreements	Framework agreements are similar to dynamic purchasing system (strictly bilateral)

14.3.4 Reference to the relevant legal acts

Information unavailable

14.4 Current usage of electronic means in Public Procurement

14.4.1 Practical use of electronic means in Public Procurement

On an operating level, the government procurement service, through Consip S.p.A. uses high quality e-purchasing models (electronic catalogues, reverse auctions, market place) as well as standard framework agreements for certain types of categories of goods and services.

The total amount of public expenditure in Italy for Goods & Services equals about EUR 97 billion (2002). This amount represents about 15% of overall public spending. In 2003 the Program's activity has been covering about EUR 16 billion. Despite their non-compulsory participation to the program on public spending rationalization, 21% of municipalities are ordering through Consip system. (year 2004 Good & Services EUR 102 billion, Program's activity cover EUR 6,7 billion, 16% of municipalities ordering)

Monitoring of the up-take and progress of e-procurement is followed on an annual basis and reported to the Ministry of Economic Affairs and Finance and Consip S.p.A. respectively. The following aspects are monitored: Number of procurement and e-procurement transactions, electronic public procurement's share of total public procurement volume, type of purchase, transaction costs and number of bidders, number of e-suppliers and number of e-products.

14.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Italy is as follows:

- Notification about tender (to a low extent)
- Publication of tender (to a large extent)
- Management of receipt/submission of tenders (to a low extent)
- Evaluation of tenders (to a low extent)
- Ordering (to a low extent)
- Invoicing (not automated today, but expected to be within three years).

14.5 Raising awareness & Promotion of electronic means

In 2005 one-half of Italy's public expenditure for goods and services is to be spent on offers which were made electronically. In addition, the government wishes to promote e-business in the wider economy – the huge and influential public sector pushing, by example and by insistence, smaller private business into computer usage and hence to e-business.

In the field of electronic exchange of data in the public procurement process, Italy intends to introduce national standards, but they are not yet defined. Some working groups, mainly composed by Local Administrations, are evaluating standards and guidelines.

15. Latvia

15.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	Procurement Monitoring Bureau (PMB), Ministry of Finance. • Started its activity on 1 January 2002, and is a separate government administrative body, supervised by the Ministry of Finance. • Has its own legal personality and its own separate budget. • Is under the control of the Ministry of Finance. The Minister of Finance exercises a supervisory control over the PMB, in respect of administrative procedure. • Monitors the conformity of the state and local government procurement procedures.
Responsible institution(s) for legal aspects	Procurement Monitoring Bureau, Ministry of Finance. • Practically prepares all the draft regulations relating to public procurement matters, although theoretically, the task belongs to the Ministry of Finance.
Responsible institution(s) for technical solutions	Procurement Monitoring Bureau, Ministry of Finance • Fulfilling the duties provided by Law, PMB is also publishing Tender notices and Contract award notices, examining complaints, providing methodological assistance and consultations and compile and analyze the statistical information available.[37]
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	There is no central procurement body, which arranges framework contracts or is responsible for the selection of suppliers. These functions are the responsibility of each individual public authority.

15.2 Strategy

At the present time the development of an operational electronic public procurement system has a medium priority on the political agenda in Latvia.

Significant advantages from the introduction of electronic public procurement are expected in the following areas:

- Lower transactions costs
- Better procurement statistics and enhanced budgetary control
- Lower prices
- Better access for SMEs in accessing and responding to public tenders
- Improving IT skills in public and private sector.

A separate strategy on e-public procurement was adopted on January 29th 2004: “Usage of information technology in the development of a public procurement system” (2004).

[37] See http://www.iub.gov.lv

15.2.1 *Statement of objectives*

It is projected that:

- 33% of all public procurement procedures will be done electronically by 2008
- the government can save EUR 1 million per year after 2008 by undertaking the procurement procedures in the public sector, electronically
- the electronic catalogue will be fully implemented in 2008 e-auctions will be used in 15 % of all procedures by 2008

15.2.2 *Scope of strategy*

The strategy has three focus areas:

- Development of a public procurement portal with the possibility of electronic notification.
- Realization of activities for using e-auctions and electronic catalogues
- Constructions of a central public procurement body

Levels of government involved	The initiatives of the strategy are obligatory for the whole central government; moreover part of the local government will be given a chance to participate in some of the projects
Legal framework	For pilot project changes in legislation are not necessary. Directive 2004/17/EC is implemented in 2004 in Latvia Deadline to the Directive 2004/18/EC implementation time is the end of 2005.
Allocated resources	Approximately EUR 0.5 million has been allocated for the introduction of operational pilot electronic procurement system at national level
Time frame	2004 – 2008

15.2.3 *Existing guidelines*

Guidelines have not been issued

15.3 Legal framework

15.3.1 *Legal status of the use of electronic means in Public Procurement*

There is no legal framework for usage of e-auctions or dynamic purchasing system or e-catalogues in the classical sector, but e-catalogues will be established using framework agreements, but all these methods have been already set in the utility sector procurement legislation.

15.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2005. Public procurement is currently regulated in national legislation by “Law on Procurement for State or Local Government Needs” (July 2001, amended June 2004) and “Law on Procurement for Public Services Providers needs” (October 2004). Electronic means for communication in the public procurement process is already regulated for utility sector.

15.3.3 *Status of tools*

Public procurement portal(s)	www.iub.gov.lv/ IUB (PMB) is a central e-public procurement portal with online notification of tenders. Moreover limited negotiations procedures are available (you can fill in the forms online); also legislation, statistics and an online Q&A functions can be found on the site (but only in Latvian). IUB (PMB) was introduced in January 2004.
Electronic signature	A qualified electronic signature has not yet been introduced in Latvia, but it is planned to be by the end of 2004. Specifications are not available
Electronic catalogues	There is no experience with e-catalogues
Electronic auctions	There is no experience with e-auctions
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Legislation allows using of Framework agreement in utility and classical sector

15.3.4 *Reference to the relevant legal acts*

Information unavailable

15.4 Current usage of electronic means in Public Procurement

15.4.1 *Practical use of electronic means in Public Procurement*

Up-take and progress on electronic public procurement is not monitored on a regular basis.

In the strategy it is assessed to save 2 mio. EUR from centralising and administrative savings. The following aspects are being assessed: number of transactions, electronic public procurement's share of total public procurement volume, types of purchases, speeding up the procurement procedures, transaction costs, and number of bidders

15.4.2 *Which phases of procurement are covered?*

The status for automating procurement phases in Latvia is as follows:

- Notification about tenders (to some extent today, but a further increase the next three years is expected)
- Publication of tenders (to some extent today, but a further increase the next three years is expected)
- Management of receipts/submission of tenders (not automated and currently not expected to be automated)
- Evaluation of tenders (not automated and currently not expected to be automated)
- Ordering (not automated and currently, but expected to be automated)
- Invoicing (not automated and currently not expected to be automated)

15.5 Raising awareness & Promotion of electronic means

A project named *"Sabiedrikais iepirkumu portāls"*[38] has been launched, which will lead to the establishment of a central e-public procurement portal. For this project, financial and human resources have been made available. The project has started in 2003, and the ambition that has been set is to finalise it by 2004.

This project prepares the set-up of a portal comprising an informational part on legal issues as well as a platform for publication of calls for tender, tender documents and consultation of terms of reference. A first phase only allow publication, facilitating this process for public entities, since the portal automatically transfer calls for tender above threshold to the relevant publication papers, i.e. the Luxembourg written press and EU official journal.

[38] Translation: " Public procurement portal"

16. Lithuania

16.1 Organisations and Institutions

In Lithuania there are three bodies with equal authority in the field of e-public procurement.

Responsible institution(s) for public procurement policy	Ministry of Economy (www.ukmin.lt) Public Procurement Office (www.vpt.lt) • Established under the Government of the Republic of Lithuania to co-ordinate and monitor compliance with the Law on Public Procurement and relevant regulations Information Society Development Committee (www.ivpk.lt) • Was set up in mid 2001, when the Ministries of Communication and of the Interior started to transfer functions of the regulation of information technologies and telecommunications and co-ordination of the development of information society[39]
Responsible institution(s) for legal aspects	Ministry of Economy (www.ukmin.lt)
Responsible institution(s) for technical solutions	Public Procurement Office (www.vpt.lt) • Responsible for development and operation of the forthcoming electronic public procurement system[40] Information Society Development Committee (www.ivpk.lt) • Responsible for the establishment of an e-society in Lithuania including the electronic signature
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	Procurement is organized in a decentralized approach. There is no central public procurement body in Lithuania.[41] Public procurement entities can make "centralized" procurements, and they buy big amounts of goods or other supplies at much lower cost and then distribute them to its subsidiaries. For instance Ministry of Interior and Ministry of National Defense have used centralized procurements.

[39] See www.ivpk.lt/main_en.php

[40] See www.vpt.lt

[41] The national law on public procurement does not specify that central procurement bodies can exist at national, regional or local level.

16.2 Strategy

The overall strategy on e-public procurement is an integrated part of a general strategy on modernising the public sector and development of the information society.

Three strategies in the field of information society development and e-government are included:

- *National Concept of Development of Information Society* (Feb. 2001)[42]: Basic tasks in creation of e-government.
- *Strategic Plan for Development of Information Society* (Aug. 2001)[43]: Ensuring progressive development of information society in Lithuania through four priorities: 1) competence of Lithuanian citizens; 2) public administration; 3) electronic business; and 4) Lithuanian culture and Lithuanian language.
- *Long-term Development Strategy of the State* (Nov. 2002)[44]: This strategy clearly emphasizes, that one of the main strategic trends in the field of development of public administration, is establishment and functioning of e-government.

Furthermore, Lithuania has a strategy for Modernising the activities of Public Procurement which is part of the general Government programme. This strategy includes activities in the field of e-public procurement. It involves only central government and focuses on a gradual transformation of public procurement into an electronic environment for adoption of the best EU Member State's practices and creation for the public procurement information system.

16.2.1 Statement of objectives

Electronic public procurement is an area which is highly prioritized by the government of Lithuania. The overall objectives for e-public procurement is to revise the national public procurement legislation, increase transparency and availability of information and develop an electronic public procurement system.

The development of e-government is followed by a variety of specific tasks. The objective here is among other things to deliver public procurement services on the Internet by 2005.

[42] See Vilnius University, Law Faculty, Legal Informatics Center (2003): "Situation of e-government in Lithuania and principles of e-government in Lithuania", Vilnius
[43] See Vilnius University, Law Faculty, Legal Informatics Center (2003): "Situation of e-government in Lithuania and principles of e-government in Lithuania", Vilnius
[44] See "eGovernment Factsheet – Lithuania" at http://europa.eu.int/ISPO/ida

16.2.2 Scope of strategy

Levels of government involved	Central government is included in the strategies[45]
Legal framework	Information unavailable
Allocated resources	To cover the development costs of the first phase of CPPP, Public procurement office already has received funding of more than 300.000 EUR this year. As stated in the PPO strategic planning document, expected funding for the development of the CPPP in 2004 should reach approximately 1.150.000 EUR, in 2005 – 3.200.000 EUR and in 2006 - 2.000.000 EUR per year (including the state budget and the European regional develop fund sources).
Time frame	Variable (specific information unavailable)

16.2.3 Existing guidelines

Guidelines have not been issued.

16.3 Legal framework

16.3.1 Legal status of the use of electronic means in Public Procurement

Rules applicable to communication and storage of data are already regulated by national legislation.

16.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented in 2006.

The use of e-auctions, dynamic purchasing systems etc. is not regulated by the legislation, but the government will provide that contracting authorities may use these procedures. However they will only be allowed for certain types of purchasing expectantly standard goods. The Public Procurement Office will develop e-procurement solutions following all requirements set by the EU e-procurement legislation.

E-auctions and DPS would be available after implementation of new public procurement directives (expected in 2006) and according implementation of technical solutions allowing these procedures.

[45] Based on interview with Mr. Ainis Pumputis, Public Procurement Office

16.3.3 *Status of tools*

Public procurement portals	A central electronic public procurement portal (CPPP) is expected to be established in the second half of 2004. The functionality of the portal will fulfil the Directive requirements. For the CPPP functionality, implemented in the first development phase, Directive requirements will be met. [46] In 2004 the first phase of Central public procurement portal (CPPP) will be established. However, a central public procurement portal with full functionality will most likely be completed approximately in 2008. Development of the first phase includes fundamental portal functionality (user authorisation system, content management, statistical and analytical functionality), notifications and tender information publishing, and e-catalogues (e-auctions are not planned for the first phase of CPPP development).
Electronic signature	The use of electronic signature has been a legal possibility since 2000.
Electronic catalogues	No experience with e-catalogues
Electronic auctions	No experience with e-auctions
Dynamic Purchasing Systems	No experience with dynamic purchasing systems
Framework agreements	No experience with framework agreements

16.3.4 *Reference to the relevant legal acts*

No information

16.4 Current usage of electronic means in Public Procurement

16.4.1 *Practical use of electronic means in Public Procurement*

There is no regular monitoring of the up-take and progress of e-procurement. However a pilot project is being planned. Moreover the government is planning to assess the impact of introducing electronic public procurement within three years when all initiatives on the field have been implemented.

16.4.2 *Which phases of procurement are covered?*

Specific statistical information about a number of e-public procurement functions will be available following the introduction of the central procurement portal by the end of 2004.

[46] Based on interview with Mr. Ainis Pumputis, Public Procurement Office

16.5 Raising awareness & Promotion of electronic means

The most significant advantage from introducing e-public procurement is expected to be public sector savings through lower prices. Moreover it is expected that the transactions costs will be lowered, and that it will be able to speed the procurement process. Finally SMEs is expected to have better access to public tenders.

17. Luxemburg

17.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	The Ministry of Public Works[47] (www.etat.lu/MTP) The Ministry of Civil Service and Administrative Reform[48] (www.mfpra.public.lu) • The Ministry of Civil Service and Administrative Reform is involved in the function of coordinator of the *e*Luxembourg Action Plan and as pilot ministry for the first phase. The National Information Society Commission[49]
Responsible institution(s) for legal aspects	The Ministry of Public Works (www.etat.lu/MTP)
Responsible institution(s) for technical solutions	*Centre Informatique de l'Etat*, The Ministry of Civil Service and Administrative Reform (www.mfpra.public.lu) (www.cie.public.lu)
Central procurement institution(s)	*Centre Informatique de l'Etat*, The Ministry of Civil Service and Administrative Reform (www.mfpra.public.lu) *Service Central des imprimés des l'Etat*, The Ministry of Civil Service and Administrative Reform (www.mfpra.public.lu) (www.scie.public.lu) • Has developed an electronic catalogue through which different authorities can pass aggregated orders.
Other important organisations	-
Type of coordination between different institutions	The selection of suppliers falls in the responsibility of the Centre Informatique, as far as IT equipment is concerned, and of the individual public authorities for the rest.

17.2 Strategy

The strategy is part of a drive to modernise public procurement in general. It mainly covers central government, although there is a common will to involve local authorities (as well as every organism falling under the national public procurement legislation), which will be obliged to use some functionalities of the new structures while they will be sensitised on the issue in general.

E-public procurement has a high priority in Luxembourg, since it forms part of the action plan *e*Luxembourg (www.eluxembourg.lu), which has been presented to the Government on 26 January 2001. One of the objectives, within the pillar "Putting new technologies at the service of citizens and enterprises as well as civil servants and public organisms", is to promote use of "tele-procedures" by businesses and professionals in communication with public authorities. Under this heading, which implies two phases (one without electronic signature, the second one implying such a signature), e-public procurement activities have been launched.

[47] *Ministère des Travaux Publics*
[48] *Ministère de la fonction publique et de la réforme administrative*
[49] *Commission nationale pour la société de l'information*

17.2.1 *Statement of objectives*

The objective has been formulated that the whole public procurement procedure from notification to invoicing and accounting should be made electronically accessible by 2005. A feasibility study launched in 2002, of which the conclusions (feasibility within 3 years) have been presented to the Government and have been approved, is considered as the strategy for introducing e-public procurement in Luxembourg. A new strategic paper will be prepared for the new Government which will emerge from the June 2004 elections, taking stock of achievements and setting new objectives. No proper guidelines have been issued, apart from minor communications and recommendations, for instance on the law establishing the possibility to include part of the proposal on CD-ROM with the paper documents.

17.2.2 *Scope of strategy*

Levels of government involved	Central government is the only level included in the strategy. Representatives of local government and the Health Sector have been consulted for the strategic study.
Legal framework	Legal aspects have been outlined in the strategic study.
Allocated resources	-
Time frame	-

17.2.3 *Existing guidelines*

Special guidelines for using e-public procurement have not been produced

17.3 Legal framework

17.3.1 *Legal status of the use of electronic means in Public Procurement*

Information unavailable

17.3.2 *Implementation of the Directives*

The systems developed will be compliant with the new European public procurement directives; however Luxembourg is expecting to use the full transposition period of 21 months, completing implementation in 2006. Apart from the possibility of electronic publication of calls for competition and the possibility to submit part of the proposal in electronic form, the use of electronic means for communication in public procurement has not been regulated yet in Luxembourg.

Electronic auctions and Dynamic Purchasing Systems will probably be authorised in Luxembourg, and national standards for the electronic exchange of data in the public procurement process, e.g. for submission templates and invoices, will be introduced.

17.3.3 *Status of tools*

Public procurement portals	A project named *"Mise en ligne des Marchés Publics"*[50] has been launched, which will lead to the establishment of a central e-public procurement portal. For this project, financial and human resources have been made available. The project has started in 2002, and the ambition that has been set is to finalise it by 2005. This project prepares the set-up of a portal comprising an informational part on legal issues as well as a platform for publication of calls for tender, tender documents and consultation of terms of reference. It will be tested by the back office in Summer 2004. A first phase will only allow publication, facilitating this process for public entities, since the portal will automatically transfer calls for tender above threshold to the relevant publication papers, i.e. the Luxembourg written press and EU official journal. A second phase will also contain features such as bid receipt with time stamping. No other public procurement portals have been created yet in Luxembourg.
Electronic signature	While no qualified electronic signature has been introduced in Luxembourg to date, a mixed economic interest group consisting of Ministry of Economy officials and representatives of the banking sector is drafting terms of reference for the development of a qualified electronic signature by 2005. However, it is not decided yet, whether the use of a qualified signature will be made mandatory for the next phase of the portal, i.e. electronic submission of tenders.
Electronic catalogues	The central purchasing agency "Service central des imprimés de l'Etat" is using electronic catalogues
Electronic auctions	There is no experience with e-auctions in the public authorities
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems in the public authorities
Framework agreements	No framework agreements are being used in Luxembourg at national level for the time being.

17.3.4 *Reference to the relevant legal acts*

Information unavailable

17.4 Current usage of electronic means in Public Procurement

17.4.1 *Practical use of electronic means in Public Procurement*

Statistics on e-public procurement will be taken in Luxembourg, covering aspects such as number of electronic transactions, number of bidders, types of purchases as well as effect on prices. Ad hoc monitoring will be performed once the system is operational.

[50] Translation: "Public Procurement Online"

17.4.2 Which phases of procurement are covered?

In Luxembourg, the publication phase has been automated to a low extent so far, as well as the reception and evaluation of tenders (if one counts the receipt of part of the proposal on CD-ROM), but the complete public procurement process is expected to be available electronically within the next three years, except for invoicing, which probably will take longer.

17.5 Raising awareness & Promotion of electronic means

Information unavailable

18. Malta

18.1 Organisations and Institutions

The two main institutions in the field are:

- The Central Information Management Unit (CIMU) within the Office of the Prime Minister
- The Department of Contracts within the Ministry of Finance and Economic Affairs is the central procurement body in Malta

Responsible institution(s) for public procurement policy	Central Information Management Unit, Office of the Prime Minister (www.opm.gov.mt)
Responsible institution(s) for legal aspects	Central Information Management Unit, Office of the Prime Minister (www.opm.gov.mt)
Responsible institution(s) for technical solutions	Central Information Management Unit, Office of the Prime Minister (www.opm.gov.mt)
Central procurement institution(s)	Department of Contracts, Ministry of Finance and Economics (www.mfin.gov.mt)
Other important organisations	-
Type of coordination between different institutions	Being the smallest country among the 25 EU member states, Malta has two administrative levels, the national governmental level and the local level, which is governed by local councils. Procurement is organized with a strong role assigned to the central governmental level. The selection of suppliers above the threshold for government is done by the Department of Contracts. The Department of Contracts is also involved in the selection of suppliers at local level for procurement above the threshold, which is done in collaboration between the department and the local councils. Procurement below the threshold at local level is done through evaluation committees operating under the local councils. Framework agreements are used neither at the national level nor at the local level.

18.2 Strategy

The Ministry for Information Technology and Investment has drawn up a programme to ensure the timely implementation of their objectives. The government's efforts in the field of e-public procurement are part of this programme as they are closely related to the third component. Being an integral part of the overall vision, the introduction of e-public procurement has a high political priority.

The government's strategy for the introduction of e-public procurement is integrated in the country's overall strategy on e-government and the development of the information society e.g. "e-Government program" (2000). The part of the strategy concerning e-public procurement is currently being developed and the more precise strategic focus is therefore yet to be determined.

18.2.1 *Statement of objectives*

The overall vision and mission in Malta is to develop a first-class information society. The three main components of the vision are:

- deliver first-class public service
- increase citizen participation in government decision making
- streamline public services and realize efficiency-gains

At present there is no specific, quantitative objectives defined which describe the efficiency gains which the Maltese government expects to achieve through the deployment of e-public procurement.

18.2.2 *Scope of strategy*

Levels of government involved	Central and local are included in the strategy
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

18.2.3 *Existing guidelines*

At a more specific level, Malta has issued a set of guidelines (published 15 April 2004) that relate to the government's recently launched e-public procurement initiative for the procurement of standard office automation hardware and software.

18.3 Legal framework

18.3.1 *Legal status of the use of electronic means in Public Procurement*

The government's e-public procurement portal is the first and only e-public procurement initiative in Malta. As described it is aimed at procurement below the threshold and it does presently not comply with the requirements of the forthcoming Public Procurement directive.

18.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2006. The use of electronic means for communication in the public procurement process is presently not regulated by national legislation.

With the new EU directives the Maltese government expects to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems. It is presently not clearly defined whether use will be applied to certain type of purchases or authorities, but the present expectation is that usage will be general and applied to different types of purchases. The same applies to the future use of dynamic purchasing systems.

Concerning the publishing of tender-related information on a ‘buyer profile by contracting authorities, it is expected that this opportunity will be used in the future.

18.3.3 Status of tools

Public procurement portals	As of mid-April 2004 the government has launched the first central electronic public procurement portal (www.e-procurement.gov.mt). The portal, which is developed and maintained by CIMU, is seen as the foundation for e-public procurement at the governmental level. The portal enables public officers to acquire IT hardware and software below the threshold and below Lm 2,500. The e-Procurement system will be reviewed and enhanced to include other functionalities including a payment gateway. Private companies may apply to become an Authorised Supplier. Application will be vetted by CIMU and if the company is approved, it will receive a login and password which will enable it to access the system. Following successful completion of a probation period, the company will be awarded the Quality Mark and thereafter become a Quality Mark Supplier.
Electronic signature	Malta has not introduced a qualified electronic signature, as this is presently not allowed by the national legislation. However, it is expected that the legislation will be amended and that a qualified electronic signature will be introduced within the next three years.
Electronic catalogues	There is no experience with electronic catalogues
Electronic auctions	There is no experience with electronic auctions
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Information unavailable

18.3.4 Reference to the relevant legal acts

Information unavailable

18.4 Current usage of electronic means in Public Procurement

18.4.1 Practical use of electronic means in Public Procurement

There is no figure available on the total volume of e-public procurement as the first e-public procurement portal was launched very recently.
There is presently no assessment of the impact of the introduction of e-public procurement, but it is expected that the impacts will be assessed in the course of the next three years concerning the number of electronic transactions, e-public procurements share of total public procurement volume, types of purchases and the impact on speeding up the procurement procedures. Notably, the security aspect of electronic transactions is an area where regular assessment is considered very important and necessary.
Monitoring of the up-take and progress of e-procurement is presently not carried out.

The resources allocated by public authorities to introducing operational public procurement are not monitored at national level, but government resources have been channeled into the development and maintenance of the recently launched e-public procurement website (precise figure is not available).

18.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Malta is as follows:

- Notification about tenders and publication of tenders have been automated to a large extent
- The management of receipt/submission of tenders and evaluation of tenders have not been automated today and it is not expected to happen within the next three years
- Ordering has been automated to some extent, but expected to be increased within three years
- Invoicing is not automated today but automation is expected to take place within the next three years

18.5 Raising awareness & Promotion of electronic means

Information unavailable

19. Netherlands

19.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Ministry of Economic Affairs (www.minez.nl) - plays a key role in the overall policy formulation in the area of public procurement, including the introduction of operational electronic public procurement, and in the collection of experiences on the ministerial use of electronic tendering. - has recently begun the preparations for the implementation of the forthcoming EU Directives on public procurement, including the development of an outline for a new legal framework for public procurement in general.
Responsible institution(s) for legal aspects	Ministry of Economic Affairs (www.minez.nl)
Responsible institution(s) for technical solutions	Ministry of Economic Affairs (www.minez.nl)
Central procurement institution(s)	Currently no central procurement bodies exist in the Netherlands. A national agency has before been responsible for the overall public procurement, but the agency was abolished due to unsuccessful results. Therefore, the selection of suppliers is typically a responsibility of the individual public institutions.
Other important organisations	-
Type of coordination between different institutions	Public procurement in the Netherlands generally takes place in a decentralised manner. According to the Action Plan (see below), all ministries are to be involved in the introduction of electronic tendering.

19.2 Strategy

The introduction of operational electronic public procurement has a medium priority in the Netherlands. Currently a national programme or strategy within the area of electronic public procurement does not exist. “Action Plan on Professional Procurement and Purchase” (2001), which described a way of working for the national government within the area of public procurement, is currently the main strategic document

The main reasons for the lack of an overall objective or strategy is firstly the absence of a regulated procurement tradition in the Netherlands, and secondly that the Dutch government find it important to integrate a national strategy into the forthcoming EU Directives on public procurement.

The abovementioned Action Plan describes a way of working for the national government within the area of public procurement, and has three main objectives:

1. *Innovative tendering:* Promoting innovation and if necessary, co-operation (cluster formation) by presenting a challenge in the invitation to tender and tailoring the contract forms to this. The government acts as a demanding customer and invites innovative tenders. This is applied on an increasing scale.
2. *European tendering:* Publishing the invitation to tender and, so increasing competition in the market. This creates opportunities for better bids. Furthermore, it is a statutory requirement for government procurement (above certain thresholds). Incentives are needed at this level, as there are shortcomings in compliance.
3. *Electronic tendering:* Publishing announcements and invitations to tender via the Internet, and further deployment of modern information and communications technology (ICT) that supports the entire procurement process.

At the central level, the Action Plan describes a number of steps to be taken among ministries to strengthen inter-departmental co-operation. Among these steps, the ministries will need to publish invitations for tender electronically at the earliest opportunity.

In addition, the central government intranet will need to incorporate en electronic network for buyers and tendering offers, acting as a virtual knowledge centre for professional procurement and tendering. The functions of the electronic procurement network will also need to include a list of buyers and tendering officials at each ministry and a list of planned and current tenders.

Finally, the Action Plan states that the Ministry of Economic Affairs will need to gain experience with electronic ordering and tendering, and place this at the disposal of other parties.

The Action Plan also lists a number of activities, which already has been initiated or implemented. Within the area of electronic public procurement, these activities cover the establishment of a network of professional purchases of the government, including a virtual meeting place (www.PIANOdesk.info), and the setting up of an interdepartmental project team on electronic purchasing.

19.2.1 Statement of objectives

The Dutch government has not yet specified an overall objective for the introduction of operational electronic public procurement in the Netherlands. Scope of strategy

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Significant resources on the introduction of e-public procurement have yet to be allocated
Time frame	Information unavailable

19.2.2 Existing guidelines

Information unavailable

19.3 Legal framework

19.3.1 Legal status of the use of electronic means in Public Procurement

No legal framework for electronic public procurement exists at this moment. Implementation of the new EU Directives on public procurement (see next paragraph) will provide this framework.

To date electronic announcement of tenders is stimulated. With a view to the forthcoming legal framework for electronic procurement some pilot-projects have been executed by individual contracting authorities.

19.3.2 Implementation of the Directives

The forthcoming EU Directives on public procurement are expected to be formally implemented in the Netherlands in 2005. However, additional Dutch requirements will not be implemented before 2007. Currently the use of electronic means in the public procurement process is not regulated by national legislation

With the new EU directives, the government is expected to provide that all Contracting Authorities may use electronic auctions and all other options as indicated in the new EU directives. In addition, Contracting Authorities may and will probably publish tender-related information on a “buyer-profile”.

The Dutch government is currently preparing for the implementation of the forthcoming EU Directives on public procurement. Following these preparations, the Dutch government will develop a more explicit strategy for the introduction of operational electronic public procurement. In this respect, full migration in public procurement to electronic means is considered a realistic and desirable goal within a timeframe of 10 years.

19.3.3 Status of tools

Public procurement portals	The Dutch government has recently introduced an electronic procurement website for the use of the construction sector. The site, which can be found at www.aanbestedingskalender.nl, provides an overview of current procurement within the construction sector. The site is however expected to form a template for the development of a central electronic public procurement portal[51]
Electronic signature	The Dutch government has recently passed an electronic signature bill (May 2003), which ensures the transposition in Dutch law of the European Directive 1999/93/EC on a Community framework for electronic signatures, and provides a firm legal basis for the deployment and use of electronic signatures in e-commerce and e-government.
Electronic catalogues	Electronic catalogues have not been used
Electronic auctions	Ministry of Social Affairs and Employment and different local hospitals and health departments have gained experience with e-auctions in pilot-projects.
Dynamic Purchasing Systems	Dynamic purchasing systems have not been used
Framework agreements	-

19.3.4 Reference to the relevant legal acts

Information unavailable

19.4 Current usage of electronic means in Public Procurement

19.4.1 Practical use of electronic means in Public Procurement

The total impact of introducing electronic public procurement in the Netherlands has not yet been assessed, and the Ministry of Economic Affairs has not agreed on whether the impact will be assessed within the next three years.

Monitoring of the up-take and progress of e-procurement does not take place in the Netherlands yet. However, with the implementation of the forthcoming EU Directives on public procurement, the Ministry of Economic Affairs is expected to do this on a regularly basis (it is not possible to estimate the frequency at this time).

[51] The portal for information and knowledge-transfer for officials in contracting authorities is www.ovia.nl. The portal is also a government initiative. Based on information from Leo Baaijen, Ministry of Economics

19.4.2 Which phases of procurement are covered?

Information unavailable

19.5 Raising awareness & Promotion of electronic means

Within this framework, the Netherlands Accreditation Council has recently accredited KPMG Certification to certify ICT service providers for the issuance of qualified certificates for electronic signatures. KPMG has carried out his first certification at PinkRoccade Megaplex, who is the first party in the Netherlands to meet all the requirements. However, it is currently unclear whether the signature will be used in public procurement and whether the use of qualified electronic signature will be made mandatory to participate in public calls for competition.

At the current time, it is still unclear whether the Dutch government intends to introduce national standards for the electronic exchange of data in the public procurement process. However, the government expect to follow the standards mentioned in the forthcoming EU Directives on public procurement.

20. Poland

20.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Public Procurement Office (www.uzp.gov.pl) • Independent unit within the Polish government, and the main co-ordinating institution on public procurement. • Created on 1 January 1995, following the adoption of the Act on Public Procurement on 10 June 1994. • Pays a policy making and co-ordinating role for the entire Polish public procurement system Elaborates training programs, and organises and inspires training events in the field of public procurement. Ministry of Scientific Research and Information Technology (www.informatyzacja.gov.pl) • Responsible for development and implementation of projects and solutions in the filed of e-public procurement in collaboration with the Public Procurement Office.
Responsible institution(s) for legal aspects	Public Procurement Office (www.uzp.gov.pl)
Responsible institution(s) for technical solutions	Public Procurement Office (www.uzp.gov.pl) • Responsible for developing and operating e-public procurement solutions including the official Public Procurement Bulletin in which public procurement notices are published
Central procurement institution(s)	Public Procurement Office (www.uzp.gov.pl) • Responsible for issuing administrative decisions in response to requests for the application of a procedure other than unlimited tendering
Other important organisations	-
Type of coordination between different institutions	Poland has a decentralized system of public procurement. Every public administration entity is responsible for its own procurement procedures and selection of suppliers. There are no central institutions which purchase on behalf of government or self government entities. However, there is a legal possibility that various public administration units agree to award public procurement contracts together (e.g. IT equipment, vehicles etc.) in order to combine their "purchasing power" and get better prices

20.2 Strategy

The overall vision regarding electronic public procurement in Poland is to ensure efficiency, and general savings in the public administration. An additional objective is to minimizing corruptive behaviour and secure transparency in the public sector activities. In general, electronic public procurement has a medium priority on the national political agenda in Poland.

In order to achieve the objectives Poland has different associated strategies on information society and technology, e-commerce and e-government in Poland. These are reflected in two core projects:

- "Gateway to Poland", State Committee for Scientific Research (2002)[52] is the Polish e-government action plan. Moreover it is an online integrated platform of public administration services available to the public. The platform is expected to increase the efficiency of public administration services by about 40 %.
- "e-Poland – Strategy for the Information Society Development in Poland, 2001-2006", The Ministry of Economy (2001, 2004)[53] is the strategy for development of the information society and includes actions in the fields of e-commerce and on-line public administration. The strategy outlines several planned actions in the period 2001 – 2006 among them a build-out of the Internet service of the Public Procurement Office and introduction of fully electronic procedures for awarding public procurement contracts. For example, it will be required to publish notices relating to public procurement electronically. Furthermore a specific task of the Office of Public Procurement described in the strategy is to introduce fully electronic procedures for awarding public procurement contracts at the latest in 2005.[54]

20.2.1 Statement of objectives

There is a set of overall objectives:

- to ensure efficiency and general savings in the public administration
- to minimize corruptive behaviour
- to secure transparency in the public sector activities

[52] See the State Committee for Scientific Research (www.kbn.gov.pl); and the Ministry of Scientific Research and Information Technology (www.informatyzacja.gov.pl)

[53] See the Ministry of Scientific Research and Information Technology (www.informatyzacja.gov.pl)

[54] "*e-Poland – Strategy for the Information Society Development in Poland, 2001-2006*" (The Ministry of Economy)

20.2.2 Scope of strategy

Levels of government involved	National, regional and local public administration are included in the strategies
Legal framework	Information unavailable
Allocated resources	There is no specific information on this issue
Time frame	Information unavailable

20.2.3 Existing guidelines

Guidelines have not been issued.

20.3 Legal framework

20.3.1 Legal status of the use of electronic means in Public Procurement

The Polish public procurement system was established in 1994 with the adoption of the Act on Public Procurement. Since then the Act has been amended several times mainly with the aim to clarify its rules and definitions, broaden the scope of application and make the procurement process more transparent and to adjust the Polish law to the EU regulatory framework.

Public procurement including E- procurement is now regulated in Poland in the new Law on public procurement (LPP), which entered into force on March 2, 2004. LPP allows among other things use of advanced electronic signature in submission of tenders in public procurement proceeding. The act dealing in general with the use of electronic signature was adopted in Poland in September 2001 and entered into force in 2002. However this legislation does not deal particularly with electronic procurement.
Moreover the Polish legislation also regulates rules applicable to communication and the use of e-auctions.

20.3.2 Implementation of the Directives

The new EU public procurement directives are expected to be implemented in the second half of 2005. Polish legislation on public procurement provides that Contracting Authorities may use e-auctions on purchases of “generally available” goods below of 60.000 EUR.

20.3.3 *Status of tools*

Public procurement portals	**There is no central public procurement portal in Poland, and generally only few activities in the public sector can take place on–line**
	In the private sector two electronic market places among other things deliver the possibility for e-procurement for utilities with low thresholds and therefore not covered by the legislation: • X – Trade (www.xtrade.pl/xtrade) • MarketPlanet (www.marketplanet.pl/en)
Electronic signature	The use of electronic signature in submission of tenders subject to consent of awarding entity has been a possibility in legislation since March 2004 and is required if the tender is submitted electronically. The new legislation equalizes the electronic signature with the written, but it is only used to a low extent in practice
Electronic catalogues	No experience with e-catalogues
Electronic auctions	A few entities in the Polish public sector have experience in organizing e-auctions[55], e.g. a small number of municipalities including the Warsaw Municipality. However the use of e-auctions is not a widespread activity in Poland.
Dynamic Purchasing Systems	No experience with dynamic purchasing systems
Framework agreements	Framework agreements are only allowed in the utility sector.

20.3.4 *Reference to the relevant legal acts*

ACT of 29 January 2004 Public Procurement Law

20.4 Current usage of electronic means in Public Procurement

20.4.1 *Practical use of electronic means in Public Procurement*

The Ministry of Scientific Research and Information Technology has assessed the impact of introducing electronic public procurement. The following aspects are being assessed: Number of electronic transaction, electronic public procurement's share of total public procurement volume, speeding up of procurement procedures, transaction costs, and effect on prices.

There has been no regular monitoring on up-take and progress on e-public procurement in Poland so far, but a more regular statistical monitoring is expected within two years.

[55] Based on interview with Mr. Dariusz Piasta, Public Procurement Office, European Integration Department

20.4.2 Which phases of procurement are covered?

IT software to be developed under the project financed from EU funds will cover all phases of public procurement up to award of contracts.

20.5 Raising awareness & Promotion of electronic means

The use of standards for electronic data exchange is a focus area in Poland, but decisions on which and how standards are to be used in the future have not been made. Under the current legislation it is obligatory to use a CPV code when sending notices.

21. Portugal

21.1 Organisations and Institutions

The recently established *Mission, Innovation and Knowledge Unit* (UMIC) is currently the institution driving the development of e-public procurement in Portugal. UMIC is established as a support structure for the development of the Portuguese government's policy for innovation, information society and e-government. UMIC is thus assigned with policy formulation for e-public procurement, the development of e-public procurement solutions and for the legal framework for e-public procurement. The latter responsibility is shared with the Ministry of Finance. In addition to the strong position currently taken by UMIC, the institutional infrastructure is expected to be strengthened through the future establishment of the new institution which will be assigned with the responsibility for public procurement, including e-public procurement.

Responsible institution(s) for public procurement policy	Mission, Innovation and Knowledge Unit, Ministry of Finance (www.min-financas.pt)
Responsible institution(s) for legal aspects	Mission, Innovation and Knowledge Unit, Ministry of Finance (www.min-financas.pt)
Responsible institution(s) for technical solutions	Mission, Innovation and Knowledge Unit, Ministry of Finance (www.min-financas.pt)
Central procurement institution(s)	Whithin the Ministry of finances the Direcção-Geral do Património is the central department which coordinates public procurement for the whole administration, at a national level, launching the adequate framework agreements for a range of goods and services. It also gives its collaboration to UMIC where e-Procurement is concerned and in the study of the legal framework for e-Procurement
Other important organisations	-
Type of coordination between different institutions	Generally public procurement has until now been conducted in a decentralized manner as regards both procurement within the ministries and the entire ministerial level. This means e.g. that when no framework agreements exist the selection of suppliers is typically done by the individual institutions both for procurement above and below the threshold. However, the decentralized model is expected to change in the future with the strategy towards more centralized organization of the procurement within the ministries as well as for the entire ministerial level. There are no central procurement institutions at regional and local levels. The Ministry of Finance is presently in a coordinating role as regards public procurement and as such it functions to some extent as a central procurement body at the national level. In this capacity the Ministry of Finance is responsible for the administration of framework agreements and the selection of suppliers under these agreements.

21.2 Strategy

Electronic public procurement is an area which is highly prioritized by the government of Portugal. The government's strategy for the deployment of e-public procure is outlined in its National e-Procurement Program, which is an integral part of the overall strategy on the development of e-government and the information society in Portugal. The main motives for introducing electronic public procurement are to achieve better control of public sector spending, achieve public sector savings, modernize the public sector, align Portugal with other EU member states and increase the efficiency and competitiveness of the private sector.

The ambitions embedded in the program are illustrated by the government's stated intention to realize savings in the magnitude of 10% - 20% on public procurement costs during the period 2003-2006. This is a direct consequence of the deployment of e-public procurement systems across government institutions at the central governmental level as well at the regional and local governmental levels. E-public procurement systems are expected to be extended across the entire public administration during 2004, and the Portuguese government plans to carry out approximately 50% of its total acquisitions electronically by 2006.

The strategic focus of the national e-public procurement program puts a strong emphasis on the organizational aspects of public procurement as it concerns the establishment of a unit at the national level for e-public procurement and outlines that all ministries should centralize the processes related to e-public procurement.

21.2.1 Statement of objectives

Overall objectives:

- Establishment of an organisation responsible for national e-public procurement
- Centralized procurement within the ministries
- Intention to realize savings in the magnitude of 10% - 20% on public procurement costs during the period 2003 – 2006
- Approximately 50% of total acquisitions to be carried out electronically by 2006

21.2.2 Scope of strategy

Levels of government involved	All levels of government included
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	2003 – 2006

21.2.3 Existing guidelines

Guidelines for e-public procurement have been developed and are integrated into the “National Initiative for Electronic Commerce” (Cabinet Resolution no. 143/2000).

21.3 Legal framework

21.3.1 Legal status of the use of electronic means in Public Procurement

The future legal framework will fully respect the Directives, as the existing legal acts fully respect the Directives in what concerns public procurement

21.3.2 Implementation of the Directives

It is presently not clarified when the forthcoming EU public procurement directives will be implemented into national legislation as the timing will depend on the government’s decision. The use of electronic means for communication in the public procurement process is presently regulated by national legislation which encompasses the rules applicable to communication and the storage of data[56].

With the new EU directives, the Portuguese government expects to provide that Contracting Authorities may use electronic auctions and the expectation is that usage will be general and applied to different types of purchases. It is presently not clarified whether dynamic purchasing systems will be used in the future. Concerning the publishing of tender-related information on a buyer profile by contracting authorities, it is expected that this opportunity will be used in the future, but it is not determined when this will take place.

As mentioned above, the Portuguese government is preparing the launch of a central e-public procurement portal in 2004, and it is expected that the new portal will be in compliance with the forthcoming European public procurement directives.

[56] Decree Law 197/1999 and Decree Law 104/2002

21.3.3 Status of tools

Public procurement portals	The launch of a central electronic procurement portal is currently underway (www.compras.gov.pt), which will overtime include and converge the experiences made in the pilot projects.
Electronic signature	The legislation for the introduction of a qualified electronic signature is in place but electronic signatures are not used at present, and it is currently not clear when a qualified electronic signature will be introduced.
Electronic catalogues	Pilot projects on electro e-catalogues have been carried through
Electronic auctions	Pilot projects on electronic auctions have been carried through
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Framework agreements exist and are used at the national level as well as at the regional and local levels. There is no aggregated data available (neither in total amounts nor as percentages of the total volume purchased through framework agreements) but for the Ministry of Finance alone the purchases made through framework agreements amounted to approximately 185 million EUR in 2002.

21.3.4 Reference to the relevant legal acts

Information unavailable

21.4 Current usage of electronic means in Public Procurement

21.4.1 Practical use of electronic means in Public Procurement

The uptake of e-public procurement is currently not monitored on a regular basis, but this aspect is expected to be monitored at some point in the future once e-public procurement accelerates. There is no figure available on the total volume of e-public procurement as the first e-public procurement initiatives are currently taking place on a pilot scale. UMIC is monitoring the implementation of the e-public procurement pilot projects in the seven ministries and will gather the experiences in terms of the number of electronic transactions, e-public procurement's share of total public procurement volume, the types of purchases undertaken, the effects on the speeding up of procurement procedures, transaction costs and the effect on prices. According to preliminary assessments, the experiences from the pilot projects are positive across the board.

As an example of the concrete experiences made, it can be mentioned that the Portuguese government conducted its first e-procurement pilot auction in November 2003. This initiative, carried out for the Ministry of Social Security and Work and the Ministry of Education, was organized in the framework of the National e-Procurement Program. According to UMIC, the auction attracted 7 companies and over 50 bids, and generated savings of EUR 9,600 in the purchase of paper for the month of December.

This represents savings of approximately 25%, which is consistent with the government's objective of achieving savings between 10% and 20% on public procurement costs between 2003 and 2006.

21.4.2 Which phases of procurement are covered?

Information unavailable

21.5 Raising awareness & Promotion of electronic means

At present seven ministries are implementing pilot projects on e-public procurement and the experiences achieved through these projects will be taken into account in the forthcoming mainstreaming of e-public procurement in the public sector. The involved ministries are: Ministry of Defense, Ministry of Justice, Ministry of Health, Ministry of Social Security, Ministry of Employment and Public Works, Ministry of Finance and the Office of the Prime Minister. Parts of these pilot projects concern the change process towards a more centralized procurement organization within the seven ministries, which is currently ongoing.

Private contractors have so far played an important role for the development of e-public procurement in Portugal as the development of the technical solutions. The operation of the portals, for the pilot projects as well as for the forthcoming central e-public procurement portal, has been contracted out to private companies. This means that the operational costs related to these e-public procurement solutions are underwritten by the users, buyers as well as suppliers, through e.g. transaction fees.

Through the pilot projects, some experience has been gained with electronic auctions and e-catalogues. Electronic auctions have been used in one of the pilot project (see further details below) for products below the threshold. E-catalogues have been used since 1999 for 14 different types of products (e.g. cars, paper, uniforms, fuel, IT hardware and software). There is no experience with multi-supplier electronic purchasing systems similar to Dynamic Purchasing Systems.

As e-public procurement presently is being explored on a pilot project level, none of the phases in the procurement cycle have been automated (i.e. notification about tender, publication of tender, management of receipt/submission of tenders, evaluation of tenders, ordering and invoicing).

The government is expected to introduce national standards for the electronic exchange of data in the public procurement process, but it is at present not clear which standards will be used and when this will happen.

22. Slovakia

22.1 Organisations and Institutions

In general, the responsibility for the implementation of the Information Society in Slovakia is shared between different government departments. Most of the relevant players are primarily working with e-government and the development of the information society and not e-procurement on a specific level. At the present, the main responsibility for information society belongs to the Ministry of Transport, Posts and Telecommunications. However, two players can be identified as the key institutions responsible for the implementation of electronic public procurement in Slovakia: The Office for Public Procurement and the upcoming the Office of the Commissioner for Information Society.

Responsible institution(s) for public procurement policy	Office for Public Procurement • directs the state policy on public procurement and concession procurement and exercises supervision over the public procurement and concession procurement. • notifies the conversion of financial thresholds for the above-threshold methods of public procurement into Slovak currency, etc. • is responsible for the overall responsibility of the future formulation of the Slovakian policies within the area electronic public procurement as well as the development of a legal framework for electronic public procurement. Office of the Commissioner for Information Society • has not yet been established • is expected to play a key role in the coordination of the ministries efforts to create favorable conditions within the area of ICT for the benefit of all segments of the society. This includes the development of the necessary platform for introducing electronic public procurement (access to the Internet, hardware, etc.)
Responsible institution(s) for legal aspects	Office for Public Procurement
Responsible institution(s) for technical solutions	Office for Public Procurement Office of the Commissioner for Information Society
Central procurement institution(s)	Office for Public Procurement
Other important organisations	National Security Authority (NSA) Ministry of Economy
Type of coordination between different institutions	Supra department coordination

22.2 Strategy

There is no specific strategy for introducing or implementing e-public procurement

However, an overall e-government strategy with the aim of introducing electronic services to citizens and business enterprises is currently under discussion. Currently, the general political priority of introducing electronic public procurement has a low priority.

In the meantime, the government focuses its efforts on the creation and development of the general environment for the introduction of operational electronic public procurement, including improving access to the Internet among SME's and the necessary IT-hardware.

The Slovakian government has recently adopted a **National Strategy for the Information Society in the Slovak Republic.** The policy derives from the e-Europe+ initiative and action plan, and defines the main challenges involved in building up an information society. In addition, the policy proposes solutions to the creation of favorable conditions to unleash the full potential of ICT's for the benefit of all segments of the society.

Several ministries are involved in the government's efforts on the creation of favorable ICT-conditions. However, there is no overall coordination among these efforts, which is seen as a weakness in relation to the introduction of electronic public procurement in Slovakia.

The Ministry of Education prepared a Policy for the Information Society in 2001, which among other matters contained a proposal for the establishment of the National Agency for the Information Society in the Slovak Republic. In 2003 coordinator for Information Society was changed from the Ministry of Education to the Ministry of Transport, Posts and Telecommunications.
Consequently, the Ministry of Transport, Posts and Telecommunications is implementing the Action Plan adopted with the National Strategy for Information Society. One of the activities is to establish the Office of the Commissioner for Information Society, which will coordinate the activities in the field of information society and ICT.

22.2.1 Statement of objectives

There are no overall objectives.

The main reasons for the lack of an overall objective or strategies for the introduction of operational electronic public procurement are:

- Fragmented responsibilities between the involved governmental institutions
- Absence of a regulated procurement tradition
- The added value of electronic public procurement is presently considered to be low compared to standard public procurement
- The government awaits experiences within the area of electronic public procurement before launching it in Slovakia
- Lack of capacities/skills within the public procurement institutions to work with electronic public procurement
- Many suppliers (especially SME's) are not ready for electronic procurement.

22.2.2 *Scope of strategy*

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

22.2.3 *Existing guidelines*

There are no special guidelines on e-procurement

22.3 Legal framework

22.3.1 *Legal status of the use of electronic means in Public Procurement*

Currently the use of electronic means for communication in the public procurement process is regulated by Act no. 610 of December 2003 on Electronic Communication, which contains the rules applicable to communication in Slovakia.

The Office for Public Procurement estimates that no operational electronic public procurement systems are currently compliant with the requirements of the forthcoming EC Directives on public procurement.

22.3.2 *Implementation of the Directives*

The Slovakian government expects to be ready to implement the forthcoming EC Directives on public procurement in 2006.

With the new EU directives, the government is expected to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems.

None of the current e-procurement systems is expected to completely fulfill the requirements of the EU public procurement directives, but the necessary investments are expected to be allocated once the requirements are clear.

22.3.3 *Status of tools*

Public procurement portals	The Slovakian government has not yet established a central electronic public procurement portal, and the Office for Public Procurement is not aware of any other public procurement portals or electronic marketplaces in Slovakia.
Electronic signature	The Slovakian law on Electronic Signature came onto effect in 2002. The certification agency for the institution of electronic signature is currently under the jurisdiction of the National Security Authority (NSA), which has recently begun the accreditation process. The Electronic Research and Project Office is currently the only certification authority entitled to issue electronic signatures. At this time, the electronic signature has therefore not been used in relation to public procurement, and the Office for Public Procurement does not expect the use of a qualified electronic signature to be made mandatory to participate in public calls for competition in Slovakia.
Electronic catalogues	Electronic catalogues have been introduced
Electronic auctions	Electronic auctions have been introduced
Dynamic Purchasing Systems	Dynamic purchasing systems have been introduced
Framework agreements	-

22.3.4 *Reference to the relevant legal acts*

- Act no. 22 of January 2004 on Electronic Commerce
- Act no. 215 of April 2002 on Electronic Signature
- Act no. 428 of July 2002 on Protection of Personal Data
- Act no. 610 of December 2003 on Electronic Communication
- Draft of Act on Information System for Public Administration, which is before approval procedure

22.4 Current usage of electronic means in Public Procurement

22.4.1 *Practical use of electronic means in Public Procurement*

The total impact of introducing electronic public procurement in Slovakia has not yet been assessed. However, the Office for Public Procurement plans to do this in line with the gradual introduction of an electronic public procurement system.

Monitoring the up-take and progress of e-procurement in Slovakia has not yet taken place. However, with the implementation of the forthcoming EC Directives on public procurement, the Office for Public Procurement is expected to do this on a regular basis (it is not possible to estimate the frequency at this time).

22.4.2 Which phases of procurement are covered?

The Office for Public Procurement has elaborated representative standard forms of public procurement notices, which will be sent by Contracting authority to the Office for Public Procurement electronically.

22.5 Raising awareness & Promotion of electronic means

Public institutions and Commercial firms or associations, which promote in the field of Information and Communication Technologies, contribute to raising awareness of using electronic means. There are for example:

- IT Association of the Slovak Republic (ITAS), which represents professional association of the most significant domestic and foreign firms.

23. Slovenia

23.1 Organisations and Institutions

Three entities can be identified as the main institutions responsible for the implementation of electronic public procurement in Slovenia:

- Ministry of Finance
- Government Centre for Informatics (CVI)
- Ministry for Information Society

Responsible institution(s) for public procurement policy	Ministry for Information Society (http://mid.gov.si/mid/mid.nsf) • responsible for information society applications and for information infrastructure including two action plans and the upgrading of the e-Slovenia strategy, the e-government strategy, and the strategy of electronic business in public administration Council for Information Society • a strategic council established by the Prime Minister • deals with strategic issues regarding information society and ICT. • among others, the tasks of SID include monitoring and assessing the implementation of directions in the field of e-commerce and preparing of initiatives and suggestions for managing issues in the field of information society
Responsible institution(s) for legal aspects	Ministry of Finance
Responsible institution(s) for technical solutions	Ministry of Finance Government Centre for Informatics (established in 1993) (www.sigov.si/cvi/eng/)
Central procurement institution(s)	Ministry of Finance
Other important organisations	
Type of coordination between different institutions	Public procurement in Slovenia is in general organised in a mixture of a decentralised and centralised approach.

23.2 Strategy

The introduction of operational electronic public procurement is highly prioritised in Slovenia. In relation to the work on EU accession, this is seen as very important for the Slovenian government to develop an information society that establishes relations between the public administration and the private businesses in order to be fully integrated in the internal market. In addition, the introduction of operational electronic procurement is seen as a very important instrument to control and reduce public sector spending as well as to modernise the public sector in general.

Furthermore, the establishment of an operational electronic public procurement system is seen as an important tool to increase the efficiency and competitiveness of the private sector in Slovenia as well as an instrument to improve the Slovenian alignment on European neighbours.

Initiatives on e-public procurement is integrated in the overall strategy on e-government and development of an information society
Strategic reports:

- "Strategy of E-commerce in Public Administration of the Republic of Slovenia for the period from 2001 until 2004" (2001)
- "Action Plan e-Government Up to 2004" (2002)

The Strategy of E-commerce in Public Administration serves as a basis for all efforts, projects, activities and tasks within the transition of public administration into an information society, with the emphasis on the introduction of electronic commerce as a basic characteristic of an information society.

The strategy contains suggestions for its realisation in the field of e-commerce of public administration through the mechanisms of realisation (procedures of planning, instalment, implementation, supervision) and institutions (organs, bodies). The strategy also refers to the fact that adoption of the Electronic Commerce and Electronic Signature Act (se below) has offered new possibilities for Slovenia in the field of public procurement.

In connection with the overall strategy, a number of programmes and projects have been outlined. Among these, the strategy outlines a programme on the introduction of electronic public procurement, enabling the Government Centre for Informatics and other state organs to transfer the procedures of public ordering into electronic form. The programme includes the following projects:

- Expert system for decision-making support on choosing the most suitable offer (EP-0901)
- Electronic system for submitting orders of smaller value (EP-0902)
- Electronic system for ordering software from chosen suppliers (EP-0903)
- Electronic system for the support of limited procedure for submitting public orders (EP-0904)
- Electronic system for publicising the intention on submitting public orders and chosen suppliers (EP-0905)

23.2.1 Statement of objectives

The overall objective is to remove administrative barriers

23.2.2 *Scope of strategy*

Levels of government involved	All levels of government are included
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

23.2.3 *Existing guidelines*

Special guidelines have not been issued

23.3 **Legal framework**

23.3.1 *Legal status of the use of electronic means in Public Procurement*

The amended public procurement act (adopted January 2004) aims at removing administrative barriers by streamlining public contracting procedures, introducing e-operations and the option of centralising procurement and public contracting procedures. One of the key amendments is the introduction of an e-procurement system, including the establishment of an information portal.

23.3.2 *Implementation of the Directives*

The forthcoming EC Directives on public procurement are expected to be implemented in Slovenia in 2006. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, storage of data and use of specific procedures, e.g. e-auctions.

With the new EU directives, the government is expected to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems.

None of the current e-procurement systems is expected to fulfil the requirements of the EU public procurement directives fully, but the necessary investments are expected to be allocated once the requirements are clear.

23.3.3 *Status of tools*

Public procurement portals	Expected establishment of an information portal, where contracting authorities will need to publish public procurement notices. The aim is that the portal will be set up within in 2005
Electronic signature	The Electronic Signature in Slovenia is regulated by the Electronic Commerce and Electronic Signature Act[57] and the Decree on Conditions for Electronic Commerce and Electronic Signing. The main significance of the Act is that under special conditions it extends the same validity to the electronic signature as the autographic signature has in the paper world.
Electronic catalogues	In the phase of starting the project
Electronic auctions	Some government authorities have experience with electronic auctions
Dynamic Purchasing Systems	Dynamic purchasing systems are not being used
Framework agreements	Information unavailable

23.3.4 *Reference to the relevant legal acts*

Electronic Commerce and Electronic Signature Act
Decree on Conditions for Electronic Commerce and Electronic Signing

23.4 Current usage of electronic means in Public Procurement

23.4.1 *Practical use of electronic means in Public Procurement*

The total impact of introducing electronic public procurement in Slovenia has not yet been assessed, but the Ministry of Finance plans to do this within the next three years.

Monitoring of the up-take and progress of e-procurement is monitored on a regular basis by the Government Centre for Informatics and the Ministry of Finance

23.4.2 *Which phases of procurement are covered?*

Information unavailable

[57] The Act is entirely in accordance with the provisions of the United Nations' Commission or the International Trade Law's Model Law of the electronic commerce and with the provisions of the primary European legislation. It also includes all the provisions of the Directive 1999/93/EC concerning common framework of the Community for electronic signatures.

23.5 Raising awareness & Promotion of electronic means

The Slovenian government intends to introduce national standards (Open Source XML) for the electronic exchange of data in the public procurement process.

24. Spain

24.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	Ministry of Economy and Finance (http://portal.minhac.es/Minhac/Home.htm) Ministry of Public Administration (www.map.es) Ministry of Trade, Industry and Tourism (www.mcyt.es)
Responsible institution(s) for legal aspects	Ministry of Economy and Finance (http://portal.minhac.es/Minhac/Home.htm) Ministry of Public Administration (www.map.es) Ministry of Trade, Industry and Tourism (www.mcyt.es)
Responsible institution(s) for technical solutions	Responsible for centralized procurement: Directorate of State Patrimony, Ministry of Economy and Finance (http://catalogopatrimonio.minhac.es)
Central procurement institution(s)	There is currently a Centralized Procurement System of goods and services which can be used by central administrations, as well as by Autonomous Communities and local administrations (http//catalogpatrimonio.minhac.es)
Other important organisations	-
Type of coordination between different institutions	Purchasing operations can be organized both centralized and decentralized. Centralized operations of goods and services are carried out through the central public procurement system (amount to around 900 million EUR). The remaining part of public procurement is under the responsibility of each individual institution.

24.2 Strategy

The Ministry of Public Administration is currently working on a strategy for the provision of e-public services in the coming years.

The Directorate of State Patrimony under the Ministry of Economy and Finance has designed a plan for centralized procurement system, which will be implemented by the end of 2004. Such a system will enable to achieve all phases of procurement electronically under the Centralized Procurement System, from the tender to the delivery phase.

24.2.1 Statement of objectives

The objective is that all transactions can be achieved electronically under the Centralized Procurement System in the course of 2005.

24.2.2 *Scope of strategy*

Levels of government involved	National and regional government are included
Legal framework	Law of Public Administration Contracts
Allocated resources	1.5 million EUR has been invested in the Centralized Procurement System during 2003-2004.
Time frame	2003-2005 (Centralized Procurement System)

24.2.3 *Existing guidelines*

Information unavailable

24.3 Legal framework

24.3.1 *Legal status of the use of electronic means in Public Procurement*

There are two relevant provisions:

- Law of public administration contracts
- Law of e-signature

A Ministerial decree is currently in the editing process. It will establish the criteria for use of electronic and telematic means in public procurement, and will be published during the last trimester of 2004.

24.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2005.

The use of electronic means under public procurement will be delimited in the last semester of 2004.

With the new EU directives it is expected for the government to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems. It is also expected that buyer profiles to publish tender-related information will be used in Spain.

The current e-public procurement system in Spain needs only few changes to be compatible with the Directive’s requirements.

24.3.3 Status of tools

Public procurement portals	The Centralized Procurement System of goods and services can be used by central administrations, as well as by Autonomous Communities and local administrations. http://catalogopatrimonio.minhac.es
Electronic signature	An advanced electronic signature has been implemented and is used both in the central administration and in some of the Autonomous Communities
Electronic catalogues	Electronic catalogues of goods and services have existed within the central State Administration since 1997. They are also available for the local communities and administrations.
Electronic auctions	-
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems in the public administration
Framework agreements	In the Central State Administration, the Central Procurement System relies on framework contracts.

24.3.4 Reference to the relevant legal acts

Information unavailable

24.4 Current usage of electronic means in Public Procurement

24.4.1 Practical use of electronic means in Public Procurement

Electronic means are used to some extent in connection with procurement of goods, whereas it is only used to a low extent in connection with services. There are no available data in relation to works.

Monitoring of the up-take and progress of e-procurement is monitored on a yearly basis. However, at this stage no data pertaining to the quantitative impact are available.

24.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Spain is as follows:

- Notification about tender (To a low extent today, expected to be within 3 years)
- Publication of tender (To a large extent today)
- Management of receipt/submission of tenders (To a low extent today)
- Evaluation of tenders (To some extent today, expected to be within 3 years)
- Ordering (N/A)
- Invoicing (N/A)

In the Central Procurement System, notification and publication of tenders, as well as provision of legal and technical information have been implemented since 2001. The remaining procurement phases except invoicing will be made electronic at the end of 2004.

24.5 Raising awareness & Promotion of electronic means

The Ministry of Public Administrations announced in October 2004 the launching of a plan to develop a system of public tenders online.

The Department of Centralized Procurement (Directorate of State Patrimony, Ministry of Economy and Finance) has developed a project of electronic tenders (from publication to contract signature) for operational goods (personal computers, furniture, cars etc.) and for public administrative services.

Both the central, regional and local administrations have access to this system and can purchase online from any computer located in the administration with a login and an advanced e-signature. Moreover, the system can deliver at any moment a picture of the advancement of ordered goods and services. Currently, 2,200 public institutions have access to this system.

The system also enables the economic operators to respond to the tender online. The bidders are entitled the access their catalogues, so that they easily can modify the description or add prices, products etc. The project has come to an end and is being implemented.

25. Sweden

25.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	National Board for Public Procurement (Nämnden för offentlig upphandling, NOU, www.nou.se), Ministry of Finance • Central government agency under the Ministry of Finance. • Responsible for policy formulation in the area of e-procurement. • NOU is also responsible for day to day operations and for contacts with contracting entities, other organisations and individuals.
Responsible institution(s) for legal aspects	National Board for Public Procurement (Nämnden för offentlig upphandling, NOU, www.nou.se), Ministry of Finance
Responsible institution(s) for technical solutions	Each organisation, central authority, municipality, county council, is responsible for their own solution. Each organisation can follow the specifications, SFTI, but it is not mandatory[58]
Central procurement institution(s)	Swedish Agency for Public Management (Statskontoret)
Other important organisations	The Swedish Association of Local Authorities (Svenska Kommunförbundet) The Swedish Federation of County Councils (Landstingsförbundet)
Type of coordination between different institutions	Public procurement in Sweden is decentralized. However central and local authorities collaborate in different ways. Central authorities, county councils and municipalities work together in a Committee under the name of Single Face To Industry (SFTI). Its programme covers activities like awareness and promotion of eProcurement, development of standards and working practices and support to suppliers The Swedish government has established a co-ordination function for government procurement under The Swedish Agency for Public Management, with one of its main tasks being to coordinate framework contracts for central government authorities. Today, 12 procurement responsible authorities are working together with the co-ordination function in the system for framework purchasing. The system includes some 100 product areas, e.g. for stationery, cars, PC's and furniture[59]

[58] This is the result of a decentralized structure of the Swedish public sector. County councils and municipalities are independent. Central government authorities have budget and goals they must achieve but within that framework they can make their own decisions, for example about technical solutions. Therefore, there are many technical solutions and a somewhat market driven development; progress is dependent on collaboration. Based on information from Irene Andersson, The Swedish Agency for Public Management

[59] Based on information from Irene Andersson, The Swedish Agency for Public Management

25.2 Strategy

The goal of the Swedish Government's IT policy is to make the country a leading information society for all. Electronic commerce including electronic procurement is one area prioritized by the Government because it is an important medium for increasing rates of growth.

Work has taken place at the national level since the mid-1990's to facilitate the introduction of electronic procurement in the public sector.

The Swedish Government has made a commitment to take various measures to stimulate the development, and use, of electronic commerce. The role of the state is to ensure that electronic commerce is developed in a way that benefits both business and consumer. To encourage electronic commerce, the state must be aware of progress in the area, and work towards solving any problems. The Swedish IT policy is based on the principle of market-driven development. The tasks of the public sector are thus to ensure that regulation is in place, but also to set a good example by being progressive in terms of e-procurement, which can help to create a beneficial and more mature climate for e-commerce in general.

Initiatives on e-public procurement are an integrated part of different policies on adoption of the information society, among different publication is:

- "An Information Society for All, a publication" (2004), which is about the Swedish IT-policy

25.2.1 Statement of objectives

While the Swedish government has worked for a number of years to introduce and advance public e-procurement, it has not been possible to identify recent specific objectives in the area due to a decentralised organisation of activities on e-public procurement.

25.2.2 Scope of strategy

Levels of government involved	Only central government is included in the strategy
Legal framework	The national law on public procurement and national law implementing the EC-directives on electronic commerce
Allocated resources	Resources have been spent but there is no information available on the total amount due to the decentralized organisation.
Time frame	Authorities set their own time frames

In order to remove obstacles to the use of electronic signatures, the Swedish government has appointed a working group with the task to conduct a survey of form requirements (e.g. provisions that a communication or documentation must be signed or in writing). The WG presented a report in April 2003, revealing some 800 provisions that do not allow electronic communication or signatures, 180 of which were deemed to be unnecessary obstacles. Each Ministry is responsible for carrying out the necessary changes in legislation.

25.2.3 Existing guidelines

Guidelines have been issued, www.eh.svekom.se/mer/litteratur.html, even though no guidelines from central government.

25.3 Legal framework

25.3.1 Legal status of the use of electronic means in Public Procurement

Some of the current e-procurement systems are assessed as already meeting the requirements of the EU public procurement directives fully.

25.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented in 2005 and come into force in 2006. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, storage of data and use regarding security (such as electronic signatures).

In Sweden the drafting of the new public procurement legislation has just begun by appointing a committee and experts. The first proposal to a new legislation shall be given in February 2005. Any proposals concerning competitive dialogue, electronic auctions and dynamic purchasing systems can be reported at the latest on June 1st 2005. The final version will be finished during the summer of that year. The group is wide and contains representatives from the main ministries involved and representatives for contracting authorities, supplier and service providers. SMEs, labour unions and an environmental organisation are represented[60].

25.3.3 Status of tools

Public procurement portals	The Swedish government has not established any central electronic public procurement portals as this is deliberately left up to private operators. Several privately owned and operated portals exist instead. Opic and Ajour are two of them that concentrates on public procurement.
	www.opic.com Private portal with information on public tenders. Functionalities are notice and publication of tenders
	www.ajour.se Meeting point for authorities and procuring entities searching for suppliers. The company is a distributor of information about public procurement gathered through a vast and well established network of purchasers. All calls for tenders are structured and distributed through two channels, the printed version AnbudsJournalen and the database www.ajour.se. The functionalities are notices and publication of tenders.

[60] Based on information from Irene Andersson, The Swedish Agency for Public Management

Electronic signature	There are five framework agreements with five suppliers offering electronic signatures in Sweden, but e-signatures are so far only used to a low extent in relation to public procurement. There are no plans to make the use of a qualified electronic signature mandatory to participate in public calls for tenders in Sweden
Electronic catalogues	Electronic catalogues are used in relation to purchase of goods. Some suppliers when submitting a bid they refer to electronic catalogues and give discount on the prices given in these catalogues.
Electronic auctions	E-auctions are not being used.
Dynamic Purchasing Systems	Dynamic Purchasing Systems are not being used.
Framework agreements	Framework agreements are widely used. Framework agreements and electronic catalogues are often combined.

25.3.4 *Reference to the relevant legal acts*

The act on Public Procurement, www.nou.se/loueng.html

The Act on Electronic Signatures, Lag (2000:832) om kvalificerade elektroniska signaturerhttp://www.pts.se/Sidor/sida.asp?SectionId=1011

The directive 2001/115/EC harmonising the VAT invoicing rules has been implemented in the 3 laws that were affected.

25.4 Current usage of electronic means in Public Procurement

25.4.1 *Practical use of electronic means in Public Procurement*

According to a survey conducted in 2003, only 15 out of 241 central government authorities had introduced electronic ordering and invoicing, with a further 7 having initiated pilot projects. 76% of the central government authorities indicated that they had no immediate plans to introduce e-procurement. There are no figures to relate to the extent or up-take of e-procurement or the intentions to introduce e-procurement of the individual authorities with the volume of procurement carried out by those authorities.

The survey also showed that 83 of 290 municipalities have introduced systems for electronic procurement in some form, and according to information made available by the Swedish Ministry of Finance, 75 municipalities and 10 counties presently have solutions in place for electronic ordering and invoicing. A further 50 municipalities are planning to introduce electronic procurement, of which 35 have already initiated pilot-studies. Over 70 municipalities envisage the introduction of electronic procurement over the next few years. Of the municipalities that have introduced electronic procurement, they have mainly purchased food and office material.

The total public procurement in Sweden amounts to about SEK 400 billion. Central government is responsible for approximately SEK 85 billion.

The Swedish Agency for Public Management was in 2003 tasked by the government to carry out a yearly monitoring in cooperation with the Local Government Association of the up-take and progress on electronic public procurement. The monitoring is carried out as a web-based questionnaire which is distributed to contracting authorities. The Agency has also presented an action plan concerning electronic procurement. One goal is to a 50 % increase in the use of electronic procurement between 2004 and 2006.

The most significant advantages from the introduction of electronic public procurement for public authorities are expected to be:

- Speeding up of procurement procedures
- Lower transaction costs
- Better procurement statistics and enhanced budgetary control
- Correct prices
- Better usage of existing framework agreements

25.4.2 *Which phases of procurement are covered?*

The status for automating procurement phases in Sweden is as follows:

- Notification about tender (to a large extent today, both above and below threshold value)
- Publication of tender (to a large extent today, both above and below threshold value)
- Management of receipt/submission of tenders (to some extent today, but expected to be increased within the next three years)
- Evaluation of tenders (automated to some extent
- Ordering, increasing, particularly within regional and local authorities
- Invoicing, increasing, particularly within regional and local authorities

Generally, evaluation and management of receipt/submission of tenders are the phases of public procurement that have been automated the least.

Many municipalities are scanning their invoices and they are also developing solutions to be able to handle flows of invoices.

Some phases are not mentioned, for example planning before the start, dissemination of contract information and follow-up incl. statistics. The Swedish Agency for Public Management will in October 2004 open a website with information about all central framework agreements, www.statskontoret.se.

Procuring entities are reluctant to use new methods in procurement unless they feel assured that they comply with the legal framework.

25.5 Raising awareness & Promotion of electronic means

The main objectives appear to concern the development of the standard of Single Face to Industry: In the mid-1990’s, the Swedish experts from national, regional and local agencies started to work on a set of standards called ‘Single Face to Industry’ (SFTI, www.eh.svekom.se). SFTI is an industry standard for electronic commerce in the public sector in Sweden. The purpose of SFTI is to establish a single set of specifications for the interchange of electronic commercial transactions with all public operators, whether at governmental, regional (county council) or local community level.

To achieve this, a platform of co-operation has been organized where representatives for all three levels meet with representatives for the suppliers to develop a shared view of the public procurement processes and agree on common specifications. The objective is that pre-planning, the procurement process, ordering, and the invoicing process shall be done electronically. The processes shall follow the standards that have been produced and adopted under the SFTI concept. It is built on EDI-messages according to the EDI-FACT standards, and can be used along with other standards.

Some recent developments are based on ebXML.

26. United Kingdom

26.1 Organisations and Institutions

The main institutions in the field are:

- The Office of Government Commerce (OGC)
- The Improvement and Development Agency (IDeA)

Responsible institution(s) for public procurement policy	Office of Government Commerce (OGC; www.ogc.gov.uk) is an independent Office of the Treasury reporting to the Chief Secretary.
Responsible institution(s) for legal aspects	Office of Government Commerce (OGC; www.ogc.gov.uk)
Responsible institution(s) for technical solutions	Improvement and Development Agency (IDeA) was established by and for regional and local government in April 1999. The mission is to support self-sustaining improvement from within local government. The IDeA has given local authorities in England and Wales the means to enhance traditional methods of procurement, through IDeA marketplace (www.idea.gov.uk/marketplace/).
Central procurement institution(s)	OGC Buying Solutions (www.OGCbuyingsolutions.gov.uk)
Other important organisations	NHS Purchasing and Supply Agency - responsible for ensuring that the National Health Service makes the most effective use of its resources by getting the best value for money possible when purchasing goods and services. Defence Procurement Agency - an executive agency of the Ministry of Defence, whose task is to procure the equipment for the UK Armed Forces. Small Business Service (SBS)
Type of coordination between different institutions	Procurement is organized as a mixture of a centralized and decentralized approach: • There is a central public procurement body, OGC Buying Solutions. It arranges framework contracts, which can be used by all public authorities in UK. However, the individual public authority is free to arrange individual framework agreements. • Procurement (selection of suppliers) is a responsibility of the individual public authority. • The total procurement through national framework contracts (OGCbuyingsolutions) is approximately 16 million pounds (0.1% of central government procurement). Figures for regional and local level are unknown.

The devolved authorities in Scotland and Wales have their own eProcurement initiatives.

26.2 Strategy

The overall e-procurement vision of the UK government is that all central civil government purchasing transactions should be able to be transmitted securely over the Internet between government and suppliers using interoperable systems based on open standards.

On the national political agenda, the introduction of operational e-public procurement has a medium priority. This reflects a recent increase of priority to this area driven by focus on more efficient procurement procedures.

A specific e-procurement Strategy for Central Civil Government from 2002 exists

It is composed by several strategic documents/sites on www.ogc.gov.uk. It is a central government strategy, but it is an inspiration for regional and local government as well. The strategy is composed of three main elements:

- The Establishment of Framework Agreements: to procure Commercial Off The Shelf (COTS) tools for interoperable systems to e-enable the procurement and sourcing processes, for example electronic tendering, auctions and payment solutions.
- Change Management: to influence policy direction and best practice and to establish a common approach for central civil government over the next 3 years; to help departments/agencies in understanding their business profiles, their procurement needs and in preparing their business cases (e.g. eProcurement Assessment Tool).
- Carrying out a feasibility study for an eHub examining how a single point of entry using common standards of communication language and coding convention might provide a data translation service between government and supplier systems, enable an improved commercial dialogue with suppliers and provide improved management information to government. The development name for this project is Zanzibar.

26.2.1 Statement of objectives

The government has specified an overall objective for the introduction of operational public procurement. The core objective is that:

- Web-enabled tools and techniques shall deliver 250 million pounds value for money improvements to government's commercial relationships during April 2003 – March 2006 (http://www.ogc.gov.uk/index.asp?docid=2364).
- 50% of citizen-facing transactions should be capable of electronic delivery by 2005 and 100% by 2008 (see also UK Online Strategy on www.citu.gov.uk).

26.2.2 *Scope of strategy*

Levels of government involved	Central, regional and local government are included
Legal framework	Information unavailable
Allocated resources	Resources have been spent but there is no information on the amount
Time frame	Information unavailable

26.2.3 *Existing guidelines*

Special guidelines for electronic public procurement have been issued:

- "E-procurement cutting through the hype – A guide to eProcurement for the public sector"; OGC; October 2002
- "Electronic Reverse Auctions"; OGC.

26.3 Legal framework

26.3.1 *Legal status of the use of electronic means in Public Procurement*

It is not known whether the current e-procurement systems will fulfil the requirements of the EU public procurement directives fully, but in forthcoming developments the requirements of the directives will be fully taken into account.

26.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented by the end of January 2006. The following areas of use of electronic means in the public procurement process will be regulated by national legislation: rules applicable to communication, storage of data and use of specific procedures, e.g. e-auctions.

The UK intends to implement the articles of the new EU directives relating to electronic auctions and dynamic purchasing systems, allowing Contracting Authorities to make use of them. Electronic auctions are expected to be used in particular. Buyer profiles to publish tender-related information on a 'buyer profile' are being used by Contracting Authorities in UK.

26.3.3 Status of tools

Public procurement portals	www.OGCbuyingsolutions.gov.uk is the central government procurement portal. It provides information and tools about electronic public procurement and framework agreements, but not yet functionalities of electronic tendering and purchasing[61]
	From CSARSS.NET – the Regional Supplies Service e-procurement site (www.csarss.net) firms and individuals can access potential public procurement business opportunities. On the site suppliers can register company de-tails and login and access procurement opportunities offered by the entire public sector.
	www.supplyinggovernment.gov.uk. Together with the Small Business Service (SBS), OGC has also launched a website – Supplying Government. This website provides a single point for information on selling to government and an access point to advertised contracts, as well as details of the West Midlands SME Procurement Pilot
Electronic signature	An official electronic signature has not been introduced in UK yet, but a pilot project has been conducted by the e-envoy[62] (www.e-envoy.gov.uk). UK is waiting on the EU directives to be finalized, and a digital signature is expected to be introduced within two years
Electronic catalogues	Amongst OGC Buying Solution's e-procurement initiatives, S-Cat and GCat. Both are designed to be used by public institutions (buyer-side) such as Government departments, Agencies, Local Authorities, Educational establishments, Police Forces, NHS bodies, public and privatised Utilities. • S-CAT is a web catalogue giving access to more than 170 service providers. S-Cat has 16 discrete Service Categories covering both IT and Business Consultancy Services. Examples are: IS Strategy Development (1) and Programme and Project Management (2). Before registering at S-CAT, suppliers have passed a tendering and evaluation process, meaning Public Sector discounts has already been negotiated for buyers. • GCAT is an online catalogue with more than 50.000 IT & Telecommunication products. GCAT provides functionalities for online ordering and online payment.

[61] The 'Zanzibar' project, a purchase to pay marketplace, is expected to be launched in 2005.

[62] Now the e-Government Unit

Electronic auctions	A number of public authorities in the UK have already gained experience with electronic auctions, and although expanding rapidly the use is not widespread. In addition to the earlier mentioned guidelines on electronic auctions, the OGC has provided public authorities with an eAuction Decision Tool to evaluate whether an eAuction is suitable for an intended procurement. A dynamic purchasing system has so far not been developed. Both eAuctions and dynamic purchasing are expected to increase with the implementation and greater understanding of the new EU public procurement directives.
Dynamic Purchasing Systems	-
Framework agreements	Framework Agreements are already used extensively in the UK either through central bodies such as OGC Buying Solutions or established directly by government departments and agencies.

26.3.4 *Reference to the relevant legal acts*

Information unavailable

26.4 Current usage of electronic means in Public Procurement

26.4.1 *Practical use of electronic means in Public Procurement*

The total public procurement in the UK is approximately 100 billion pounds. Central government is responsible for approximately £16 billion of procurement; the rest is the responsibility of regional and local authorities, including the health care system.

Monitoring of the up-take and progress of e-procurement is monitored on a 6-monthly basis by a questionnaire to all government departments. The following aspects are monitored: Number of procurement transactions and transaction costs, use of various eProcurement tools, and savings achieved. The monitoring is kept as simple as possible to ensure that public institutions actually use it.

The resources allocated by public authorities to introducing operational public procurement are not monitored at national level, but development and maintenance of OGCbuyingsolutions.gov.uk amounts to 16.5 million pounds alone.

26.4.2 *Which phases of procurement are covered?*

The following is the estimated status for automating procurement phases in the UK:

- Notification about tender (not automated today, but expected to be within three years)
- Publication of tender (to a low extent today, but expected to be within three years)
- Management of receipt/submission of tenders (to a low extent today, but expected to be within three years)
- Evaluation of tenders (not automated, but expected to be within three years)
- Ordering (to some extent, but expected to be within three years)
- Invoicing (to a low extent, but expected to be within three years).

Generally, repetitive purchasing is the phase of public procurement that has been automated the most, whereas individual contracts and invoicing are only automated to a low extent. Repetitive purchasing is done via individual systems for each contracting authority based on technology such as EDI and by use of electronic catalogues.

26.5 Raising awareness & Promotion of electronic means

Within the e-Government Interoperability Framework (e-GIF), UK has standardized a number of areas related to electronic public procurement, including XML schemes, metadata, GCL (Government Category List) and Government Data Standards Catalogue. Zanzibar will provide further standards in the area of electronic procurement.

Impact Assessment: Action Plan on electronic Public Procurement

Part 1: Baseline Analysis

Annex B: The use of electronic means in different phases in the procurement cycle 204

1. Introduction

1.1 Background and objective of the study

The Internal Market Strategy sets out the relatively ambitious targets by 2006, to carry out a significant part of public procurement on an electronic basis and by 2010, to ensure that electronic public procurement has been generalised to meet the Lisbon objectives. To meet the targets, the European Commission intends to adopt an Action Plan on e-public procurement and has decided that an Impact Assessment of the Action Plan should be conducted.

This report is part one of the impact assessment. The objective of the report is:

- To provide an initial assessment and comparison of the current situation across and within EU member states.
- To undertake a preliminary review of the forthcoming EU directives on public procurement in order to identify elements that may have important implications for the member states.

The report is carried out by RAMBOLL Management for the Internal Market Directorate-General.

1.2 Content of the Baseline Analysis

The Baseline Analysis contains the following main sections:

- Section 2 contains the results of a preliminary review and assessment of the new public procurement directives. In this section we identify elements that may influence the development of e-public procurement across the EU. The objective of this analysis is to identify potential barriers which should be included in the next phase of the impact assessment.
- Section 3 contains a comparative analysis across the EU member states which presents main findings of the research and in which the main issues concerning the current status for e-public procurement in the EU member states are analysed. The purpose of the comparative analysis is to provide an overview across the EU member states that will give input to the subsequent phase of the study. The comparative analysis includes a compilation and presentation of findings and each main section is accompanied by a short concluding analysis and an assessment of the most important perspectives and implications.

The following 25 sections contain the presentations of the current status for e-public procurement in each of the EU member states. Each section follows the same structure and includes descriptions of:

- The organizations and institutions responsible for implementing e-public procurement
- The national strategies and objectives for e-public procurement
- Legal framework
- Current usage of electronic means in public procurement
- Promotion of e-public procurement

The Baseline Analysis is based on two main sources of data:

- Desk research of official documents, strategy papers etc. in EU member states, reports and analyses of e-public procurement and public procurement at country level and at European level and of the forthcoming European public procurement directives.
- Interviews and consultations with experts in member states and representatives of governmental institutions responsible for or involved in public procurement and the development of e-public procurement in the country.

In this regard it should be noted that the study attempts to include use and experiences of e-public procurement systems at all levels of government in the member states (national, regional, local), but does not uncover the vast total number of existing e-public procurement systems and primarily looks at the situation in a member state seen from the perspective of the central level (due to the fact that the main data sources are key documents prepared at the national level and interviews with experts and representatives at the central, governmental level).

2. Legal Aspects

The new consolidated Directive (Directive no. 2004/18/EC) and the new utilities Directive (Directive no. 2004/17/EC) sets out the procedural rules for the use of electronic means in public procurement. The new legislation entered into force on 20 April 2004.

The following chapter contains a description of the directives and an analysis of the impacts of the new directives on electronic procurement and other legislation relevant for electronic procurement.

2.1 The present public procurement directives

The former EU procurement legislation consists of the 4 main directives on procurement of public supplies, public works, public services and public utilities:

- Public Supplies Directive 93/36/EC as amended by Directive 97/52/EC.
- Public Works Directive 93/37/EC as amended by Directive 97/52/EC.
- Public Services Directive 92/50/EC as amended by Directive 97/52/EC.
- Public Utilities Directive 93/38/EC as amended by Directive 98/4/EC.

The directives do not contain specific provisions regarding the use of electronic means in the procurement process.

The use of written communication is to some extent, however, seen as a prerequisite for the proper documentation of the procurement process. Also, several articles of the directives contain mandatory use of written communication.

The combination of mandatory use of written communication in some situations and the general documentation requirements makes it difficult to use communication by electronic means under the present directives, as it would be necessary to supplement any electronic communication with written communication in most cases[1].

2.2 The new directives

The new procurement directives of the European Union have two main objectives: The first is to simplify and clarify the existing Community Directives; the second is to adapt them to the modern administrative needs in a changing economic environment.

Like the former directives, the new directives focus on the tendering procedure and establish the legal framework from the publication of notices to the award of contracts. Aspects such as ordering, invoicing and digital signatures are subject to other pieces of community law (such as Directive 2000/31/EC on electronic commerce etc.).

[1] Analysis of electronic procurement pilot projects in the EU" carried out by PLS Rambøll Management for The European Commission Internal Market DG, 2001, p. 137

The new directives introduce detailed provisions on the use of electronic means in the procurement process and new procurement processes based on the use of electronic means (dynamic purchasing systems and e-auctions). The directives also introduce new rules on notification and time-limits when using electronic means in the notification and tendering process. The introduction of the new framework on electronic means is a major part of the efforts to adapt the public procurement in the Internal Market to the modern administrative needs.

The use of electronic means for communication in the procurement process is built on the following principles:

- The directives put the use of electronic means on a par with traditional means of communication and information exchange. The definitions of: "written" or "in writing" in the directives is changed so that it now “may include information which is transmitted and stored by electronic means”.

- The directives only allow the use of electronic means for communication under the normal procedural guarantees of paper based procurement. Furthermore, certain specific conditions have to be fulfilled under the Directive in order to use electronic communication in the tendering process.

- The use of electronic means for communication in the procurement process is technological neutral in the sense that it does not require the use of specific technologies, but only that the technology used as far as possible is compatible with the technologies used in other Member States.

- The choice of electronic means for communication in the procurement process is left to the contracting authorities. The new directives make it clear that the contracting authorities can require the use of electronic communication for accessing documents and for submission of offers.

The regulation of the use of electronic means for communication in the procurement process is aimed at eliminating the legal barriers inherent to the use of different regulation on electronic means in the procurement process in the Member States.

It is foreseen in the new directives and various studies that the use of electronic purchasing techniques will help to increase competition and streamline public purchasing, particularly in terms of the savings in time and money.

2.3 The preconditions and specific requirements for the use of electronic means for communication in the procurement process

The directives offer a framework for using electronic means in public procurement. The choices go from the use of one/way dispatch of information, simple e-mails to fully electronic procedures, including the use of electronic catalogues, the dynamic purchasing system and e-auctions.

It is a precondition for the use of electronic procurement that the contracting authorities comply with the rules drawn up under the directives and the principles of equal treatment, non-discrimination and transparency.[2] This means that electronic procurement offers the same procedural guarantees as the paper based procurement process.

The directives require an electronic dispatch of tender notices to the central EU electronic board (TED – Tenders Electronic Daily) according to the format and procedures accessible at the SIMAP internet site.

In order to ensure these principles the use of electronic means for communication between the contracting authorities and the contactors shall meet some specific requirements. The table below illustrates the basic requirements related to the use of different procurement processes.

Table 2.1: Requirements related to the different e-procurement processes

E-procurement type	Features	Complexity/Requirements
Dispatch of information	Supports dispatch of information but does not offer any interactivity between participants	Low. Minimal technical requirements. The public authority must have a PC with Internet access. Businesses access to publication for tenders will also require a PC with Internet access
Electronic tendering	Supports the electronic exchange of documents between participants including the conclusion of contracts.	Low Both the contracting authority and the supplier may need special hardware and software. Business must have a PC with e-mail and normal word processing or spreadsheet software and internet access.
Advanced electronic tendering systems		Medium The contracting authority and the bidders must have a PC with internet access and specific software that complies with the specific requirements of the directive for using the e-action system or the dynamic purchasing system. The contracting authority must have software for the receipt of tenders and request to participate. This can in principle be based on normal available software such as spreadsheet or database software.

2.3.1 PC with Internet access

Logically, both business and the contracting authority need access to a PC and the Internet to use electronic means in the procurement process.

Cross-border electronic procurement could be influenced by differences among the level of business with PC's and Internet access in the Member States, because businesses in a Member State with a high level of PC's and Internet access hold a structural advantage over businesses from Member States with a lesser level of businesses with Internet access.

2.3.2 The requirements for dispatch of information

All that is required to dispatch award notices and tender documents is a PC with an (broadband) Internet connection, which almost all public authorities in the EU Member States have access to.

For businesses, having a PC with Internet access help them to become aware of notices that are being published electronically.

Online access to tender information reduces the importance of the location of the supplier. The use of tender boards can further make it easier for businesses to identify relevant tenders.

The dispatch of information on a given tender will consequently improve the economic efficiency by promoting competition amongst domestic and foreign suppliers. Stronger competition brings down costs, improves quality and delivery terms and foster innovation[3].

2.3.3 The requirements for electronic tendering

As mentioned earlier, the contracting authorities can require the use of electronic communication for accessing documents and for submission of offers. To do this, a number of requirements must be meet. The requirements include:

- General availability of means, including general availability of the tools used to communicate by electronic means and their technical characteristics
- Interoperability of the tools used with information and technology products in general use
- Integrity of data and confidentiality of data exchanged
- Limitations in the contracting authorities' access to data transmitted before the time-limits for submitting tenders, etc. have expired
- Availability of information regarding the specifications necessary for the electronic tendering, including encryption
- Security-measures guaranteeing that:
    - The exact time and date of the receipt of tenders, requests to participate and the submission of plans and projects can be determined precisely;
    - The access to data is possible only through simultaneous action by authorised persons, and only after the prescribed date

[3] A report on the functioning of public procurement markets in the EU: benefits from the application of EU directives and challenges for the future 03/02/04 page 6-8.

- The access to data is limited to persons authorised to acquaint themselves therewith
- Infringements of access prohibition is clearly detectable
- The dates for opening data received may be changed only by authorised persons (respect of the 4 “eyes” principle).

The requirements entails that the contracting authority must have the required devices for the receipt of tenders.

The principle of mutual recognition is explicitly mentioned in the directives. Article 42 states that diplomas, certificates or other evidence of formal qualifications required for participation in a procurement procedure or a design contest should be mutually recognized.

2.3.4 *The requirements for advanced electronic purchasing systems*

The use of fully automatic procurement processes should meet specific requirements related to the use of E-auctions and the dynamic purchasing systems in order to avoid the misuse of such systems.

2.3.5 *The dynamic purchasing system*

The dynamic purchasing system is a completely electronic process for making commonly used purchases. The duration of a dynamic purchasing system should be limited to 4 years and should be open throughout its validity to any economic operator which satisfies the selection criteria and has submitted an indicative tender that complies with the specification.

The dynamic purchasing system is set up following the rules applicable to the open procedure. Every operator taking part is automatically invited to submit a bid but in addition a new operator who submits an indicative tender in accordance with the specification and meets the selection criteria is also allowed to join the system.

This allows for a list of operators to be established and increases competition. New market entrants will be aware of the system via a notice when the system is put in place and a simplified contract notice is published for each specific contract to be awarded under the system.

2.3.6 *The E-auction*

The electronic auction is a repetitive process involving an electronic device for the presentation of new prices, revised downwards, and/or new values concerning certain elements of tenders, which occurs after an initial full evaluation of the tenders, enabling them to be ranked using automatic evaluation methods.

The Directive introduces the use of electronic auctions in the open, restricted and negotiated procedure, and when reopening of competition among the parties to a framework agreement.

Electronic auctions can be used with contracts for works, supplies or services. The electronic auction can, however, only be used when the contract specifications can be established with precision. E-auctions shall be based on prices and/or other elements of the tenders suitable for automatic evaluation by electronic means indicated in the tender specification.

2.3.7 *Implementation of the dynamic purchasing and the E-auction*

The usage of e-auctions and the dynamic purchasing system are optional for the Member States. Thus, the directives state that Member States "may provide" that contracting authorities may use these procurement methods.

The survey shows that 23 Member States plan to introduce e-auctions, whereas only Belgium does not intend to do so. Finland has not yet decided whether to introduce the e-auction.

It is notable that the vast majority of the Member States have chosen to implement the e-auction.

18 Member States plan to introduce the dynamic purchasing systems. France, Hungary and Poland report that they will not introduce the system. Belgium, Finland, the Netherlands and Portugal have not decided whether to introduce the dynamic purchasing system or not.

More than half of the Member States plan to introduce the dynamic purchasing system, and that number might rise even further, as it is likely that some of the Member States who are now undecided will chose to implement the system.

The fact that not all the Member States plan to introduce the e-auction and the dynamic purchasing systems creates a situation, where the systems are implemented in some Member States, but not all. There will, hence, be differences in the electronic processes used in the Member States leading to fragmentation of the internal market and uneven spread of the benefits from the use of electronic means in public procurement procedures.

Differences in legislation are an inherent cause of market fragmentation in the Internal Market. Lack of uniform introduction of the e-auction and the dynamic purchasing among the Member States could therefore cause fragmentation.

However, the specific requirements for the dynamic purchasing system and the electronic auction ensure that businesses from other Member States will be able to participate in cross-border dynamic purchases and electronic auctions. Consequently, the differences regarding the implementation of the systems among the Member States will not cause the normal market fragmentation inherent to differences in legislation.

The most significant fragmentation caused by the Member States different approaches to the implementation of the electronic auction and the dynamic purchasing system will be that businesses from Member States that use the systems will be more experienced in the process than businesses from Member States that have not introduced these procedures.

2.3.8 *The Buyer profile*

One of the new tools to benefit from electronic procurement in the new directives is the introduction of the new "buyer profile". The buyer profile enables a contracting authority to use its Internet site to publish information on its future purchases in the same way as with publication of a prior information notice.

16 Member States report that they are aware that the new buyer profiles are/will be used by Contracting Authorities. Three Member States report that the buyer profile will not be used by the contracting authorities. Six Member States do not know whether the buyer profile will be used (Finland, Luxembourg, the Czech Republic, the Republic of Cyprus, Estonia and Lithuania).

2.3.9 The electronic catalogue

The new directives do not have specific rules regarding the use of electronic catalogues in the procurement process. However, recital 12 of the preamble of Directive 2004/18/EC states "[that] Contracting authorities may make use of electronic purchasing techniques, providing such use complies with the rules drawn up under this Directive and the principles of equal treatment, non-discrimination and transparency. To that extent, a tender submitted by a tenderer, in particular where competition has been reopened under a framework agreement or where a dynamic purchasing system is being used, may take the form of that tenderer's electronic catalogue if the latter uses the means of communication chosen by the contracting authority in accordance with Article 42."

This recital implies that the tenderer may use his electronic catalogue as a part of the tender, as long as the tenderer follows the means of communication chosen by the contracting authority.

Considering the specific requirements under the directives it can prove difficult to establish what requirements should be used in relation to the tenderers electronic catalogue, and in what circumstances the tenderer can use their own electronic catalogue.

If e-catalogues are used differently in the Member States, this might cause unnecessary problems for the contracting authorities in assessing whether the tenders met the required electronic standards. This might in turn have an adverse effect in relation to the use of electronic catalogues.

2.4 The implementation

The implementation of the directives raises questions in relation to the timely implementation of the directives, the impact of the implementation period and the correct implementation of the directives.

2.4.1 The timely implementation

The directives must be implemented within 21 months after coming into effect. This means that the Member States will need to complete the Implementation of the Directives before 31st January 2006[4]. Although the new directives entered into force on 30 April 2004 the existing directives will only be repealed with effect from the expiry of the implementation period, the 31st January 2006[5].

[4] Article 80 of Directive 2004/18/EC on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts

[5] Article 82 of Directive 2004/18/EC on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts

The survey shows that one Member State expects the directives to be implemented in 2004, 14 Member States expect the directives to be implemented in 2005 and eight Member States expect the directives to be implemented in 2006. Two of the Member States have not yet decided when the directives will be implemented.

Table 2.2: Implementation of directives

2004	2005	2006	Not decided
Denmark	Austria	Republic of Cyprus	Czech Republic
	Belgium	Greece	Portugal
	Estonia	Lithuania	
	Finland	Luxembourg	
	France	Malta	
	Germany	Slovakia	
	Hungary	Slovenia	
	Ireland	Sweden	
	Italy		
	Latvia[6]		
	The Netherlands		
	Poland		
	Spain		
	United Kingdom		

The majority of Member States expect the directives to be implemented in 2005. The Member States implementing the directives in 2006 will be faced with a very tight implementation schedule, as the directives will have to be implemented in January 2006. The same can be said for Member States implementing the directives in the later part of 2005. These Member States risk to be faced with a tight implementation process that does not leave room for unforeseen hindrances or delays. This situation poses risks of implementation beyond the implementation period.

There will, consequently, be a special need for a detailed and thorough planning as well as monitoring of the progress of the implementation process in the Member States.

2.4.2 *The implementation period and co-existence of different procurement rules*

When considering the impacts caused by the implementation period two issues arise. Firstly, what impacts are caused by the fact that the Member States will implement the directives with different speeds and Member states have reported that they do not expect any major difficulties in implementing the directives, and secondly what the impacts would be if the directives are not implemented within the given time-frame. The majority of member states refer to the fact that the new directives are a natural evolution of the former directives, and that any potential obstacles were eliminated in the process of implementing the old directives implementation period.

[6] DIRECTIVE 2004/17/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 31 March 2004 coordinating the procurement procedures of entities operating in the water, energy, transport and postal services sectors is implemented in 2004 in Latvia

Only few conflicts with other non-procurement existing legislation are in evidence. The member states do not expect any risk of delay to come out of any such conflicts.

Some member states have already initiated comprehensive consultations with relevant stakeholders, such as industry and interests groups to streamline the political process of passing any new legislation through their respective parliaments. Those states that have not taken such initiatives could face the risk of lack of acceptance and poor compliance in the time immediately after implementation.

It is clear that if the Member States do not implement the directives at the same time, there will be a situation with different procurement regulation in the Member States, where some Member States have implemented the new directives and others still use the existing procurement directives.

The stakeholders in the member states acknowledge the political decision of implementing in different stages, but they also expect that this will contribute to further complicate the practical application of the rules.

In the transition period, potential bidders will need not only knowledge about the rules but also knowledge of the current status of implementation in the residence country of the procuring entity. This, combined with the number of areas where the new directive only sets minimum standards, could enhance the potential bidder's experience of non-uniform rules between the member states compared with the present system.

However, looking at the de facto differences in the application of the present directives, the introduction of the new, more coherent, directives will contribute to an overall more transparent situation where the differences between the member states are documented and based on a legal instrument.

It seems likely that information about the directives to businesses, especially SMEs, will be disseminated in the individual Member State. This means that businesses from slow-implementing Member States will not have access to the same information as other Member States, and are therefore not as well prepared to participate in cross-border electronic procurement.

Moreover, the existence of different legal procurement regimes can also cause market fragmentation in itself, as the legal systems that the businesses are operating in will be different.

2.4.3 The correct implementation

The correct implementation of the directives primarily raises the question of the actual correct understanding of the legal framework in the implementation phase.

Only Denmark has at present a complete draft for the implementation of the procurement directives[7].

[7] Finland has informed the Commission in the "Contribution of Finland concerning Working Documents 5 April 2004" that the drafting of the new public procurement legislation has begun"

The new directives do not regulate a new area, but they are an adjustment of the already existing procurement legislation and rules. It is therefore the general expectation from Member States, that the implementation will be less cumbersome than the implementation of a completely new directive. This probably applies to the *legal* implementation of the directives, whereas the application by purchasing entities and integration of electronic means in the procurement process will be an entirely new task in most Member States.

When considering the national obstacles in relation to the implementation of the directives, it should be particularly examined how existing national rules that are within the same field that is regulated by the new procurement directives should be dealt with[8].

The member states have their national procurement legislation well adopted to the present procurement directives. The new directives will require some adjustments to the national rules, but this is not generally regarded as an issue by the member states. Furthermore, the member states do not foresee that any difficulties arising out of existing procurement legislation will be allowed to in any way delay the implementation of the new directives.

The fact that the Member States have not at present drafted new rules, makes it likely that any interpretive document from the Commission on the correct understand of the new rules, will be considered by the Member States in the actual implementation of the directives. It is therefore likely that any guidance from the Commission on the correct interpretation of the new rules in the present phase could have a positive impact in relation to the uniform and correct understanding of the new directives.

Because of this, the Commission is presently in a position where it can greatly influence the uniformity of the final implementation across all member states. The member states do not envisage that they will seek to implement any specific national rules on the areas of electronic communication and tendering. Should the Commission issue guidelines and technical appendixes in due time, these will certainly also form the basis of the national implementation of the directives. Thus, there does not seem to be an issue of over-implementation or “gold-plating”, if only the Commission offers timely guidance.

2.4.4 Compliance

The most difficult and complex part of the implementation of the directives is the process of ensuring that existing electronic procurement systems complies with the rules of the directives. The question of whether the existing systems comply with the directives is relevant because, fear of the compliance issue might cause contracting authorities to abstain from using electronic procurement, and because use of non-complying systems will cause businesses and contracting authorities to lose trust in the electronic procurement,

The implications of this problem are significant, because the detection of compliance problems in the existing systems will be difficult and require a thorough scrutiny of existing systems that might be considered inappropriate and unnecessary cumbersome for the contracting authorities.

[8] See section 2.5

If a given electronic procurement system do not meet the requirement of the directives, use of that system will be a violation of the directives. Depending on the type of violations, it can be hard for the relevant actors (the government agency responsible for the implementation of the directive, the contracting authority it self, and businesses) to detect and address the violation. This would especially be the case with the requirements relating to the devices used by contracting authorities in the electronic procurement process.

The survey shows that 11 Member States think they have (at least one) electronic procurement system(s) that is compliant with the directives, whereas 14 Member States do not.

Table 2.3: Does your country have operational electronic procurement systems that are compliant with the requirements of the Directives?

Yes	No
Austria	Republic of Cyprus
Belgium	Czech Republic
Denmark	Estonia
France	Finland
Germany	Hungary
Ireland	Greece
Italy	Latvia
Lithuania	Malta
Luxembourg	Poland
The Netherlands	Slovakia
Portugal	Slovenia
Sweden	Spain
	United Kingdom

When considering the feed-back received from the Member States, attention should be given to a recent analysis by IDA with an examination of some the major national electronic procurement portals, see section 3.7 Potential risks and barriers. The analysis shows that they generally fail to meet all the requirement of the directives (e.g.) the requirement regarding interoperability).

The answers in table 2.5 and the actual examination of the leading national procurement systems in the IDA report under lines the fact that it is very important for the Member States and their contracting authorities to conduct a thorough examination of the shortcomings of the existing systems in relation to the requirements of the directives. It also shows that is difficult to assess whether a given system meets the requirements of the directives.

The member states expect that compliance concerning the new features of the directives, such as electronic tendering, will be rather low. The member states intend to counter this by launching information campaigns and issuing guidelines. Any guidance from the Commission in assessing procurement systems compliance is welcomed by the member states. There is a real danger, that act of certainty on the legal status of any available procurement system will pose a major barrier to the use of such systems.

Further, it should be underlined that the investment needed in order for the contracting authorities and for businesses to meet the requirements provides a major barrier against the successful integration of the electronic procurement framework. Even after the fulfilment of certain of the requirements compliance costs remains.

2.5 Contradicting national rules

The survey shows that 17 out of 25 Member States have regulated the use of electronic means in the procurement process in their national legislation.

Among the 17 Members States which have regulated the use of electronic means in the procurement process, 15 have regulated the rules applicable to communication, 12 have regulated the storage of data and seven have regulated the use of specific procedures (e.g. eAuction and DPS).

Table 2.4: Is the use of electronic means for communication in the public procurement process regulated by national legislation?

Yes	Yes, rules applicable to communication	Yes, storage of data	Yes, use of specific procedures (e.g. eAuction, DPS)	Other
Austria	√	√	√	
Belgium	√	√		√
Czech Republic	√			
Estonia	√	√		
Finland	*Don't know*	*Don't know*	*Don't know*	*Don't know*
France	√	√	√	
Germany		√		
Greece	√	√	√	
Ireland	√	√		
Italy	√	√	√	√
Lithuania	√	√		
Poland	√		√	
Portugal	√	√		
Slovakia	√			
Slovenia	√	√	√	
Sweden	√			√
United Kingdom	√	√	√	

Note: The following countries answered "No" to the question: Cyprus, Denmark, Hungary, Latvia[9], Luxembourg, Malta, The Nederland and Spain.

There are differences in the extent to which the Members States have regulated the use of electronic procurement in national law. Generally, only few Member States have regulation covering both rules applicable to communication, storage of data and the use of specific procedures. Almost half of the Member States have not introduced regulation applicable to communication, storage of data and the use of specific procedures (e.g. eAuction and DPS).

[9] DIRECTIVE 2004/17/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 31 March 2004 coordinating the procurement procedures of entities operating in the water, energy, transport and postal services sectors is implemented in 2004 in Latvia.

The differences between the Member States regulation of the rules applicable to communication, storage of data, and the use of specific procedures presents challenges to the current use of cross-border electronic procurement as businesses will need to understand and comply with specific national rules and requirements when engaging in cross-border procurement[10][11].

The question naturally arises whether any existing national rules and standards are compatible with the directives, and if they are, to what extent they are compatible with one another. It is of course important for the transparency and effectiveness of the use of electronic communication that the systems and standards that are used are interoperable. As rules contradictory to the directive must be changed during the transposition phase, the main question is whether the national standards are interoperable with one another. That question is discussed under section 3 of the baseline analysis.

2.6 Digital signatures

The conclusion of contracts is often based on the signature of the parties of the contract or by the fact that one of the parties sends an order confirmation or similar document to the other party.

If the parties to the contract know one another in advance there will be no doubt as to the identity of the other party to the contract. However, many contracts are entered into by parties who have no prior knowledge of the other party, for instance when there communication are conducted by letter or faxes.

When the communication of the parties is based on paper, the signature of the parties serves as identification. The use of paper also serves as evidence of the contents of the document, as it is difficult to change written documents after they have been issued.

However when the communication is made through digital nets, which are open to general access, for instance the Internet, the parties can similarly sure of the identity of the other part. Further, electronic communication does not leave easy detectable tracks if the document used in the communication has been changed.

Electronic communication and commerce therefore necessitate electronic signatures' and related services allowing data authentication, and it can generally be said that the existence of an electronic contract law with digital signatures is a natural prerequisite for the use of electronic procurement.

Directive 1999/93/EC on a Community framework for electronic signatures contains a basic law of electronic signatures. The directive was to be implemented in 2002. The purpose of the directive is "to facilitate the use of electronic signatures and to contribute to their legal recognition". It establishes a legal framework for electronic signatures and certain certification-services in order to ensure the proper functioning of the internal market.

[10] We have not made any direct comparison of the given national rules. However, the fact that that there differences in the Member States regulation of the rules applicable to communication, storage of data, and the use of specific procedures suggest that differences exists between the national rules.

[11] Austria has, for instance regulated the areas communication, storage of data and the use of specific procedures, whereas Germany has only regulated storage of data. See table 2.6 in Preliminary Report for the full detail of which areas are regulated in the Member States.

The E-signature directive distinguishes between electronic signatures and advanced electronic signatures. The electronic signature is defined in article 2, section 1 of the Directive: "

- 'electronic signature' means data in electronic form which are attached to or logically associated with other electronic data and which serve as a method of authentication;"

The advanced digital signature is defined in Article 2, section 2:

- "'advanced electronic signature' means an electronic signature which meets the following requirements: (a) it is uniquely linked to the signatory; (b) it is capable of identifying the signatory; (c) it is created using means that the signatory can maintain under his sole control; and (d) it is linked to the data to which it relates in such a manner that any subsequent change of the data is detectable;"

According to article 5 of Directive 1999/93/EC the "Member States shall ensure that advanced electronic signatures which are based on a qualified certificate and which are created by a secure-signature-creation device:

(a) satisfy the legal requirements of a signature in relation to data in electronic form in the same manner as a handwritten signature satisfies those requirements in relation to paper-based data; and

(b) are admissible as evidence in legal proceedings."

Essentially article 5 of the Directive gives a "qualified electronic signature" attached to electronic data the same status as a hand written signature on a paper document.

2.6.1 *The use of electronic signatures in the procurement process*

The conclusion of electronic contracts is an important element in the new procurement directives. Recital 38 of the preamble of Directive 2004/18/EC EC on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts addresses the question of the interaction between the new procurement directives and the E-signature Directive. It is stated in the recital that:

"The public procurement procedures and the rules applicable to service contests require a level of security and confidentiality higher than that required by these Directives. Accordingly, the devices for the electronic receipt of offers, requests to participate and plans and projects should comply with specific additional requirements. To this end, use of electronic signatures, in particular advanced electronic signatures, should, as far as possible, be encouraged. Moreover, the existence of voluntary accreditation schemes could constitute a favorable framework for enhancing the level of certification service provision for these devices."

Annex X of Directive 2004/18/EC stipulates correspondingly that "[the] Devices for the electronic receipt of tenders, requests for participation and plans and projects in contests must at least guarantee, through technical means and appropriate procedures, that electronic signatures relating to tenders, requests to participate and the forwarding of plans and projects comply with national provisions adopted pursuant to Directive 1999/93/EC;"

The Member States are according to Article 42 of Directive 2004/18/EC on EC on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts left the option to require, in compliance with Article 5 of Directive 1999/93/EC, that electronic tenders be accompanied by an advanced electronic signature in conformity with paragraph 1. It is clear that if the Member States chooses to require the use of a specific advanced digital signature, then the general interoperability problems connected to the use of the advanced digital signature will arise in the electronic procurement.

The survey shows that 15 Member States have introduced an advanced digital signature. Ten Members States have not introduced an advanced digital signature. Six of the nine Member States that have not yet introduced an advanced digital signature plan to introduce one[12].

Table 2.5: Introduction of advanced digital signatures

Already introduced	Not introduced yet	Planning to introduce[13]
Austria	Belgium	Belgium
Czech Republic	Republic of Cyprus	Republic of Cyprus
Denmark	France	France
Estonia	Ireland[14]	
Finland	Latvia	
Germany	Lithuania	
Greece	Luxembourg	Luxembourg
Hungary	Malta	Malta
Italy	Portugal	
The Netherlands	United Kingdom	United Kingdom
Poland		
Slovakia		
Slovenia		
Spain		
Sweden		

Nine Member States report that the use of an advanced digital signature will be made mandatory in public calls for competition, seven Member States report that they will not require an advanced digital signature and two do not know yet if an advanced digital signature will be made mandatory.

[12] Further information about the standards for electronic signatures used in the Member States can be found in Leuven-report page 127.
[13] Only countries which have not yet introduced an advanced digital signature.
[14] In Ireland, the use of advanced signatures will be catered for where they are required by awarding authorities.

Table 2.6: Will the use of an advanced digital signature be made mandatory in calls for competition?

Yes	No	Do not know
Austria	Belgium	The Netherlands
Czech Republic	Denmark	Portugal
Estonia	Finland	Cyprus
Germany	France	Hungary
Greece	Ireland[15]	Latvia
Italy	Luxembourg	Lithuania
Poland	Slovakia	Malta
Slovenia	Sweden	United Kingdom
Spain		

There is reason to focus on how the Member States that expects to require an advanced digital signature, will handle the interoperability problem.

Looking at the national level, the present penetration of the advanced digital signature in the Member States will, of course, be of importance in relation to the question of how smoothly and successfully businesses will be able to use the advanced digital signatures in the procurement process.

The survey shows that among the Member States with an advanced digital signature more than half of the Members States report that the signature has been used to a low extent or not at all. Only one Member State reports that the advanced digital signature is used to a high extent.

Table 2.7: Use of advanced digital signatures

To a high extent	To some extent	To a low extent	Not used	Do not know
Austria	Slovenia	Czech Republic	Finland	Denmark
	Germany	Estonia	Slovakia	Ireland
		Greece	Belgium	The Netherlands
		Hungary	Cyprus	
		Italy	France	
		Poland	Latvia	
		Spain	Lithuania	
		Sweden	Luxembourg	
			Malta	
			Portugal	
			United Kingdom	

Only Austria reports that the current extent of usage of the advanced digital signatures is high and Slovenia and Germany report that the advanced digital signature is used to "some extent".

[15] The use of advanced digital signatures will not be made mandatory in the Irish system, but the system will cater for awarding authorities who wish to avail of such signatures in calls for competition.

The low general penetration of the advanced digital signature might cause problems if the contracting authorities require the use of advanced digital signatures. In Italy, for instance, it has been policy to let operators who do not dispose electronic certification to participate in procedures carried out electronically[16]

Otherwise there is a risk, that businesses will chose not to obtain the advanced digital signature, and thereby not participating in an electronic call for tender requiring an advanced digital signature. It is possible that particularly foreign businesses (from other Member States than the contracting authority) will find it so burdensome to obtain the national digital signature used in the contracting authority's Member State or face the interoperability problems related the use of a signature from the Member State of the business that it will decide not to participate in the public call for tender.

This could be a serious adverse effect to the use electronic procurement and the intentions of saving time and money, because the level off competition and particularly cross-border competition will drop.

According to a recent study, the various national Certification Authorities ("CA") has chosen different standards for the digital signature. Each CA has established its own methods for modeling this technology, usually abiding to local or national rules. It can be said that the Member States are divided into two general approaches. Some have interoperable but not secure-proof systems and other have chosen secure systems that exclude suppliers which do not have digital signatures from specific CAs[17].

Digitally signed documents verified by a CA, usually require software from the same CA in order for the documents to be opened. Furthermore, the time for obtaining the necessary software or hardware from a CA is usually lengthy and may require the physical presence of a supplier in the CA premises for approval[18].

It is clear that lack of cross-boarder interoperability of electronic signatures crates major obstacles in relation to the conclusion of electronic contracts and thereby hinder the free movement of goods in the Internal Market.

The most obvious way of reducing the recognition problem and the burdens of obtaining a digital signature in another Member State is a system of mutual recognition or a European trust centre that interfaces with different existing national trust centers[19]. It seems a prerequisite for the establishment of a European trust centre that a consensus is established among the Member States for a common level of the security of the digital signature[20]

[16] Advisory Committee on Public Procurement, working group on e-procurement minutes of the meeting 12 March 2003 p. 4.

[17] IDA Public eProcurement State of the Art Report, version 0.60 p. 129.

[18] IDA Public eProcurement State of the Art Report, version 0.60 p. 129.

[19] The recommendation for a European trust centre has for instance been made in the Analyses of Public eProcurement initiatives for IDA, by Unisys Management Consulting p. 11.

[20] The recommendation for a common level of security also suggested in the Analyses of Public eProcurement initiatives for IDA, by Unisys Management Consulting p. 57.

Such a system could provide the contracting authorities with the necessary guarantee that the signature is genuine and in compliance with the special security demands, and it would be easy to use for the companies.

2.7 Other contractual aspects

As mentioned earlier, aspects such as ordering, invoicing and digital signatures are subject to other pieces of community law.

Directive 2000/31/EC on certain legal aspects of information society services such as electronic commerce, contains three provisions on electronic contracts, the most important of which being the obligation on Member States to ensure that their legal system allows for contracts to be concluded electronically. This provision, in effect, requires the Member States to screen their national legislation to eliminate provisions which might hinder the electronic conclusion of contracts. Many Member States have introduced into their legislation a horizontal provision stipulating that contracts concluded by electronic means have the same legal validity as contracts concluded by more "traditional" means[21].

Furthermore, Articles 10 and 11 of the Directive, concerning information to be provided about the electronic conclusion of contracts and the requirement to confirm receipt of an order are transposed almost literally in national legislation. Feedback from the Member States indicates that after some phasing in and initial difficulties, information society service providers quickly adapted their websites to comply with those requirements. Three Member States have included rules in their transposition legislation dealing with the actual moment of the conclusion of a contract. In the other Member States this issue is governed by general contract law. So far, no case law has come to the attention of the Commission indicating difficulties created by the general contract law rules in determining the moment of conclusion of an electronic contract[22].

The provisions in the procurement directives, the Directive on electronic signatures and the Information society Directive complements each other. The Directive on electronic signatures and the Information society Directive provides the necessary legal framework for the award of electronically based public procurement contracts.

The basic contract law is, however, left for the individual rules of the Member States. The electronic signatures Directives similarly states: “that the directive does not seek to harmonize national rules concerning contract law, particularly the formation and performance of contracts, or other formalities of a non contractual nature concerning signatures”.

Once a procurement contract is awarded the national law of contracts and sale of goods will regulate the contractual relations between the contracting authority and the tenderer, who won the call for public procurement. This situation is similar to that of the normal non electronic procurement process, and therefore poses no special risks to electronic procurement.

[21] COM(2003) 702 final p. 11.
[22] COM(2003) 702 final p. 11.

Cross-border electronic procurement also raises the question of choice-of-law. For each electronic cross-border contract, there will be an applicable system of law.

The relevant system of law can be determined on the basis of an agreement by the parties prior to the contract in question. Generally the procurement contract will decide the applicable law. Otherwise the Convention on the law applicable to contractual obligations (codified version published in the Official Journal C 27, 26.01.1998) will apply.

The Convention applies to contracts between parties situated in different member states. As a rule the law of country in which the supplier resides is applicable to the contract.

When engaging in cross-border electronic procurement the procuring entity should be aware that the validity of a contract entered into with a supplier from a different member state, as a rule is governed by the legal system of the state in which the supplier resides.

The Convention on the law applicable to contractual obligations does not pose special risk in relation electronic procurement as the rules also apply similar in the normal procurement process.

2.8 Summary of legal issues

- The new procurement directives introduce a coherent set of rules governing the electronic procurement and thereby allowing for the use of electronic procurement in the Internal Market.

- Some businesses do not have the access to a PC and Internet that is required for the participation in electronic tendering. The investment and human resources needed for theses businesses to participate in electronic tendering is a structural barrier for the full development of the electronic procurement market, especially among SME's. However, the generally low costs of acquiring a functioning PC will not be a great problem in the development of the electronic public procurement market, because all most all business that compete in regular public tenders over the threshold values will have a PC for writing tenders etc.

- The Member States implementing the directives in 2006 and late in 2005 will be faced with a very tight implementation schedule, as the directives will have to be implemented in January 2006. Such short implementation process does not leave room for unforeseen hindrances or delays. This situation poses serious risks of hasty, erroneous and non coherent implementation of the directives or delays in the implementation beyond the implementation period.

- The co-existence of different procurement rules in EU (former and new) provides a strong risk that businesses, and especially SME's, in Member States that have not implemented the directives will not have the necessary information and guidance regarding the new procurement directives to participate in cross-border procurement in Member States that have implemented the directives.

- The implementation of the dynamic purchasing system and e-auctions are optional. Most of the Member States plan to introduce these procurement procedures. Assuming that not all Member States implement the procedures, the differences between Member States could cause problems for especially SMEs in those Member States, where the new procedures are not introduced.

- The feedback received from the Member States in relation to the compliance of the existing electronic procurement systems demonstrates the difficulties and correspondingly need for thorough examination of the existing electronic procurement systems

- Lack of cross-boarder interoperability of electronic signatures crates obstacles to the free movement in the Internal Market and can prevent confidence in electronic transactions. Several Member States plans to introduce a requirement for an advanced digital signature in relation to electronic procurement, which will create even further obstacles for cross-border electronic procurement.

- Different contractual and sale of goods laws provide a general barrier for cross-border procurement. However, the barrier is not limited to the use of electronic procurement

- The implementation of electronic invoicing may result in non-compatible solutions and the prevention of realizing the full potential savings from digitizing of the entire tendering process.

3. Comparative analysis

3.1 National strategies on e-public procurement

In order to provide an overview and comparison of the overall approach to e-public procurement in the member states the study uncovers the current state of play in each of the member states and in a cross-country perspective. The central parameters chosen for the description of the approaches of the member states are:

- National strategy
- Objectives
- Resources allocated or planned for the introduction of operational e-public procurement
- Levels of government included (national, regional, local)
- Plans for the implementation of operational e-public procurement

Although it is not possible to draw a clear cut line between those countries that have taken a very proactive approach and those that are still at the early stage of embarking, or have not yet embarked, on e-public procurement, the analysis does seek to identify to what extent the member states already have taken steps to promote a coherent approach to e-public procurement. As not all member states have taken actions in this direction, the interview survey also includes questions that uncover the reasons why some countries at the moment have chosen not to advance e-public procurement very actively at the overall political and strategic level. It is however important to note that the research conducted in the member states also shows that the absence of an overall objective and a coherent strategy does not mean that there are no e-public procurement initiatives and activities in the country. In fact, the interview survey documents that activities do exist in some countries that have not defined an overall objective and/or strategy, but the point to be made here is that they are not part of and tied into an overall strategy.

3.1.1 Findings

As a point of departure the interview survey shows that the majority of the member states have developed a strategy for the introduction of operational e-public procurement (21 countries[23]), and that a majority of the member states have set an overall objective for the introduction of operational e-public procurement (23 countries[24]). The timeframe for the achievement of the objectives defined by the member states mostly covers the period up until 2005-2006, while one country (Latvia) have formulated an objective for the coming four years until 2008 and another country (France) goes as far as 2010. The table below summarizes the findings concerning strategy; objectives, resources committed or spent and the levels of government (national, regional, local) included in the national strategies for e-public procurement for each of the EU member states. Moreover, the table summarizes the most important elements concerning the plans for the implementation of operational e-public procurement.

[23] Portugal, Slovenia, Lithuania, Sweden, Latvia, Germany, Czech Republic, Italy, Ireland, Luxembourg, Finland, Belgium, United Kingdom, Hungary, Malta, Cyprus, Poland, France, Greece, Denmark, Spain

[24] Portugal, Slovenia, Lithuania, Sweden, Latvia, Germany, Czech Republic, Italy, Ireland, Luxembourg, Finland, Belgium, Austria, Slovakia, United Kingdom, Hungary, Malta, Cyprus, Poland, France, Greece, Denmark, Spain

Table 3.1: National strategies on e-public procurement

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Austria	No strategy for introducing operational e-public procurement due to lack of capacities within public procurement institutions to work with e-public procurement	No specific objectives on e-public procurement. Approximated financial savings of administrative costs as a result of introducing e-government account to EUR 1.5 billion Overall objective is to implement the directive on e-public procurement and to create and transmit tenders with electronic signature A year of fulfilment has yet to be set	Information unavailable	Information unavailable	An advanced electronic signature based on qualified certificated has been introduced. The use of electronic signature will be made mandatory when participating in public calls for competition On an experimental level, implementation of an e-auction system has been started Pilot schemes of the implementation of dynamic purchasing systems and e-catalogues have been outlined A special guideline for electronic procurement and especially e-tendering, has been issued ("Verordnung der Bundesregierung betreffend die Erstellung und Übermittlung von elektronischen Angeboten in Vergabeverfahren – E-Procurement-Verordnung 2004")
Belgium	No overall strategy for e-public procurement E-public procurement initiatives are part of the overall governmental strategies of administrative simplification and reduction of administrative burden and e-government A working group will draft a strategic paper on e-public procurement for implementation in 2005	Main objective is to lower the administrative burden for enterprises It is planned to publish all federal call for tenders, electronically, by end of 2004 E-tendering application should be operational by 2005	No resources allocated in 2004 Resources for implementation of the forthcoming strategy will be allocated in 2005	E-public procurement initiative covers central level, only	Electronic catalogues and framework contracts are being used by the central purchasing agency, "Services contrat-cadre multi-SPF" Projects on e-auctions or dynamic purchasing systems have yet to be initiated No special guidelines have been issued Electronic signature based on the electronic identity card will be introduced in 2004, and is expected to be fully implemented in 2007

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Cyprus	The strategy is an integrated part of the Cyprus Government strategy on modernizing public procurement procedures[25]	An overall objective is to ensure that a large proportion of public procurements shall be awarded through electronic procurement procedures by 2008 Implementation of an electronically based procurement system will take place during 2005 and is estimated to be fulfilled in year 2007	The government has used EUR 800.000 on state level The government will spend EUR 2.4 million over a period of three years	Central and local government are included	Electronic signature does not exists but will be introduced No specific guidelines guiding electronic public procurement have so far been issued Government authorities have no experience with e-auctions, dynamic purchasing systems or e-catalogues
Czech Republic	Strategy and priorities on electronic public procurement are integrated in the overall strategy on the Information Society and E-government - among others “State Information Policy (SIP)” (1999)[26]	Overall objective is to promote an electronic marketplace used for repeated and bulk purchases in the whole field of the public administration (time-frame 2002 – 2006)	Information on amount of allocation is presently unavailable	Only central government is included	Electronic signature has been introduced Special guidelines for electronic public procurement have been developed, but it is not obligatory to use them Authorities have no experiences with systems for procurement involving electronic auctions, electronic purchasing systems or electronic catalogues
Denmark	Strategy on e-public procurement is part of the existing strategy for e-commerce (2002) - e.g. “IT for everybody”, “Strategy for e-commerce 2002”, “The digital supplier” and “The digital buyer” A new strategy (2004) from the government and the coalition of municipalities includes guidelines for digitizing towards 2006	The overall objectives are - to save money by centralizing the procurement process - to make the public sector a leading driving force in electronic procurement and commerce - to realize un-utilized economic potential within electronic commerce in both the public and private sector	Public investment have been made to introduce e-public procurement, but there is no available specification of the amount spent	All levels of government are included in the strategies	Guidelines on e-public procurement were published in 2003 An electronic signature has been introduced, but not been used for electronic public procurement Electronic catalogues are being used Few entities have experience with e-auctions There is no experience with dynamic purchasing systems

[25] Based on interview with Stelios Kountouris, Public Procurement Department, Treasury of the Republic of Cyprus

[26] The Czech e-government strategy is laid down in the State Information Policy (SIP) of 1999. This policy defines eight priority areas for the development of the Information Society in the Czech Republic, including e-government. It is being implemented through a SIP Action Plan which first version was adopted in 2000 (for the period to 2002) and an updated version adopted in February 2002 (for the period to 2003). http://europa.eu.int/ISPO/ida/jsps/index.jsp?fuseAction=showDocument&documentID=1356&parent=chapter&preChapterID=140-203-383-389. The Ministry of Informatics drafted in March 2004 Act on Electronic Communications (http://www.micr.cz/files/1282/Electronic_Communications_Act.pdf)

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
		Year of fulfilment has not been specified			
Estonia	There is no strategy on e-public procurement. However, a strategy has been prepared and introduced in the State Budget for 2005	Objectives on e-public procurement have not been formulated	Information unavailable	Information unavailable	Electronic signature has been introduced Governmental institutions have no experience with e-auctions, dynamic purchasing systems or e-catalogues
Finland	Initiatives on e-public procurement are integrated in the overall strategy on e-government - e.g. “Development programme 2002-2005 for electronic services” including initiatives on electronic signature and XML A procurement strategy was published in January 2004, and the government’s “Information Society Programme” in April 2004	Overall objective is to take advantage of information technology to enhance effectiveness of public procurement	Public resources are allocated but specific information concerning the size of the amount is unavailable	Strategies cover all levels of government	A recommendation for electronic public procurement has been issued on electronic invoicing - another on electronic ordering is being prepared An official digital signature has been introduced but is yet to be used for electronic public procurement Electronic catalogues are used when purchasing goods but neither e-auctions nor dynamic purchasing systems are being used
France	Project on e-public procurement is part of the governmental modernisation plan “Administration électronique 2004/2007” (ADELE) The overall strategy on electronic procurement also constitutes a part of the e-government and information society initiatives There is no separate strategy for e-public procurement	Main objective is to publish all calls for tenders electronically by 2010 (project: “100% Dematerialisation”) Introduction of e-tendering by 2005	Approximately EUR 2 million has been allocated for the introduction of operational electronic procurement at national level The Ministry of Defence has allocated approximately EUR 4 million over the last 3 – 4 years In 2005, EUR 1 million is earmarked for using on an inter-ministerial platform	Central, regional and local government are included in the strategies for procurement Also public enterprises are covered by the initiatives	Guidelines for e-public procurement have been issued The Ministry of Defence and certain local authorities have experience with using e-auctions. The Ministry of Defence also has experience with electronic catalogues An electronic signature does not exist, but will be introduced in 2004 Dynamic purchasing systems have not been used

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Germany	E-public procurement initiatives are part of an overall strategy to develop the information society and create e-government - “BundOnline 2005” - “Deutschland-Online” - “Information Society Germany 2006”	Achieve greater efficiency and transparency, and cut costs in the tendering cycle Develop integrated electronic services on all administrative levels and create standards and infrastructures Secure e-tendering system by the end of 2005	At state level, the public authorities allocate approximately EUR 4.5 million per year to introduce operational electronic procurement	The strategies include central government	The Ministry of Economics and Labour has published a guide on e-public procurement Another guideline has been published to define the technical conditions for e-public procurement (“Optimierung der Beschaffung”) Advanced qualified electronic signature has been introduced and is used to some extent The Procurement Office of the Federal Ministry of the Interior are experienced in using electronic catalogues E-auctions and dynamic purchasing systems are not a legal possibility
Greece	The strategy for the introduction of operational electronic public procurement is an integrated part of the overall strategy on e-government and the development of the information society[27] The focus of the strategy is to obtain improved IT skills in public and private sector, speeding up procurement procedures, and to secure lower prices on public procures	Introduce an operational e-public procurement system by the end of 2007 30% of goods awarded from the Ministry of development will be awarded by electronic means by the end of 2008	Information unavailable	Include central government	Electronic signature has been introduced and is being used to a low extent There is no experience with electronic catalogues, electronic auctions, dynamic purchasing systems or Framework agreements
Hungary	The strategy for introducing an operational electronic public procurement is included in the overall strategy on E-government and Information society - among other things “Hungarian Information Society Strategy” (HISS), 2002[28]	The overall objectives are harmonization and modernization of the law, ease of use among a wide range of participants, transparency, and support of centralised procurement Objectives are estimated to be realized in March 2005	Internal government figures exists but cannot be disclosed publicly	All levels of government are included	Electronic signature has been introduced Specific guidelines have been issued E-auctions are being used below threshold for experimental purpose E-catalogues are also used to some extent in order to gather information Dynamic purchasing systems are not being used

[27] Information received from Mr. Spatharis, Ministry of Development. There is no information on title of the strategy/strategies.
[28] See http://www.ihm.hu/English/_20030211_1.html

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Ireland	Strategies on e-public procurement are integrated in a overall strategy on modernising Public Procurement - "Strategy for the Implementation of eProcurement in the Irish Public Sector" (2001) - "Modernising Public Procurement" (2003)	Key targets to be achieved by the end of 2007 (described in the strategies): - Unit cost reductions of 2.5% of total expenditure on supplies and services and works - Transaction costs reduction of 5% for supply services and works - Unit cost reductions of 0.5% of total expenditure on capital works - Transaction cost related reductions of 0.25% in overall expenditure on capital works - 90% of tender competitions (above EU thresholds) carried out electronically - 80% of payments carried out electronically - 10% of all expenditures on supply and services supported by electronic catalogue and ordering facilities Approximated financial benefits by 2007 are estimated at EUR 414 million and potentially up to EUR 1 billion, annually	Approximately EUR 4 million on national level for implementation of the national strategy Some projects funded by other sources	All levels of government included in the national strategies on e-public procurement Projects are planned for development of a separate e-procurement strategy for local and sector level	The public authorities have no experience with e-auctions, dynamic purchasing systems or electronic catalogues. Project initiatives on these areas are outlined in the strategies Pilot initiatives on national level are recommended in the strategies, e.g. a pilot project on electronic ordering using electronic catalogues Guidelines on operational implementation have not been issued

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Italy	Strategy on e-public procurement is integrated in an overall plan of introducing e-government and integrated into the program of rationalizing public spending for goods and services - e.g. "The Public Spending Rationalization Program" (2000)	Reduce expenses of goods and utilities and simplify the buying procedures Electronic procurement of goods and services for EUR 12 billion (timeframe: 2000 – 2005)	Information unavailable	Strategies cover all levels of government	Electronic signature has been introduced but is only being used to a low extent Electronic auctions has been a legal possibility since 2002 and there are numerous experiences both on national and local level For purchases under threshold, a market place of public administration exists based on the principles of dynamic purchasing systems Government procurement service through Consip S.p.A. uses high quality e-purchasing models such as electronic catalogues, reverse auctions, market place etc. Guidelines in support of the different areas have been issued as part of the strategy for e-government
Latvia	A separate strategy on e-public procurement (timeframe: 2004 – 2008) is available. - "Usage of information technology in the development of a public procurement system" (2004) This strategy is the part of e-government strategy, because the e-procurement strategy is mentioned in e-government strategy as one of the main goals.	It is projected that: - 10% of total public procurement contract amount will be awarded electronically by 2008 - the government can save EUR 1 million per year after 2008 by undertaking the procurement procedures in the public sector, electronically - the electronic catalogue and e-auctions will be fully implemented in 2008	Information unavailable	Central and regional authorities are included	An electronic signature has not been introduced There is no experience with neither e-auctions, dynamic purchasing systems or e-catalogues in the public sector, while private enterprises have experience in e-catalogue and e-auctions using Electronic auctions and dynamic purchasing system has been a legal possibility in the utility sector since 2004

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Lithuania	The overall strategy on e-public procurement is an integrated part of a general strategy on modernising the public sector and develop the information society Three strategies in the field of information society development and e-government are included: - "National Concept of Development of Information Society" (2001) - "Strategic Plan for Development of Information Society" (2001) - "Long-term Development Strategy of the State" (2002) Activities for the modernising of the activities of Public Procurement have also been planned as a part of the general government programme.	Overall objectives are to revise the national public procurement legislation, increase transparency and availability of information and develop an electronic public procurement system	Approximately EUR 300.000 per year has been used for introducing e-procurement within national public authorities	Central government is included in the strategies	An electronic signature has not been implemented Guidelines have not been issued There is no experience with neither e-auctions, dynamic purchasing systems or e-catalogues
Luxembourg	Initiatives on e-public procurement are an integrated part of the action plan "eLuxembourg" (www.eluxembourg.lu) on development of e-government	All public procurement procedures including invoicing and accounting have to be done electronically by 2005	Information unavailable	Central government is the only level included in the strategy	An electronic signature will be introduced in 2005 Special guidelines for using e-public procurement have not been produced There is no experience with e-auctions or dynamic purchasing systems in the public authorities The central purchasing agency "Service central des imprimés de l'Etat" is using electronic catalogues

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Malta	Strategy for the introduction of e-public procurement is integrated in the country's overall strategy on e-government and the development of the information society, but has not yet been fully developed - e.g. "e-Government program" (2000)[29]	Three overall objectives have been formulated: - deliver first-class public service - increase citizen participation in government decision making - streamline public services and realize efficiency-gains	Information unavailable	Central and local are included in the strategy	An electronic signature has not been introduced A set of guidelines relating to the government's e-public procurement initiative have been published (2004) There is no experience with electronic auctions, dynamic purchasing systems or electronic catalogues
Netherlands	There is no strategy on e-public procurement An action plan from 2001, which described a way of working for the national government within the area of public procurement is currently the main strategic document - "Action Plan on Professional Procurement and Purchase" (2001)	There is no overall objectives on e-public procurement	Significantly resources on the introduction of e-public procurement have yet to be allocated	Information unavailable	Ministries of Social Affairs and Employment and different local hospitals and health departments are experienced in using e-auctions An electronic signature has been introduced There is no guidelines on e-public procurement Dynamic purchasing systems and electronic catalogues have not been used
Poland	Strategy on e-public procurement is an integrated part of the overall strategy on e-government - "Gateway to Poland" is the Polish e-government action plan - "e-Poland" is the strategy for development of the information society	There is a set of overall objectives: - to ensure efficiency and general savings in the public administration - to minimize corruptive behaviour - to secure transparency in the public sector activities	There is no specific information on this issue	National, regional and local public administration are included in the strategies	Electronic signature has been a legal possibility since March 2004 A few entities in the Polish public sector have experience in organizing e-auctions, e.g. municipalities Public authorities have no experience with e-catalogues and dynamic purchasing systems

[29] See http://www.gov.mt/egovernment.asp?p=110&l=2

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Portugal	Strategy for the deployment of e-public procure is outlined in “National e-Procurement Program”, which is an integral part of the overall strategy on the development of e-government and the information	Establishment of an organisation responsible for national e-public procurement Centralized procurement within the ministries Intention to realize savings in the magnitude of 10% - 20% on public procurement costs during the period 2003 – 2006 Approximately 50% of total acquisitions to be carried out electronically by 2006	Information unavailable	All levels of government included	Guidelines for e-public procurement have been developed and are integrated into the “National Initiative for Electronic Commerce” Pilot projects on electronic auctions and e-catalogues have been carried through There is no experience with dynamic purchasing systems Electronic signature has not been introduced
Slovakia	There is no strategy for introducing or implementing e-public procurement	No overall objectives	Information unavailable	Information unavailable	Electronic signature, electronic auctions, dynamic purchasing systems and electronic catalogues have been introduced There is no special guidelines on e-procurement
Slovenia	Initiatives on e-public procurement is integrated in the overall strategy on e-government and development of an information society Strategic reports: - “Strategy of E-commerce in Public Administration of the Republic of Slovenia for the period from 2001 until 2004” (2001) - “Action Plan e-Government Up to 2004” (2002)	The overall objective are to remove administrative barriers	Information unavailable	All levels of government are included	An electronic signature has been implemented Government authorities have experience with both electronic auctions and catalogues Dynamic purchasing systems are not being used Special guidelines have not been issued

	Strategy	Quantitative and qualitative objectives	Resources allocated to introduce operational e-procurement	Levels of government included	State of affairs on implementation of operational e-public procurement
Spain	Actions for adopting e-public procurement are integrated in an overall strategy for developing the information society - "Info XXI Action Plan for the development of the Information Society" (2001) A specification on adoption of e-procurement in the public administration has also been produced (SLICE)	All transactions in public e-procurement should be done electronically by 2005	Information unavailable	National and regional government are included	Special guidelines for electronic public procurement have been issued, which addresses functional, technical and security issues ("Guilas Silici") Local and regional public authorities have experience with e-auctions Central and regional public authorities have experience with electronic catalogues There is no experience with dynamic purchasing systems in the public administration An electronic signature has been issued but only used once in a while
Sweden	Initiatives on e-public procurement is an integrated part of different policies on adoption of the information society - "An Information Society for All, a publication" (2004) is about the Swedish IT-policy	There is no overall objective on electronic procurement due to a decentralised organisation of activities on e-public procurement	Resources have been spent at all levels of government but there is no information on the amount	Only central government is included in the strategy	Guidelines have not been issued E-auctions and dynamic purchasing systems are not being used Electronic catalogues are used in relation to purchase of goods Electronic signature has been introduced but is only but only used once in a while
United Kingdom	A specific e-procurement Strategy for Central Civil Government from 2002 exists It is composed by several strategic documents/sites on www.ogc.gov.uk	Web-enabled tools and techniques shall deliver £ 250 million pounds of value for money improvement to government's commercial relationships during April 2003 – March 2006 50% of dealings should be capable of electronic delivery by 2005 and 100% by 2008	Resources have been spent but there is no information on the amount	Central, regional and local government are included	No electronic signature – will be introduced in 2006 Guidelines have been issued, e.g. "E-procurement cutting through the hype – A guide to eProcurement for the public sector" (2002) and "Reverse Electronic Auctions" Electronic catalogues are, typically, used for ordering Dynamic purchasing systems are not being used Several authorities have experience with e-auctions, but the use is not widespread. An e-auction Decision Tool to evaluate whether an e-auction is suitable for an intended procurement also exists

Based on table 3.1 above, some observations across the EU member states may be highlighted:

- First, the table shows that most countries consider the field of e-public procurement as an integral part of their e-government and information society strategies. Four countries (France, Cyprus, Ireland and Lithuania) have integrated a strategy on e-public procurement into the national strategy on public procurement, while one country, the UK, have chosen to formulate a separate strategy for the introduction of e-public procurement.

- Second, eleven member states have issued special guidelines for e-public procurement (Austria, Czech Republic, Finland, France, Germany, Hungary, Italy, Malta, Portugal, Spain, UK), while the remaining countries have not.

- Third, in countries where strategies for the introduction of e-public procurement exist, the strategy is most often aimed at the central governmental level and less frequently at e-public procurement at the regional and local levels. Table 3.2 below summarizes which countries have included respectively the national, regional and local levels in their strategies.

Table 3.2: Levels included in the national strategy on e-public procurement[30]

Central government	Regional government	Local government
Belgium		
Cyprus		Cyprus
Czech Republic		
Denmark		
Finland	Finland	Finland
		France
Germany		
Greece		
Hungary		
Ireland	Ireland	Ireland
Italy	Italy	Italy
Latvia		
Lithuania		
Luxembourg		
Malta		Malta
Poland	Poland	Poland
Portugal	Portugal	Portugal
Slovenia	Slovenia	Slovenia
Spain	Spain	
Sweden		
United Kingdom		

[30] Information not available from the countries that have no strategy; Austria, Estonia, Nederland and Slovakia

Finally and related to the listing of the main elements of the national strategies and objectives, the interview survey uncovers the most important motives related to e-public procurement in the EU member states. The table below summarises and ranks the most important motives that, according to interview statements from member states representative, drive the efforts to introduce and mainstream e-public procurement in the member states that have formulated objectives and/or strategies for the introduction of e-public procurement.

Table 3.3: Motives for introducing e-public procurement (high and medium importance and total no. of countries that consider a specific motive important)

	High importance	Medium importance	Total (no. of countries)
Public sector savings	14	4	18
Modernisation of public sector	10	8	18
Increased efficiency and competitiveness of private sector	9	9	18
Better control of public sector spending	9	9	18
Alignment on European neighbours	3	11	14
Other	6	1	7

The table clearly shows that the achievement of public savings and the modernisation of the public sector through the introduction of electronic business processes are major driving forces. It is, however, also noteworthy that a number of member states see the introduction of e-public procurement as a mean to increase the efficiency and competitiveness of the private sector in the sense that demands from public institutions to suppliers will create an incentive for the suppliers to 'e-enable' their businesses. Some interviewees have mentioned additional motives, such as improving the transparency in the public sector, simplification of the administrative work for businesses and using the introduction of e-public procurement as a mean to promote the development of the information society in the country.

As mentioned, the survey seeks to uncover the underlying reasons why some member states have not at this point developed overall strategies or objectives for the introduction of operational public procurement. The analysis shows that four[31] of the 25 member states have presently not developed overall strategies or objectives in the field. The reasons given by the interviewees do not point at one single (or two) most important factor that seems to have barred or impeded the development of e-public procurement objectives and/or strategies across member states. The information provided by the interviewees point to a broad range of factors that have played a role in this respect[32]:

- Fragmented responsibilities between the involved governmental institutions (2 countries)
- Absence of regulated procurement tradition (2 countries)
- Lack of capacities/skills within institutions to work with e-public procurement (2 countries)
- Many suppliers are not ready for e-procurement (2 countries)
- Complex legal requirements (1 country)

[31] Austria, Estonia, Nederland and Slovakia.
[32] Each interviewee has been able to point at several reasons.

- Failed experiences in previous initiatives (1 country)
- The added value of e-public procurement is considered as low (1 country)
- Awaits experiences in e-public procurement in other countries before launching it in the country (1 country).

3.1.2 *Assessment*

The study shows that the EU member states have approached the development of e-public procurement differently in their national strategies, and that they presently are at various stages as regards the operational implementation of e-public procurement. In the light of this present situation it can be envisaged that the introduction and main-streaming of e-public procurement will be rolled out at varying speed across the EU in the coming years, which entails a risk for a certain level of market fragmentation. The more fragmented the market is, the greater the impediment to the development of an effective internal market and European competitiveness. The differences between the countries, which will maintain and possibly reinforce the existing variations in the level of implementation of e-public procurement, can be seen in the following areas:

- The existence of a comprehensive and detailed strategy
- The extent to which public investments have been made or earmarked to the introduction of e-public procurement

Although the majority of countries have included e-public procurement in a broader strategy or have formulated a separate strategy for e-public procurement, there are significant differences between the countries concerning the level of detailing and how comprehensive the strategy is. The formulation of quantitative targets is done at different levels of specification: In most cases, the targets are described in quite broad and qualitative terms that outline the overall direction, while some countries have defined targets that are more specific and expressed in measurable, quantitative terms. Examples of specific targets are seen e.g. in Ireland where a number of quite specific objectives for a range of parameters are defined, in the UK and in Latvia where the amount of savings and share of electronic transactions have been specified, and in Portugal where an overall target of savings on public procurement in the range of 10%-20% have been set.

The analysis shows that the introduction of e-public procurement is mainly driven from the level of central government as only 14 member states have included the regional and/or the local levels in their national strategies. However, as shown in the outline of activities in table 3.1 above, it is important to note that e-public procurement is an area in development where with many concrete activities currently ongoing or in the pipeline.

Although information about investments in e-public procurement is generally difficult to find, the study indicates that several countries have either not invested resources in e-public procurement or they have not earmarked resources for future investments. Information about public resources spent and allocated for the introduction of e-public procurement are in most cases sparse, most frequently because the investments in e-public procurement come from different public sources and there is consequently no aggregate information available. In some cases have public funding not been invested or allocated because the establishment and operational introduction has been contracted out to an external, private supplier.

This means that the initial investments have also been contracted out, as the business model includes that the private operator will obtain a return on investments from the transaction and subscription fees paid by the users (buyers and suppliers). In countries where information on invested resources is available, the typical level of investment in the establishment of operational systems seems to vary roughly between 1 and 5 million EUR, but there are also examples of larger investments, such as Italy where the e-public procurement system launched in 2000 required initial investments of 25 million EUR.

When the above mapping of the motives is compared with the expectations in the member states to the advantages of e-public procurement and the key performance indicators which the member states use or plan to use for monitoring uptake and assessing impact (presented in tables (3.8 and 3.9) later in this section), the overall picture across the countries is that the main focus is on the national context and the achievement of public savings and modernization of the public sector, while elements such as cross-border trade and the participation rate of small and medium-sized enterprises are generally absent. The broader European perspective, in terms of the creation of European competitiveness and an effective internal market through cross-border trade, is largely absent.

3.2 Organisations and institutions responsible for implementing electronic public procurement

The following contains an overall description of the main findings and assessment of the current situation in the member states with regard to the organisations and institutions responsible for implementing electronic public procurement.

3.2.1 Findings

Institutional set-up
The survey among member states has included a number of questions aiming at describing the distribution of responsibilities among public authorities within each country. The table on the next pages provides an overview of the public institutions, responsible for and involved in public procurement policies, legal aspects and technical issues within each member state. In addition, the table provides an overview of the existence of central procurement institutions within each country.

As the table shows, the general finding across the member states is that the typical institutional set-up involves one or more ministries or departments at national, governmental level, responsible for implementation of overall policies as well as legal aspects. The survey among member states shows that the same authorities are responsible for the overall public procurement policy and legal aspects in the following 20 member states:

- Austria
- Cyprus
- Czech Republic
- Estonia
- France
- Germany
- Greece
- Hungary
- Ireland
- Italy
- Latvia
- Lithuania
- Luxembourg
- Malta
- The Netherlands
- Portugal
- Slovakia
- Spain
- Sweden
- United Kingdom

These responsibilities within overall public procurement policies and legal aspects are typically assigned to the ministries of economic affairs, the ministries of finance or the ministries of science and information technology.

Table 3.4: Public authorities responsible for implementing e-public procurement

	Responsible institution(s) for public procurement policy	Responsible institution(s) for legal aspects	Responsible institution(s) for technical solutions	Central procurement institution(s)
Austria	Federal Chancellery Federal Procurement Company Ltd.	Federal Chancellery	Austrian Federal Economic Chamber	ICT-Board Chief Information Office
Belgium	Federal Steering Group on Joint E-Procurement	Public Procurement Commission	Federal ICT Department (FEDICT)	Services contract-cadre multi-SPF

Slovakia	Office for Public Procurement Agency for Informatisation of Society	Office for Public Procurement	Office for Public Procurement Agency for Informatisation of Society	Office for Public Procurement

	Responsible institution(s) for public procurement policy	Responsible institution(s) for legal aspects	Responsible institution(s) for technical solutions	Central procurement institution(s)
Slovenia	Ministry for Information Society Council for Information Society	Public Procurement Office	Public Procurement Office Government Centre for Informatics	Public Procurement Office
Spain	Ministry of Economy and Finance Ministry of Public Administration Ministry of Trade, Industry and Tourism	Ministry of Economy and Finance Ministry of Public Administration Ministry of Trade, Industry and Tourism	Directorate of State, Patrimony, Ministry of Economy and Finance	
Sweden	Ministry of Finance, National Board for Public Procurement	Ministry of Finance, National Board for Public Procurement	Agency for Public Management	Agency for Public Management
United Kingdom	Office of Government Commerce	Office of Government Commerce	Improvement and Development Agency	OGC Buying Solutions

The institutions are often assigned with the development of overall national procurement policies and strategies, with the application of legal aspects, and coordination of the inter-ministerial initiatives to adapt both the national policies/strategies and the legal framework. As an example, the Office for Government Commerce (OGC), which is an independent office of the Treasury in United Kingdom, is responsible for an integrated government procurement policy and strategy and for helping to co-ordinate the procurement of governmental departments and agencies. In addition, OGC has an important role representing the UK on procurement matters in Europe and the World Trade Organisation, and in helping departments apply the rules in the UK. OGC also take the lead on the Government's policy of achieving value for money in public procurement as well as giving advice and producing guidance[33].

The survey thus also shows that different authorities are responsible for the overall policy and for the legal aspects in the following 5 countries: Belgium, Denmark, Finland, Poland and Slovenia:

- In Belgium and Denmark, four different institutions are responsible for the overall public procurement policy, legal aspects, technical solutions and the operational development of e-public procurement. In Belgium, policy formulation on e-public procurement is done by the federal Steering Group on Joint E-Procurement where all federal organisms are represented, whereas overall responsibility lies with the government (Conseil des Ministres) itself. The legal framework falls into the responsibility of the Public Procurement Commission (Commission des marchés publics) under the authority of the Prime Minister. Technically, e-public procurement projects are conducted by line ministries in consultation with and under the coordination of the Federal ICT Service (SPF FEDICT). In Denmark, The Ministry of Science, Technology and Innovation is responsible for policy formulation and support to promotion of operational electronic public procurement systems, while the Danish Competition Authority under the Danish Ministry of Economic and Business affairs is responsible for the legal framework for public procurement including electronic public procurement. The Agency for Governmental Management under the Ministry of Finance is responsible for the operation of the central public procurement portal.

- In Finland, the Ministry of Finance is responsible for the public procurement policy, while the Ministry of Trade and Industry is responsible for legal aspects and technical solutions. Finally, the Finnish government has established a central procurement body (Trading House Hansel), responsible for the operational development of e-public procurement, including the arrangement of framework contracts.

[33] "Fostering SMEs' Participation in the Information Society: What Lies Ahead?" (September 2003), by National Technical University of Athens, and www.ogc.gov.uk

- In Poland and Slovenia, the Public Procurement Offices are responsible for legal aspects, technical solutions as well as the operational development of e-public procurement[34]. In Poland, the Public Procurement Office is also involved in the overall public procurement policy in cooperation with the Ministry of Scientific Research and Information Technology. The responsibility for Slovenian procurement policy is shared between the Ministry for Information Society and the Council for Information Society.

The survey among member states also shows that the same authority is responsible for overall public procurement policies, legal aspects and technical issues in 11 member states. These member states are:

- Cyprus
- France
- Greece
- Ireland
- Italy
- Latvia
- Malta
- The Netherlands
- Poland
- Portugal
- Slovakia

These responsibilities within these countries are typically assigned to the ministries of economic affairs or the ministries of finance. In some of these countries, responsibility is however assigned to a governmental unit within these ministries.

As regards the operational development of e-public procurement, responsibility is most often assigned to a governmental unit with a more specific focus on IT and technological solutions, e.g. a ministry for IT or a public procurement agency. The study shows that the majority of the member states have established a central procurement institution.

These member states are:

- Austria
- Belgium
- Cyprus
- Czech Republic
- Denmark
- Estonia
- Finland
- France
- Germany
- Hungary
- Italy
- Luxembourg
- Malta
- Poland
- Slovakia
- Slovenia
- Sweden
- United Kingdom

The survey thus shows that the Greece, Latvia, Lithuania, the Netherlands, Portugal and Spain have not established a central procurement institution. In the Netherlands, the selection of suppliers is typically a responsibility of the individual public institutions, but a procurement body has before existed on national level. The agency was however abolished due to unsuccessful results.

[34] In Slovenia, the responsibility for technical solutions is shared between the Public Procurement Office and the Government Centre for Informatics.

In Portugal public procurement has until now been conducted in a decentralized manner as regards both procurement within the ministries and the entire ministerial level. This means e.g. that when no framework agreements exist the selection of suppliers is typically done by the individual institutions both for procurement above and below the threshold. However, the decentralized model is expected to change in the future with the strategy towards more centralized organization of the procurement within the ministries as well as for the entire ministerial level.

Centralisation vs. decentralisation

At the aggregate level, the survey provide some data that may be used to establish the characteristics of the organisational model applied for public procurement in the EU as regards the application of a centralised approach vs. a decentralised approach to public procurement in the countries.

In short, a centralised approach includes, first, that there is one or more central procurement institutions in the country (at national, regional and/or local governmental levels), second, that these institutions are actively involved and responsible for the selection of suppliers (which may be selection of suppliers for contracts both above and below the EU threshold).

A decentralised approach includes that a central procurement institution, if it exists in the country, is responsible for the overall policy formulation and coordination of public procurement, but that the management of tenders and selection of suppliers are done at the institutional level[35], and that the central procurement body is not involved in this process.

The survey shows that there are central procurement bodies in the majority of the member states – 19 member states have central procurement bodies and 6 countries have not established such institutions. While central procurement bodies exist in most countries, the responsibility for the selection of suppliers typically rests with the individual public institution. Only in a few countries, including the Czech Republic, Hungary, and Malta, the central procurement body has the responsibility for the selection of suppliers for procurements in public institutions. In Malta, the selection of suppliers at national level above threshold is done by the Department of Contracts, which also is involved in the selection of suppliers at local level above threshold (in collaboration with local councils). Procurement below the threshold at local level is done through evaluation committees operating under the local councils.

[35] The term ‘institution’ is in this respect used in the broad sense and includes institutions such as e.g. a line ministry and a university or a hospital.

Framework agreements

The survey included questions about the use of framework agreement in the countries. The table below summarises the use of framework agreements among EU member states at national, regional and local level. The table also list those countries that do not use framework agreements:

Table 3.5: Use of framework agreements

National level	Regional level	Local level	No use
Austria			Republic of Cyprus
Belgium			Czech Republic
Denmark	Denmark	Denmark	Estonia
Finland	Finland	Finland	France
Germany	Germany	Germany	Greece
Hungary	Hungary	Hungary	Lithuania
Ireland		Ireland	Luxembourg
Italy	Italy	Italy	Malta
Latvia		Latvia	Slovenia
The Netherlands	The Netherlands	The Netherlands	
Poland			
Portugal	Portugal	Portugal	
		Slovakia	
Spain	Spain		
Sweden	Sweden	Sweden	
United Kingdom	United Kingdom	United Kingdom	

The table shows that more than half of the member states use framework agreements at the national level, and that 10 countries use framework agreements on regional level[36]. Most of those countries that use framework agreements at regional level also use framework agreements at the local level. The study thus also shows that 10 countries do not use framework agreements at any level.

The study also shows similarities in the use of framework agreements at the national level. As examples of this, the central public procurement bodies in Denmark, Finland and UK arrange framework contracts, which can be used by all public authorities. However, the individual public authorities are free to arrange individual framework agreements.

It should be noted that despite framework agreements exist, the analysis does not cover the extent to which these agreements are actually used. The survey included questions on the share of total procurement which is purchased through framework agreements, but only few data seems to exist on this matter, and it has therefore not been possible to carry out any valid analysis in this context. In other words, even though framework agreements exist at various levels under the aegis of a central procurement they might only be used to a relatively limited extent by the public institutions.

[36] Slovakia uses framework agreements at local level, but not at the national or regional level.

3.2.2 Assessments

Risks of a decentralised approach

The study on the characteristics of the organisational model applied for public procurement in the EU as regards the application of a centralised approach versus a decentralised approach, shows that public procurement across the EU is generally organised in a manner that follows the decentralised approach. The main rationale behind this organisational set-up seems to be that procurement is considered as an integral part of the financial management, responsibilities and accountabilities assigned to the institutional level and that placing this responsibility at the institutional level creates an incentive for sound financial management for the individual institution. However, it also indicates that the level and the speed of uptake of e-public procurement across the EU will mainly be determined by the individual institutions and the extent to which they decide to use e-public procurement instead of traditional, paper-based procurement.

The decentralised approach includes a risk for a relatively slow transition to e-public procurement. Because the responsibility for the use of public funding is decentralised to individual institutions, they will be able to decide whether they want to use e-public procurement or not. Therefore, the pace of transition to e-public procurement may be held up by the individual buyers, who choose not to use electronic means in procurement, e.g. because they consider the transition costs too high, because their procurement volume lacks sufficient critical mass in order to obtain added value from the transition to e-public procurement or because they lack the necessary skills to handle e-public procurement.

The decentralised approach also includes a risk of the development of many different e-procurement systems, which would mean the creation of additional barriers and costs for suppliers. This is the result of the decentralisation of the responsibility for the use of e-public procurement to the individual buyers, which would allow these to develop their own e-procurement systems, causing different requirements for suppliers.

Framework agreements and incentives for suppliers

The establishment of a framework agreement between buyer and a selected number of suppliers does not necessary award any business to a supplier. To begin with the framework agreement simply results in one or more suppliers being available for the buyer to contract with, if and when the buyer decides that it wishes to purchase something that is covered under the framework agreement. Furthermore, the incentives for suppliers to engage in framework agreements may be lowered by a low level of detail on the total contract volume in the tendering process. As an example, the central procurement institution in Denmark, SKI, has in the past received only limited discount from suppliers on tenders with no detailed estimate on the total contract volume. As a way to overcome this, SKI chose to include more precise estimates on the contract volume, resulting in better prices. However, according to interview data, there is also experience of extensive use of framework agreements (Sweden).

The push for development and implementation of e-public procurement

The interviewees in countries with defined objectives and/or strategies for e-public procurement were asked to assess the acceptance rate of the stated national objectives and/or strategies for the introduction of operational e-public procurement. The table below summarises and ranks the acceptance rate among different stakeholders:

Table 3.6: Acceptance rate of the stated national objectives or strategies for introducing operational e-public procurement

	High acceptance	Medium acceptance	Total no. of countries[37]
Public procurement experts, academia	14	3	21
National administration	10	9	21
Suppliers	3	11	21
Regional administration	3	10	20
SMEs	2	8	19
Local administration	2	9	20
General public opinion	1	8	21
Other	1	0	6

The analysis shows that the two stakeholders who seem to favor the introduction of e-public procurement at the most are public procurement experts, including experts in the academic community in the country, and the public administration at national level. This assessment is not surprising as these two groups are those most closely involved in the introduction of e-public procurement. The general impression of the acceptance rate from other stakeholders is that in half of the member states or more these stakeholders, including the suppliers from the private sector, do not appear as the leading advocates, who will drive the introduction of e-public procurement in the country.

The high acceptance rate within the public administration and the relatively low acceptance rate within the private sector, indicates that the push for development and implementation of e-public procurement primarily comes from the public administration at the national level. The main reason for this seems to be that the introduction of public e-procurement is seen as a driving force for improving the effectiveness of the public purchasing process, generating structural gains and savings.

However, the developments of an extensive use of e-public procurement will also require wide support and involvement from both the private sector and public administration at regional and local level. Because e-public procurement across the EU is generally organized in a manner, that follows the decentralized approach, the public decisions at regional and local level will be crucial for the introduction and main-streaming of e-public procurement across the EU.

[37] This figure describes the total number of countries which have answered the 8 questions. Some countries have answered "Low acceptance" or "Don't know". These answers are not described in the table.

3.3 The use of electronic means in the procurement cycle

The desk research and interviews have focused on identifying the most important procurement portals and e-marketplaces in the Member States. The portals and e-marketplaces identified are all primarily focused on public sector institutions as buyers and private companies as suppliers. The identified systems are listed in the table be-low. The table in annex B is not an exhaustive list of public procurement solutions in Europe, but rather a list of the most important, in terms of use and focus from government institutions.

Below, we describe the public procurement systems and their functionalities.

Existing public procurement solutions

The research has identified 36 electronic public procurement systems currently operating (please refer to annex B)[38]. In addition, two important pilot projects, which are not yet in operation, have been identified:

- www.compras.gov.pt (Portugal): Central e-public procurement portal.
- www.handwerk.de/dstgb (Germany): E-procurement system for tendering between small companies and towns / municipalities.

More than half the systems, 21 of the 36 systems in operation, are nationwide portals covering a broad range of sectors and institutions. Nine of the systems are regionally based:

- Marchespublics (Wallonie/Belgium)
- Marches-publics (France)
- Vergabe (Nordrhein-Westfalen/Germany)
- www.had.de (Hessen/Germany)
- www.ausschreibungen-brandenburg.de (Brandenburg/Germany)
- www.ausschreibungen.hamburg.de (Hamburg/Germany)
- www.bayerischerstaatsanzeiger.de (Bayern/Germany)
- www.ausschreibungsanzeiger-thueringen.de (Thueringen/Germany)
- www.csarss.net (Northern Ireland/United Kingdom)

The remaining six are nationwide, but sector/institution specific systems:

- www.oebb.at (Railway)
- www.achats.defense.gouv.fr (Defense)
- www.ixarm.com (Defense)
- www.saomap.application.equipement.gouv.fr (Ministry of Equipment, Transport and Housing)
- www.aanbestedingskalender.nl (Construction sector)
- www.e-procurement.gov.mt (IT software and hardware)

The majority of the systems, 29 of 36, are owned by public institutions, but it is important to note that a number of these are in fact operated and maintained by private companies.

The majority of the countries, 16 of the 25, have already established electronic public procurement systems. In 9 Member States important portals or e-marketplaces for public sector procurement have not been identified: Cyprus, Greece, Lithuania, Luxembourg, Poland, Portugal, Slovakia, Slovenia and Spain.

[38] It should be noted that this is not a complete listing of existing systems and the list mainly includes major e-public procurement systems at the central, national level.

As shown in the table in annex B, a total of 13 of the 25 member states have established such a central public procurement portal. Furthermore, as mentioned before, Portugal is currently establishing a central public procurement portal.

Functionalities of public procurement solutions
The research has mapped the main phases covered by the identified electronic public procurement solutions, as shown in the table in annex B.

For the purpose of simplicity, six main phases in the procurement cycle (functionalities) have been singled out: notification about tenders, publication of tenders, management of receipts /submission of tenders, evaluation of tenders, ordering and invoicing. Each of these functionalities is briefly described below:

Notification about tenders:
This functionality provide information to suppliers about past, current and future tenders. The supplier can read the information online or download it. Notification functionalities can be integrated in cross-government and cross-sector portals to provide suppliers with an overview of all relevant public tenders.

Publication of tenders:
This functionality makes tenders documents available online at a web-page. Tenders can be downloaded and returned by post, fax or e-mail.

Management of receipts /submission of tenders:
The simplest way to forward tenders is by e-mail, but this method does not provide the optimal security in the handling of tenders and ensuring tenders have been submitted by the right supplier. Thus, in this report management of receipt / submission of tenders are a specific functionality aimed at receiving tenders, ensuring that no tenders are opened before a given deadline and identify suppliers. Ultimately, such systems can be based on a digital signature and a public key infrastructure.
These systems can also include administration of questions from suppliers and answers from the awarding authority.

Evaluation of tenders
Elaboration of tenders (suppliers) and evaluation of tenders (buyers) can be very time-consuming. E-procurement systems can support this process by enabling systematic assessment of tenders on various pre-selected criteria. Such systems can motivate a re-engineering of the entire work flow from elaborating tenders to award of contract, to make the process simpler.

Ordering
Processing of orders by traditional means (paper or fax) is time consuming and slow. Electronic public procurement systems can manage the ordering process. This usually requires the suppliers to submit an electronic catalogue, which one or several buyers are permitted to order from. Orders can then be placed and order confirmation can be returned electronically.

Invoicing
E-invoicing is a system which is used for electronic invoicing between companies or private suppliers and public buyers. E-invoice systems can be based on e-mail, browser-based systems or fully integrated systems (e.g. Microsoft BizTalk technology). With the most advanced systems, the invoice is forwarded directly from the accounting system of the supplier to the accounting system of the buyer. Table 3.7 lists the procurement phases covered by the 36 identified procurement systems. An overview of the phases covered is shown in the table below:

Table 3.7: Procurement phases covered by the identified procurement systems

	Frequency	%
Notification about tenders	33	92%
Publication of tenders	17	47%
Management of receipts/submission of tenders	9	25%
Evaluation of tenders	3	8%
Ordering	8	22%
Invoicing	1	3%
Total	36	100%

As indicated in table 3.7 above, the two procurement phases most frequently included in the public procurement solutions are (1) Notification about tenders and (2) Publication of tenders. Please note that electronic notification and publication do not necessarily mean that the entire work-flow behind these processes are automated, i.e. that notices are generated by individual institutions and forwarded online to central portals.

Management of receipts/submission of tenders is only covered by nine systems, and evaluation of tenders is only covered by three: Ethics (Denmark), www.ausschreibungen.hamburg.de, (Germany) and OGCbuyingspublicsolutions.gov.uk (UK). Public procurement systems for ordering have been identified in eight cases, whereas for invoice, only one of the 36 identified system, DOIP (Denmark), have a system in operation with this functionality. Moreover, Sweden has acquired experience with electronic ordering and invoicing as 75 municipalities and 10 counties had solutions in place at the time of the study.

3.3.1 *Assessment*

As mentioned above, central public procurement portals and e-marketplaces have been established in 13 of the Member States, and several of the remaining member states are expected to establish central portals and e-marketplaces within the next couple of years. The research illustrate that the two procurement phases most frequently included in the solutions are notification about tenders and publication of tenders. To explain this tendency, the table below illustrates the costs and benefits related to the use of electronic means in the six procurement phases. The costs and benefits involved are based on Ramboll's expert assessment, and they are indicative and very much dependent on selected technology, level of back-end integration, organizational set-up etc.

The costs and benefits of using electronic means in the six procurement phases and implications of the cost/benefit relation are briefly described below:

Table 3.8: Estimated cost and benefits of using electronic means in the various procurement phases

	Costs	Benefits
Notification about tenders	Low • Adjustment and maintenance of web page	High • Reduced publication costs • Reduced search-cost • Increased transparency and competition in the public procurement market • Communication of tenders to a broader audience of suppliers
Publication of tenders	Low • Adjustment and maintenance of web page	Medium • Quick publication of tenders • Reduced administrative costs for buyers and suppliers
Management of receipts / submission of tenders	High • IT-investments (hardware and software) • Development of a digital signature and public key infrastructure	Medium • Reduced administrative and postage costs • Increased transparency • Ease of auditing • Better security/privacy.
Evaluation of tenders	Low • IT-investments (hardware and software) • Re-structurering of tender format	Medium • Reduction of work load involved in this part of the procurement process. • The evaluation process becomes much more well-documented and transparent.
Ordering	High • Communication about format • Developing electronic catalogues • IT-investments (hardware and software) • Re-organization of internal workflows • Back-end integration	High • Reduced printing and posting cost • Reduced administrative cost • Faster processing of orders • More efficient market/lower prices
Invoicing	High • Communication about format • IT-investments (hardware and software) • Re-organization of internal workflows • Back-end integration	High • Reduced printing and posting cost • Reduced administrative cost • Faster processing of invoices.

Costs
As shown in the table, the initial phases are relatively easy to automate, as it essentially means that notification and publication is done via a website. These early phases are also the stages characterized by the lowest complexity and the lowest degree of integration to e.g. back-end systems and management systems. The flow of communication between demand side and the supply side is entirely one-way from the public authorities to the potential suppliers. E.g. most of these systems are more simple one-way communication database systems. It is technically more complicated to establish two-way communicating systems and routines, which involves receipt /submission of tenders (technical clarification communication), ordering and invoicing.

Benefits
Notification about tenders has a significant impact by improving access and transparency for suppliers to the public procurement marketplace. Using electronic means in the processing of orders and invoices provides significant benefits, as these are often high-frequency processes, meaning potential benefits are likewise high.

Implications
The table on cost/benefits of using electronic means in the procurement cycle can provide an explanation on why the initial phases in the procurement cycle are those phases where the use of electronic means is most extensive compared to the other, subsequent phases in the cycle. These are steps which can easily done electronically, and, especially in the case of tender notification, provide significant benefits for buyers and suppliers.

3.4 The use of electronic means for different types of purchases and in utilities

A study of 36 electronic public procurement portals in 16 countries in the EU shows that procurement of goods is the most frequent procurement done by public authorities on the studied portals. Almost 70% of the portals are used for procurement of goods. To a slightly lower degree the authorities also use the procurement portals for purchases of services – here 56% of the portals have this function integrated. 42% of the portals studied are used for procurement of works, while 8%. of the portals are in use for procurement of utilities for the public sector. The study also demonstrates that a main part of the portals (58%) are multifunctional, e.g. being used for purchases of two or more types public procurements at the same time. The most frequent number of procurement that each portal is handling simultaneously is three.

The detailed data of the study is enclosed in annex A.

This research therefore indicates that electronic public procurement systems - as shown in other studies on electronic public procurement too[39] - typically are more applicable and functional for procurement of goods than purchases of more complex types of procurement, e.g. service and utilities.

[39] "An Economic Analysis of Electronic Marketplaces", Report for OGC by European Economics, (2001), (p .5)

The table below shows the assessments made by the interviewed experts in the member states concerning the extent to which electronic means are used for different types of purchases. The assessments made generally comply with the observations above and they indicate that goods are the type of purchase where the use of electronic means is most extensive.

Table 3.9: Level of use of electronic means for different types of purchases

	Works	Goods	Services
Austria	To a large extent	To a large extent	To some extent

3.5 Experiences with e-auctions, dynamic purchasing systems and electronic catalogues

3.5.1 Findings

This section describes the use of electronic auctions, dynamic purchasing systems and electronic catalogues and outlines some of the key success factors for e-public procurement portals.

The interviewees have provided their assessment of whether full migration from traditional, paper-based procurement to e-public procurement is a realistic objective in their respective countries. The analysis shows that interviewees from 18 member states[40] consider this a realistic objective. Moreover, five countries[41] expect to use paper-based procurement procedures along with e-procurement procedures in a transition period of up to 3 years, while six other countries[42] expect to use both types of procedures in a transition period of up to 6 years. In total 11 countries[43] expect to use both types of procurement procedures in the long term, while the remaining countries are unable to assess this question.

As described in the section on legal aspects, the new procurement directives include that member states may provide that contracting authorities may use electronic auctions and dynamic purchasing systems. The survey shows that some countries have already gained experiences in this field, and that public authorities in several countries have experiences with electronic catalogues:

- Public authorities in 10 countries have experiences with electronic auctions[44]
- Public authorities in 2 countries have experiences with dynamic purchasing systems[45]
- Public authorities in 14 countries have experiences with electronic catalogues[46]

Regarding the extent of experiences, these vary between the countries as displayed in the table below.

[40] Austria, Belgium, France, Germany, Greece, Ireland, Italy, Nederland, Portugal, Spain, UK, Czech Republic, Hungary, Latvia, Lithuania, Malta, Poland, Slovenia.

[41] Germany, Ireland, Spain, Malta, Slovenia.

[42] Greece, Italy, Sweden, UK, Latvia, Lithuania.

[43] Austria, Belgium, Denmark, Finland, France, Luxembourg, Portugal, Czech Republic, Cyprus, Hungary, Poland.

[44] Austria, Denmark, Finland, Italy, Nederland, Portugal, Spain, UK, Hungary, Slovenia

[45] Austria, Italy.

[46] Austria, Belgium, Denmark, Finland, France, Germany, Italy, Luxembourg, Portugal, Spain, Sweden, UK, Hungary, Slovenia.

Table 3.9: Extent of experience with electronic auctions, dynamic purchasing systems and electronic catalogues

	Electronic auction	Dynamic purchasing system	Electronic catalogue
Some experience on national level	Denmark Italy France United Kingdom	Italy	Denmark Germany Italy United Kingdom Finland France
Limited experience/ pilot projects	Austria Hungary Ireland Netherlands Portugal Slovenia	Austria	Austria Belgium Hungary Ireland Luxembourg Portugal Slovenia Sweden

Within each of the three fields there are only few countries with some experience on national level. Some member states use these features to some extent where other member states have less experience or just recently started pilot projects. Moreover, there are some countries that use these features to some extent and finally member states which have less experience or have started pilot projects.

Electronic auction
Two member states, Denmark and Italy, have experience with e-auctions. Both systems that are used for e-auctions in Denmark and Italy are based on an “out-of-the-box” Oracle Exchange server. As a matter of fact, the two systems have some similar characteristics as displayed below[47]:

Table 3.10: Characteristics of the e-auctions systems in Denmark and Italy

System feature		System implementation details
Overview of functionality		Submission of bids by online Web Forms Define e-auction space (type of event, bidding fields, evaluation function etc.) Automatic evaluation of bids and ranking of bidders in real-time
Actors		Administrator: responsible for defining e-auctions according to the buying administration’s requirements Supplier: responsible for the submission of bids during the e-auction
Interesting system characteristics	*Technology used*	Oracle Exchange Server is used for the back-office
	Security policy	Both systems use digital signatures for the user authentication
	Evaluation function	Support for advanced flexibility defining the evaluation function (e.g. include unlimited number of parameters and weights) Support the use of Web Forms based on customisable bidding fields for the submission of bids
	Supplier Intelligent Reporting	Obtaining information of previous auction events, savings generated by e-auctions, participation figures, etc.

[47] IDA Public eProcurement, State of the Art Report (April 2004).

Both systems can to a large extent be uniformed with the EU guidelines. The only fields where the functionality does not (yet) fit with the guidelines are the areas of interoperability, monitoring of logs, questions and answers as well as detection of tampering attempts. The following table presents a detailed overview of the possible activities within the two systems:

Table 3.11 Possible activities within the e-auction systems in Denmark and Italy

Activity	Actor	Description
Creation of an auction event	Buyer	Select the type of auction; define the exact parameters of the e-auction (e.g. single round, two rounds or multiple rounds e-auctions, conditions for closing a round, time period between rounds, etc.)
Definition of bidding fields	Buyer	Define bidding fields Define bidding fields specifications (i.e. minimum and maximum allowed figures for each field)
Definition of the evaluation function	Buyer	Define precise evaluation formula for determining bids ranking according to the requirements of each e-auction. Definition of Economic and Technical Evaluations utilising an unlimited number of variables and weights
Invitation of suppliers	Buyer	Select suppliers to be invited in the e-auction
Place bids	Supplier	A bid is placed online, utilising online Web Forms Set figures of their offer for all mandatory fields and submit the bid
Ranking of bids	System	Automatic ranking of bids based on the evaluation function No manual intervention is allowed
Closing a round	Buyer	A round is closed, either automatically by a pre-set deadline, or by a manual intervention by the buyer if all participating suppliers have submitted their bids
Closing of the auction event	System	Automatically termination of the e-auction when the number of pre-set rounds is reached No manual intervention is allowed

Dynamic purchasing system

In the field of dynamic purchasing systems, Italy is the only country with in-depth experience. One reason for this is that in a number of other member states, the national laws prohibit the use of dynamic purchasing systems.

The system in Italy (Lotto 1) is open to all suppliers, even those that do not have framework agreements with the Italian public sector. The system is available to all Italian public sector organisations. Buyers are provided with the functionality to purchase goods or services directly from suppliers, or issue a Request for Quotation (RFQ) first.[48] The following table presents an overview of the main aspects of the Lotto1 system:

[48] IDA Public eProcurement, State of the Art Report (April 2004)

Table 3.12: Lotto 1 (dynamic purchasing system, Italy)

System feature		System implementation details
Functionality overview		Purchasing from supplier catalogues Issue RFQs Update supplier catalogues Full audit trailing functionality
Exploitation model		Self-funding operation Buying administrations: • No cost • Free training Suppliers: • No cost • Upload eCatalogues for free
Actors		Standard User: responsible for browsing through supplier catalogues, comparing commodities, adding commodities to a shopping cart and place orders which require approval Super User: can perform direct purchasing, place RFQs and approve pending orders Administrator: responsible for uploading catalogues, reviewing logs, performing general maintenance of the database records
Interesting system characteristics	*Technology used*	Based on the Oracle Exchange software modified to some extent in order to comply with the Italian eProcurement legislation Oracle Database is utilised for the back-end Oracle Portal is the software solution for the front-end
	Security policy	Limited use of digital signatures by suppliers outside the system in order to prepare their catalogues Orders are digitally signed before sent to suppliers by email
	Uploading and updating of eCatalogues	Catalogue templates for all types of products in MS Excel format including technical and economic attributes Suppliers complete their eCatalogues and send via email to Consip Validation by Consip administrator and conversion into XML format (for uploading on the system) and PDF (for sending confirmation to supplier) Maintenance/updating of catalogues is performed in a similar process
	Version control	Document Management service used for safe-storage of supplier catalogues Version control allows for the storage of current and previous versions of a supplier eCatalogue, useful for conflict resolutions
	Audit trailing / reporting mechanism	Recording of all system activities in logs Generate standard reports "Supplier Intelligent Reporting" facility generates customised reports

Presently, this system only fulfils a couple of the requirements as described in the guidelines.

eCatalogue
The system, most frequently used by the member states, is the eCatalogue. Four countries (Denmark, Germany, Italy and United Kingdom) have already in-depth experiences with eCatalogues, while 2 countries have some and 8 countries less experience or are conducting pilot projects in this field.

Within the single e-Catalogues there are differences concerning the functionality and activities as well as the coverage of the new legislative framework on eProcurement. Presently, the Italian system Lotto 1 enables the following activities:[49]

[49] IDA Public eProcurement, State of the Art Report (April 2004).

Table 3.13: Lotto 1 (e-catalogue, Italy)

Activity	Description
Search eCatalogues	Search by keywords, favourite items Perform a complete catalogue search in a tree-exploring manner
Compare Products	Select two or more products from the same or different suppliers and compare them System presents all attributes of the selected products in a tabular form
Place an order	Place one or more products into the shopping cart and define the necessary quantity System automatically checks whether the actor is a Standard (approval steps need to be followed) or Super user (the order is directly send to the corresponding supplier via email after being digitally signed)
Approve an order	If an order is placed by a Standard User, a Super User is required to approve of the purchase Once approved, the order is automatically sent to the corresponding supplier by email (needs to be digitally signed first)
Define RFQ	Name of the RFQ, whether the RFQ will be visible to the public or not, the ranking criteria, etc.
Invoicing/Delivery Details	Specify invoice and delivery addresses, delivery details, relevant notes Upload any relevant attachments
Definition of attributes	Defined attributes cover both technical characteristics of the desired product and financial offer itself
Invitation of suppliers	Participation invitation must be sent to at least 5 suppliers Select from suppliers that are defined in the system, or invite suppliers to register in the system before participating
Execution definition	Define start and end date of the RFQ and delivery date
Submit	Confirm details and submit All relevant emails are sent to suppliers for their notification

At this stage the system is only accordable to some of the guidelines of the new EU legislation, e.g. the fields of Interoperability, order fulfilment, order invoice and order payment as well as data encryption are not supported online.

Portal
As regards the identified systems and solutions in the countries, some success factors for the implementation of an effective eProcurement system with relatively low or medium cost can be identified:[50]

First, to create a successful eProcurement system it is necessary to adopt a supplier adoption programme and an approach for helping public administrations to join the eProcurement programme and the eProcurement system must guarantee the equal treatment and transparency of competitions.

Second, other supplier related success factors are

- Simple registration process for suppliers
- Matching supplier profile to business opportunities
- Moderate Q&A session to ensure confidentiality
- Assist suppliers during submission through user-friendly GUI
- Phased opening of bids according to the bid documentation type
- Updating a bid.

[50] IDA Public eProcurement, State of the Art Report (April 2004) and Transborder eProcurement Study (IDA)

Procedures like this help to make the submission process easier and more user-friendly and, practically, and they help suppliers to understand the potentials of e-procurement and adhere to this.

In addition to this, the security of transaction must be guaranteed and the confidentiality of sensitive information submitted by suppliers and interoperability of technical solutions must to be taken into account. To enable this, following steps have proven to be successful:

- Utilisation of SSL to guarantee minimum communication security level
- Support of all widely used electronic document standards
- Matching logs from different modules and use a unified log
- Virus check supplier bids upon submission
- Third party to guarantee virus free bid documents.

Another useful feature is the assurance of system transactions and data storage as well as the provision of mechanisms that help tracking user activities and provide the capability of analysing their behaviour. The eProcurement system should also guarantee the general availability of its operations to the involved parties. To guarantee the continuous and consistent operation of the eProcurement system it can be helpful to define level of services with the technology providers and organise training events simulating the real competition environment.

3.5.2 Assessment

To obtain the full benefits of using an eProcurement system for the order and payment process, an integration of buyer and supplier systems is required. Ideally, systems should therefore use the same underlying protocol and semantics. Through the automated order and payment process, both public entities and suppliers can realise their cost saving objectives. However, in many countries this is not the case at the moment. There are only few countries that have introduced one system on national level. Today, many different implementations exist and interoperability proves to be difficult as well as time- and money-consuming. This makes the entrance level to the system too high for most of the smaller companies, especially when coming from another member state.

Nearly half of all member states have taken actions and at least started pilot projects in the direction of e-auctions, eCatalogues or dynamic purchases systems and are going to start the regular operation within a few years. To speed up the implementation and usage of such systems, the countries that already have working systems could serve as best practise.

In countries with some experience, the availability of only one public eProcurement platform has proven advantageous. On one hand, the investment costs for e.g. multiple catalogue management is seen as an important barrier for trading electronically on a large scale. On the other, it leave the suppliers feeling obliged to integrate their product catalogues in order to protect their market share within the public sector procurement market. However, many suppliers are reluctant to do so, whilst most of them have already previously invested in sophisticated and more specialised web shops, which they felt were better suited for their business. Suppliers feel that a common catalogue system is not always adequate to fully promote their products and services.

Nevertheless, to be able to compete on an equal basis, the idea of defining a common standard, e.g. catalogue standard, for Europe or beyond is supported.

3.6 Quantitative data concerning the impact and opportunities of public procurement and e-procurement

3.6.1 Findings

The survey among member states included a number of questions aimed at describing whether the countries have taken actions to assess the impact of introducing e-public procurement, including how often and by what methods the progress of e-public procurement is being monitored. Furthermore, the member states were asked to identify the areas in which they expect significant advantages from the introduction of e-public procurement.

The survey shows that almost half of the member states (10 countries[51]) have taken actions to assess the impact of introducing e-public procurement, and that most of the remaining member states responding to this question (12 countries[52]) plan to make an assessment within the next 3 years. The table below summarises and ranks the most important areas of assessment within the area of e-public procurement:

Table 3.14 List of aspects of electronic procurement, which are being assessed

Listed aspects	Countries
Number of electronic transactions	France, Italy, Luxembourg, Portugal, United Kingdom, Hungary, Latvia, Poland
Transaction costs	France, Germany, Ireland, Italy, Portugal, United Kingdom, Poland
Types of purchases	Ireland, Italy, Luxembourg, Portugal, Latvia,
Speeding up of procurement procedures	France, Ireland, Portugal, Hungary, Poland
Effect on prices	Germany, Ireland, Luxembourg, Latvia, Poland
Electronic public procurement's share of total public procurement volume	France, Italy, Portugal, Latvia
Number of bidders	Italy, Luxembourg
SME participation	Ireland, Latvia
Cross-border participation	Ireland

The analysis of the most important areas for impact assessment clearly shows that the frequency of electronic transactions and the costs of transaction are major aspects of e-public procurement. Likewise, the types of purchases, the speed of procurement procedures and the effect of e-procurement on prices are important areas of assessment among the member states. By contrast, the level of SME participation in public procurement

[51] France, Germany, Ireland, Italy, Luxembourg, Portugal, UK, Hungary, Latvia, Poland
[52] Austria, Belgium, Denmark, Finland, Spain, Czech Republic, Cyprus, Estonia, Lithuania, Malta, Slovakia, Slovenia

and the level of cross-border participation are not seen as important aspects of e-public procurement.

In connection with the extent of assessments of the impacts of e-public procurement, the survey shows that half of the member states (8 countries[53]) are monitoring and reporting the progress of e-public procurement on a regular basis. The study shows that the countries in general use different data transactions (number of users of websites, command-points, volume, prices, etc.) as a basis for monitoring the progress of e-public procurement. The table below summarizes and ranks the member states' expectations to the advantages from the introduction of e-public procurement.

Table 3.15: Expected advantages from introduction of e-public procurement

Listed aspects	Countries
Speeding up of procurement procedures	Austria, Denmark, Finland, Germany, Greece, Ireland, Italy, Latvia, Luxembourg, Nederland, Portugal, Spain, Sweden, United Kingdom, Czech Republic, Cyprus, Hungary, Lithuania, Malta, Poland, Slovakia, Slovenia
Lower transaction costs	Austria, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Nederland, Portugal, Spain, Sweden, United Kingdom, Czech Republic, Cyprus, Estonia, Latvia, Lithuania, Malta, Poland, Slovakia, Slovenia
Better procurement statistics and enhanced budgetary control	Finland, France, Greece, Ireland, Italy, Latvia, Luxembourg, Portugal, Sweden, United Kingdom, Czech Republic, Cyprus, Hungary, Latvia, Lithuania, Poland, Slovakia, Slovenia
Lower prices (increased competition, reduction of maverick buying etc.)	Austria, Denmark, France, Germany, Greece, Ireland, Italy, Latvia, Luxembourg, Portugal, United Kingdom, Czech Republic, Cyprus, Estonia, Latvia, Lithuania, Poland
Better access for SMEs in accessing and responding to public tenders	Austria, Denmark, Germany, Greece, Ireland, Italy, Latvia, Luxembourg, Nederland, Spain, Cyprus, Hungary, Lithuania, Malta, Slovenia, Sweden
Improved IT skills in public and private sector	Austria, Finland, France, Germany, Italy, Portugal, Spain, Slovakia
Other significant advantages	Austria, Greece, Ireland, Italy, Latvia, Nederland, Estonia, Slovakia

The table clearly shows that the introduction e-public procurement is expected to speed up the procedures of procurement and to lower the costs of transaction. Likewise, the member states expect that the introduction and use of e-public procurement systems will lower prices, provide better statistics on procurement, including enhanced budgetary control, and improve the access of SMEs to public tenders.

[53] Belgium, Germany, Ireland, Italy, UK, Estonia, Hungary, Slovenia

The data situation regarding the impact of the introduction of e-public procurement in the EU is still rather weak, both in member states which do not conduct monitoring of e-public procurement activities yet and in member states already carrying out regular impact assessments. This is due to the relatively early stage of introducing e-public procurement in many member states, characterised by pilot projects and gradual roll-out of e-public procurement to all levels of public administration. This fact is also illustrated by the high number of countries planning to accomplish statistical monitoring within the next three years.

The information collected and documented often concerns primary figures, which do not directly demonstrate the impact of the introduction of e-public procurement. Statistics frequently cover the number of registered contracting authorities, registered suppliers, calls for tender published, resources allocated and the number of transactions, such as in Ireland. In March 2004, close to 20,000 suppliers and over 1,700 awarding authorities had registered in Ireland, and in 2003 close to 4,500 tender opportunities had been advertised on the e-public procurement portal. On the other hand, figures about the volume of public procurement contracted electronically are relatively rare, but can be found, for instance, in Estonia, where the declared value of electronically advertised calls for tender was EUR 475 million.

In some relatively advanced member states where statistics are taken, figures show that the percentage of electronic transactions is high or rising. In Finland, for instance, 50-60% of the tender notices over threshold value and 95% of the notices under threshold are sent electronically via the Internet to the national Official Journal[54]. In Denmark, 54% of state authorities and 63% of regional authorities use an e-procurement system, and turnover at the public procurement portal has increased to approximately EUR 5 million.

Also in countries where no overall figures exist, a steady increase in the use of electronic means in public procurement by procurement agencies and suppliers is registered. In France, the e-public procurement portals operated by the Ministry of Defence handled 50% of the ministry’s public procurement processes in the last quarter of 2003. The number of tender documentation put online and the number of download of electronic documentation increased considerably during the first months of 2004[55]. However, a high number of tender documentation downloads still originate from unregistered tenderers which eventually submit their bids offline. The upcoming challenge for public authorities will therefore be to encourage these suppliers to use electronic means for submitting their tenders.

In order to obtain a comparative overview, a recent web-based study, commissioned by the European Commission’s DG Information Society, has measured the state of the play in basic online public services for citizens and businesses in the then 15 EU member states[56].

[54] Office of Governmental Commerce (OGC), UK, An Economic Analysis of Electronic Marketplaces.

[55] IDA Public eProcurement, State of the Art Report, Version 0.60, 15 April 2004 (p. 38).

[56] European Commission / Cap Gemini Ernst & Young, Web-based Survey on Electronic Public Services, Results of the Third Measurement October 2002, February 2003.

Public Procurement was one of the 20 public services, of which level of online sophistication has been examined, and several stages of advancement in introducing e-public procurement have been defined for research purposes, from simple online information on calls for competition to the electronic case-handling of the entire tendering procedure. The member states found to be most advanced in introducing the complete cycle of e-public procurement included Finland, Sweden, Denmark, Germany and the UK, followed by Portugal Ireland and Italy, and behind them, France and Austria. Belgium, Greece, Spain and the Netherlands obtained the lowest ratings in this survey.

One of the advantages expected by most member states by means of introducing e-public procurement concerns savings caused through lower transaction costs and lower prices. The savings achieved or expected often lie in the range of 15 to 30% when public authorities buy online. A pilot e-procurement auction conducted in Portugal in November 2003 has, for instance, generated savings of approximately 25%, which is consistent with the government's objective of achieving savings between 10% and 20% on public procurement costs.

The volume of savings put forward by several member states are considerable, but frequently constitute mere expectations, even though they might be calculated through precise economic methods. Thus Ireland forecasts, in its e-public procurement strategy, cumulative potential savings of EUR 414 million for the years 2002 to 2007, with potential annual savings of EUR 177 million per annum thereafter[57]. This represents an approximate cost reduction of 2% on the total public procurement expenditure of EUR 8.8 billion.

Concrete and measured savings however are (still) at a relatively small scale compared to investments and often offset by high costs for introducing new IT systems and applications. The Italian e-public procurement system launched in 2000, for instance, required initial investment of EUR 25 million, whereas estimated gains through savings on administrative costs for 2001 were at EUR 774.700[58]. Also recurrent costs are generated by e.g. organising electronic auctions.

As for the impact of introducing e-public procurement on businesses and in particular SMEs, few figures are available yet. It should, however, be noted that participation and registration in operational e-public procurement systems entails transaction costs for suppliers and registration fees for administrative users in some countries (e.g. Denmark), while it does not in others (e.g. Finland). Enterprises are faced with a number of different costs when implementing e-procurement, and the various cost elements can add up to a significant level altogether. The case below is an illustration of the costs facing suppliers when entering into e-procurement with a public institution as buyer[59] with the purpose of exchanging business documents, i.e. orders or invoices. The example is based on evidence from Denmark, but the cost structure is largely the same in other European countries, that have established public procurement marketplaces.

[57] E-Procurement in Ireland – a strategy to provide an improved service to all stakeholders, IDA case study

[58] IDA Public eProcurement, State of the Art Report, Version 0.60, 15 April 2004.

[59] The example is based on evidence from the project conducted by Rambøll Management, 2003-2004: Implementation of e-commerce in [60] SMEs, Danish Ministry of Science, Technology and Innovation.

Case Box 3.1: Cost of e-procurement (ordering) for suppliers.

Example from Denmark

Integration with financial system, picture databases etc.: from EUR 3.000 and upwards depending on system, automatisation level, functionalities etc.

Sign on fee, portals: EUR 1,500[60] (DOIP), EUR 800-2,400 (RAKAT)[61], EUR 700 (KMD).

Annual fee: EUR 1,500 (DOIP[62]), EUR 800-2,400 (RAKAT)[63], EUR 700 (KMD).

Transaction costs: From EUR 0.03% (RAKAT) to 2% of turnover (DOIP).

In some cases, upgrading of the ERP system to a newer or more widely used software package can be a pre-requisite for automated and integrated e-procurement.

Total:
Implementation costs: from EUR 6,000 (excl. revisions in ERP system)
Annual costs: EUR 3,000 (fixed) + variable costs according to turnover and number of transactions

As shown in the example above, implementation cost and running costs are considerable for an SME, especially when the use of the systems by public authorities is often limited. It should be noted that the above example includes only the direct costs. Other derived costs, in terms of acquiring the necessary e-procurement software, briefing and/or training in-house staff, updating the company's ERP system, and generally adjusting the business routines cannot be estimated in a simple example, but they may add up to a considerable amount.

As illustrated by the country survey, cross-border participation in e-public procurement procedures is hardly measured in the member states' impact assessments, and is not named as one of the expected advantages of introducing e-public procurement. However, it is still worth to examine the trans-border impact of e-public procurement, in view of establishing an internal public procurement market within the EU.

Although few statistical data are available on the share of bids and contract awards across borders in e-public procurement, the current participation of foreign competitors does not appear higher in electronic procurement procedures than in traditional paper-based public procurement. A study on trans-border e-public procurement identifies actions that would enable interoperability in trans-border e-public procurement and to avoid obstacles to it[64]. It finds that although most vendors on the market agreed to use the XML standard, there are still strong differences as many companies introduced their own schemes (e.g. xCBL, cXML). E-public procurement systems use the Common Procurement Vocabulary (CPV), but this standard is not detailed enough. Security requirements and standards vary greatly in the EU member states. Furthermore the study identifies a lack of a European trust centre that interfaces with national institutions as regards digital signatures, and therefore calls for pan-European standards as the key for interoperability.

[60] If a framework contract has already been signed with a public institution, this fee is zero.
[61] EUR 800 per message format (order, order confirmation and invoice).
[62] 6-10 users, 1.001-5.000 catalogue lines.
[63] EUR 800 per message format (order, order confirmation and invoice).
[64] IDA / Unisys, Transborder eProcurement Study, August 2002.

Accordingly, the study issues recommendations on establishing a portal for EU-wide e-public procurement and information, actions to ensure interoperability and certification, new and updated legislation and awareness-raising.

In order to illustrate the potential impact of e-public procurement two examples from respectively the UK and France are described below. Both cases illustrate e-public procurement initiatives in large markets and describe some results which these initiatives have achieved in countries that have applied operational e-public procurement for some years.

***Case: The e-procurement portals of the French Ministry of Defence*[65]**

The e-public procurement strategy of the French Ministry of Defence is embedded in a larger modernization campaign. The Ministry of Defence is the largest French ministry in terms of purchases, spending between EUR 15 and 17 billion per annum, launching 8000 calls for tender per year above EUR 90.000, and 80.000 below this threshold, and comprising about 220 procuring entities. The Ministry was therefore best placed to improve its procurement performance.

Within the Ministry the largest procuring entity is the General Delegation for Armament (Délégation générale pour l'Armement). This body started a vast reform programme in 1997, including enhanced use of ICT, new management tools, and the creating of a purchasing function. The overall impact of this reform is estimated EUR 10 billion of savings on armament expenditure, and 31% of savings on administrative costs.

E-public procurement was one of the pillars of the reform, and the project "e-achat" was launched in 2000. The stated objectives were to facilitate the access to the public procurement of the Ministry, to create savings and to enlarge the base of suppliers, in particular to SMEs and at European level, since 30% of the calls for tender have been unsuccessful before.

It comprised the creation of two e-public procurement portals, www.ixarm.com, used for the procurement of arms, ammunition and other combat-related supplies, and www.achats.defense.gouv.fr, covering the remaining defense procurement needs, such as construction works, fuel, furniture, food, etc. In 2001, the tender regarding the creation of the portals was launched, and in November 2002, the two portals have been set up and are operational since. The costs of the project have been between EUR 6 and 7 million between 2001 and 2004, including technical assistance costs.

In the beginning the portals have been restrained to DG Armament, but have quickly been extended to all of the Ministry's procuring entities, especially in the light of the rule set by Article 56 of the new public procurement code, which requires all administrations to accept electronic bids by 1st January 2005. The two portals are linked by the "Service public défense" marketplace, which contains the different functionalities for both portals:

- "Avis de Publicité": Publication of tender notices, above and below threshold
- "Salle des Consultations":
  - Possibility to download all tender dossiers
  - Possibility to send bids electronically with receipt notice and within a secured space

[65] Source: Interview data.

- “Outils d’achat” (procurement tools):
    - “Salle des Enchères Inversées”: inversed electronic auctions
    - “Salle des Acquisitions sur Catalogues”: electronic catalogues
- “Salle de Facturation”: electronic invoicing, currently under development (the problem currently is that signatures are required from authorities outside of the MoD, e.g. the Ministry of Finance).

Furthermore, there is a vast information section, containing:

- An electronic address book of the Ministry’s procuring entities (with contact persons, contact details etc.)
- Legal news and information on administrative documents to be submitted
- Methodology on public procurement
- Glossary of public procurement
- Frequently Asked Questions (FAQ).

Beyond the functionalities foreseen by the two portals and the marketplace, an “Espace Partenaires” (Partner Room) has been created, which is used for the execution of contracts, such as transactions in frameworks, exchange of information, studies, documents etc. between DG Armament, enterprises, the armed forces and other state bodies, such as the Ministry of Finance. This is carried out on a private secured ENX network. The costs for this Espace Partenaires have been roughly EUR 15 million.

It is possible for suppliers to register on the portals, which allows them to personalize the portal according to their interests, to receive regularly information on calls for tender which correspond to the criteria they have chosen, to submit bids electronically (since March 2003), even without the administrative documents if such a dossier has been previously constituted (from September 2004). It is also possible for them to present their company, products and services; also it is possible to send unsolicited proposals.

Some statistics on the results achieved so far:

- 203 of the Ministry’s 220 procuring entities are now registered, with 5 to 6 buyers each
- More than 5300 users are registered, of which 4000 are suppliers (and the rest buyers), the estimation within a couple of months is 20.000
- 71% of the Ministry of Defence’s calls for tender are published on the portals in May 2004
- 909 tender dossiers have been made available in April 2004, 619 in May, up from around 140 in January
- 4400 downloads have been registered in May 2004, of which 75% came from non-registered enterprises, with about 7 downloads per tender dossier.

Change management was one of the main prerequisites, both internally and externally. 200 of the Ministry’s staff have been trained (roughly 1 per procuring entité), more are going to be trained. User manuals have been prepared, and a Help Desk with Hotline will be established. Information events have been organized across the country for suppliers, which were attended by 1400 people. It was essential to stress the security aspects with users. No exact statistics have been taken, but an estimated 80% of the project costs have been used on change management activities.

The number of bids submitted electronically is still very low: it concerns roughly 1-2 o/oo of all bids, but is slowly increasing, which shows the necessity for the administration to accompany the suppliers. The use of the portals and the marketplace is free of charge for suppliers. Only "télé TVA" type signature certificates have to be bought once. The problems for the suppliers are mostly weak technical capacities for SMEs and security aspects as well as heavy internal procedures in large companies.

For the administration, two kinds of savings are possible: on administrative costs and on prices. While statistics on lower prices are still difficult to get (on June 2000, the first e-auction took place in France, in which 24% on the purchasing amount have been saved), there are visible savings on administrative costs. The publication of a call for tender on the portal is much cheaper than on one of the legal announcement journals, which can be quite expensive, while it lives up to the publicity requirement. Also there are lower cost of reproduction and sending of tender dossiers, which are roughly EUR 90 per dossier, and between EUR 800 and 3000 in the construction sector. These repetitive costs are not occurred if tender documents are put online. The price for publishing tender dossiers is currently EUR 120 (EUR 30 under threshold), and will go down to EUR 60. Requests for paper dossiers have gone down by 90% since they are published on the e-public procurement portals.

Case: United Kingdom's 'Government IT Catalogue' (GCat) and the e-catalogue for professional services, 'S-Cat'[66]

Over the past 25 years the Central Computer and Telecommunications Agency (CCTA) has offered advice and guidance to Government organizations on the development of IS strategies, and the procurement and management of IT systems and services including telecommunications and data communications. In 1996, CCTA introduced the Government IT Catalogue (GCat www.gcat.gov.uk) which offers a wide catalogue of IT products and supply-related services from a variety of manufacturers and suppliers through pre-tendered framework contracts. The take up in the public sector has been increasing steadily and GCat is presently used by more than 700 organizations from across the public sector (up from around 200 in 1998-99), and it contains an online catalogue with more than 50,000 IT and telecommunication products and offers online ordering and payment. The value of the purchases made electronically has increased from £5.9 million in 2001-02 to £10.3 million in 2003-04, although a decrease in annual value has occurred as the figure for the financial year 2002-03 was £14.6 million. This decrease has spurred an effort from OGCbuyingsolutions to make public purchasers use the portal to a higher extent.

S-Cat (www.s-cat.gov.uk) is a catalogue based procurement scheme established by CCTA in 1997 to provide public sector organizations with a simplified means of procuring, and contracting for a wide range of IT related consultancy and specialist services from a variety of service providers. S-Cat is a sister scheme to GCat and covers wider IT consultancy and specialist services not available through GCat. S-Cat is based on framework contracts, which CCTA has established with a number of service providers following the conduct of an advertised procurement under EC procedures.

[66] Source: Interview data, presentation by OGCbuyingsolutions at the European Commission's Working Group on e-procurement, Brussels 7 July 2004.

Following a re-competition during 1999 (through the addition of the Management Consultancy offerings) it grew to take account of the increasing need for organizational change support required with the application of new technologies. S-Cat has been expanded to meet the government's requirements in the following areas:

- IT Consultancy, Services & Related Products including GIS
- Management & Business Consultancy
- Human Resources
- Financial Services
- Business Information & Research

All public sector organizations are eligible to use the scheme. It offers buyers to undertake anonymous electronic requests for information and submission of tenders can be done electronically. The e-catalogue gives contracting authorities access to more than 170 service providers, and the buyers can screen supplier profiles and get information on the service providers pricing online which allows online rate comparisons.

Although aggregate data concerning the impact, in terms of public savings, of the e-procurement solutions do not exist and although it is not possible to give a precise estimate of the impact for the individual institution, because it varies from one institution to another, the experience from the UK shows it is possible to achieve savings per transaction in the magnitude of £28 to £90, according to an independent review of e-procurement.

3.6.2 Assessment

Due to the current lack of statistical evidence, it appears to be too early to assess whether the expectations regarding advantages resulting from the introduction of e-public procurement have materialised, especially regarding the speeding-up of procedures, lower prices and the impact on SMEs and IT skills in private enterprises. However, the experience from existing procurement portals in France and the UK suggests that it is possible to achieve public savings in terms of reduced transaction costs through e-procurement. Other examples, as illustrated by the situation in Denmark, which is a much smaller market than in France and the UK, point in a different direction and indicate that the realization of lower transaction costs and administrative savings have yet to be achieved as the high transition costs for introducing new equipment and software, training, etc. appear to have outweighed the savings so far. In the longer term this finding may not hold true as the dynamics of the market evolve constantly, and it seems very relevant to reassess this aspect at a later stage.

3.7 Potential risks and barriers

3.7.1 Findings from existing reports and papers

The cases and examples in the previous section illustrate some of the opportunities and potentials in e-public procurement. This section will approach the matter from a different angle, as the research conducted has uncovered a range of factors that might work as barriers in different areas to the development of e-public procurement. The following text gives an overview of identified barriers in five categories respectively economic, technical, organisational, human resource and others barriers.

Economic barriers

In summary, adjustment and operational costs can be significant barriers for suppliers in adapting to an operational e-procurement system. The costs of participation in e-procurement for a supplier may include: purchasing hardware, connection setup and maintenance, catalogue build and maintenance, recoding of content in compliance with the classification used nationally (and in the EU), analysis and redesign of their internal processes, management of change within their own organization, staff training and support[67].

Results from existing reports point out that the high adjustment costs following from introduction of electronic procurement can be a significant barrier. Findings show that both authorities and firms are concerned for the relatively considerable costs following from the implementation of procurement procedures[68].

From an overall point of view electronic marketplaces need to be designed in such a way that they do not create unnecessary barriers to entry. Small suppliers in particular are likely to be disadvantaged when introducing e-procurement by entry fees, technological requirements or an obligation to provide a wide range of goods/services.[69] Smaller firms, which are suppliers to e.g. larger companies, may be forced from the introduction of e-procurement to adopt different types of electronic means in order to continue to trade with their customers even if the costs are higher than the potential gains.[70] The same impact on the suppliers could also happen if the public authorities decide only to use electronic means for procurement in the public sector. Their suppliers will be forced to adopt the solutions chosen by the public sector.[71]

In general, SMEs have fewer resources (in time and finances) available for the adjustment to e-procurement than larger companies; they have a limited capacity to take risks and the introduction and use of operational electronic procurement will therefore be an even bigger barrier for this group of suppliers, due to the risk of imposing additional costs on the smaller companies.[72]

Technical barriers

The e-public procurement systems, which are being used today, are in some respects not compatible. Protocols and standards are needed to make sure different computers and different operating systems can communicate. To develop fully compatible systems, standards need to be used in a number of different 'layers' of a computer network.

[70] European Commission “B2B Internet trading platforms: opportunities and barriers for SMEs” Brussels 2003 (p. 16).

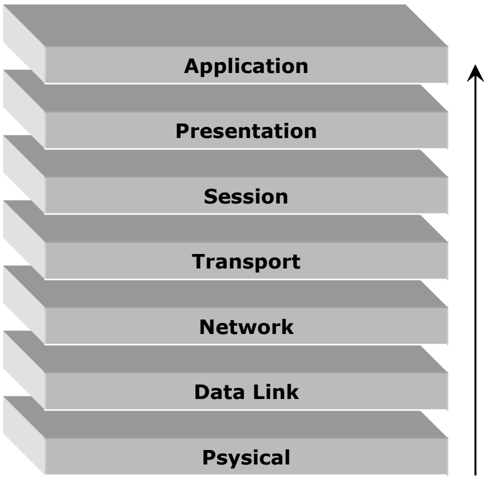
[71] European Commission “A report on the functioning of public procurement markets in the EU: benefits from application of EU directives and challenges for the future”, Brussels 2004 (p. 22).

[72] European Commission “B2B Internet trading platforms: opportunities and barriers for SMEs” Brussels 2003 (p. 16).

The so-called Open System Interconnection (OSI) model has been developed as an ISO standard for worldwide communications that defines a networking framework for implementing protocols and standards in seven layers. The OSI model was created to create common standards of communication between computers from different manufacturers[73].

The OSI model defines a hierarchical architecture that logically partitions the functions required to support system-to-system communication. Most of the functionality in the OSI model exists in all communications systems[74]. The model illustrates all the different layers of a computer network which needs to be standardised. Layering is a structuring technique to organize networking software design and implementation. The seven layers of the OSI model are as follows:

7. Application: Provides different services to the application
6. Presentation: Converts the information
5. Session: Handles problems which are not communication issues
4. Transport: Provides end to end communication control
3. Network: Routes the information in the network
2. Data Link: Provides error control
1. Physical: Connects the entity to the transmission media



OSI Reference Model

The application, presentation, and session layers comprise the upper layers of the OSI Model[75]. Software in these layers performs application specific functions like data formatting, encryption, and connection management. The interoperability between systems in these layers is important when doing e-commerce or e-procurement.

There is no data available for EU25 on the problem of interoperability, but the three tables below summarize the compliance with the requirements of the new directives of some of the existing systems in member states.

[73] Miller, Rachelle L. (2001): “The OSI Model: An Overview”, SANS Institute.

[74] It should be noted that some protocols do not exactly fit the OSI model. However, the concept of the OSI Model is still very useful since the terminology persists. An alternative for the OSI model is the TCP/IP model.

[75] The TCP/IP model refers to these three layers as the “Application layer”.

The content of the table is based on a recent report[76] which assesses a selection of existing systems against a range of criteria, including legal compliance. For the purpose of this report the description of the criteria in the right side column has been modified to reflect the legal requirements of the directives, as outlined in the previous section on legal aspects, but the content of table remains unchanged.

The selected systems compose a non-exhaustive list of the systems that presently are in operation in Europe, and as such they do not provide a complete overview of the extent to which existing systems in the member states comply with the requirements of the new directives. However, the systems are described in the recent study as 'best practice' examples, and due to this perspective they represent an assessment of the state-of-the-art concerning legal compliance of the most advanced systems. This can give an indication of the level of compliance in other systems throughout Europe. In other words, if there are areas where these, relatively advanced, systems do not comply with the new directives it is reasonable to assume that other, relatively less advanced, systems will have similar characteristics.

Symbols: Non-compliance = ×, Compliance = ✓

The tables show that the existing systems on a number of areas are generally compliant with the new directives. However, there are also areas where compliance are not fully meet across the systems, e.g. localization parameterization (currency, time/date format, units of measurement, etc.) and the specification of exact time and date of the receipt.

In summary, lack of common standards and the existence of incompatible standards for e-procurement are fundamental barriers for the realization of European e-public procurement[77]. For example is the use of an electronic signature in the e-procurement system based on national or local rules a hurdle for interoperability, which can exclude suppliers for taken part in a business opportunity. The lack of European standards in this area usually results in limited participation of foreign suppliers and SMEs[78]. A European e-procurement system needs to guarantee the general availability of its operations to the involved parties including the SMEs[79].

Security barriers are important issues for suppliers[80]; many suppliers are concerned about using the Internet to transmit confidential information. Use of procurement systems, which cannot guarantee the security of transactions and the confidentiality of sensitive information, will therefore be a significant barrier for operational e-public procurement in Europe[81].

A number of the technical barriers described above are also cross-border trade barriers[82]. A study from 2002 based on detailed analysis on e-procurement initiatives in Europe has identified several technical cross-border barriers which relate to e-procurement[83]:

- The current common e-procurement vocabulary (CPV) is not sufficiently developed
- The absence of centralized access point for information on all member states e-procurement
- Non-interoperability on standards for authentication
- Different and non-interoperable e-procurement systems[84]
- Lack of common standards for transmissions of notices (except from XML)
- Different formats for collecting supplier information

As regards barriers to cross-border trade in procurement in general, another more recent study has found evidence that cross-border procurement is fairly widespread; in fact this study suggests that 46 % of firms involved in procurement activities have carried out some kind of cross-border procurement.[85] However, the listed barriers are a significant obstacle for especially smaller firms as their costs related to the handling of such barriers are comparatively higher that those of larger firms.

[81] IDA “Public e-procurement. State of the Art Report. Version 0.60” Brussels 2004
[82] Se for example.
[83] IDA / Unisys “Transborder eProcurement Study ‘Public eProcurement’ Initiatives and experiences, Borders and Enablers” (August 2002).
[84] It is Important to ensure that European specific issues (linguistic, cultural, legislative) are taken fully into account (See “Standards – a key pre-requisite for interoperability” which can be found on http://europa.eu.int/ISPO/ida/export/files/en/1842.pdf)
[85] European Commission “A report on the functioning of public procurement markets in the EU: benefits from application of EU directives and challenges for the future”, Brussels 2004 (p. 3).

A report on the access of SMEs to public procurement contracts suggests that even through the overall success rate of SMEs is higher than for the larger companies; their chances of success in cross-border procurement are much lower.[86] This implies that SMEs have relatively easier access to contracts with local authorities than with national authorities in their own country or other European countries. This suggests that there are significant general barriers for SMEs associated with doing cross-border procurement which are not limited to e-public procurement.

Human resources

User adoption is also a general challenge. Behavior and competences on organizational and personal level need to be changed both in the public sector entities and in the suppliers companies. Lack of IT competences can be a significant barrier for e-procurement regarding the ability to understand technology and the ability to use technology.[87]

For instance, suppliers may lack the resource and skills to understand the technology and thus to build their business case for e-procurement. This means that suppliers do not have the ability to access public procurement contracts. This barrier can be significant for especially smaller firms. According to a recent report the access of SMEs to public procurement contracts is relatively low;[88] and three out of four Finnish and British SMEs think that external help and training would help them to an easier access to public contracts.[89]

Lack of technical competences is also a significant barrier in relation to sending and receiving material electronically. The employees in both public and private sector need to fully understand and be able to use electronic tools.[90]

Organisational barriers

Another barrier is human resistance to change. This is a cultural barrier based on human perceptions. Findings show that employees often resist changes within their organization partly because they are afraid of loosing their jobs and partly because they find it difficult to change their normal work procedures. Both private and public organizations experience this barrier.[91] Moreover, as pointed out in section 3.4, the fact that most countries use a decentralize approach in their overall organization will slow down the mainstreaming of e-public procurement as the decisions to connect to e-procurement are mainly made at the level of individual institutions.

[86] European Commission “A report on the functioning of public procurement markets in the EU: benefits from application of EU directives and challenges for the future”, Brussels 2004 (p. 20).

[88] EIM Business and Policy Research “The access of SMEs to public procurement contracts; Final report”, The Netherlands 2003 (p. 36).
[89] EIM Business and Policy Research “The access of SMEs to public procurement contracts; Final report”, The Netherlands 2003 (p. 113).
[90] KPMG Consulting “Analyse af statslige indkøb” Copenhagen (2000) (p. 35).
[91] KPMG Consulting “Analyse af statslige indkøb” Copenhagen (2000) (p. 35) and Rambøll Management “Analysis of electronic public procurement pilot projects in the European Union” 2000 (p. 27).

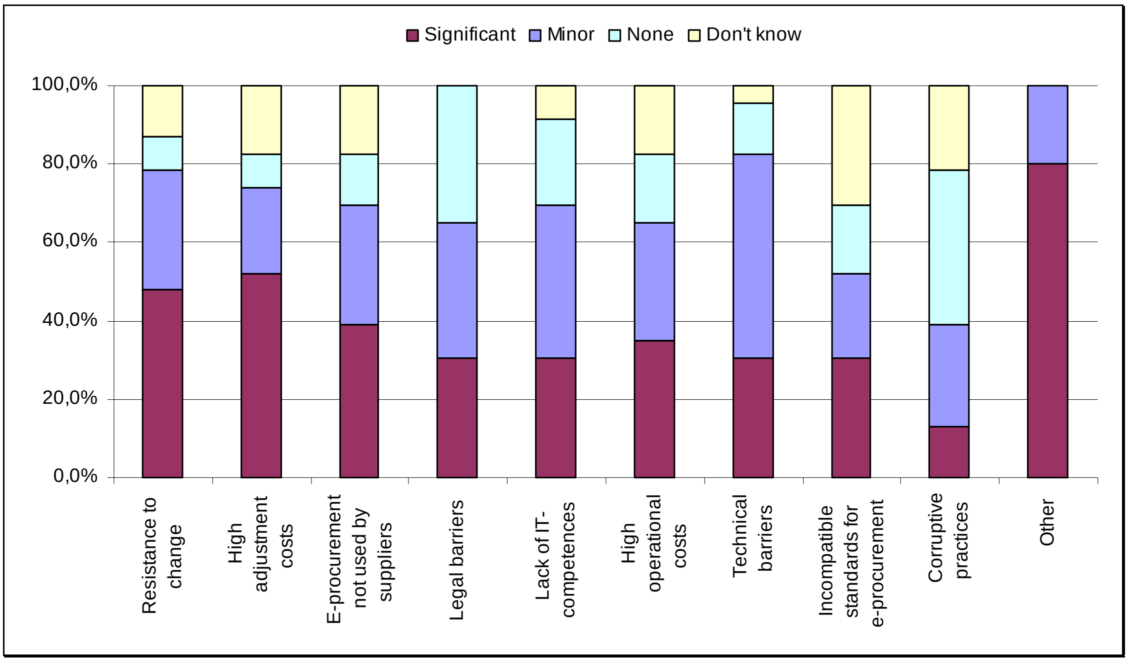
Other issues
Another factor which account for a significant barrier is contract length and size. Findings show that the size of contracts can be a barrier for SMEs to participate in public procurement.[92]

Further non-technical cross-border barriers for e-procurement are language borders related to the MS-languages and missing or incomplete general information on public procurement[93]. In summary, the lack of centralised, easily accessible information or the existence of insufficient information is an important obstacle for SMEs when tendering for public procurement contracts in Europe[94]. Additional main barriers for this category of businesses when tendering for contracts are bureaucracy, unclear wording in the invitation to tender and the short time span. [95]

3.7.2 *Findings from the survey*

The survey included a number of questions aimed at describing the potential risks or barriers of introducing e-public procurement, which generally reflects many of the barriers described above, in order to obtain an assessment from the point of view of expects in the member states covering the importance of these barriers. The figure below ranks the most significant barriers encountered by public authorities upon introducing e-public procurement.

Figure 3.1: Significant barriers encountered among public authorities upon introducing electronic public procurement

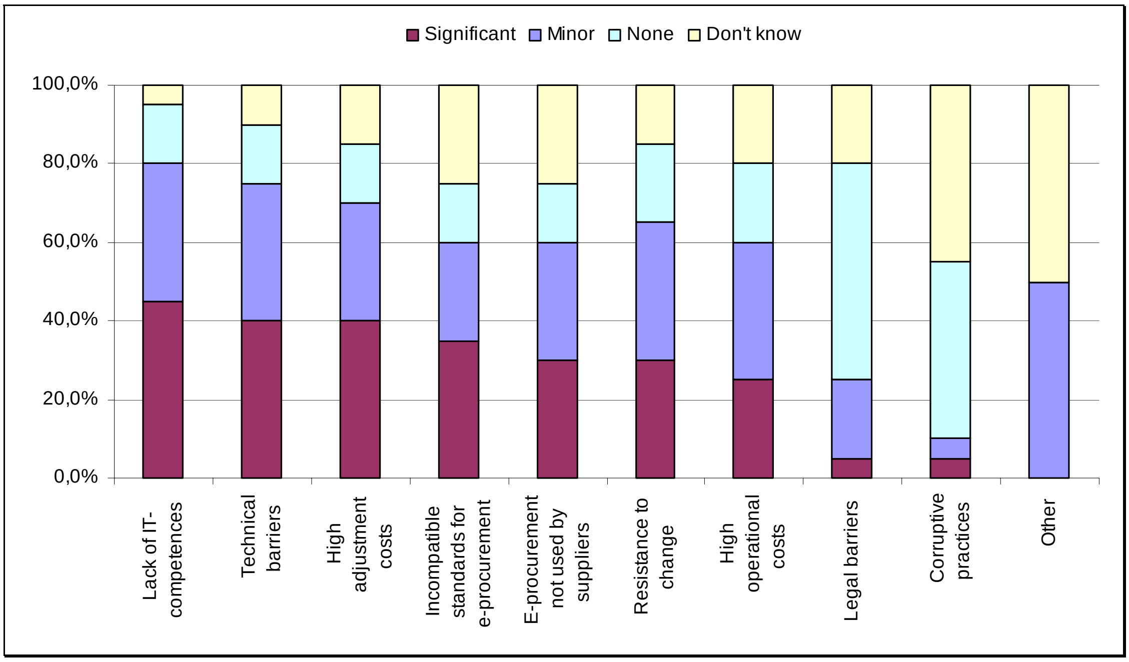


[92] EIM Business and Policy Research "The access of SMEs to public procurement contracts; Final report", The Netherlands 2003 (p. 81)
[93] IDA / Unisys "Transborder eProcurement Study 'Public eProcurement' Initiatives and experiences, Borders and Enablers" (August 2002)
[94] See also IDA / Unisys "Transborder eProcurement Study 'Public eProcurement' Initiatives and experiences, Borders and Enablers" (August 2002).
[95] EIM Business and Policy Research "The access of SMEs to public procurement contracts; Final report", The Netherlands 2003 (p. 90, 147) and Europe Economics OGC "An Economic Analysis of Electronic Marketplaces" 2001 (p. 16).

The figure shows that the presence of resistance to changes among public authorities and relatively high adjustment costs are seen as the most significant barriers of introduction of electronic procurement in the public sector among the member states. Likewise, the risk of a limited number of suppliers will use the e-procurement system, national legal issues, lack of IT-competencies within public authorities, and high operational costs are seen as significant obstacles. Some interviewees have mentioned other significant barriers, such as a low level of knowledge within e-procurement among both public authorities and suppliers and the need for consultation with experts on the practical use of e-procurement systems.

Similarly, the survey has included question on the most significant barriers encountered by SMEs upon introducing e-public procurement. The figure below ranks the most significant barriers among SMEs:

Figure 3.2: Significant barriers encountered among SMEs upon introducing electronic public procurement



The figure shows that lack of IT-competencies, technical issues, and high adjustment costs are seen as the most important barriers among SMEs upon introducing e-public procurement. On the contrary, legal barriers and corruptive practices are not seen as significant to the use of e-public procurement among SMEs.

The interview survey therefore indicates that high adjustment costs and lack of IT-competencies are highlighted as potentially significant barriers for both public authorities and SMEs upon introduction of e-public procurement. Correspondingly, corruptive barriers are not seen as significant for the introduction of e-public procurement among public authorities or SMEs.

3.7.3 *Assessment*

In summary, the following key existing and potential barriers have been identified in the two sections above.

Economic

- High investments and operational costs (e.g. subscription and transaction fees) for suppliers and public authorities are barriers that might impede and prevent the development of critical mass in the market.
- Small suppliers in particular are likely to be disadvantaged by entry fees, technological requirements etc. since they have fewer resources in time and finances

Technical

- Lack of technical standardization and lack of compatibility between e-procurement systems within and across countries may be a barrier to suppliers' cross-border participation in public procurement competition.
- Issues on lack of security and confidentiality of transactions are important for suppliers.

Human resources

- Many suppliers, in particular SMEs, and public authorities lack both strategic and substantial insight concerning the potentials of e-procurement and the operational skills to establish and maintain/operate e-procurement systems.

Organizational

- There is widespread resistance within public institutions to change existing procurement procedures and processes.
- Public procurement across the EU member states is to a high extent organized according to a decentralized approach. E-public procurement uptake will therefore largely be driven by the decisions of individual institutions whether to transform to e-procurement.

4. Austria

4.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Federal Chancellery (Bundeskanzleramt, www.bka.gv.at)
Responsible institution(s) for legal aspects	Federal Chancellery (Bundeskanzleramt, www.bka.gv.at) The "Länder" (regions, according to the Austrian Federal Constitution) regarding remedies procedures
Responsible institution(s) for technical solutions	Austrian Federal Economic Chamber (Wirtschaftskammer Österreich) has been dealing with the implementation of e-procurement in practice. It initiated the electronic public procurement service "er@t" which is now continued by the tender service company Auftrag.at ausschreibungsservice GmbH (www.auftrag.at). It contains all Austrian tenders as well as EU-wide tenders (TED). Austrian Standards Institute (www.on-norm.at) is currently working on a contractual standard for public e-procurement
Central procurement institution(s)	Federal Procurement Company Ltd. (Bundesbeschaffung GmbH, www.bbg.gv.at) organizes the field of procurement, excluding works at the national level. The Federal Procurement company is the purchasing service provider, mainly to the federal state administration and offers its services also to the regional governments and municipalities. Its responsibility lies in realizing a large number of enumerated services and supplies procurements for the federal state, whereas the regional and local levels do not have a central procurement facility and procurement is mostly done by the individual institutions.
Other important organisations	Chief Information Office (www.cio.gv.at) creates, coordinates and supports the implementation of e-government. ICT-Board is staffed by the federal chief information officer and one member of each Federal Ministry. It is the central department for consolidating the different IT-activities at the state level.
Type of coordination between different institutions	-

4.2 Strategy

Within the area of e-procurement there is no explicit strategy and no quantitative objectives due to lack of staff capacities within public procurement institutions to work with e-public procurement.

However, the overall federal Austrian e-government strategy is based on tight cooperation between all public stakeholders, which means the national level, regions, cities and municipalities as well as lobbies and major public institutions. Innovative e-government is therefore an important aim.

Another key element is to work for the adoption of uniform interfaces and for clear as well as open standards. This would avoid further adjustments between single parts of applications. Therefore, there is a need to define uniform standardized processes, data formats and specifications for all proceeding steps.

4.2.1 *Statement of objectives*

With the overall readjustment of the administration towards e-government, the Austrian government highly prioritizes its e-government efforts and with it e-public procurement.

There are no specific objectives on e-public procurement. However, the main objective hereby lies in the online provision of all federal administration services to the public by 2005.[96]

As public services are not excluded from the budgetary savings, the Austrian government is very motivated to extend its provision of e-government in order to realize financial savings of administrative costs that are expected to account to EUR 1.5 billion. Also, it emphasizes increasing efficiency. The government plans to create the most advanced European administration in the upcoming years.

Another overall objective is to implement the new procurement directives to facilitate e-public procurement and to create and transmit tenders electronically using electronic signature

4.2.2 *Scope of strategy*

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	A year of fulfilment has yet to be set

4.2.3 *Existing guidelines*

A special regulation for electronic procurement especially concerning e-offers, has been issued (“Verordnung der Bundesregierung betreffend die Erstellung und Übermittlung von elektronischen Angeboten in Vergabeverfahren – E-Procurement-Verordnung 2004“)

[96] http://www.cio.gv.at/egovernment/strategy/Teil_I.html

4.3 Legal framework

4.3.1 Legal status of the use of electronic means in Public Procurement

So far, the areas “rules applicable to communication”, “storage of data” and “the use of specific procedures, e.g. e-auctions” are regulated in the legal framework.

Austria was the first country to implement the Directive on Electronic Signatures with its Electronic Signature Act in 1999 (Signaturgesetz BGBl I 1999/1). The same day that the EU directive (e-signatures Directive, 1999/93/EC) became effective, the Austrian Electronic Signature Act was implemented as well.

According to national standards for the electronic exchange of data there are two norms in the field of works: Ö-Norm B 2063 and Ö-Norm B 2064.

4.3.2 Implementation of the Directives

The government expects that the forthcoming EU public procurement directives will be implemented in 2005.

4.3.3 Status of tools

Public procurement portals	There is no official central electronic public procurement portal in Austria so far. At present the Bundeskanzleramt is planning a portal which should be implemented in approximately two years. So far, the most important portal on national level is the portal “@-AVA” of the national railways company “Österreichische Bundesbahnen”, www.oebb.at
	www.lieferanzeiger.at is an online database by the official Viennese newspaper and a private enterprise
	The construction industry has its own database Ausschreibung (www.ausschreibung.at) which offers tenders online. It has open as well as public tenders and offers information on the bidders as well.
Electronic signature	An advanced electronic signature based on qualified certificated has been introduced. The use of electronic signature is mandatory when participating in public calls for competition
Electronic catalogues	Pilot schemes of the implementation of e-catalogues have been outlined
Electronic auctions	On an experimental level, implementation of an e-auction system has been started
Dynamic Purchasing Systems	Pilot schemes of the implementation of dynamic purchasing systems have been outlined
Framework agreements	Below the threshold values the use of framework agreements is possible

4.3.4 Reference to the relevant legal acts

Use of electronic means is regulated by:

- E-Government-Gesetz, BGBl. I 2004/10: The government passed the e-government law in Februrary 2004 which regulates the electronic communication with public bodies. Accompanying the e-government law, the government passed the administration signature regulation (Verwaltungssignaturverordnung (VerwSigVO), BGBl. II 2004/159). It contains the security, technical and organisational relevant requirements for the administration signature.
- Bundesvergabegesetz (BVergG), BGBl I 2002/ 99: The law on Federal tender creates the legal conditions for electronic tender. Since-July 2003, it is possible to make overall invitations to tender for the state, regions and municipalities. Accompanying the BVergG a special regulation for electronic procurement has been issued (see above 1.2.3.)
- Bundesbeschaffung GmbH (BB-GmbH-Gesetz) BGBl I 2002/99: The Federal Procurement Company was created with the passing of the Law in 2002. This concentrated the task of federal procurement into one body.

4.4 Current usage of electronic means in Public Procurement

So far, there is very little experience with electronic means in public procurement. Nevertheless, the Federal Procurement company is running pilot projects in each field of the procurement phase and hopes to implement them shortly for regular use.

An international study found out that Austria is the country that had the highest growth in full electronic case handling in its e-government activities and in the field of e-public procurement in 2003. (Full electronic case handling means that the publicly accessible website offers the possibility to completely treat the public service via the website, including decision and delivery. No other formal procedure is necessary for the applicant via "paperwork"). Compared to 2002 it increased by 48 per cent to now 68 per cent in terms of percentage of services that offer a complete electronic case handling. This is the largest progress inside the EU and gives Austria a good standing at second place of the EU-wide study[97].

4.4.1 Which phases of procurement are covered?

The status for automating procurement phases in Austria is as follows:

- Notification about tender (to some extent)
- Publication of tender (to some extent)
- Management of receipt/submission of tenders (to a low extent today)
- Evaluation of tenders (to a low extent today)
- Ordering (to a low extent today)
- Invoicing (to a low extent today).

[97] Source: Cap Gemini Ernst & Young

4.5 Raising awareness & Promotion of electronic means

Austria is expecting that 'buyer profile' will be implemented by the end of 2005. At present some of the regions together with the Austrian confederation of municipalities (Gemeindebund) and the confederation of cities (Städtebund) participate in an electronic public procurement project "ANKÖ" (Auftragsnehmerkataster Österreich, www.ankoe.at). This is a supplier database of suitable contractors who fulfil the legal requirements for public tenders.

The Austrian municipalities have implemented a joint venture internet portal for the communal level which also contains tender information (www.kommunalnet.at).

Impact assessments of the introduction of e-procurement are of no major concern to the government. At present it is discussed whether to do it within the next three years.

5. Belgium

5.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Federal Steering Group on Joint E-Procurement (major federal organisms are represented)
Responsible institution(s) for legal aspects	Public Procurement Commission (Commission des marches publics)
Responsible institution(s) for technical solutions	Federal ICT Department (FEDICT)[98]
Central procurement institution(s)	A central procurement body called "Services contrat-cadre multi-SPF" (Multi-ministry framework contract service) organises grouped purchases (IT material, cars, office stationery, and furniture). Its services are being used by some federal authorities and are accessible through the federal Intranet.
Other important organisations	-
Type of coordination between different institutions	Other Belgian non-federal public entities such as the federated (regional and community) entities, local and parastatal authorities will be able to file orders and use the same applications as federal authorities. It is now possible for all these entities to sub-scribe to JEPP (see below). The Walloon Region has developed its own e-public procurement strategy and portal[99]. The Flemish and Brussels regions have not started own initiatives as yet.

5.2 Strategy

Although no overall strategy for e-public procurement has been designed yet, a working group will, on the basis of the consultation of businesses mentioned below, draft a strategic paper (*"plan d'informatisation"*) which will contain a business case, a calendar for implementation and a budget for 2005.

The first step of the Belgian e-procurement has been realised on a "buy a little, test a little field a little" strategy. This activity covers the e-publication phase and has been placed under the lead of the Ministry of Defence.
A second step (e-payment or e-tendering) is under consideration and initial coordination on the feasibility is ongoing.

[98] Technically, e-public procurement projects are conducted by line ministries in cooperation with and under the coordination of the Federal ICT Service (SPF FEDICT). Due to its large spending budget, SPF Défense (Federal Ministry of Defence) has been particularly involved in the activities. SPF Justice (Federal Ministry of Justice) has also been involved since it runs the official journal (Moniteur belge – Bulletin des adjudications)

[99] http://avis.marchespublics.wallonie.be/

The e-public procurement initiatives are embedded in the overall government strategy of administrative simplification and reduction of administrative burden as well as the government's e-government strategy.
There are also regional and local initiatives like by the walloon region (http://avis.marchespublics.wallonie.be/)

5.2.1 *Statement of objectives*

The main objective is to lower the administrative burden for enterprises. In terms of timeframe, the authorities involved have issued the aim of publishing all federal calls for competition by end of 2004.

5.2.2 *Scope of strategy*

Levels of government involved	Central government (federal)
Legal framework	EC directives and guidelines complemented by or translated into royal decrees (AR)
Allocated resources	-
Time frame	2006

5.2.3 *Existing guidelines*

Information unavailable

5.3 Legal framework

5.3.1 *Legal status of the use of electronic means in Public Procurement*

A royal decree (*arrêté royal*) of 18 February 2004 authorises the use of electronic means in all or part of the public procurement procedure. It contains rules applicable to communication, regulates storage of data, but does not cover specific procedures such as e-auctions. A special law on electronic signatures has been passed in 1999. While Belgian authorities will probably not be authorised to use electronic auctions, they may employ Dynamic Purchasing Systems and e-catalogues.

5.3.2 *Implementation of the Directives*

All existing and future applications are compliant with the European public procurement directives and it is expected that they will be fully implemented after formal endorsement of the relevant EC directives/regulations.
Status of tools

Public procurement portals	www.jepp.be – Joint Electronic Public Procurement (JEPP) is the instrument used by the Belgian federal government for electronic publication of calls for tender. JEPP was launched on 13 November 2002 and is available to companies since 6 January 2003. At the beginning only the Federal Ministry of Defence published in JEPP, other federal organisms follow suit. The objective is that, at least, all federal calls for tender are published in JEPP by end of 2004. As a first major evolution of the system it is the intention to generalize used of the JEPP portal to non-federal entities by end of 2005. JEPP is today providing the following services : the objective is to assist buyers in drafting their calls for tender and submit them electronically to the official publication organisms[100] A pyramidal structure of websites (a joint national portal, a portal for each public entity, and a site for each adjudicating authority) make the calls for tender and the terms of reference available online. A search engine assist is finding and downloading these documents. General data such as information on purchasing ser-vices or technical notes can be published as well. Enterprises have the faculty to subscribe to the JEPP system, which automatically notifies them by e-mail on new opportunities which correspond to the chosen criteria. Businesses can also choose to be automatically informed on errata on documents they have downloaded. The adjudicating authorities can use JEPP to notify contract awards, invitations to tender as well as other documents such as minutes of clarification meetings. It is foreseen that the JEPP joint portal will eventually become the official publication site of the Bulletin des Adjudications which will unify all Belgian public procurement publications, offering the private sectors services equivalent to those described above. Public entities can affiliate to JEPP in three different ways: The JEPP application is working within the installations of the concerned public entity. The successful tenderer will take upon itself the delivery and installation of the necessary software and hardware. The successful tenderer plays the role of an Application Service Provider (host). In this case the public entity only needs a simple browser. The public entity only acquires a user licence. It will have to install JEPP on its own responsibility.

[100] Official Journal of the European Union, Bulletin des Adjudications - Belgian official journal

	In order to reduce costs, several public entities can group together in order to file a joint order and install the application in a single spot. A federal grouped managed by the Federal ICT Service (FEDICT) allows each federal service and each parastatal under its authority to benefit from JEPP services.
Electronic signature	The introduction of qualified electronic signatures has been delayed, but certifying organisms are being established now. The signature will be based on the electronic identity card, a pilot project now being rolled out to all of Belgium and supposed to cover all citizens by 2007.
Electronic catalogues	Electronic catalogues are being used by the above-mentioned central purchasing agency *Services contrat-cadre multi-SPF*
Electronic auctions	No electronic auctions activities have been tested so far
Dynamic Purchasing Systems	No Dynamic Purchasing Systems activities have been initiated so far
Framework agreements	Framework contracts are being used by the above-mentioned central purchasing agency *Services contrat-cadre multi-SPF*

5.3.3 Reference to the relevant legal acts

Information unavailable.

5.4 Current usage of electronic means in Public Procurement

5.4.1 Practical use of electronic means in Public Procurement

Phase I of the e-public procurement project which was running from 2001 to 2002 led to the establishment of a central e-public procurement portal (JEPP[101]) at federal level, which was established at the beginning of 2003. It is operational, but it is not used yet by all federal public entities and covers only the publication phase of the tendering process. The aim is that all federal entities use the portal by end of 2004.

Concepts for other applications have been drafted; however, they have not been developed yet. Since the Belgian federal e-public procurement activities have been re-launched in January 2004, an inter-ministerial working group is preparing Phase II of the e-public procurement activities, going well beyond publication and covering the actual tendering process. Prior to updating the e-public procurement plan and to drafting a timetable and a budget, the group has launched a request (trough the Belgian Official Journal) for information to enterprises and organisations in order to allow for a stocktaking of current applications on the market. This will feed into the terms of reference for a tender on the new application.

[101] http://www.jepp.be

Different applications have been conceived at federal level, however apart from JEPP, none of these applications is operational yet, and most of them are still in the concept phase:

- JEPP: electronic publication (see above)
- E-Bid: electronic bidding (see below)
- E-registered mail (see below)
- E-File (see below)
- E-Cat: electronic catalogues (see below)
- E-Payable: electronic invoicing and payment (see below)

Currently no systematic assessment of the impact of e-public procurement is carried out or planned in Belgium. Evaluation is not yet integral part of the Belgian administrative culture, but some kind of assessment mechanism will form part of the strategic paper developed by the e-public procurement working group to be delivered by September 2004. Monitoring will take place at least on an annual basis.

5.4.2 Which phases of procurement are covered?

In Belgium, only the publication phase has been automated so far, all other phases are expected to be automated within 5 years. However, the Belgian federal services have already developed concepts for several modular but integrated and communicating applications for e-public procurement, and have ensured the possibility to connect with back office IT legacy such as logistical systems and budgetary data bases. The user will therefore only perceive a single system. The interface of the synchronised system will be an Enterprise Application Integration (EAI) which will manage this interchange based on the accepted W3C XML standard. This EAI will be sufficiently flexible in order to connect budgetary information systems of different federal public services to the same e-public procurement application (e.g. the federal e-catalogue).

5.5 Raising awareness & Promotion of electronic means

The Belgian federal government has launched its first e-public procurement activities under its public administration modernisation programme in the 1999-2003 legislatures, between 2001 and 2002. The current state of affairs in e-public procurement can be viewed on the Belgian government's web portal[102]. This initiative was then put on hold for a year. In January 2004 it was re-launched and put on top of the agenda again, when a federal Council of Ministers meeting decided to accelerate the development of e-public procurement activities.

[102] http://www.belgium.be/eportal/application?origin=navigationBanner.jsp&event=bea.portal.framework.internal.refresh&pageid=indexPage&navId=4603

Forthcoming initiatives:

Apart from JEPP, several applications have been conceived, but they are still in the concept phase:

E-Bid

The objective of this project is to allow public entities to receive bids and expressions of interest, to give them a time stamping, to control the validity of the digital signature and to keep these documents in a well-secured and widely accessible system. This phase is still in the market-survey and information gathering phase.

The launch of E-Bid depends on certain prerequisites, such as the adaptation of Belgian legislation on public procurement. The draft royal decree on the use of electronic means in public procurement has been approved by the Public Procurement Committee in March 2003 and follows its way. The difficulties in this process are related to proper implementation of agreed interoperable procedures and the availability of proven technologies.

E-File

In order to accelerate the public procurement procedures and to simplify administrative work, it is envisaged to completely digitalise the files handled by purchasing services. These digital files would circulate between the various authorities involved (e.g. Inspecteur des Finances – tax inspector) by means of an electronic workflow system.

Particular attention will be paid to the availability of an integrated tool to manage the evolution of these files and to the integration of this software within the other applications (logistical, budgetary or public procurement). This project will be implemented when the above projects will have succeeded.

E-Cat

Open markets are only useful when information flows well. Buyers must know possibilities of ordering, the adjudicating authorities wish to follow the progress of their calls, and tenderers demand administrative simplification. A catalogue accessible online, which is reliable and taking into account of the common rights and requirements of everybody involved, is therefore an indispensable tool to support the new model of federal grouped purchases.

The following functions are envisaged:

- Loading and updating of the catalogue
- Consultation of the catalogue
- Approval workflow
- Control of budgetary availability
- Drafting and sending of a letter to the successful bidder
- Confirmation of receipt by the bidder
- Confirmation of the order to the buyer

The other usual functions for e-catalogues (delivery request, billing etc.) are part of the E-Payable project since they have no particularities compared with a closed contract.

The two main difficulties for e-catalogues are the non-existence of universally accepted standards and the administrative burden of loading and controlling the catalogue. The solution envisaged in Belgium is to impose for the offers a normalised inventory in one or several commercially available and widely supported standards (e.g Excel or DTD XML) and to apply to the chosen bidder's inventory an automatic conversion and loading tool.

The feasibility study for this project has been closed, and it is planned to launch the project shortly to support the new purchasing model of the federal administration.

E-Payable

The area of E-Payable starts with the request of receipt and ends with the payment of the invoice. It aims at:

- giving the administration a powerful management tool
- allowing electronic invoicing
- allowing electronic settlement (invoice control), remittance and payment
- improving the information of winning tenderers
- accelerating payments and thus meeting tenderers expectation for a work well done.

6. Republic of Cyprus

6.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	The Public Procurement Directorate Treasury of the Republic of Cyprus
Responsible institution(s) for legal aspects	The Public Procurement Directorate Treasury of the Republic of Cyprus
Responsible institution(s) for technical solutions	The Public Procurement Directorate Treasury of the Republic of Cyprus
Central procurement institution(s)	Public Procurement Department is at the national level authorized to and responsible for the procurement of common used items for individual government and public institutions[103]
Other important organisations	-
Type of coordination between different institutions	Information unavailable

6.2 Strategy

The strategy for introducing and developing an electronic public procurement system for government and public institutions in The Republic of Cyprus is an integrated part of the Cyprus Government strategy on modernizing public procurement procedures.

6.2.1 Statement of objectives

An overall objective is to ensure that a large proportion of public procurements shall be awarded through electronic procurement procedures by 2008 In the endeavour of realizing this overall objective the Cyprus Government has set as objective to design an electronic system making government institutions capable for undertaking procurements by electronic means.

[103] Based on interview with Mr. Stelios Kountouris, Public Procurement Department, Treasury of the Republic of Cyprus

6.2.2 *Scope of strategy*

Levels of government involved	Central and local government are included
Legal framework	Information unavailable
Allocated resources	The government will spend EUR 100.000 on an assessment for the introductoion of electronic procurement and EUR 2.4 million over a period of three years with the purpose of implementing electronic procurement in all levels of state level authorities. The resources have been allocated to the following areas: • IT hardware: EUR 500.000 • IT software: EUR 1.700.000 • Training: EUR 200.000
Time frame	Implementation of an electronically based procurement system will take place during 2005 and is estimated to be fulfilled in year 2007

6.2.3 *Existing guidelines*

No specific guidelines guiding electronic public procurement have so far been issued.

6.3 Legal framework

6.3.1 *Legal status of the use of electronic means in Public Procurement*

Operational electronic procurement systems in Cyprus that are compliant with the requirements in the Directives do not presently exist. Specifically, the use of electronic means for communication in public procurement process is not regulated by national legislation.

6.3.2 *Implementation of the Directives*

The Cyprus Government estimates that the new EU public procurements directives will be implemented in January 2006.

It is considered by the government that all contracting authorities will have access to Electronic Auctions. Dynamic Purchasing Systems is expected to be used by central purchasing authorities for common used items.

6.3.3 *Status of tools*

Public procurement portal(s)	-
Electronic signature	Electronic signature does not exist but will be introduced
Electronic catalogues	Government authorities have no experience with e-catalogues
Electronic auctions	Government authorities have no experience with e-auctions
Dynamic Purchasing Systems	Government authorities have no experience with dynamic purchasing systems
Framework agreements	Framework agreements are not being used

6.3.4 *Reference to the relevant legal acts*

Information unavailable

6.4 Current usage of electronic means in Public Procurement

6.4.1 *Practical use of electronic means in Public Procurement*

Presently, no data on practical use of electronic means in Public Procurement are available. However, the Cyprus government is planning to do an assessment on the impact of introducing electronic public procurement.

The Cyprus Government expects that a system operating with an automated electronic public procurement cycle will be implemented within three years. The elements included in the procurement system are: notification about tender, publication of tender, management of receipt/submission of tender and evaluation of tender

6.4.2 *Which phases of procurement are covered?*

Information unavailable

6.5 Raising awareness & Promotion of electronic means

Since July 2003 the Treasury has worked with implementing suggestions from a study of e-commerce in Cyprus. The study concerned among other things assessment of the existing legal framework and suggestions for changes and recommendations on legal and institutional infrastructure for the promotion and operation of e-commerce in Cyprus.

With the purpose of stimulating the general use of electronic procurement in Cyprus the Government has made a proposal for the financing of a project through the Transition Facility Funds of the EU. This proposal includes objectives on implementing electronically procurement procedures for public institutions.

7. Czech Republic

7.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Ministry of Informatics (www.micr.cz) is in charge of policy formulation in the area of electronic public procurement
Responsible institution(s) for legal aspects	Ministry of Informatics (www.micr.cz) Ministry of Regional Development (www.mmr.cz)
Responsible institution(s) for technical solutions	-
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	At the national level, a central body is responsible for public procurement. Furthermore, selection of suppliers is a responsibility for the central procurement body. No individual public institutions are involved in selecting suppliers for procurements.

7.2 Strategy

Since 2002 the Government of the Czech Republic has had electronic public procurement as a political priority. At the moment the government considers the development of electronic public procurement as having a medium political priority.

Strategy and priorities on electronic public procurement are integrated in the overall strategy on the Information Society and E-government among others "State Information Policy (SIP)" (1999)

7.2.1 Statement of objectives

The overall objective is to promote an electronic marketplace used for repeated and bulk purchases in the whole field of the public administration.

The central body for the electronic market place is the Ministry of Informatics but just for office facilities including information and communication technology (under condition that it is lower than 2 millions czech crowns).[104]

[104] Based on information from David Kotris, Ministry of Informatics

7.2.2 *Scope of strategy*

Levels of government involved	The strategy on electronic public procurement includes the central government. Regional and local governments are at the moment not included in the strategy for electronic public procurement
Legal framework	-
Allocated resources	Information on amount of allocation is presently unavailable
Time frame	2002 – 2006

7.2.3 *Existing guidelines*

Special guidelines for electronic public procurement have been developed, but it is not obligatory to use them

7.3 **Legal framework**

7.3.1 *Legal status of the use of electronic means in Public Procurement*

National legislation regulates the use of electronic means in the public procurement process. The legislation concerns specific rules for the communication process related to the electronic procurement process.

7.3.2 *Implementation of the Directives*

The government has not yet formulated an exact time-schedule for implementing the new EU Directives on public procurement.

The government intends to introduce national standards for the electronic exchange of data in the electronic public procurement process.

According to the EU Directives the government expects that the use of both electronic actions and dynamic purchasing may be regulated by the use of Contracting Authorities. It is not expected that Contracting Authorities may publish tender-related information on a ‘buyer profile’.

7.3.3 Status of tools

Public procurement portals	A public electronic procurement portal for electronic procurements is expected to be functional within few years.
Electronic signature	An electronic signature has been introduced by the government. At the moment the signature is used to a medium degree. It is expected that the use of the signature will be obligatorily for actors participating in public calls for competition.
Electronic catalogues	Authorities have no experiences with systems for procurement involving catalogues
Electronic auctions	Authorities have no experiences with systems for procurement involving electronic auctions
Dynamic Purchasing Systems	Authorities have no experiences with systems for procurement involving electronic purchasing systems
Framework agreements	-

7.3.4 Reference to the relevant legal acts

7.4 Current usage of electronic means in Public Procurement

7.4.1 Practical use of electronic means in Public Procurement

There are no operational public procurement systems compliant with the requirements of the forthcoming European Public Procurement Directives in The Czech Republic presently.

The Czech Republic government has implemented an automated electronic public procurement system for procurements in the public sector. In this respect, procedures for notification about tender as well as publications about tender are integrated in the procurement cycle. This procurement phase has been automated to a large extent.

7.4.2 Which phases of procurement are covered?

Procedures for ordering and invoicing are integrated in the automated electronic procurement system. This procurement phase has been automated to some extent.

7.5 Raising awareness & Promotion of electronic means

Within the next three years the Government of the Czech Republic is planning to introduce regular assessments of the impacts expected to be related to the introduction of electronic public procurement.

8. Denmark

8.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	The Danish Competition Authority (www.ks.dk) under the Danish Ministry of Economic and Business Affairs (www.oem.dk) Ministry of Finance (www.fm.dk)
Responsible institution(s) for legal aspects	The Danish Competition Authority (www.ks.dk) under the Danish Ministry of Economic and Business Affairs (www.oem.dk)
Responsible institution(s) for technical solutions	The Agency for Governmental Management (www.oes.dk) under the Danish Ministry of Finance (www.fm.dk)
Central procurement institution(s)	National Procurement Ltd. (SKI, www.ski.dk) was established to ensure the highest possible procurement efficiency in public organizations. It has more than 8500 public organization subscribers, around 250 suppliers on framework agreements many with distributors and totalling more than 1200 order addresses in Denmark. SKI runs the e-tendering systems ETHICS, Netindkøb and Netkatalog.
Other important organisations	The Ministry of Science, Technology and Innovation (www.vtu.dk) and Local Government Denmark (KL, www.kl.dk), an association of Danish municipalities.
Type of coordination between different institutions	Procurement is organized as a mixture of a centralized and decentralized approach: • The main principle is that each individual public authority is responsible for procurement (award of contract) and arrangement of framework contracts • Each institution e.g. ministry or agency can organize procurement in a centralized or decentralized way • There is a central public procurement body, SKI which arranges framework contracts, which can be used by all public authorities in Denmark. However, the individual public authority is free to arrange individual framework agreements. • The total procurement through national framework contracts (SKI) is approximately 0.5 billion Euro per year. Figures for regional and local level are unknown.

8.2 Strategy

The national strategy on e-public procurement is part of the existing strategy for e-commerce from 2002

- “IT for everybody” (Ministry of Science, Technology and Innovation, 2002)
- “Strategy for e-commerce 2002” (Ministry of Science, Technology and Innovation, 2002)

A new strategy from the government and the coalition of municipalities includes guidelines for digitizing towards 2006 has been published:

- “Strategy for digital administration 2004-06” (The Digital Taskforce, 2004)

8.2.1 Statement of objectives

There are no specific objectives on e-public procurement as a whole. However, some overall objectives for all of the initiatives and strategies have been defined:

- to save money by centralizing the procurement process
- to make the public sector a leading force in electronic procurement and commerce
- to realize un-utilized economic potential within electronic commerce in both the public and private sector

8.2.2 Scope of strategy

The strategy has four core elements:

- Electronic public procurement: Promoting electronic communication in the relation between the private suppliers and public buyers. The strategy calls for a far more efficient public sector in close partnership with private businesses. Various initiatives have been made already. For example the establishment of the Public Procurement Portal (DOIP) in the beginning of 2002 (see below).
- Safety and increased knowledge on e-commerce: Technical and legal insecurity are main barriers for making use of the full potential for e-commerce. Various projects have been put in effect (see later).
- Legal and technical e-commerce infrastructure: Coordinating the effort concerning standardization of data exchange for example in the area of e-payment.
- International dimensions within e-commerce: A major part of e-commerce is cross-border trading. This has lead to a focus on customs barriers, etc. Various projects have been initiated in relation to European initiatives.

In addition, the regional and local players have a high priority on electronic commerce and digital government/administration. A new strategy (February 2004) from the Danish government and the coalition of municipalities includes guidelines for digitizing towards 2006.

Levels of government involved	National, regional and local government are included in the strategies.
Legal framework	No information
Allocated resources	Public investment has been made to introduce e-public procurement, but there is no available specification of the amount spent (or allocated).
Time frame	Year of fulfilment has not been specified

8.2.3 *Existing guidelines*

As part of its modernization program for the public sector (from 2003), a guide on public procurement was published including guidelines on electronic procurement. It is required that all state institutions use electronic procurement whenever possible and of economic advantage to the state.

- "The digital supplier" (Ministry of Science, Technology and Innovation, 2002)[105]: Specific guidelines on electronic public procurement for the private supplier. Recommends DOIP.
- "The digital buyer" (Ministry of Science, Technology and Innovation, 2002): Specific guidelines on electronic public procurement for the private and public buyer at all levels of administration. Recommends DOIP but is open to the fact that the buyer might also use other systems.
- "Public procurement Guidelines" (Ministry of Finance, 2003)[106]: General guidelines on public procurement in the national administration. The target group is buyers in the public sector. No recommendations on solutions.

8.3 Legal framework

8.3.1 *Legal status of the use of electronic means in Public Procurement*

According to National Procurement Ltd., ETHICS fulfils the requirements of the forthcoming EU public procurement directives. DOIP shouldn't conflict with the directives either, but it remains to be seen when further guidelines, etc. will be published.

Buyer profiles to publish tender-related information on a 'buyer profile' are being used in systems such as DOIP, KMD and RAKAT.

8.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in the beginning of 2005. Public procurement is regulated in national legislation, and follows the EU public procurement directives. Use of electronic means in the public procurement process falls within the general rules for entering into an agreement.

With the new EU directives, the Danish government will provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems. However, a restriction on electronic auctions is foreseen on works contracts.

[105] See www.videnskabsministeriet.dk

[106] See http://www.moderniseringsprogram.dk/visArtikel.asp?artikelID=5462

8.3.3 *Status of tools*

Public procurement portal(s)	www.doip.dk is provided by Gatetrade and was launched in 2002. The portal is a web-based system based on Oracle exchange software. The current version supports: e-auctions, e-catalogues and integration with back-office systems.[107]
	www.rakat.dk is run by the private company COMCARE. Functionalities are mainly e-purchasing (ordering and electronic invoice). Up to 40 regional and local authorities have selected RAKAT.
	KMD Webindkøb (www.kmd.dk) is run by the private company KMD. Functionalities are mainly e-purchasing (ordering and electronic invoice). Up to 70 regional and local authorities have selected KMD Webindkøb.
	ETHICS (http://ski.ethics.dk/), www.netkatalog and www.netindkøb is operated by National Procurement Ltd. Functionalities on these portals include e-tendering.
Electronic signature	An electronic signature has been introduced (www.digitalsignatur.dk), but not been used for electronic public procurement.
Electronic catalogues	Electronic catalogues are being used.
Electronic auctions	Electronic auctions are being used to a low extent.
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems.
Framework agreements	Framework agreements are used on national, regional and local level of government.

8.3.4 *Reference to the relevant legal acts*

Information unavailable since special rules do not exist.

8.4 Current usage of electronic means in Public Procurement

8.4.1 *Practical use of electronic means in Public Procurement*

Electronic public procurement is not being monitored specifically, but other data on e-commerce are available:

- 54% of state authorities use an e-procurement system.
- 63% of regional authorities use an e-procurement system.
- 34% of local authorities use an e-procurement system.

Source: "*IT i praksis*® *2003*", RAMBOLL Management

Moreover, turnover at the Public Procurement portal (DOIP) increased to approximately 5 million Euro in 2003, which represented a significant increase.

[107] IDA "State of the Art Report. Version 0.60" Brussels (2004)

8.4.2 Which phases of procurement are covered?

The following is the status for automating procurement phases in Denmark:

- Notification about tenders (to a large extent today)
- Publication of tenders (to some extent today, but a further increase the next three years is expected)
- Management of receipts/submission of tenders (to a low extent today, a further increase the next three years is expected)
- Evaluation of tenders (to a low extent today, a further increase the next three years is expected)
- Ordering (to some extent today, a further increase the next three years is expected)
- Invoicing (to a low extent today, a further increase the next three years is expected)

8.5 Raising awareness & Promotion of electronic means

Several initiatives have been started to provide free help-desk for public organizations, establish interest in e-commerce in smaller municipalities and counties through campaigns and workshops, set off pilot projects and collect best practice, and create a special award for best e-merchant every year.

Various projects have been put in effect in the area of safety and knowledge, including the e-brand ("E-handelsmærket"), to help small and medium-sized businesses start e-commerce.

Generally, international standards are followed, implemented and translated, e.g. EDI/EDIFACT and XML. Danish Standards Association has established a special working group on e-public procurement (Group 380 on e-business). Standard formats for all public contracting authorities on tendering or purchasing have not yet been issued.

The Danish Ministry of Science, Technology and Innovation has chosen XML as the core communication standard in the public sector (Source: Handlingsplan for e-handel 2002).

A XML project consisting of two main sub-projects was started:

- Standardizing public data. The main target to determine standards for exchanging data between public authorities and between public and private institutions/organizations.
- Establishment of the Infostructurebase has, as the key objective, to create a database with information on the content of public databases and how to access these data. (Source: http://www.oio.dk/XML). The main purpose and value is to support exchange and reuse of data related to public and private service delivery.

It is the vision that it will be possible from this website to look up all the above types of information from public and private organizations, and thus to collect information about what data are available and how data are accessed. An important part of the content will be standards approved by the Danish e-Government IT-architecture and XML committees. The formal status of content will be part of the metadata of the content. (Source: http://isb.oio.dk/info/)

In January Denmark became the first country to adopt an early version of OASIS Universal Business Language (UBL) as a standard for e-Commerce in the public sector. Following a 30-day public hearing, the Danish XML Committee decided to use UBL 0.7 to enable integration between systems controlled by state authorities and the Pub-lic Procurement Portal (DOIP). UBL provides an XML library of common business data components together with a set of standard business documents such as purchase orders and invoices that are assembled from the component library.

Another project on establishing standards for e-commerce in Denmark is translating the international UNSPEC coding initiated by the Ministry of Science, Technology and Innovation.

9. Estonia

9.1 Organisations and Institutions

There are only few core actors in the field of electronic public procurement in Estonia. It is mainly a State level initiative and it is in the phase of beginning.

Responsible institution(s) for public procurement policy	Ministry of Finance (www.fin.ee)
Responsible institution(s) for legal aspects	Ministry of Finance (www.fin.ee)
Responsible institution(s) for technical solutions	Ministry of Finance (www.fin.ee)
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	The selection of suppliers is the responsibility of the individual public institutions – there is no central procurement body which is responsible for framework agreements etc.

9.2 Strategy

Development of e-public procurement is a priority and a strategy on e-public procurement is expected to be formulated and introduced in 2005[108].

9.2.1 Statement of objectives

The process of drafting of new Public Procurement Act has been started to transpose the new directives. In the new Public Procurement Act the principles of e-public procurement will be provided[109]. By introducing e-public procurement achieving such objectives like additional transparency, lower transaction costs and more effective supervision are expected.

[108] Based on interview with Mr. Märt Kiisel, State Aid and Public Procurement Division, Financial Policy Department, Ministry of Finance

[109] Based on interview with Mr. Märt Kiisel, State Aid and Public Procurement Division, Financial Policy Department, Ministry of Finance

9.2.2 *Scope of strategy*

The content of the strategy has not been formulated.

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

9.2.3 *Existing guidelines*

Basic guidelines for using the electronic Public Procurement State Register have been issued. Guidelines are improved continually.

9.3 Legal framework

9.3.1 *Legal status of the use of electronic means in Public Procurement*

Public Procurement Act and Government Regulation establishing the Public procurement State Register cover rules for e-notifying via Public Procurement State Register. Rules for communication (e.g. e-mailing, using of e-signature) and moreover storage of data are regulated by other legal acts.

9.3.2 *Implementation of the Directives*

The new directives on public procurement are expected to be transposed by the end of 2005[110]. Issues concerning use of electronic means in e-public procurement are already regulated with different legal acts e.g. the electronic signature.

In course of transposing the principles of the new public procurement directives into national law no restrictions for using e-public procurement systems described in the directives have been planned (contracting authorities may use in the public procurement process all e-public procurement systems described in the directives - e-auctions, dynamic purchasing systems, e-catalogues etc.). In the area of standards no specific provisions have been planned.

[110] Based on interview with Mr. Märt Kiisel, State Aid and Public Procurement Division, Financial Policy Department, Ministry of Finance

9.3.3 Status of tools

Public procurement portal(s)	The Public Procurement State Register (established in 2001, http://register.rha.gov.ee/) is a simple e-public procurement portal, where all public procurement notices are published electronically. The register is using CPV standards in the catalogue, and all the information in the register is publicly accessible via internet free of charge.
Electronic signature	Electronic signature has been introduced, but is being used to low extent. However, it will be made mandatory to use the e-signature to participate in public calls for competition.
Electronic catalogues	No experience with e-catalogues.
Electronic auctions	No experience with e-auctions.
Dynamic Purchasing Systems	No experience with dynamic purchasing systems.
Framework agreements	Information unavailable.

9.3.4 Reference to the relevant legal acts

Public Procurement Act, Databases Act, Digital Signature Act, Administrative Procedure Act.

9.4 Current usage of electronic means in Public Procurement

9.4.1 Practical use of electronic means in Public Procurement

In 2003 the number of procurements advertised via Public Procurement State Register was 4,859 with the value declared of EUR 663 Million.

9.4.2 Which phases of procurement are covered?

Till now there is covered only publicising phase of the public procurement notices. Further impact of the use of electronic means in public procurement has not been assessed yet, but it is planned to measure impact of electronic public procurement in the future. The following aspects will be assessed: number of electronic transactions, types of purchases, transaction costs, effect on price and number of bidders.

9.5 Raising awareness & Promotion of electronic means

Information unavailable.

10. Finland

10.1 Organisations and Institutions

The main institutions in the field of electronic public procurement are:

- Ministry of Finance
- Ministry of Trade and Industry
- Ministry of Transport and Communication
- Hansel Ltd.

Responsible institution(s) for public procurement policy	Ministry of Finance[111]
Responsible institution(s) for legal aspects	Ministry of Trade and Industry[112]
Responsible institution(s) for technical solutions	Ministry of Finance Ministry of Trade and Industry
Central procurement institution(s)	Hansel Ltd.[113]
Other important organisations	The Finnish Association of Local Authorities Finnish Information Society Development Centre (Tieke)
Type of coordination between different institutions	Public Procurement in Finland is organized as a mixture of a centralized and decentralized approach: • There is a central public procurement body for state entities, Hansel Ltd (www.hansel.fi). Hansel is a government owned public procurement company. • It arranges framework contracts which can be used by all state authorities[114] in Finland. However, individual public authorities are free to arrange individual framework agreements (buying through or with help of Hansel is not compulsory). • Procurement (selection of suppliers) is a responsibility of the individual public authority.

[111] Ministry of Finance is responsible of policymaking with regard public procurement in general which includes eProcurement; the ministry is also responsible for development of electronic administration

[112] Ministry of Trade and Industry is responsible of legal framework for public procurement in general which includes also implementation of new electronic measures/procedures from new public procurement directives

[113] Hansel is a state owned central purchasing authority

[114] Municipalities are not allowed to buy direct (without competition) from Hansel. Hansel is central purchasing body only for state entities.

10.2 Strategy

The government procurement strategy was published in January 2004, and the government's "Information Society Programme" in April 2004.

Initiatives on e-public procurement are integrated in the government's overall strategy on public procurement. According to it utilization of information technology is one element when developing public procurement and its eProcurement policies and procedures. Pilot projects will be initiated to improve procurement procedures and utilization of information technology.

The municipalities are independent and the government procurement strategy does not apply to them. They do not have a common procurement or e-procurement strategy. However, municipalities are more and more cooperating when doing or developing procurement.

10.2.1 Statement of objectives

The overall objective is to take advantage of information technology to enhance effectiveness of public procurement

10.2.2 Scope of strategy

Levels of government involved	Procurement strategies cover only central government
Legal framework	Is at the moment under renewal. First draft of the new pp law shall be at the end of October 2004. Deadline for implementation is the end of 2005.
Allocated resources	Public resources are allocated but specific information concerning the size of the amount is unavailable
Time frame	-

10.2.3 Existing guidelines

A recommendation for electronic public procurement has been issued on electronic invoicing - another on electronic ordering is being prepared.

10.3 Legal framework

10.3.1 Legal status of the use of electronic means in Public Procurement

None of the current e-procurement systems are expected to fulfil the requirements of the forthcoming EU public procurement directives fully (e.g. systems for the entire procurement process and digital signature), but it remains to be seen when further guidelines etc. are published.

10.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented in 2005. Public procurement is regulated in national legislation, which follows the EU public procurement directives. Use of electronic means in the public procurement process falls within the general rules for entering into an agreement.

10.3.3 Status of tools

Public procurement portals[115]	www.ktm.fi/julma Responsible authority is Ministry of Trade and Industry and the portal is run by the private undertaking Edita Oy. Functionality includes information and notices concerning public procurement below the threshold value.
	www.credita.fi The portal contains information concerning publication of notices especially above the threshold value. It also provides information about public procurement. The portal is run by the private undertaking Edita Oy.
Electronic catalogues	Electronic catalogues are used when purchasing goods[116]
Electronic auctions	E-auctions are not being used
Electronic signature	An official electronic signature has been introduced in Finland, but so far it has not been used for electronic public procurement[117]
Dynamic Purchasing Systems	Dynamic purchasing systems are not being used
Framework agreements	The total procurement through national framework contracts is not known precisely, but it is estimated to be 5% or below.

10.3.4 Reference to the relevant legal acts

The Act on Public Procurement; the Act on Electronic Signatures.

10.4 Current usage of electronic means in Public Procurement

10.4.1 Practical use of electronic means in Public Procurement

The annual value of public procurement in Finland is about EUR 19 billion which is about 15% of the GDP. Electronic public procurement is not being monitored.

The most significant advantages from the introduction of electronic public procurement for public authorities are expected to be:

- Speeding up of procurement procedures
- Lower transaction costs
- Better procurement statistics and enhanced budgetary control.

[115] Hansel Ltd (www.hansel.fi) once operated a complete system for electronic tendering and procurement but due to lack of turnover, the system is no longer in operation.
[116] Catalogues are usually suppliers own
[117] Information is available at the internet (Population Register Centre): www.vaestorekisterikeskus.fi/vrk/home.nsf/pages/index_eng

Initiatives which are primarily focused on information and tools about electronic public procurement include:

- www.kilpanet.fi: Provides information and models concerning public procurement in the field of services. It is run by private local authorities owned undertaking Efectia Oy.
- www.hymonet.com: This includes information and models concerning environment issues in connection to public procurement. It is run by private local authorities owned undertaking Efectia Oy.
- www.kunnat.net: Provides much information on public procurement legal issues. It is the Finnish local authority portal.

10.4.2 Which phases of procurement are covered?

The status for automating procurement phases in the Finland is as follows:

- Notification about tenders (to a large extent today)
- Publication of tenders (to some extent today, but a further increase the next three years is expected)
- Management of receipt/submission of tenders (to some extent today, but a further increase the next three years is expected)
- Evaluation of tenders (to a low extent today, but a further increase the next three years is expected)
- Ordering (to a low extent today, but a further increase the next three years is expected)
- Invoicing (to a low extent, but a further increase the next three years is expected).

Notification is the phase of public procurement which has been automated the most via the Credita and Julma portals, whereas the more advanced stages of electronic procurement are only automated to a low extent. Most frequently used electronic tools are e-mail and internet based ordering.

10.5 Raising awareness & Promotion of electronic means

Electronic means will be promoted when implementing public procurement strategy for central government and Information Society Programme. A recommendation for electronic invoice has and will be promoted.

New projects have started also in municipal sector. It is worth to mention i.e. Juhk e–project, which has started on spring together with about 10 municipals and Finnish Association of Local Authorities, private enterprises etc stakeholders. The aim is to promote e-procurement’s implementation among municipals starting from guide lining e-invoicing, e-ordering partly even to tendering procedures. Target is not however to develop any new purchasing system.

11. France

11.1 Organisations and Institutions

The responsibility for the e-public procurement activities in France are shared between mainly two government bodies:

- the Agency for the Development of Electronic Administration (*Agence pour le Développement de l'Administration Électronique – ADAE*)[118], under the direct authority of the Prime Minister, which has drafted the electronic administration strategy and action plan (ADELE); and
- the Ministry for Economy, Finance and Industry.

Responsible institution(s) for public procurement policy	Ministry for Economy, Finance and Industry
Responsible institution(s) for legal aspects	Ministry for Economy, Finance and Industry, Legal Department
Responsible institution(s) for technical solutions	Agency for the Development of Electronic Administration
Central procurement institution(s)	Union de Groupements d'Achats Publics (UGAP) [119] which local, regional and national authorities can make use of, will allow bidders to submit tenders electronically through State solution.
Other important organisations	Ministry of Defence
Type of coordination between different institutions	The selection of suppliers, however, remains within the responsibility of individual public institutions

Within the ministry for Economy, Finance and Industry, a Mission for the Digital Economy (*Mission pour l'Economie Numérique*) (www.men.minefi.fr) has been created for five years to play a concertation role between the public and the private sector. It contributes to inter-ministerial initiatives to adapt the legal framework to the digital economy and prepares the French position in multilateral negotiations and at EU level. It is divided into working groups, of which group no. 7 "Dematerialisation of public procurement and of settlement of public expenditure"[120] works on these issues. Legal affairs are dealt with by the legal department of the ministry (*Direction des Affaires Juridiques*), while the development of e-public procurement solutions are coordinated between ADAE and the ministries (Defense will joint later as they have their own solution).

[118] See http://www.adae.gouv.fr

[119] See http://www.ugap.fr/

[120] *Dématérialisation des achats publics et de l'exécution de la dépense publique*; http://www.men.minefi.gouv.fr/webmen/groupetravail/g7.html

11.2 Strategy

E-public procurement enjoys medium priority in France as it is not promoted by a minister, but is the fruit of cooperation between several ministries[121]. The e-public procurement strategy of the French government is therefore twofold: It forms part of the e-government and information society initiatives made public at large scale, but is also part of efforts to generally modernise the national public procurement system. There is no separate strategy for e-public procurement.

- The governmental modernisation plan "Administration électronique 2004/2007" (ADELE), launched in February 2004 by the Prime Minister. The project is one of 140 measures which are part of the plan.

- Reforms of the Public Procurement Act (Code des marchés publics) in 2001 and 2004. This law includes the objective that all public entities have to accept electronic bids by 1 January 2005, whereas enterprises are free to use electronic means or paper. No obligation for businesses is introduced by the reforms.

11.2.1 Statement of objectives

Main objective is to publish all calls for tenders electronically by 2010. This objective is part of the project "100% Dématerialisation", which covers the whole procurement chain including control, payment and archiving, is anticipated for 2007-2010).

Besides the development of electronic tools, the other objectives of the project are reengineering of process and training in order to professionalize the buyer function.

Another objective is introduction of e-tendering by 2005.

11.2.2 Scope of strategy

Levels of government involved	Central, regional and local government are included in the strategies for procurement. Also public enterprises are covered by the initiatives
Legal framework	Public Procurement Code
Allocated resources	Approximately EUR 2 million has been allocated for the introduction of operational electronic procurement at national level The Ministry of Defence has allocated approximately EUR 4 million over the last 3 – 4 years In 2005, EUR 1 million is earmarked for using on an inter-ministerial platform
Time frame	2004-2005 2005-2008

[121] In France called 'dematerialisation of public procurement'

11.2.3 Existing guidelines

A guide for dematerialization will be published in September, 2004. It will be based on legal framework developed and interpreted through working group managed by Ministry of Economy and ADAE.

11.3 Legal framework

11.3.1 Legal status of the use of electronic means in Public Procurement

The use of electronic means for communication in the public procurement process are regulated by French national legislation, covering rules applicable to communication, storage of data and use of specific procedures. This was already done with the reform of the *Code des marchés publics* in 2001, however, the provisions have been formulated in a very open way, in order not to freeze the *status quo* and thereby prevent technological development and innovation.

11.3.2 Implementation of the Directives

The systems developed in France are very nearly compliant with the requirements of the forthcoming EU public procurement directives. While part of the directives requirements have already been taken into account for the 2001 and 2004 reform of the *Code des marchés publics*, it is expected that the directives will be fully implemented by autumn 2005. Electronic auctions are allowed in France and used, among others, by the Ministry of Defence. Dynamic Purchasing Systems are not allowed yet, but the directives' provisions will be implemented, as well as the ones on the "buyer profile". No national standards on electronic exchange of data will be introduced in order not to prevent evolution, and it is expected that standards will be developed at EU level.

11.3.3 Status of tools

Apart for State administration, there is no central e-public procurement portal for all national (and sub-national) public entities in France, so that local and regional authorities have launched their own activities, sometimes by joining forces where appropriate. They will nevertheless be able to access to State administration platform trough UGAP, customer of the same market.

Public procurement portals	The French Ministry of Defence has developed an electronic market place, called *Service public Défense*, consisting of two e-public procurement portals. • One of these portals relates to the purchase of current supplies and support material (www.achats.defense.gouv.fr) • whereas the other is specifically dedicated to the purchase of armament, ammunition and war material (IXARM) (http://www.ixarm.com) All prior information, tender and award notices are published on these websites which also contain a search engine as well as an alert system for businesses who register on the website. Also procurement contracts that do not have to be published feature on the ministry's portal, and terms of reference can be consulted online. There is a possibility for enterprises to present their services and products as well as available information on conclusion and settlement of public procurement contracts. Finally, companies can submit their expressions of interest and bids electronically, through a secured tendering system with time-stamping of the digital signature. The investment costs of the ministry's portals amount to EUR 4 million for the last three or four years.
	The French Ministry of Equipment, Transport, Housing, Tourism and Maritime Affairs offers it own public procurement portal, called "*Serveur d'appels d'offres et de marchés publics*" (SAOMAP) (http://saomap.application.equipement.gouv.fr/saomap_public). Businesses can search tender all over the French territory, consult tender material and communicate it to sub-contractors. Twelve services of the ministry are already using the service which allows them to publish calls for tender, tender material and other information. It is expected that all service will do so before end of 2004
	All ministries are currently working, under the aegis of the Ministry of Economy, Finance and Industry and the Agency for the Development of Electronic Administration, on an inter-ministerial platform for e-public procurement. It will, for legal reasons, not be open to regional or local public entities except through Union de Groupements d'Achats Publics, but only for national ministries. The portal will be set up in third quarter 2004 and should be operational by 1st quarter 2005. The budget for this project is about EUR 1 million
	Several General Councils (at department level), for instance *Conseil general de la Moselle*[122], or Conseil général de l'Oise have established their own e-public procurement portals. An accompanying ministerial project for regional and local entities as well as public enterprises is designed to favour exchange of best practice between public authorities. The *Observatoire de l'Administration Electronique* identifies best practices in the field of e-public procurement among others and awards the Prix Hourtin to outstanding portals
Electronic signature	About 16 certificate families from the private sector have been referenced by the Ministry of Economy, Finance and Industry for use in general electronic procedures, among which e public procurement.

[122] http://marches-publics57.com

Electronic catalogues	The Ministry of Defence also has experience with electronic catalogues
Electronic auctions	The Ministry of Defence and certain local authorities have experience with using e-auctions.
Dynamic Purchasing Systems	Dynamic purchasing systems have not been used
Framework agreements	No framework contracts are being used for the time being since they are not permitted by law.

11.3.4 Reference to the relevant legal acts

Public procurement code

11.4 Current usage of electronic means in Public Procurement

11.4.1 Practical use of electronic means in Public Procurement

So far, only the Ministry of Defence has introduced e-public procurement on a wide scale, assessing in particular, the number of electronic transactions, the speeding-up of procurement procedures, transaction costs and e-procurement's share of the total public procurement volume. The reduction of costs for companies should also be included in the assessment. The Ministry of Equipment has also obtained interesting results reducing publishing costs.

No assessment is as yet planned for the inter-ministerial platform, but there will probably be a regular monitoring of activities. France expects that the introduction of e-public procurement will significantly lower transaction costs and prices through increased competition and reduction of the cost of public procurement for administration and businesses etc.

11.4.2 Which phases of procurement are covered?

So far, only the first phases in the public procurement cycle, i.e. notification and publication of tender, have been automated, at least to some extent. Pilot projects have been launched for dematerialisation of ordering and invoicing, and the management of receipt as well as the evaluation of tender is expected to be done automatically within 3 years.

11.5 Raising awareness & Promotion of electronic means

There are a number of initiatives at the state and local level as well as in the private sector to increase awareness of the benefits of e-public procurement.

12. Germany

12.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	The Ministry of Economics and Labour (www.bmwa.de) and the Ministry of the Interior (www.bmi.de) are the overall responsible authorities in the area of e-procurement.
Responsible institution(s) for legal aspects	Ministry of Economics and Labour (www.bmwa.de)
Responsible institution(s) for technical solutions	Ministry of the Interior (www.bmi.de)
Central procurement institution(s)	Procurement Office of the Federal Ministry of the Interior (Beschaffungsamt, www.bescha.bund.de) manages purchases for 26 different federal authorities, foundations and research institutions. It runs a pilot project called "Öffentlicher Eink@uf Online" (Public Purch@sing Online). The project sets out a path for electronic procurement. From February 1st it is possible to transfer the offers electronically (www.evergabe-online.de). Federal Office of Defense Technology and Procurement (Bundesamt für Wehrtechnik und Beschaffung) of the Federal Ministry of Defense (www.bmvg.de). Federal Customs Administration (Beschaffungsamt der Bundeszollverwaltung) of the Federal Ministry of Finance (www.bundesfinanzministerium.de)
Other important organisations	Several private providers offer either software products which support electronic procurement, e.g.: • www.beschaffen.de: Beschaffen.de is provided by the company Wegweiser and offers a platform for purchasers of the public authorities to find e-procurement solutions according to their needs. • www.ai-ag.de: Administration Intelligence AG (AI-AG) offers electronic pro-curement solutions for a public procurement law-conforming handling of public tenderings. • www.bos-bremen.de: bremen online services (bos) GmbH & Co. KG develop and implement eGovernment solutions for the German Federal Government, the federal states and local governments. ...or online databases for public as well as private purchasers, e.g. • www.vergabereport.de: offers two online databases with calls for tender. It serves also as an information portal. ...or both supporting products and online databases, e.g.: • www.cosinex.de: Cosinex.de has been the first private provider for electronic public procurement. It offers the public authorities support for the realization of a strategic management of procurement.

	- www.subreport.de: Subreport.de is the biggest platform for e-procurement. About 98% of all public tenders can be found. Subreport.de is the first Internet platform for a complete digital awarding of contract. A registration is required.
Type of coordination between different institutions	It is the responsibility of each of the 16 Länder to implement e-procurement strategies on the basis of a close co-ordination between the state, the other Länder and the Kommunen (local governments). So far each of the Länder are developing or already have developed and implemented a strategy (see www.deutschland-online.de/Links/links.htm). Some of the most advanced Länder as regards e-government strategies are Nordrhein-Westfalen, Baden-Württemberg, Bavaria, Lower Saxony and Bremen. Hamburg was the first to implement its e-procurement strategy[123]

12.2 Strategy

Electronic public procurement is highly prioritized in Germany. E-public procurement initiatives are part of an overall strategy to develop the information society and create e-government.

In September 2000 the initiative ”BundOnline 2005” that also include e-procurement was started by Federal Chancellor Gerhard Schröder. More than 100 individual authorities and departments of the Federal Administration are taking part in the project.

To overcome the heterogeneous IT-landscape of Germany, the relevant players have agreed on a joint e-government strategy in June 2003 (“Deutschland-Online”). The aim of the joint ”Deutschland-Online” e-government strategy is to develop integrated electronic services on all administrative levels as well as to create the standards and infrastructures which are necessary. In addition to this strategy, the government in autumn 2003 decided on the program of action ”Information Society Germany 2006”. The objective of this procurement-focused program is to have a Federal Government's contract-awarding procedure exclusively via a secure e-tendering system in line with legal requirements by the end of 2005.

12.2.1 Statement of objectives

Overall objectives are:

- Achieve greater efficiency and transparency, and cut costs in the tendering cycle
- Develop integrated electronic services on all administrative levels and create standards and infrastructures
- Secure e-tendering system by the end of 2005
- Public sector strives to be the pioneer in the field of e-business in Germany

[123] See http://fhh.hamburg.de/stadt/Aktuell/behoerden/finanzbehoerde/ausschreibungen/e-vergabe/start.html

12.2.2 *Scope of strategy*

Levels of government involved	The strategies include central government
Legal framework	-
Allocated resources	At state level, the public authorities allocate approximately EUR 4.5 million per year to introduce operational electronic procurement
Time frame	-

12.2.3 *Existing guidelines*

Public procurement portals	The official online database for public tendering on the Federal level is titled Bundesausschreibungsblatt online, www.bundesausschreibungsblatt.de
	"E-Vergabe", www.evergabe-online.de has been developed by the Ministry of Economics and Labour (BMWA) together with the Ministry of the Interior (BMI). E-vergabe is an online database with call for tenders. From February 1st it is possible to transfer the offers electronically.
	Several Länder own an online database with call for tenders, e.g. • Nordrhein-Westfalen (www.vergabe.nrw.de), • Hessen (www.had.de), • Brandenburg together with Berlin (www.ausschreibungen-brandenburg.de), • Hamburg (www.ausschreibungen.hamburg.de), • Bayern (www.bayerischer-staatsanzeiger.de), • Sachsen-Anhalt (www.ausschreibungsanzeiger.com), • Thüringen (www.ausschreibungsanzeiger-thueringen.de)
	Another leading electronic public procurement platform for public and private calls for tenders is www.ausschreibungs-abc.de
Electronic signature	Advanced qualified electronic signature has been introduced
Electronic catalogues	There exists an electronic catalogue on behalf of the Federal Ministry of the Interior and its Procurement Office, which is called "Öffentlicher Eink@uf Online".
Electronic auctions	E-auctions are not a legal possibility
Dynamic Purchasing Systems	Dynamic purchasing systems are not a legal possibility
Framework agreements	-

The Ministry of Economics and Labor has published a guide on electronic public procurement (www.bmwa.bund.de/Redaktion/Inhalte/Downloads/br-elektronische-vergabe-von-auftraegen,property=pdf.pdf). It is required that all state institutions use electronic procurement whenever possible and of economic advantage to the state. In December 2003 the Federal Government has taken a cabinet decision initiating an optimization of public procurement with the means of new information technology. The cabinet decision aims to realize a thorough digitalization of the procurement process and to establish a virtual marketplace (Kaufhaus des Bundes) on the basis of framework agreements.

12.3 Legal framework

12.3.1 Legal status of the use of electronic means in Public Procurement

Multiple legal acts regulated e-public procurement at present time (see below).

12.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented by the end of 2005. The storage of data is regulated by national legislation. With the new EU directives, Germany expects the government to provide that Contracting Authorities may use electronic auctions (with the possible exception of works contracts) and dynamic purchasing systems. Buyer profiles to publish tender-related information are being used by Contracting Authorities in Germany.

The use of an electronic signature will be made mandatory to participate in public calls for competition

12.3.3 Status of tools

Public procurement portals	The official online database for public tendering on the Federal level is titled Bundesausschreibungsblatt online, www.bundesausschreibungsblatt.de
	"E-Vergabe", www.evergabe-online.de has been developed by the Ministry of Economics and Labour (BMWA) together with the Ministry of the Interior (BMI). E-vergabe is an online database with call for tenders. From February 1st it is possible to transfer the offers electronically.
	Several Länder own an online database with call for tenders, e.g. • Nordrhein-Westfalen (www.vergabe.nrw.de), • Hessen (www.had.de), • Brandenburg together with Berlin (www.ausschreibungen-brandenburg.de), • Hamburg (www.ausschreibungen.hamburg.de), • Bayern (www.bayerischer-staatsanzeiger.de), • Sachsen-Anhalt (www.ausschreibungsanzeiger.com), • Thüringen (www.ausschreibungsanzeiger-thueringen.de)

	Another leading electronic public procurement platform for public and private calls for tenders is www.ausschreibungs-abc.de
Electronic signature	Advanced qualified electronic signature has been introduced and is presently used to some extent.
Electronic catalogues	There exists an electronic catalogue on behalf of the Federal Ministry of the Interior and its Procurement Office, which is called “Öffentlicher Eink@auf Online”.
Electronic auctions	E-auctions are not a legal possibility
Dynamic Purchasing Systems	Dynamic purchasing systems are not a legal possibility
Framework agreements	-

12.3.4 *Reference to the relevant legal acts*

At present the legal framework for e-public procurement is among other things based on:

- „Gesetz über Rahmenbedingungen für elektronische Signaturen (Signaturgesetz – SigG)“ of 16. May 2001 (BGBl. I S. 876)
- Signaturverordnung vom 16. November 2001 (BGBl. I S. 3074)
- Verordnung über die Vergabe öffentlicher Aufträge in der Fassung vom 11.Februar 2003 (BGBL I, S.169) – im Besonderen § 15 VgV.
- Anpassung der Verdingungsordnungen (VOL/A Abschnitt 1 und VOB/A[124]) (in order to implement directive2001/78/EC)
- "Gesetz zur Anpassung der Formvorschriften des Privatrechts und anderer Vorschriften an den modernen Rechtsgeschäftsverkehr" – Formvorschriften-Anpassungsgesetz. Implementation 1. August 2001 (BGBL I Nr. 35 vom 18. Juli 2001)

12.4 Current usage of electronic means in Public Procurement

12.4.1 *Practical use of electronic means in Public Procurement*

Every year, the approximately 600 awarding offices of the Federal Government buy products and services worth around EUR 63 billion.
In January 2004, nine federal authorities, as well as state and communal authorities, used eTendering.

Monitoring of the up-take and progress of e-public procurement is carried out on an annual basis by a questionnaire to a Working Committee of all government departments. The following aspects are watched: Transaction costs and the effect on prices.

[124] See http://www.bmwi.de/Navigation/Wirtschaft/Wirtschaftspolitik/Oeffentliche_20Auftr_C3_A4ge/vergaberecht-vorschriften.html

The resources allocated by public authorities to introducing operational public procurement are also monitored at national level. Other aspects which should be considered in the future are: Number of electronic transaction, e-public procurement's share of total public procurement volume, types of purchases, speeding up of procurement procedures, SME participation and number of bidders.

12.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Germany is as follows:

- Notification about tender (to a large extent)
- Publication of tender (to a large extent)
- Management of receipt/submission of tenders (to a large extent)
- Evaluation of tenders (not automated, but expected to be within two years)
- Ordering (to a large extent)
- Invoicing (to a large extent).

12.5 Raising awareness & Promotion of electronic means

At state level the public authorities allocate approximately EUR 4.5 mio per year to introduce operational electronic procurement. These resources are e.g. used for the development and implementation of software and the support of research dealing with e-public procurement.

Within 2004 it is planned that all electronic public tenders on Federal level will be published on the central portal of the State, www.bund.de

In Germany special advice centers (Auftragsberatungsstellen) impart practical experi-ence and information to enterprises that plan to tender for public contracts. www.abst.de lists every advice centre of each of the Länder. Some local governments have initiated portals, see e.g. Düsseldorf (www.duesseldorf.de/ausschreibung/index.shtml)

The German Association of Towns and Municipalities (www.dstgb.de) decided on electronic procurement regarding trade in co-operation with the Central Organization of German Trade (www.handwerk.de/dstgb). Together with the German Telecom the DSTGB also started an initiative with the goal to identify the chances of small and medium-sized towns regarding their potential to modernize, rationalize and initiate new projects[125].

The Federal Government, the Länder and the municipalities have developed a common architecture for e-government. The e-government standard is called SAGA (Standards and Architectures for e-Government Applications[126]). SAGA defines a series of uniform standards which must be used for the implementation of e-government applications. Furthermore SAGA is included in the "Interoperability Framework" of the IDA-program of the European Union. OSCI (Online-Services-Computer-Interface) as well as ISIS-MTT (Industrial Signature Interoperability and Mailtrust Specification) are two obligatory standards in the Federal Administration which are based on SAGA. Communication standards are XML, HTML and PDF.

[125] See www.dstgb.de/index_inhalt/homepage/index.html

[126] See http://www.kbst.bund.de/Anlage304417/Saga_2_0_en_final.pdf

Another existing e-procurement tool is the Vergabe@Governikus[127]. This is a software solution for the control of the communication and handling of public tenders via Internet. It is possible to publish digital announcements, provide data for placing of contracts by tender (Verdingungsunterlagen) and accept electronic offers.

Vergabe@Work is an electronic management solution for tendering. The control system is form-based and supports the handling of the entire internal process of contract awarding digitally and law-conforming. Vergabe@Work has been specially designed for the application within contracting authorities (www.ai-ag.de). Vergabe@Work is being used by the Ministry of Finance and the Ministry of Defence.

[127] See www.bos-bremen.de/produkte/kap2_6.html

13. Greece[128]

13.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	General Secretariat of Commerce, Ministry of Development
Responsible institution(s) for legal aspects	General Secretariat of Commerce, Ministry of Development
Responsible institution(s) for technical solutions	General Secretariat of Commerce, Ministry of Development
Central procurement institution(s)	General Secretariat of Commerce, Ministry of Development
Other important organisations	-
Type of coordination between different institutions	The selection of suppliers is typically the responsibility of a central procurement body. In some cases the Ministry of Development gives authorization to other ministries and bodies of public sector, to run their own auction. In these cases they are responsible for the selection of suppliers.

13.2 Strategy

In general the introduction of electronic public procurement has a high priority in Greece.

The strategy for the introduction of operational electronic public procurement is an integrated part of the overall strategy on e-government and the development of the information society.

The focus of the strategy is to obtain improved IT skills in public and private sector, speeding up procurement procedures, and to secure lower prices on public procures.

13.2.1 Statement of objectives

The overall objective is to introduce an operational electronic public procurement system in Greece by the end of 2007.

It is planned that about 30% of goods which are awarded from the Ministry of development will be awarded by electronic means by the end of 2008.

[128] This section is based entirely on information from Mr. Spatharis, Ministry of Development

13.2.2 Scope of strategy

Levels of government involved	Central government
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	2004 – 2010[129]

13.2.3 Existing guidelines

No special guidelines for e-public procurement have been issued.

13.3 Legal framework

13.3.1 Legal status of the use of electronic means in Public Procurement

The use of electronic means for communication in the public procurement process will be regulated by national legislation. The following aspects will be regulated: rules applicable to communication, storage of data, use of specific procedures e.g. e-auctions; dynamic purchasing system; open, restricted and negotiated procedures; notification about tender; publication of tender; management of receipt/submission of tender; and ordering.

Operational electronic procurement system does not exist in the public sector in Greece yet. However, a system in compliance with the requirement of the forthcoming directives will be introduced shortly.

13.3.2 Implementation of the Directives

The directives are expected to be implemented in 2006

[129] Estimated number of years for full migration in public procurement to electronic means is 6 years (Source: Based on information from Mr. Spatharis, Ministry of Development)

13.3.3 *Status of tools*

Public procurement portals	www.gge.gr is the public procurement portal (only in Greek) The portal has the following functionalities: Publication of legal framework of public procurement, guidelines on public procurement, central government annual programme of supplies, calls for tendering on monthly basis, contracts on monthly basis.
Electronic signature	Electronic signature has been introduced and is being used to a low extent. However, the use of electronic signature will be made mandatory to participate in public calls for competition.
Electronic catalogues	There is no experience with electronic catalogues
Electronic auctions	There is no experience with electronic auctions
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Framework agreements are not being used

13.3.4 *Reference to the relevant legal acts*

Information unavailable

13.4 Current usage of electronic means in Public Procurement

Currently, the uptake on electronic public procurement is not being monitored on a regularly basis in Greece.

Hence, there is no information available on the existing usage of electronic means in public procurement.

13.4.1 *Which phases of procurement are covered?*

Information unavailable

13.5 Raising awareness & Promotion of electronic means

Information unavailable

14. Hungary

14.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Council for Public Procurement (www.kozbeszerzes.hu)
Responsible institution(s) for legal aspects	Council for Public Procurement (www.kozbeszerzes.hu)
Responsible institution(s) for technical solutions	Electronic Government Centre, Office of the Prime Minister (www.magyarorszag.hu)
Central procurement institution(s)	Central Service Directorate is the central procurement body for public procurements at the national level .This institution has responsibility for the selection of suppliers for procurements in public institutions
Other important organisations	-
Type of coordination between different institutions	

14.2 Strategy

Electronic public procurement has been on the Hungarian government's agenda since 2001. At the present the development of an operational electronic public procurement system has a medium priority on the Hungarian government's agenda.

The strategy for introducing an operational electronic public procurement is included in the overall strategy on E-government and Information society among others "Hungarian Information Society Strategy" (HISS), 2002[130].

14.2.1 Statement of objectives

The government has specified overall objectives for introducing electronic public procurement. In a draft plan for secondary legislation these objectives are stipulated and are as follows:

- the harmonization and modernization of the law
- ease of use among wide range of participants
- transparency
- support of centralised procurement

[130] See http://www.ihm.hu/English/_20030211_1.html

14.2.2 *Scope of strategy*

There are different stages in the strategy for the implementation of e public procurement. The first stage concerns strategic procurement on obligatory basis in central government. The second stage is widening the scope toward voluntarily participants and non-strategic procurements.

Levels of government involved	The plan includes a strategy for e-procurement at different levels of the Hungarian public sector, including central-, regional- and local governments
Legal framework	
Allocated resources	Internal government figures exists but cannot be disclosed publicly
Time frame	Implementation of the plan will start in June 2004. Objectives are estimated to be realized in March 2005.

14.2.3 *Existing guidelines*

Specific and detailed guidelines for electronic public procurement are under preparation in Government Decree on the electronically supported activities allowed in public procurement and in special electronic procurement procedures.

14.3 Legal framework

14.3.1 *Legal status of the use of electronic means in Public Procurement*

No national legalization is presently regulating the use of electronic means for communication in the public procurement process. However, legalization is under preparation in *Government Decree on the electronically supported activities allowed in public procurement and in special electronic procurement procedures.*

14.3.2 *Implementation of the Directives*

The Hungarian Government expects that implementation of the forthcoming EU-public procurement directives will take place in 2005.

Future electronic procurement systems will be compliant with the requirements of the forthcoming European Public Procurement Directives. It is estimated that Contracting Authorities will be allowed to use Electronic Auctions according to the Directives. It is not expected that Contracting Authorities will be mandated to implement Dynamic Purchasing Systems. Electronic Auctions are assumed will be used for purchasing MRO goods (Maintenance, Repair and Operations goods) by central government institutions.

The Hungarian Government expects that buyer profiles will be used by Contracting Authorities. Moreover, the government intends to introduce national standards for the electronic exchange of data in the public procurement process. The standards considered relevant are XML and EDI - both EAN compatible.

14.3.3 Status of tools

Public procurement portals	So far a central electronic public procurement portal has been established at www.kozbeszerzes.hu. The website is public owned by the Advertising Agency of the Council of Public Procurement. On this site one can reach the relevant public procurement rules, the Hungarian Official Journal in public procurement and the tender notices, recommendations and information of the Council, information on the Council and its working structure (Secretariat), contact details, international related links.
Electronic signature	An electronic signature has been introduced, but currently the signature is used only to a low extent. It is expected that a full operational electronic signature will be ready for use in March 2005. It is expected that the use of the signature will be mandatory for participating in public calls for competition.
Electronic catalogues	E-catalogues are also used to some extent in order to gather information
Electronic auctions	E-auctions are being used below threshold for experimental purpose
Dynamic Purchasing Systems	Dynamic purchasing systems are not being used
Framework agreements	Framework agreements are not used at the moment.

14.3.4 Reference to the relevant legal acts

Information unavailable

14.4 Current usage of electronic means in Public Procurement

14.4.1 Practical use of electronic means in Public Procurement

At the moment there are no operational electronic procurement systems in Hungary that are compliant with the requirements of the forthcoming European Public Procurement Directives.

The Hungarian government expects to carry out assessments during the implementation of electronic public procurement. The activities which will be assessed include the number of electronic transactions and the speeding up of procurement procedures. Other activities for regular assessments are workflow atomization and the professionalism of the system for electronic public procurement.

14.4.2 Which phases of procurement are covered?

The Hungarian Government expects that a fully automated electronic public procurement system will be available within tree years. The system will include the central elements in electronic procurement: notification about tender, publication of tender, management of receipt/submission of tender, evaluation of tender and ordering. Within five years the government anticipates procedures for invoicing to be an integrated part of the electronic procurement system as well.

14.5 Raising awareness & Promotion of electronic means

Information unavailable

15. Ireland

15.1 Organisations and Institutions

The main institution is The Department of Finance, National Public Procurement Policy Unit. It is responsible for policy formulation and the legal framework for e-procurement.

Responsible institution(s) for public procurement policy	Public Procurement Policy Unit, Department of Finance
Responsible institution(s) for legal aspects	Public Procurement Policy Unit , Department of Finance
Responsible institution(s) for technical solutions	Public Procurement Policy Unit, Department of Finance Centre for Management and Organisation Development, Department of Finance Local Government Computer Services Board • A public sector organisation closely aligned with local government in Ireland • Main task is to provide local authorities with the best solutions to meet all their information and communication technology needs ICT bodies within the Health Sector
Central procurement institution(s)	Government Supplies Agency and Office of Public Works
Other important organisations	Information Society Commission
Type of coordination between different institutions	The selection of suppliers is typically a responsibility of the individual public institution. Some coordination exists in parts of the health sector and in third level educational institutions

15.2 Strategy

Strategies on e-public procurement are integrated in an overall strategy on modernising Public Procurement

- "Strategy for the Implementation of eProcurement in the Irish Public Sector" (2001)
- "Modernising Public Procurement" (2003) (See below)

Arising out of the Government's Action Plan on Implementing the Information Society in Ireland the Department of Finance, in conjunction with the Department of the Taoiseach, identified e-procurement as an essential element in eCommerce, having a role in both:

- Accelerating the transition of the Irish economy to an information society
- Contributing to the attainment of the Government objective of modernizing the public service through the development of new, innovative and more efficient procurement processes.

The government has a Strategy for the Implementation of e-Procurement in the Irish Public Sector approved by Government in April 2002. This strategy emphasized the need for procurement management reform, and points out four aspects to implementation of e-procurement in Ireland. These are:

- Capacity building: organisational capacity to strategically manage procurement effort in order to maximize measurable savings and benefits;
- Training and education developing for public sector staff through targeted procurement training and education to sustain measurable improvements in procurement performance;
- Aggregation: reducing costs by leveraging public sector demand in certain markets; and lastly
- e-procurement systems: improving efficiency through the use of cost effective technologies in support of various aspects of procurement.

15.2.1 *Statement of objectives*

The strategy contains a number of key targets to be achieved by the end of 2007. These include:

- Unit cost reductions of 2.5% of total expenditure on supplies and services and works (repairs and maintenance), arising from reductions in off-contract procurement and aggregation of procurement across agencies;
- Average transaction costs reductions of 5% for supplies services and works (repair and maintenance) as a result of standardisation, streamlining and automation;
- Unit cost reductions of 0.5% of total expenditure on capital works arising from savings in professional fees resulting from efficiency gains in the tender process and contract administration;
- Transaction cost related reductions of 0.25% in overall expenditure on capital works as a result of public sector administrative cost savings;
- 90% of tender competitions (above EU thresholds) carried out electronically;
- 80% of payments carried out electronically;
- 10% of all expenditures on supplies and services supported by electronic catalogue and ordering facilities.

15.2.2 *Scope of strategy*

Levels of government involved	All levels of government included in the national strategies on e-public procurement. Projects are planned for development of a separate e-procurement strategy for local and sector level
Legal framework	The two principal sources of regulation that impact on e-public procurement in Ireland are public procurement regulation and eCommerce regulation. • The public procurement legislative framework consists principally of the EC Treaty, the EU Public Procurement Directives (implemented by was of Statutory Instrument into Irish law) and the World Trade Organisation Agreement on Government Procurement. • The principal sources of eCommerce regulation are the Electronic Commerce Directive, the Electronic Signatures Directive and the Electronic Commerce Act, 2000. The Electronic Commerce Act implements the Electronic Signatures Directive and those parts of the Electronic Commerce Directive dealing with the formation of contracts.
Allocated resources	Approximately € 4 million annually from central allocation during implementation stage of national strategy. Some sectoral projects are funded by other sources
Time frame	The Strategy for the Implementation of eProcurement in the Irish Public Sector originally envisaged targets being achieved by end 2007 but this timeframe is currently being reviewed.

15.2.3 *Existing guidelines*

Public procurement guidelines setting out the steps to be followed in conducting an appropriate competitive process under EU and national rules have been issued. These guidelines encourage the use of the national public procurement website www.etenders.gov.ie.

Guides, help and resources are available on the website for awarding authorities and suppliers that wish to participate in e-procurement.

15.3 Legal framework

15.3.1 *Legal status of the use of electronic means in Public Procurement*

None of the current e-procurement systems presently fulfil the requirements of the EU public procurement directives fully, but the necessary investments are expected to be allocated at a later stage.

15.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented by 2005. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, and storage of data.

With the new EU directives it is expected that the Irish the government will provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems and that these will be generally available. Buyer profiles to publish tender-related information on a 'buyer profile' are expected to be used by Contracting Authorities in Ireland

It is also expected that Ireland will introduce national standards for the electronic ex-change of data in the public procurement process.

15.3.3 *Status of tools*

Public procurement portals	www.etenders.gov.ie is the central government procurement portal. It provides information and tools about electronic public procurement and advertises notices for EU and sub-EU threshold contracts for the Irish public sector including central government, local authorities, Health Boards and hospitals, universities and schools. Developments in 2004 will include an electronic "post-box" to facilitate the electronic transmission of tenders by suppliers; site forums for the different sectors involved in public procurement such as central government, local government, health and education; and more comprehensive guidance material. Other features planned for the duration of the current contract include a pilot online tender evaluation system; and a facility to conduct tender clarifications/discussions between buyers and vendors online. Ireland recently became the first country to have "national" eSender status. The etenders website has a facility for the online creation and submission of OJEU notices.
	www.tendersireland.com (Public Sector Tender Market in Ireland) is a website where all of the procurement opportunities advertised by Central and Local Government in Ireland (North and South) are published on the Tenders Ireland Web Site.
	www.go-source.com (Go-Source) is a webguide for doing business in the public sector in Ireland. Three private companies are responsible for this joint directory of public sector procurement opportunities.
Electronic signature	An official digital signature has not yet been introduced in Ireland and it is unclear when one will be introduced
Electronic catalogues	The public authorities have no experience electronic catalogues. Pilot initiatives on national level are recommended in the strategies, e.g. a pilot project on electronic ordering using electronic catalogues
Electronic auctions	The public authorities have no experience with e-auctions

Dynamic Purchasing Systems	The public authorities have no experience with dynamic purchasing systems
Framework agreements	The public authorities plan to set up broad based framework agreements.

15.3.4 *Reference to the relevant legal acts*

Electronic Commerce Act 2000:

- The purpose of the Act is to create a legal framework by providing a comprehensive piece of legislation which addresses many of the legal issues that have arisen as a result of electronic commerce and facilitate the growth of electronic commerce and electronic transactions in Ireland.
- The Electronic Commerce Act, 2000 provides for the legal recognition of contracts, electronic writing, electronic signatures and original information in electronic form in relation to commercial and non-commercial transactions and dealings and other matters, the admissibility of evidence in relation to such matters, the accreditation, supervision and liability of certification service providers and the registration of domain names, and provide for related matters.

15.4 Current usage of electronic means in Public Procurement

15.4.1 *Practical use of electronic means in Public Procurement*

The total non-payroll procurement spending in the non commercial public sector in Ireland is in the region of € 9 billion per annum of which Central government is responsible for approximately 2.4 billion € of procurement, education 1.4 billion €, health 1.9 billion €, and local authorities 3.1 billion € (2001 figures).

Monitoring of the up-take and progress of e-procurement is monitored regularly focusing on the number of users of the eTenders website and the extent of its usage. The site was launched on a pilot basis in March 2001 and three years of operation have seen its usage increase significantly. As of March 2004 there are close to 20,000 registered suppliers and over 1,700 registered Awarding Authority users (buyers). In 2003 close to 4,500 tender opportunities were advertised on the site.

The resources allocated by public authorities to introduce operational public procurement amounts to 4 million € per year at state level for the implementation of the national strategy, of which 2.5 million € are allocated for capital and 1.5 million € for administration, etc.

15.4.2 *Which phases of procurement are covered?*

The status for automating procurement phases in Ireland is as follows:

- Notification about tender (to a large extent today)
- Publication of tender (to a large extent today)
- Provision of contract documents for downloading electronically (to a large ex-tent today)
- Management of receipt/submission of tenders (to a low extent today)
- Evaluation of tenders (not automated, but a pilot system will be established)
- Ordering (to some extent)

- Invoicing (to some extent)

Generally, notification and publication and downloading of tender documents are the phases of public procurement which have been automated the most, whereas management and evaluation are not or only to a low extent automated.

There is generally little experience with electronic auctions and multi-supplier electronic purchasing systems yet. However, the first electronic catalogue, with information on current contract arrangements, has been developed and is expected to be online very shortly.

15.5 Raising awareness & Promotion of electronic means

In September 2003 a new report from the Information Society Commission was published. Modernising Public Procurement indicated that the Government could potentially save up to 1 EUR billion annually on public procurement. This new report was made because of the slow pace of progress since the former strategy was finalized at the end of 2001. It also acknowledges important developments following from among other things the establishment of the National Public Procurement Policy Unit (NPPPU) in the Department of Finance (in 2003). The key recommendations from the report are:

- Resource the National Procurement Strategy adequately
- Enhance the e-tenders website
- Examine alternative delivery models – including PPP
- Support SME adjustment in line with procurement reform.

Forthcoming initiatives:

A “signpost” website, the “Irish Public Procurement Portal”, will shortly be available and this site will contain links to all websites associated with public procurement in Ireland.

16. Italy

16.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	Prime Minister - Cabinet Office (http://www.governo.it) Ministry of Economic Affairs and Finance - MEF (www.tesoro.it) Local Administrations (for example Regions, Municipalities)
Responsible institution(s) for legal aspects	Prime Minister - Cabinet Office (http://www.governo.it) Ministry of Economic Affairs and Finance (www.tesoro.it) Ministry of Innovation and Technology (www.innovazione.gov.it)
Responsible institution(s) for technical solutions	Ministry of Economic Affairs and Finance (MEF) by means of Consip S.p.A. (www.acquistinretepa.it), a State owned company that operates exclusively to serve Public Administrations. The overall mission of Consip is to ensure that every Public Administration employee will be able to order different categories of goods and services online through web-based technologies. Consip (following the MEF guidelines) is responsible for the development and operation of e-public procurement solutions. Ministry of Innovation and Technology (www.innovazione.gov.it) defines/suggest guidelines to implement e-procurement systems. Local Administrations are able and authorized to develop and implement e-procurement systems.
Central procurement institution(s)	Consip S.p.A. (www.consip.it)
Other important organisations	Every Public Administration can develop and implement specific e-procurement systems
Type of coordination between different institutions	The organization of public procurement contains both centralized and decentralized elements: • There is a central public procurement body, but the establishment of procurement bodies at the regional level is planned . • Procurement (selection of suppliers) is the responsibility of the individual public authority.

16.2 Strategy

Since December 1999, the Italian Government has constantly developed and improved a program for public procurement in the Italian Public Administration. It places a high priority on the introduction of operational e-public procurement.

Strategy on e-public procurement is integrated in an overall plan of introducing e-government and integrated into the program of rationalizing public spending for goods and services e.g. “The Public Spending Rationalization Program” (2000) (Programma di Razionalizzazione della Spesa per Beni e Servizi della Pubblica Amministrazione).

This program deals with the following principles and guidelines:

- Defining purchasing strategies
- Drawing up competitive frame contracts for public administrations
- Delivering innovative e-procurement models
- Promoting the use of e-procurement within the public administration
- Providing purchasing monitoring tools to the public administration that use the framework contracts and other e-procurement systems.

16.2.1 Statement of objectives

The overall goals of the e-procurement program are to:

- Limit a potential "digital divide" across society;
- Reduce the expenses of goods and utilities, simplify the buying procedures and improve the transparency, efficiency and the effectiveness of public sector purchases;
- Provide a better service for both buyers and suppliers;
- Improve the transparency, the visibility and therefore accountability of public sector contracting;
- Reinforce the Italian government's commitment to the goals of e-Europe;
- Minimize transaction costs through standardization and to obtain scale economics in selected purchasing areas.
- Goods and services for EUR 12 billion purchased electronically (timeframe: 2000 – 2005).

16.2.2 Scope of strategy

Levels of government involved	Strategies cover all levels of government
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	2000 – 2005

16.2.3 Existing guidelines

Guidelines in support of the different areas have been issued as part of the strategy for e-government e.g. a special guideline for e-public procurement:

- Decree of Republic President n. 101/2002 (Rules to accede and utilize public administration market-places and electronic auctions, guidelines to adopt and utilize electronic advanced signatures).

16.3 Legal framework

16.3.1 Legal status of the use of electronic means in Public Procurement

	Date	**N.**	**Argument**
Legislative Decree	12th February 1993	39	Art.3 – Rules on automated informative systems of public administrations, as laid down in the art.2, co.1, let. mm) of the Law 23rd October 1992, n.421
Law	15th March 1997	59	Art.15, co.2 – Proxy to Government on granting functions to Regions and local Authorities about Public Administration reform and administrative simplification
Decree of the President of the Republic	10th November 1997	513	Regulation on procedures for documents registration and transmission with electronic systems, as laid down in the art.15, co.2, of Law 25th March 1997, n.59
Decree of the President of the Republic	20th October 1998		Rules on procedures on managing of electronic protocol by public administration
Prime Minister Decree	8th February 1999		Technical rules on registration, transmission, duplication, copying and approving of electronic documents
Law Decree	22nd May 1999	185	Implementation of the Directive 97/7/CE on consumer protection
Prime Minister Decree	28th October 1999		Electronic management of internal flow of information of Public Administration
Law	23rd December 1999	488	Financial act 2000
Prime Minister Decree	31st October 2000		Technical rules on electronic protocol - Decree of the President of the Republic 20th October 1998, n.428
Law	23rd December 2000	388	Financial act 2001
Decree of the President of the Republic	28th December 2000	445	Administrative procedure Act
Law	28th December 2001	448	Financial act 2002
Legislative Decree	23rd January 2002	10	Implementation of Directive 1999/93/CEE on the communitarian framework for electronic signature

	Date	N.	Argument
Decree of the President of the Republic	4th April 2002	101	Regulates online auctions and marketplace
Law	24th December 2003	350	Financial act 2004
Law Decree	12th July 2004	168	Amendments on Financial act

16.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2005. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, storage of data and use of specific procedures, e.g. e-auctions, e-catalogues and marketplaces. Others follow the Decree of Republic President n. 445/2002 on administrative documentation, technical rules on electronic advanced signatures and certificated mails.

16.3.3 *Status of tools*

Public procurement portals	The portal www.acquistinretepa.it (Acquisti in Rete[131]; AiR) is the Public government procurement portal. The goal of the e-procurement platform is to improve public procurement and efficiency. The platform facilitates the use of three main tools for public e-procurement: *Electronic Shops, Reversed on-line Auctions* and *The Marketplace.* Furthermore the platform provides information on e-procurement activities already started or about to start as well as to diffuse this information, it provides newsletters, best cases and community on e-procurement.
	Local public procurement portal: Intercent ER is a portal for e-sourcing, which belongs to the Emilia Romagna Region and local public authorities
	Local public procurement portal: Purchasing System Piedmont Region is a portal e-sourcing and e-catalogues, which is owned by the region of Piedmont and the local public authorities www.csi.it
	Local public procurement portal: Marketplace for the Municipality of Florence: http://news.comune.fi.it/cgi-bin/market/index.pl
Electronic signature	Electronic signature has been introduced. Nevertheless the use of a qualified electronic signature is compulsory in e-procurement.
Electronic catalogues	Public Administration procurement system and some Local Administrations uses high quality e-purchasing models such as electronic catalogues.
Electronic auctions	Electronic auctions have been a legal possibility since 2002 and there are numerous experiences both on national and local level.

[131] Translation: ”Purchases on the Net”

Dynamic Purchasing Systems	For purchases under threshold, exists Market Place of Public Administration based on the principles of dynamic purchasing systems
Framework agreements	Framework agreements are similar to dynamic purchasing system (strictly bilateral)

16.3.4 Reference to the relevant legal acts

Information unavailable

16.4 Current usage of electronic means in Public Procurement

16.4.1 Practical use of electronic means in Public Procurement

On an operating level, the government procurement service, through Consip S.p.A. uses high quality e-purchasing models (electronic catalogues, reverse auctions, market place) as well as standard framework agreements for certain types of categories of goods and services.

The total amount of public expenditure in Italy for Goods & Services equals about EUR 97 billion (2002). This amount represents about 15% of overall public spending. In 2003 the Program's activity has been covering about EUR 16 billion. Despite their non-compulsory participation to the program on public spending rationalization, 21% of municipalities are ordering through Consip system. (year 2004 Good & Services EUR 102 billion, Program's activity cover EUR 6,7 billion, 16% of municipalities ordering)

Monitoring of the up-take and progress of e-procurement is followed on an annual basis and reported to the Ministry of Economic Affairs and Finance and Consip S.p.A. respectively. The following aspects are monitored: Number of procurement and e-procurement transactions, electronic public procurement's share of total public procurement volume, type of purchase, transaction costs and number of bidders, number of e-suppliers and number of e-products.

16.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Italy is as follows:

- Notification about tender (to a low extent)
- Publication of tender (to a large extent)
- Management of receipt/submission of tenders (to a low extent)
- Evaluation of tenders (to a low extent)
- Ordering (to a low extent)
- Invoicing (not automated today, but expected to be within three years).

16.5 Raising awareness & Promotion of electronic means

In 2005 one-half of Italy's public expenditure for goods and services is to be spent on offers which were made electronically. In addition, the government wishes to promote e-business in the wider economy – the huge and influential public sector pushing, by example and by insistence, smaller private business into computer usage and hence to e-business.

In the field of electronic exchange of data in the public procurement process, Italy intends to introduce national standards, but they are not yet defined. Some working groups, mainly composed by Local Administrations, are evaluating standards and guidelines.

17. Latvia

17.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	Procurement Monitoring Bureau (PMB), Ministry of Finance. • Started its activity on 1 January 2002, and is a separate government administrative body, supervised by the Ministry of Finance. • Has its own legal personality and its own separate budget. • Is under the control of the Ministry of Finance. The Minister of Finance exercises a supervisory control over the PMB, in respect of administrative procedure. • Monitors the conformity of the state and local government procurement procedures.
Responsible institution(s) for legal aspects	Procurement Monitoring Bureau, Ministry of Finance. • Practically prepares all the draft regulations relating to public procurement matters, although theoretically, the task belongs to the Ministry of Finance.
Responsible institution(s) for technical solutions	Procurement Monitoring Bureau, Ministry of Finance • Fulfilling the duties provided by Law, PMB is also publishing Tender notices and Contract award notices, examining complaints, providing methodological assistance and consultations and compile and analyze the statistical information available.[132]
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	There is no central procurement body, which arranges framework contracts or is responsible for the selection of suppliers. These functions are the responsibility of each individual public authority.

17.2 Strategy

At the present time the development of an operational electronic public procurement system has a medium priority on the political agenda in Latvia.

Significant advantages from the introduction of electronic public procurement are expected in the following areas:

- Lower transactions costs
- Better procurement statistics and enhanced budgetary control
- Lower prices
- Better access for SMEs in accessing and responding to public tenders
- Improving IT skills in public and private sector.

A separate strategy on e-public procurement was adopted on January 29th 2004: "Usage of information technology in the development of a public procurement system" (2004).

[132] See http://www.iub.gov.lv

17.2.1 *Statement of objectives*

It is projected that:

- 33% of all public procurement procedures will be done electronically by 2008
- the government can save EUR 1 million per year after 2008 by undertaking the procurement procedures in the public sector, electronically
- the electronic catalogue will be fully implemented in 2008 e-auctions will be used in 15 % of all procedures by 2008

17.2.2 *Scope of strategy*

The strategy has three focus areas:

- Development of a public procurement portal with the possibility of electronic notification.
- Realization of activities for using e-auctions and electronic catalogues
- Constructions of a central public procurement body

Levels of government involved	The initiatives of the strategy are obligatory for the whole central government; moreover part of the local government will be given a chance to participate in some of the projects
Legal framework	For pilot project changes in legislation are not necessary. Directive 2004/17/EC is implemented in 2004 in Latvia Deadline to the Directive 2004/18/EC implementation time is the end of 2005.
Allocated resources	Approximately EUR 0.5 million has been allocated for the introduction of operational pilot electronic procurement system at national level
Time frame	2004 – 2008

17.2.3 *Existing guidelines*

Guidelines have not been issued

17.3 Legal framework

17.3.1 *Legal status of the use of electronic means in Public Procurement*

There is no legal framework for usage of e-auctions or dynamic purchasing system or e-catalogues in the classical sector, but e-catalogues will be established using framework agreements, but all these methods have been already set in the utility sector procurement legislation.

17.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2005. Public procurement is currently regulated in national legislation by “Law on Procurement for State or Local Government Needs” (July 2001, amended June 2004) and “Law on Procurement for Public Services Providers needs” (October 2004). Electronic means for communication in the public procurement process is already regulated for utility sector.

17.3.3 Status of tools

Public procurement portal(s)	www.iub.gov.lv/ IUB (PMB) is a central e-public procurement portal with online notification of tenders. Moreover limited negotiations procedures are available (you can fill in the forms online); also legislation, statistics and an online Q&A functions can be found on the site (but only in Latvian). IUB (PMB) was introduced in January 2004.
Electronic signature	A qualified electronic signature has not yet been introduced in Latvia, but it is planned to be by the end of 2004. Specifications are not available
Electronic catalogues	There is no experience with e-catalogues
Electronic auctions	There is no experience with e-auctions
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Legislation allows using of Framework agreement in utility and classical sector

17.3.4 Reference to the relevant legal acts

Information unavailable

17.4 Current usage of electronic means in Public Procurement

17.4.1 Practical use of electronic means in Public Procurement

Up-take and progress on electronic public procurement is not monitored on a regular basis.

In the strategy it is assessed to save 2 mio. EUR from centralising and administrative savings. The following aspects are being assessed: number of transactions, electronic public procurement's share of total public procurement volume, types of purchases, speeding up the procurement procedures, transaction costs, and number of bidders

17.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Latvia is as follows:

- Notification about tenders (to some extent today, but a further increase the next three years is expected)
- Publication of tenders (to some extent today, but a further increase the next three years is expected)
- Management of receipts/submission of tenders (not automated and currently not expected to be automated)
- Evaluation of tenders (not automated and currently not expected to be automated)
- Ordering (not automated and currently, but expected to be automated)
- Invoicing (not automated and currently not expected to be automated)

17.5 Raising awareness & Promotion of electronic means

A project named *"Sabiedrikais iepirkumu portāls"*[133] has been launched, which will lead to the establishment of a central e-public procurement portal. For this project, financial and human resources have been made available. The project has started in 2003, and the ambition that has been set is to finalise it by 2004.

This project prepares the set-up of a portal comprising an informational part on legal issues as well as a platform for publication of calls for tender, tender documents and consultation of terms of reference. A first phase only allow publication, facilitating this process for public entities, since the portal automatically transfer calls for tender above threshold to the relevant publication papers, i.e. the Luxembourg written press and EU official journal.

[133] Translation: " Public procurement portal"

18. Lithuania

18.1 Organisations and Institutions

In Lithuania there are three bodies with equal authority in the field of e-public procurement.

Responsible institution(s) for public procurement policy	Ministry of Economy (www.ukmin.lt) Public Procurement Office (www.vpt.lt) • Established under the Government of the Republic of Lithuania to co-ordinate and monitor compliance with the Law on Public Procurement and relevant regulations Information Society Development Committee (www.ivpk.lt) • Was set up in mid 2001, when the Ministries of Communication and of the Interior started to transfer functions of the regulation of information technologies and telecommunications and co-ordination of the development of information society[134]
Responsible institution(s) for legal aspects	Ministry of Economy (www.ukmin.lt)
Responsible institution(s) for technical solutions	Public Procurement Office (www.vpt.lt) • Responsible for development and operation of the forthcoming electronic public procurement system[135] Information Society Development Committee (www.ivpk.lt) • Responsible for the establishment of an e-society in Lithuania including the electronic signature
Central procurement institution(s)	-
Other important organisations	-
Type of coordination between different institutions	Procurement is organized in a decentralized approach. There is no central public procurement body in Lithuania.[136] Public procurement entities can make "centralized" procurements, and they buy big amounts of goods or other supplies at much lower cost and then distribute them to its subsidiaries. For instance Ministry of Interior and Ministry of National Defense have used centralized procurements.

[134] See www.ivpk.lt/main_en.php

[135] See www.vpt.lt

[136] The national law on public procurement does not specify that central procurement bodies can exist at national, regional or local level.

18.2 Strategy

The overall strategy on e-public procurement is an integrated part of a general strategy on modernising the public sector and development of the information society.

Three strategies in the field of information society development and e-government are included:

- *National Concept of Development of Information Society* (Feb. 2001)[137]: Basic tasks in creation of e-government.
- *Strategic Plan for Development of Information Society* (Aug. 2001)[138]: Ensuring progressive development of information society in Lithuania through four priorities: 1) competence of Lithuanian citizens; 2) public administration; 3) electronic business; and 4) Lithuanian culture and Lithuanian language.
- *Long-term Development Strategy of the State* (Nov. 2002)[139]: This strategy clearly emphasizes, that one of the main strategic trends in the field of development of public administration, is establishment and functioning of e-government.

Furthermore, Lithuania has a strategy for Modernising the activities of Public Procurement which is part of the general Government programme. This strategy includes activities in the field of e-public procurement. It involves only central government and focuses on a gradual transformation of public procurement into an electronic environment for adoption of the best EU Member State's practices and creation for the public procurement information system.

18.2.1 Statement of objectives

Electronic public procurement is an area which is highly prioritized by the government of Lithuania. The overall objectives for e-public procurement is to revise the national public procurement legislation, increase transparency and availability of information and develop an electronic public procurement system.

The development of e-government is followed by a variety of specific tasks. The objective here is among other things to deliver public procurement services on the Internet by 2005.

[137] See Vilnius University, Law Faculty, Legal Informatics Center (2003): "Situation of e-government in Lithuania and principles of e-government in Lithuania", Vilnius
[138] See Vilnius University, Law Faculty, Legal Informatics Center (2003): "Situation of e-government in Lithuania and principles of e-government in Lithuania", Vilnius
[139] See "eGovernment Factsheet – Lithuania" at http://europa.eu.int/ISPO/ida

18.2.2 *Scope of strategy*

Levels of government involved	Central government is included in the strategies[140]
Legal framework	Information unavailable
Allocated resources	To cover the development costs of the first phase of CPPP, Public procurement office already has received funding of more than 300.000 EUR this year. As stated in the PPO strategic planning document, expected funding for the development of the CPPP in 2004 should reach approximately 1.150.000 EUR, in 2005 – 3.200.000 EUR and in 2006 - 2.000.000 EUR per year (including the state budget and the European regional develop fund sources).
Time frame	Variable (specific information unavailable)

18.2.3 *Existing guidelines*

Guidelines have not been issued.

18.3 Legal framework

18.3.1 *Legal status of the use of electronic means in Public Procurement*

Rules applicable to communication and storage of data are already regulated by national legislation.

18.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2006.

The use of e-auctions, dynamic purchasing systems etc. is not regulated by the legislation, but the government will provide that contracting authorities may use these procedures. However they will only be allowed for certain types of purchasing expectantly standard goods. The Public Procurement Office will develop e-procurement solutions following all requirements set by the EU e-procurement legislation.

E-auctions and DPS would be available after implementation of new public procurement directives (expected in 2006) and according implementation of technical solutions allowing these procedures.

[140] Based on interview with Mr. Ainis Pumputis, Public Procurement Office

18.3.3 Status of tools

Public procurement portals	A central electronic public procurement portal (CPPP) is expected to be established in the second half of 2004. The functionality of the portal will fulfil the Directive requirements. For the CPPP functionality, implemented in the first development phase, Directive requirements will be met. [141] In 2004 the first phase of Central public procurement portal (CPPP) will be established. However, a central public procurement portal with full functionality will most likely be completed approximately in 2008. Development of the first phase includes fundamental portal functionality (user authorisation system, content management, statistical and analytical functionality), notifications and tender information publishing, and e-catalogues (e-auctions are not planned for the first phase of CPPP development).
Electronic signature	The use of electronic signature has been a legal possibility since 2000.
Electronic catalogues	No experience with e-catalogues
Electronic auctions	No experience with e-auctions
Dynamic Purchasing Systems	No experience with dynamic purchasing systems
Framework agreements	No experience with framework agreements

18.3.4 Reference to the relevant legal acts

No information

18.4 Current usage of electronic means in Public Procurement

18.4.1 Practical use of electronic means in Public Procurement

There is no regular monitoring of the up-take and progress of e-procurement. However a pilot project is being planned. Moreover the government is planning to assess the impact of introducing electronic public procurement within three years when all initiatives on the field have been implemented.

18.4.2 Which phases of procurement are covered?

Specific statistical information about a number of e-public procurement functions will be available following the introduction of the central procurement portal by the end of 2004.

[141] Based on interview with Mr. Ainis Pumputis, Public Procurement Office

18.5 Raising awareness & Promotion of electronic means

The most significant advantage from introducing e-public procurement is expected to be public sector savings through lower prices. Moreover it is expected that the transactions costs will be lowered, and that it will be able to speed the procurement process. Finally SMEs is expected to have better access to public tenders.

19. Luxemburg

19.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	The Ministry of Public Works[142] (www.etat.lu/MTP) The Ministry of Civil Service and Administrative Reform[143] (www.mfpra.public.lu) • The Ministry of Civil Service and Administrative Reform is involved in the function of coordinator of the *e*Luxembourg Action Plan and as pilot ministry for the first phase. The National Information Society Commission[144]
Responsible institution(s) for legal aspects	The Ministry of Public Works (www.etat.lu/MTP)
Responsible institution(s) for technical solutions	*Centre Informatique de l'Etat*, The Ministry of Civil Service and Administrative Reform (www.mfpra.public.lu) (www.cie.public.lu)
Central procurement institution(s)	*Centre Informatique de l'Etat*, The Ministry of Civil Service and Administrative Reform (www.mfpra.public.lu) *Service Central des imprimés des l'Etat*, The Ministry of Civil Service and Administrative Reform (www.mfpra.public.lu) (www.scie.public.lu) • Has developed an electronic catalogue through which different authorities can pass aggregated orders.
Other important organisations	-
Type of coordination between different institutions	The selection of suppliers falls in the responsibility of the Centre Informatique, as far as IT equipment is concerned, and of the individual public authorities for the rest.

19.2 Strategy

The strategy is part of a drive to modernise public procurement in general. It mainly covers central government, although there is a common will to involve local authorities (as well as every organism falling under the national public procurement legislation), which will be obliged to use some functionalities of the new structures while they will be sensitised on the issue in general.

E-public procurement has a high priority in Luxembourg, since it forms part of the action plan *e*Luxembourg (www.eluxembourg.lu), which has been presented to the Government on 26 January 2001. One of the objectives, within the pillar "Putting new technologies at the service of citizens and enterprises as well as civil servants and public organisms", is to promote use of "teleprocedures" by businesses and professionals in communication with public authorities. Under this heading, which implies two phases (one without electronic signature, the second one implying such a signature), e-public procurement activities have been launched.

[142] *Ministère des Travaux Publics*
[143] *Ministère de la fonction publique et de la réforme administrative*
[144] *Commission nationale pour la société de l'information*

19.2.1 Statement of objectives

The objective has been formulated that the whole public procurement procedure from notification to invoicing and accounting should be made electronically accessible by 2005. A feasibility study launched in 2002, of which the conclusions (feasibility within 3 years) have been presented to the Government and have been approved, is considered as the strategy for introducing e-public procurement in Luxembourg. A new strategic paper will be prepared for the new Government which will emerge from the June 2004 elections, taking stock of achievements and setting new objectives. No proper guidelines have been issued, apart from minor communications and recommendations, for instance on the law establishing the possibility to include part of the proposal on CD-ROM with the paper documents.

19.2.2 Scope of strategy

Levels of government involved	Central government is the only level included in the strategy. Representatives of local government and the Health Sector have been consulted for the strategic study.
Legal framework	Legal aspects have been outlined in the strategic study.
Allocated resources	-
Time frame	-

19.2.3 Existing guidelines

Special guidelines for using e-public procurement have not been produced

19.3 Legal framework

19.3.1 Legal status of the use of electronic means in Public Procurement

Information unavailable

19.3.2 Implementation of the Directives

The systems developed will be compliant with the new European public procurement directives; however Luxembourg is expecting to use the full transposition period of 21 months, completing implementation in 2006. Apart from the possibility of electronic publication of calls for competition and the possibility to submit part of the proposal in electronic form, the use of electronic means for communication in public procurement has not been regulated yet in Luxembourg.

Electronic auctions and Dynamic Purchasing Systems will probably be authorised in Luxembourg, and national standards for the electronic exchange of data in the public procurement process, e.g. for submission templates and invoices, will be introduced.

19.3.3 *Status of tools*

Public procurement portals	A project named *"Mise en ligne des Marchés Publics"*[145] has been launched, which will lead to the establishment of a central e-public procurement portal. For this project, financial and human resources have been made available. The project has started in 2002, and the ambition that has been set is to finalise it by 2005. This project prepares the set-up of a portal comprising an informational part on legal issues as well as a platform for publication of calls for tender, tender documents and consultation of terms of reference. It will be tested by the back office in Summer 2004. A first phase will only allow publication, facilitating this process for public entities, since the portal will automatically transfer calls for tender above threshold to the relevant publication papers, i.e. the Luxembourg written press and EU official journal. A second phase will also contain features such as bid receipt with time stamping. No other public procurement portals have been created yet in Luxembourg.
Electronic signature	While no qualified electronic signature has been introduced in Luxembourg to date, a mixed economic interest group consisting of Ministry of Economy officials and representatives of the banking sector is drafting terms of reference for the development of a qualified electronic signature by 2005. However, it is not decided yet, whether the use of a qualified signature will be made mandatory for the next phase of the portal, i.e. electronic submission of tenders.
Electronic catalogues	The central purchasing agency "Service central des imprimés de l'Etat" is using electronic catalogues
Electronic auctions	There is no experience with e-auctions in the public authorities
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems in the public authorities
Framework agreements	No framework agreements are being used in Luxembourg at national level for the time being.

19.3.4 *Reference to the relevant legal acts*

Information unavailable

19.4 Current usage of electronic means in Public Procurement

19.4.1 *Practical use of electronic means in Public Procurement*

Statistics on e-public procurement will be taken in Luxembourg, covering aspects such as number of electronic transactions, number of bidders, types of purchases as well as effect on prices. Ad hoc monitoring will be performed once the system is operational.

[145] Translation: "Public Procurement Online"

19.4.2 Which phases of procurement are covered?

In Luxembourg, the publication phase has been automated to a low extent so far, as well as the reception and evaluation of tenders (if one counts the receipt of part of the proposal on CD-ROM), but the complete public procurement process is expected to be available electronically within the next three years, except for invoicing, which probably will take longer.

19.5 Raising awareness & Promotion of electronic means

Information unavailable

20. Malta

20.1 Organisations and Institutions

The two main institutions in the field are:

- The Central Information Management Unit (CIMU) within the Office of the Prime Minister
- The Department of Contracts within the Ministry of Finance and Economic Affairs is the central procurement body in Malta

Responsible institution(s) for public procurement policy	Central Information Management Unit, Office of the Prime Minister (www.opm.gov.mt)
Responsible institution(s) for legal aspects	Central Information Management Unit, Office of the Prime Minister (www.opm.gov.mt)
Responsible institution(s) for technical solutions	Central Information Management Unit, Office of the Prime Minister (www.opm.gov.mt)
Central procurement institution(s)	Department of Contracts, Ministry of Finance and Economics (www.mfin.gov.mt)
Other important organisations	-
Type of coordination between different institutions	Being the smallest country among the 25 EU member states, Malta has two administrative levels, the national governmental level and the local level, which is governed by local councils. Procurement is organized with a strong role assigned to the central governmental level. The selection of suppliers above the threshold for government is done by the Department of Contracts. The Department of Contracts is also involved in the selection of suppliers at local level for procurement above the threshold, which is done in collaboration between the department and the local councils. Procurement below the threshold at local level is done through evaluation committees operating under the local councils. Framework agreements are used neither at the national level nor at the local level.

20.2 Strategy

The Ministry for Information Technology and Investment has drawn up a programme to ensure the timely implementation of their objectives. The government's efforts in the field of e-public procurement are part of this programme as they are closely related to the third component. Being an integral part of the overall vision, the introduction of e-public procurement has a high political priority.

The government's strategy for the introduction of e-public procurement is integrated in the country's overall strategy on e-government and the development of the information society e.g. "e-Government program" (2000). The part of the strategy concerning e-public procurement is currently being developed and the more precise strategic focus is therefore yet to be determined.

20.2.1 *Statement of objectives*

The overall vision and mission in Malta is to develop a first-class information society. The three main components of the vision are:

- deliver first-class public service
- increase citizen participation in government decision making
- streamline public services and realize efficiency-gains

At present there is no specific, quantitative objectives defined which describe the efficiency gains which the Maltese government expects to achieve through the deployment of e-public procurement.

20.2.2 *Scope of strategy*

Levels of government involved	Central and local are included in the strategy
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

20.2.3 *Existing guidelines*

At a more specific level, Malta has issued a set of guidelines (published 15 April 2004) that relate to the government's recently launched e-public procurement initiative for the procurement of standard office automation hardware and software.

20.3 **Legal framework**

20.3.1 *Legal status of the use of electronic means in Public Procurement*

The government's e-public procurement portal is the first and only e-public procurement initiative in Malta. As described it is aimed at procurement below the threshold and it does presently not comply with the requirements of the forthcoming Public Procurement directive.

20.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2006. The use of electronic means for communication in the public procurement process is presently not regulated by national legislation.

With the new EU directives the Maltese government expects to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems. It is presently not clearly defined whether use will be applied to certain type of purchases or authorities, but the present expectation is that usage will be general and applied to different types of purchases. The same applies to the future use of dynamic purchasing systems.

Concerning the publishing of tender-related information on a ‘buyer profile by contracting authorities, it is expected that this opportunity will be used in the future.

20.3.3 *Status of tools*

Public procurement portals	As of mid-April 2004 the government has launched the first central electronic public procurement portal (www.e-procurement.gov.mt). The portal, which is developed and maintained by CIMU, is seen as the foundation for e-public procurement at the governmental level. The portal enables public officers to acquire IT hardware and software below the threshold and below Lm 2,500. The e-Procurement system will be reviewed and enhanced to include other functionalities including a payment gateway. Private companies may apply to become an Authorised Supplier. Application will be vetted by CIMU and if the company is approved, it will receive a login and password which will enable it to access the system. Following successful completion of a probation period, the company will be awarded the Quality Mark and thereafter become a Quality Mark Supplier.
Electronic signature	Malta has not introduced a qualified electronic signature, as this is presently not allowed by the national legislation. However, it is expected that the legislation will be amended and that a qualified electronic signature will be introduced within the next three years.
Electronic catalogues	There is no experience with electronic catalogues
Electronic auctions	There is no experience with electronic auctions
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Information unavailable

20.3.4 *Reference to the relevant legal acts*

Information unavailable

20.4 Current usage of electronic means in Public Procurement

20.4.1 *Practical use of electronic means in Public Procurement*

There is no figure available on the total volume of e-public procurement as the first e-public procurement portal was launched very recently.
There is presently no assessment of the impact of the introduction of e-public procurement, but it is expected that the impacts will be assessed in the course of the next three years concerning the number of electronic transactions, e-public procurements share of total public procurement volume, types of purchases and the impact on speeding up the procurement procedures. Notably, the security aspect of electronic transactions is an area where regular assessment is considered very important and necessary.
Monitoring of the up-take and progress of e-procurement is presently not carried out.

The resources allocated by public authorities to introducing operational public procurement are not monitored at national level, but government resources have been channeled into the development and maintenance of the recently launched e-public procurement website (precise figure is not available).

20.4.2 Which phases of procurement are covered?

The status for automating procurement phases in Malta is as follows:

- Notification about tenders and publication of tenders have been automated to a large extent
- The management of receipt/submission of tenders and evaluation of tenders have not been automated today and it is not expected to happen within the next three years
- Ordering has been automated to some extent, but expected to be increased within three years
- Invoicing is not automated today but automation is expected to take place within the next three years

20.5 Raising awareness & Promotion of electronic means

Information unavailable

21. Netherlands

21.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Ministry of Economic Affairs (www.minez.nl) - plays a key role in the overall policy formulation in the area of public procurement, including the introduction of operational electronic public procurement, and in the collection of experiences on the ministerial use of electronic tendering. - has recently begun the preparations for the implementation of the forthcoming EU Directives on public procurement, including the development of an outline for a new legal framework for public procurement in general.
Responsible institution(s) for legal aspects	Ministry of Economic Affairs (www.minez.nl)
Responsible institution(s) for technical solutions	Ministry of Economic Affairs (www.minez.nl)
Central procurement institution(s)	Currently no central procurement bodies exist in the Netherlands. A national agency has before been responsible for the overall public procurement, but the agency was abolished due to unsuccessful results. Therefore, the selection of suppliers is typically a responsibility of the individual public institutions.
Other important organisations	-
Type of coordination between different institutions	Public procurement in the Netherlands generally takes place in a decentralised manner. According to the Action Plan (see below), all ministries are to be involved in the introduction of electronic tendering.

21.2 Strategy

The introduction of operational electronic public procurement has a medium priority in the Netherlands. Currently a national programme or strategy within the area of electronic public procurement does not exist. "Action Plan on Professional Procurement and Purchase" (2001), which described a way of working for the national government within the area of public procurement, is currently the main strategic document

The main reasons for the lack of an overall objective or strategy is firstly the absence of a regulated procurement tradition in the Netherlands, and secondly that the Dutch government find it important to integrate a national strategy into the forthcoming EU Directives on public procurement.

The abovementioned Action Plan describes a way of working for the national government within the area of public procurement, and has three main objectives:

1. *Innovative tendering:* Promoting innovation and if necessary, co-operation (cluster formation) by presenting a challenge in the invitation to tender and tailoring the contract forms to this. The government acts as a demanding customer and invites innovative tenders. This is applied on an increasing scale.
2. *European tendering:* Publishing the invitation to tender and, so increasing competition in the market. This creates opportunities for better bids. Furthermore, it is a statutory requirement for government procurement (above certain thresholds). Incentives are needed at this level, as there are shortcomings in compliance.
3. *Electronic tendering:* Publishing announcements and invitations to tender via the Internet, and further deployment of modern information and communications technology (ICT) that supports the entire procurement process.

At the central level, the Action Plan describes a number of steps to be taken among ministries to strengthen inter-departmental co-operation. Among these steps, the ministries will need to publish invitations for tender electronically at the earliest opportunity.

In addition, the central government intranet will need to incorporate en electronic network for buyers and tendering offers, acting as a virtual knowledge centre for professional procurement and tendering. The functions of the electronic procurement network will also need to include a list of buyers and tendering officials at each ministry and a list of planned and current tenders.

Finally, the Action Plan states that the Ministry of Economic Affairs will need to gain experience with electronic ordering and tendering, and place this at the disposal of other parties.

The Action Plan also lists a number of activities, which already has been initiated or implemented. Within the area of electronic public procurement, these activities cover the establishment of a network of professional purchases of the government, including a virtual meeting place (www.PIANOdesk.info), and the setting up of an interdepartmental project team on electronic purchasing.

21.2.1 Statement of objectives

The Dutch government has not yet specified an overall objective for the introduction of operational electronic public procurement in the Netherlands. Scope of strategy

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Significant resources on the introduction of e-public procurement have yet to be allocated
Time frame	Information unavailable

21.2.2 Existing guidelines

Information unavailable

21.3 Legal framework

21.3.1 Legal status of the use of electronic means in Public Procurement

No legal framework for electronic public procurement exists at this moment. Implementation of the new EU Directives on public procurement (see next paragraph) will provide this framework.

To date electronic announcement of tenders is stimulated. With a view to the forthcoming legal framework for electronic procurement some pilot-projects have been executed by individual contracting authorities.

21.3.2 Implementation of the Directives

The forthcoming EU Directives on public procurement are expected to be formally implemented in the Netherlands in 2005. However, additional Dutch requirements will not be implemented before 2007. Currently the use of electronic means in the public procurement process is not regulated by national legislation

With the new EU directives, the government is expected to provide that all Contracting Authorities may use electronic auctions and all other options as indicated in the new EU directives. In addition, Contracting Authorities may and will probably publish tender-related information on a “buyer-profile”.

The Dutch government is currently preparing for the implementation of the forthcoming EU Directives on public procurement. Following these preparations, the Dutch government will develop a more explicit strategy for the introduction of operational electronic public procurement. In this respect, full migration in public procurement to electronic means is considered a realistic and desirable goal within a timeframe of 10 years.

21.3.3 *Status of tools*

Public procurement portals	The Dutch government has recently introduced an electronic procurement website for the use of the construction sector. The site, which can be found at www.aanbestedingskalender.nl, provides an overview of current procurement within the construction sector. The site is however expected to form a template for the development of a central electronic public procurement portal[146]
Electronic signature	The Dutch government has recently passed an electronic signature bill (May 2003), which ensures the transposition in Dutch law of the European Directive 1999/93/EC on a Community framework for electronic signatures, and provides a firm legal basis for the deployment and use of electronic signatures in e-commerce and e-government.
Electronic catalogues	Electronic catalogues have not been used
Electronic auctions	Ministry of Social Affairs and Employment and different local hospitals and health departments have gained experience with e-auctions in pilot-projects.
Dynamic Purchasing Systems	Dynamic purchasing systems have not been used
Framework agreements	-

21.3.4 *Reference to the relevant legal acts*

Information unavailable

21.4 Current usage of electronic means in Public Procurement

21.4.1 *Practical use of electronic means in Public Procurement*

The total impact of introducing electronic public procurement in the Netherlands has not yet been assessed, and the Ministry of Economic Affairs has not agreed on whether the impact will be assessed within the next three years.

Monitoring of the up-take and progress of e-procurement does not take place in the Netherlands yet. However, with the implementation of the forthcoming EU Directives on public procurement, the Ministry of Economic Affairs is expected to do this on a regularly basis (it is not possible to estimate the frequency at this time).

[146] The portal for information and knowledge-transfer for officials in contracting authorities is www.ovia.nl. The portal is also a government initiative. Based on information from Leo Baaijen, Ministry of Economics

21.4.2 *Which phases of procurement are covered?*

Information unavailable

21.5 Raising awareness & Promotion of electronic means

Within this framework, the Netherlands Accreditation Council has recently accredited KPMG Certification to certify ICT service providers for the issuance of qualified certificates for electronic signatures. KPMG has carried out his first certification at PinkRoccade Megaplex, who is the first party in the Netherlands to meet all the requirements. However, it is currently unclear whether the signature will be used in public procurement and whether the use of qualified electronic signature will be made mandatory to participate in public calls for competition.

At the current time, it is still unclear whether the Dutch government intends to introduce national standards for the electronic exchange of data in the public procurement process. However, the government expect to follow the standards mentioned in the forthcoming EU Directives on public procurement.

22. Poland

22.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	Public Procurement Office (www.uzp.gov.pl) • Independent unit within the Polish government, and the main co-ordinating institution on public procurement. • Created on 1 January 1995, following the adoption of the Act on Public Procurement on 10 June 1994. • Pays a policy making and co-ordinating role for the entire Polish public procurement system Elaborates training programs, and organises and inspires training events in the field of public procurement. Ministry of Scientific Research and Information Technology (www.informatyzacja.gov.pl) • Responsible for development and implementation of projects and solutions in the filed of e-public procurement in collaboration with the Public Procurement Office.
Responsible institution(s) for legal aspects	Public Procurement Office (www.uzp.gov.pl)
Responsible institution(s) for technical solutions	Public Procurement Office (www.uzp.gov.pl) • Responsible for developing and operating e-public procurement solutions including the official Public Procurement Bulletin in which public procurement notices are published
Central procurement institution(s)	Public Procurement Office (www.uzp.gov.pl) • Responsible for issuing administrative decisions in response to requests for the application of a procedure other than unlimited tendering
Other important organisations	-
Type of coordination between different institutions	Poland has a decentralized system of public procurement. Every public administration entity is responsible for its own procurement procedures and selection of suppliers. There are no central institutions which purchase on behalf of government or self government entities. However, there is a legal possibility that various public administration units agree to award public procurement contracts together (e.g. IT equipment, vehicles etc.) in order to combine their “purchasing power” and get better prices

22.2 Strategy

The overall vision regarding electronic public procurement in Poland is to ensure efficiency, and general savings in the public administration. An additional objective is to minimizing corruptive behaviour and secure transparency in the public sector activities. In general, electronic public procurement has a medium priority on the national political agenda in Poland.

In order to achieve the objectives Poland has different associated strategies on information society and technology, e-commerce and e-government in Poland. These are reflected in two core projects:

- "Gateway to Poland", State Committee for Scientific Research (2002)[147] is the Polish e-government action plan. Moreover it is an online integrated platform of public administration services available to the public. The platform is expected to increase the efficiency of public administration services by about 40 %.
- "e-Poland – Strategy for the Information Society Development in Poland, 2001-2006", The Ministry of Economy (2001, 2004)[148] is the strategy for development of the information society and includes actions in the fields of e-commerce and on-line public administration. The strategy outlines several planned actions in the period 2001 – 2006 among them a build-out of the Internet service of the Public Procurement Office and introduction of fully electronic procedures for awarding public procurement contracts. For example, it will be required to publish notices relating to public procurement electronically. Furthermore a specific task of the Office of Public Procurement described in the strategy is to introduce fully electronic procedures for awarding public procurement contracts at the latest in 2005.[149]

22.2.1 Statement of objectives

There is a set of overall objectives:

- to ensure efficiency and general savings in the public administration
- to minimize corruptive behaviour
- to secure transparency in the public sector activities

[147] See the State Committee for Scientific Research (www.kbn.gov.pl); and the Ministry of Scientific Research and Information Technology (www.informatyzacja.gov.pl)
[148] See the Ministry of Scientific Research and Information Technology (www.informatyzacja.gov.pl)
[149] "*e-Poland – Strategy for the Information Society Development in Poland, 2001-2006*" (The Ministry of Economy)

22.2.2 Scope of strategy

Levels of government involved	National, regional and local public administration are included in the strategies
Legal framework	Information unavailable
Allocated resources	There is no specific information on this issue
Time frame	Information unavailable

22.2.3 Existing guidelines

Guidelines have not been issued.

22.3 Legal framework

22.3.1 Legal status of the use of electronic means in Public Procurement

The Polish public procurement system was established in 1994 with the adoption of the Act on Public Procurement. Since then the Act has been amended several times mainly with the aim to clarify its rules and definitions, broaden the scope of application and make the procurement process more transparent and to adjust the Polish law to the EU regulatory framework.

Public procurement including E- procurement is now regulated in Poland in the new Law on public procurement (LPP), which entered into force on March 2, 2004. LPP allows among other things use of advanced electronic signature in submission of tenders in public procurement proceeding. The act dealing in general with the use of electronic signature was adopted in Poland in September 2001 and entered into force in 2002. However this legislation does not deal particularly with electronic procurement.
Moreover the Polish legislation also regulates rules applicable to communication and the use of e-auctions.

22.3.2 Implementation of the Directives

The new EU public procurement directives are expected to be implemented in the second half of 2005. Polish legislation on public procurement provides that Contracting Authorities may use e-auctions on purchases of “generally available” goods below of 60.000 EUR.

22.3.3 *Status of tools*

Public procurement portals	**There is no central public procurement portal in Poland, and generally only few activities in the public sector can take place on–line**
	In the private sector two electronic market places among other things deliver the possibility for e-procurement for utilities with low thresholds and therefore not covered by the legislation: • X – Trade (www.xtrade.pl/xtrade) • MarketPlanet (www.marketplanet.pl/en)
Electronic signature	The use of electronic signature in submission of tenders subject to consent of awarding entity has been a possibility in legislation since March 2004 and is required if the tender is submitted electronically. The new legislation equalizes the electronic signature with the written, but it is only used to a low extent in practice
Electronic catalogues	No experience with e-catalogues
Electronic auctions	A few entities in the Polish public sector have experience in organizing e-auctions[150], e.g. a small number of municipalities including the Warsaw Municipality. However the use of e-auctions is not a widespread activity in Poland.
Dynamic Purchasing Systems	No experience with dynamic purchasing systems
Framework agreements	Framework agreements are only allowed in the utility sector.

22.3.4 *Reference to the relevant legal acts*

ACT of 29 January 2004 Public Procurement Law

22.4 Current usage of electronic means in Public Procurement

22.4.1 *Practical use of electronic means in Public Procurement*

The Ministry of Scientific Research and Information Technology has assessed the impact of introducing electronic public procurement. The following aspects are being assessed: Number of electronic transaction, electronic public procurement's share of total public procurement volume, speeding up of procurement procedures, transaction costs, and effect on prices.

There has been no regular monitoring on up-take and progress on e-public procurement in Poland so far, but a more regular statistical monitoring is expected within two years.

[150] Based on interview with Mr. Dariusz Piasta, Public Procurement Office, European In-tegration Department

22.4.2 Which phases of procurement are covered?

IT software to be developed under the project financed from EU funds will cover all phases of public procurement up to award of contracts.

22.5 Raising awareness & Promotion of electronic means

The use of standards for electronic data exchange is a focus area in Poland, but decisions on which and how standards are to be used in the future have not been made. Under the current legislation it is obligatory to use a CPV code when sending notices.

23. Portugal

23.1 Organisations and Institutions

The recently established *Mission, Innovation and Knowledge Unit* (UMIC) is currently the institution driving the development of e-public procurement in Portugal. UMIC is established as a support structure for the development of the Portuguese government's policy for innovation, information society and e-government. UMIC is thus assigned with policy formulation for e-public procurement, the development of e-public procurement solutions and for the legal framework for e-public procurement. The latter responsibility is shared with the Ministry of Finance. In addition to the strong position currently taken by UMIC, the institutional infrastructure is expected to be strengthened through the future establishment of the new institution which will be assigned with the responsibility for public procurement, including e-public procurement.

Responsible institution(s) for public procurement policy	Mission, Innovation and Knowledge Unit, Ministry of Finance (www.min-financas.pt)
Responsible institution(s) for legal aspects	Mission, Innovation and Knowledge Unit, Ministry of Finance (www.min-financas.pt)
Responsible institution(s) for technical solutions	Mission, Innovation and Knowledge Unit, Ministry of Finance (www.min-financas.pt)
Central procurement institution(s)	Whithin the Ministry of finances the Direcção-Geral do Património is the central department which coordinates public procurement for the whole administration, at a national level, launching the adequate framework agreements for a range of goods and services. It also gives its collaboration to UMIC where e-Procurement is concerned and in the study of the legal framework for e-Procurement
Other important organisations	-
Type of coordination between different institutions	Generally public procurement has until now been conducted in a decentralized manner as regards both procurement within the ministries and the entire ministerial level. This means e.g. that when no framework agreements exist the selection of suppliers is typically done by the individual institutions both for procurement above and below the threshold. However, the decentralized model is expected to change in the future with the strategy towards more centralized organization of the procurement within the ministries as well as for the entire ministerial level. There are no central procurement institutions at regional and local levels. The Ministry of Finance is presently in a coordinating role as regards public procurement and as such it functions to some extent as a central procurement body at the national level. In this capacity the Ministry of Finance is responsible for the administration of framework agreements and the selection of suppliers under these agreements.

23.2 Strategy

Electronic public procurement is an area which is highly prioritized by the government of Portugal. The government's strategy for the deployment of e-public procure is outlined in its National e-Procurement Program, which is an integral part of the overall strategy on the development of e-government and the information society in Portugal. The main motives for introducing electronic public procurement are to achieve better control of public sector spending, achieve public sector savings, modernize the public sector, align Portugal with other EU member states and increase the efficiency and competitiveness of the private sector.

The ambitions embedded in the program are illustrated by the government's stated intention to realize savings in the magnitude of 10% - 20% on public procurement costs during the period 2003-2006. This is a direct consequence of the deployment of e-public procurement systems across government institutions at the central governmental level as well at the regional and local governmental levels. E-public procurement systems are expected to be extended across the entire public administration during 2004, and the Portuguese government plans to carry out approximately 50% of its total acquisitions electronically by 2006.

The strategic focus of the national e-public procurement program puts a strong emphasis on the organizational aspects of public procurement as it concerns the establishment of a unit at the national level for e-public procurement and outlines that all ministries should centralize the processes related to e-public procurement.

23.2.1 Statement of objectives

Overall objectives:

- Establishment of an organisation responsible for national e-public procurement
- Centralized procurement within the ministries
- Intention to realize savings in the magnitude of 10% - 20% on public procurement costs during the period 2003 – 2006
- Approximately 50% of total acquisitions to be carried out electronically by 2006

23.2.2 Scope of strategy

Levels of government involved	All levels of government included
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	2003 – 2006

23.2.3 Existing guidelines

Guidelines for e-public procurement have been developed and are integrated into the “National Initiative for Electronic Commerce” (Cabinet Resolution no. 143/2000).

23.3 Legal framework

23.3.1 Legal status of the use of electronic means in Public Procurement

The future legal framework will fully respect the Directives, as the existing legal acts fully respect the Directives in what concerns public procurement

23.3.2 Implementation of the Directives

It is presently not clarified when the forthcoming EU public procurement directives will be implemented into national legislation as the timing will depend on the government’s decision. The use of electronic means for communication in the public procurement process is presently regulated by national legislation which encompasses the rules applicable to communication and the storage of data[151].

With the new EU directives, the Portuguese government expects to provide that Contracting Authorities may use electronic auctions and the expectation is that usage will be general and applied to different types of purchases. It is presently not clarified whether dynamic purchasing systems will be used in the future. Concerning the publishing of tender-related information on a buyer profile by contracting authorities, it is expected that this opportunity will be used in the future, but it is not determined when this will take place.

As mentioned above, the Portuguese government is preparing the launch of a central e-public procurement portal in 2004, and it is expected that the new portal will be in compliance with the forthcoming European public procurement directives.

[151] Decree Law 197/1999 and Decree Law 104/2002

23.3.3 *Status of tools*

Public procurement portals	The launch of a central electronic procurement portal is currently underway (www.compras.gov.pt), which will overtime include and converge the experiences made in the pilot projects.
Electronic signature	The legislation for the introduction of a qualified electronic signature is in place but electronic signatures are not used at present, and it is currently not clear when a qualified electronic signature will be introduced.
Electronic catalogues	Pilot projects on electro e-catalogues have been carried through
Electronic auctions	Pilot projects on electronic auctions have been carried through
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems
Framework agreements	Framework agreements exist and are used at the national level as well as at the regional and local levels. There is no aggregated data available (neither in total amounts nor as percentages of the total volume purchased through framework agreements) but for the Ministry of Finance alone the purchases made through framework agreements amounted to approximately 185 million EUR in 2002.

23.3.4 *Reference to the relevant legal acts*

Information unavailable

23.4 Current usage of electronic means in Public Procurement

23.4.1 *Practical use of electronic means in Public Procurement*

The uptake of e-public procurement is currently not monitored on a regular basis, but this aspect is expected to be monitored at some point in the future once e-public procurement accelerates. There is no figure available on the total volume of e-public procurement as the first e-public procurement initiatives are currently taking place on a pilot scale. UMIC is monitoring the implementation of the e-public procurement pilot projects in the seven ministries and will gather the experiences in terms of the number of electronic transactions, e-public procurement's share of total public procurement volume, the types of purchases undertaken, the effects on the speeding up of procurement procedures, transaction costs and the effect on prices. According to preliminary assessments, the experiences from the pilot projects are positive across the board.

As an example of the concrete experiences made, it can be mentioned that the Portuguese government conducted its first e-procurement pilot auction in November 2003. This initiative, carried out for the Ministry of Social Security and Work and the Ministry of Education, was organized in the framework of the National e-Procurement Program. According to UMIC, the auction attracted 7 companies and over 50 bids, and generated savings of EUR 9,600 in the purchase of paper for the month of December.

This represents savings of approximately 25%, which is consistent with the government's objective of achieving savings between 10% and 20% on public procurement costs between 2003 and 2006.

23.4.2 Which phases of procurement are covered?

Information unavailable

23.5 Raising awareness & Promotion of electronic means

At present seven ministries are implementing pilot projects on e-public procurement and the experiences achieved through these projects will be taken into account in the forthcoming mainstreaming of e-public procurement in the public sector. The involved ministries are: Ministry of Defense, Ministry of Justice, Ministry of Health, Ministry of Social Security, Ministry of Employment and Public Works, Ministry of Finance and the Office of the Prime Minister. Parts of these pilot projects concern the change process towards a more centralized procurement organization within the seven ministries, which is currently ongoing.

Private contractors have so far played an important role for the development of e-public procurement in Portugal as the development of the technical solutions. The operation of the portals, for the pilot projects as well as for the forthcoming central e-public procurement portal, has been contracted out to private companies. This means that the operational costs related to these e-public procurement solutions are underwritten by the users, buyers as well as suppliers, through e.g. transaction fees.

Through the pilot projects, some experience has been gained with electronic auctions and e-catalogues. Electronic auctions have been used in one of the pilot project (see further details below) for products below the threshold. E-catalogues have been used since 1999 for 14 different types of products (e.g. cars, paper, uniforms, fuel, IT hardware and software). There is no experience with multi-supplier electronic purchasing systems similar to Dynamic Purchasing Systems.

As e-public procurement presently is being explored on a pilot project level, none of the phases in the procurement cycle have been automated (i.e. notification about tender, publication of tender, management of receipt/submission of tenders, evaluation of tenders, ordering and invoicing).

The government is expected to introduce national standards for the electronic exchange of data in the public procurement process, but it is at present not clear which standards will be used and when this will happen.

24. Slovakia

24.1 Organisations and Institutions

In general, the responsibility for the implementation of the Information Society in Slovakia is shared between different government departments. Most of the relevant players are primarily working with e-government and the development of the information society and not e-procurement on a specific level. At the present, the main responsibility for information society belongs to the Ministry of Transport, Posts and Telecommunications. However, two players can be identified as the key institutions responsible for the implementation of electronic public procurement in Slovakia: The Office for Public Procurement and the upcoming the Office of the Commissioner for Information Society.

Responsible institution(s) for public procurement policy	Office for Public Procurement • directs the state policy on public procurement and concession procurement and exercises supervision over the public procurement and concession procurement. • notifies the conversion of financial thresholds for the above-threshold methods of public procurement into Slovak currency, etc. • is responsible for the overall responsibility of the future formulation of the Slovakian policies within the area electronic public procurement as well as the development of a legal framework for electronic public procurement. Office of the Commissioner for Information Society • has not yet been established • is expected to play a key role in the coordination of the ministries efforts to create favorable conditions within the area of ICT for the benefit of all segments of the society. This includes the development of the necessary platform for introducing electronic public procurement (access to the Internet, hardware, etc.)
Responsible institution(s) for legal aspects	Office for Public Procurement
Responsible institution(s) for technical solutions	Office for Public Procurement Office of the Commissioner for Information Society
Central procurement institution(s)	Office for Public Procurement
Other important organisations	National Security Authority (NSA) Ministry of Economy
Type of coordination between different institutions	Supra department coordination

24.2 Strategy

There is no specific strategy for introducing or implementing e-public procurement

However, an overall e-government strategy with the aim of introducing electronic services to citizens and business enterprises is currently under discussion. Currently, the general political priority of introducing electronic public procurement has a low priority.

In the meantime, the government focuses its efforts on the creation and development of the general environment for the introduction of operational electronic public procurement, including improving access to the Internet among SME's and the necessary IT-hardware.

The Slovakian government has recently adopted a **National Strategy for the Information Society in the Slovak Republic.** The policy derives from the e-Europe+ initiative and action plan, and defines the main challenges involved in building up an information society. In addition, the policy proposes solutions to the creation of favorable conditions to unleash the full potential of ICT's for the benefit of all segments of the society.

Several ministries are involved in the government's efforts on the creation of favorable ICT-conditions. However, there is no overall coordination among these efforts, which is seen as a weakness in relation to the introduction of electronic public procurement in Slovakia.

The Ministry of Education prepared a Policy for the Information Society in 2001, which among other matters contained a proposal for the establishment of the National Agency for the Information Society in the Slovak Republic. In 2003 coordinator for Information Society was changed from the Ministry of Education to the Ministry of Transport, Posts and Telecommunications.
Consequently, the Ministry of Transport, Posts and Telecommunications is implementing the Action Plan adopted with the National Strategy for Information Society. One of the activities is to establish the Office of the Commissioner for Information Society, which will coordinate the activities in the field of information society and ICT.

24.2.1 Statement of objectives

There are no overall objectives.

The main reasons for the lack of an overall objective or strategies for the introduction of operational electronic public procurement are:

- Fragmented responsibilities between the involved governmental institutions
- Absence of a regulated procurement tradition
- The added value of electronic public procurement is presently considered to be low compared to standard public procurement
- The government awaits experiences within the area of electronic public procurement before launching it in Slovakia
- Lack of capacities/skills within the public procurement institutions to work with electronic public procurement
- Many suppliers (especially SME's) are not ready for electronic procurement.

24.2.2 Scope of strategy

Levels of government involved	Information unavailable
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

24.2.3 Existing guidelines

There are no special guidelines on e-procurement

24.3 Legal framework

24.3.1 Legal status of the use of electronic means in Public Procurement

Currently the use of electronic means for communication in the public procurement process is regulated by Act no. 610 of December 2003 on Electronic Communication, which contains the rules applicable to communication in Slovakia.

The Office for Public Procurement estimates that no operational electronic public procurement systems are currently compliant with the requirements of the forthcoming EC Directives on public procurement.

24.3.2 Implementation of the Directives

The Slovakian government expects to be ready to implement the forthcoming EC Directives on public procurement in 2006.

With the new EU directives, the government is expected to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems.

None of the current e-procurement systems is expected to completely fulfill the requirements of the EU public procurement directives, but the necessary investments are expected to be allocated once the requirements are clear.

24.3.3 *Status of tools*

Public procurement portals	The Slovakian government has not yet established a central electronic public procurement portal, and the Office for Public Procurement is not aware of any other public procurement portals or electronic marketplaces in Slovakia.
Electronic signature	The Slovakian law on Electronic Signature came onto effect in 2002. The certification agency for the institution of electronic signature is currently under the jurisdiction of the National Security Authority (NSA), which has recently begun the accreditation process. The Electronic Research and Project Office is currently the only certification authority entitled to issue electronic signatures. At this time, the electronic signature has therefore not been used in relation to public procurement, and the Office for Public Procurement does not expect the use of a qualified electronic signature to be made mandatory to participate in public calls for competition in Slovakia.
Electronic catalogues	Electronic catalogues have been introduced
Electronic auctions	Electronic auctions have been introduced
Dynamic Purchasing Systems	Dynamic purchasing systems have been introduced
Framework agreements	-

24.3.4 *Reference to the relevant legal acts*

- Act no. 22 of January 2004 on Electronic Commerce
- Act no. 215 of April 2002 on Electronic Signature
- Act no. 428 of July 2002 on Protection of Personal Data
- Act no. 610 of December 2003 on Electronic Communication
- Draft of Act on Information System for Public Administration, which is before approval procedure

24.4 Current usage of electronic means in Public Procurement

24.4.1 *Practical use of electronic means in Public Procurement*

The total impact of introducing electronic public procurement in Slovakia has not yet been assessed. However, the Office for Public Procurement plans to do this in line with the gradual introduction of an electronic public procurement system.

Monitoring the up-take and progress of e-procurement in Slovakia has not yet taken place. However, with the implementation of the forthcoming EC Directives on public procurement, the Office for Public Procurement is expected to do this on a regular basis (it is not possible to estimate the frequency at this time).

24.4.2 Which phases of procurement are covered?

The Office for Public Procurement has elaborated representative standard forms of public procurement notices, which will be sent by Contracting authority to the Office for Public Procurement electronically.

24.5 Raising awareness & Promotion of electronic means

Public institutions and Commercial firms or associations, which promote in the field of Information and Communication Technologies, contribute to raising awareness of using electronic means. There are for example:

- IT Association of the Slovak Republic (ITAS), which represents professional association of the most significant domestic and foreign firms.

25. Slovenia

25.1 Organisations and Institutions

Three entities can be identified as the main institutions responsible for the implementation of electronic public procurement in Slovenia:

- Ministry of Finance
- Government Centre for Informatics (CVI)
- Ministry for Information Society

Responsible institution(s) for public procurement policy	Ministry for Information Society (http://mid.gov.si/mid/mid.nsf) • responsible for information society applications and for information infrastructure including two action plans and the upgrading of the e-Slovenia strategy, the e-government strategy, and the strategy of electronic business in public administration Council for Information Society • a strategic council established by the Prime Minister • deals with strategic issues regarding information society and ICT. • among others, the tasks of SID include monitoring and assessing the implementation of directions in the field of e-commerce and preparing of initiatives and suggestions for managing issues in the field of information society
Responsible institution(s) for legal aspects	Ministry of Finance
Responsible institution(s) for technical solutions	Ministry of Finance Government Centre for Informatics (established in 1993) (www.sigov.si/cvi/eng/)
Central procurement institution(s)	Ministry of Finance
Other important organisations	
Type of coordination between different institutions	Public procurement in Slovenia is in general organised in a mixture of a decentralised and centralised approach.

25.2 Strategy

The introduction of operational electronic public procurement is highly prioritised in Slovenia. In relation to the work on EU accession, this is seen as very important for the Slovenian government to develop an information society that establishes relations between the public administration and the private businesses in order to be fully integrated in the internal market. In addition, the introduction of operational electronic procurement is seen as a very important instrument to control and reduce public sector spending as well as to modernise the public sector in general.

Furthermore, the establishment of an operational electronic public procurement system is seen as an important tool to increase the efficiency and competitiveness of the private sector in Slovenia as well as an instrument to improve the Slovenian alignment on European neighbours.

Initiatives on e-public procurement is integrated in the overall strategy on e-government and development of an information society
Strategic reports:

- "Strategy of E-commerce in Public Administration of the Republic of Slovenia for the period from 2001 until 2004" (2001)
- "Action Plan e-Government Up to 2004" (2002)

The Strategy of E-commerce in Public Administration serves as a basis for all efforts, projects, activities and tasks within the transition of public administration into an information society, with the emphasis on the introduction of electronic commerce as a basic characteristic of an information society.

The strategy contains suggestions for its realisation in the field of e-commerce of public administration through the mechanisms of realisation (procedures of planning, instalment, implementation, supervision) and institutions (organs, bodies). The strategy also refers to the fact that adoption of the Electronic Commerce and Electronic Signature Act (se below) has offered new possibilities for Slovenia in the field of public procurement.

In connection with the overall strategy, a number of programmes and projects have been outlined. Among these, the strategy outlines a programme on the introduction of electronic public procurement, enabling the Government Centre for Informatics and other state organs to transfer the procedures of public ordering into electronic form. The programme includes the following projects:

- Expert system for decision-making support on choosing the most suitable offer (EP-0901)
- Electronic system for submitting orders of smaller value (EP-0902)
- Electronic system for ordering software from chosen suppliers (EP-0903)
- Electronic system for the support of limited procedure for submitting public orders (EP-0904)
- Electronic system for publicising the intention on submitting public orders and chosen suppliers (EP-0905)

25.2.1 Statement of objectives

The overall objective is to remove administrative barriers

25.2.2 *Scope of strategy*

Levels of government involved	All levels of government are included
Legal framework	Information unavailable
Allocated resources	Information unavailable
Time frame	Information unavailable

25.2.3 *Existing guidelines*

Special guidelines have not been issued

25.3 Legal framework

25.3.1 *Legal status of the use of electronic means in Public Procurement*

The amended public procurement act (adopted January 2004) aims at removing administrative barriers by streamlining public contracting procedures, introducing e-operations and the option of centralising procurement and public contracting procedures. One of the key amendments is the introduction of an e-procurement system, including the establishment of an information portal.

25.3.2 *Implementation of the Directives*

The forthcoming EC Directives on public procurement are expected to be implemented in Slovenia in 2006. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, storage of data and use of specific procedures, e.g. e-auctions.

With the new EU directives, the government is expected to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems.

None of the current e-procurement systems is expected to fulfil the requirements of the EU public procurement directives fully, but the necessary investments are expected to be allocated once the requirements are clear.

25.3.3 *Status of tools*

Public procurement portals	Expected establishment of an information portal, where contracting authorities will need to publish public procurement notices. The aim is that the portal will be set up within in 2005
Electronic signature	The Electronic Signature in Slovenia is regulated by the Electronic Commerce and Electronic Signature Act[152] and the Decree on Conditions for Electronic Commerce and Electronic Signing. The main significance of the Act is that under special conditions it extends the same validity to the electronic signature as the autographic signature has in the paper world.
Electronic catalogues	In the phase of starting the project
Electronic auctions	Some government authorities have experience with electronic auctions
Dynamic Purchasing Systems	Dynamic purchasing systems are not being used
Framework agreements	Information unavailable

25.3.4 *Reference to the relevant legal acts*

Electronic Commerce and Electronic Signature Act
Decree on Conditions for Electronic Commerce and Electronic Signing

25.4 Current usage of electronic means in Public Procurement

25.4.1 *Practical use of electronic means in Public Procurement*

The total impact of introducing electronic public procurement in Slovenia has not yet been assessed, but the Ministry of Finance plans to do this within the next three years.

Monitoring of the up-take and progress of e-procurement is monitored on a regular basis by the Government Centre for Informatics and the Ministry of Finance

25.4.2 *Which phases of procurement are covered?*

Information unavailable

[152] The Act is entirely in accordance with the provisions of the United Nations' Commission or the International Trade Law's Model Law of the electronic commerce and with the provisions of the primary European legislation. It also includes all the provisions of the Directive 1999/93/EC concerning common framework of the Community for electronic signatures.

25.5 Raising awareness & Promotion of electronic means

The Slovenian government intends to introduce national standards (Open Source XML) for the electronic exchange of data in the public procurement process.

26. Spain

26.1 Organizations and Institutions

Responsible institution(s) for public procurement policy	Ministry of Economy and Finance (http://portal.minhac.es/Minhac/Home.htm) Ministry of Public Administration (www.map.es) Ministry of Trade, Industry and Tourism (www.mcyt.es)
Responsible institution(s) for legal aspects	Ministry of Economy and Finance (http://portal.minhac.es/Minhac/Home.htm) Ministry of Public Administration (www.map.es) Ministry of Trade, Industry and Tourism (www.mcyt.es)
Responsible institution(s) for technical solutions	Responsible for centralized procurement: Directorate of State Patrimony, Ministry of Economy and Finance (http://catalogopatrimonio.minhac.es)
Central procurement institution(s)	There is currently a Centralized Procurement System of goods and services which can be used by central administrations, as well as by Autonomous Communities and local administrations (http//catalogpatrimonio.minhac.es)
Other important organisations	-
Type of coordination between different institutions	Purchasing operations can be organized both centralized and decentralized. Centralized operations of goods and services are carried out through the central public procurement system (amount to around 900 million EUR). The remaining part of public procurement is under the responsibility of each individual institution.

26.2 Strategy

The Ministry of Public Administration is currently working on a strategy for the provision of e-public services in the coming years.

The Directorate of State Patrimony under the Ministry of Economy and Finance has designed a plan for centralized procurement system, which will be implemented by the end of 2004. Such a system will enable to achieve all phases of procurement electronically under the Centralized Procurement System, from the tender to the delivery phase.

26.2.1 Statement of objectives

The objective is that all transactions can be achieved electronically under the Centralized Procurement System in the course of 2005.

26.2.2 *Scope of strategy*

Levels of government involved	National and regional government are included
Legal framework	Law of Public Administration Contracts
Allocated resources	1.5 million EUR has been invested in the Centralized Procurement System during 2003-2004.
Time frame	2003-2005 (Centralized Procurement System)

26.2.3 *Existing guidelines*

Information unavailable

26.3 Legal framework

26.3.1 *Legal status of the use of electronic means in Public Procurement*

There are two relevant provisions:

- Law of public administration contracts
- Law of e-signature

A Ministerial decree is currently in the editing process. It will establish the criteria for use of electronic and telematic means in public procurement, and will be published during the last trimester of 2004.

26.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented in 2005.

The use of electronic means under public procurement will be delimited in the last semester of 2004.

With the new EU directives it is expected for the government to provide that Contracting Authorities may use electronic auctions and dynamic purchasing systems. It is also expected that buyer profiles to publish tender-related information will be used in Spain.

The current e-public procurement system in Spain needs only few changes to be compatible with the Directive’s requirements.

26.3.3 *Status of tools*

Public procurement portals	The Centralized Procurement System of goods and services can be used by central administrations, as well as by Autonomous Communities and local administrations. http://catalogopatrimonio.minhac.es
Electronic signature	An advanced electronic signature has been implemented and is used both in the central administration and in some of the Autonomous Communities
Electronic catalogues	Electronic catalogues of goods and services have existed within the central State Administration since 1997. They are also available for the local communities and administrations.
Electronic auctions	-
Dynamic Purchasing Systems	There is no experience with dynamic purchasing systems in the public administration
Framework agreements	In the Central State Administration, the Central Procurement System relies on framework contracts.

26.3.4 *Reference to the relevant legal acts*

Information unavailable

26.4 Current usage of electronic means in Public Procurement

26.4.1 *Practical use of electronic means in Public Procurement*

Electronic means are used to some extent in connection with procurement of goods, whereas it is only used to a low extent in connection with services. There are no available data in relation to works.

Monitoring of the up-take and progress of e-procurement is monitored on a yearly basis. However, at this stage no data pertaining to the quantitative impact are available.

26.4.2 *Which phases of procurement are covered?*

The status for automating procurement phases in Spain is as follows:

- Notification about tender (To a low extent today, expected to be within 3 years)
- Publication of tender (To a large extent today)
- Management of receipt/submission of tenders (To a low extent today)
- Evaluation of tenders (To some extent today, expected to be within 3 years)
- Ordering (N/A)
- Invoicing (N/A)

In the Central Procurement System, notification and publication of tenders, as well as provision of legal and technical information have been implemented since 2001. The remaining procurement phases except invoicing will be made electronic at the end of 2004.

26.5 Raising awareness & Promotion of electronic means

The Ministry of Public Administrations announced in October 2004 the launching of a plan to develop a system of public tenders online.

The Department of Centralized Procurement (Directorate of State Patrimony, Ministry of Economy and Finance) has developed a project of electronic tenders (from publication to contract signature) for operational goods (personal computers, furniture, cars etc.) and for public administrative services.

Both the central, regional and local administrations have access to this system and can purchase online from any computer located in the administration with a login and an advanced e-signature. Moreover, the system can deliver at any moment a picture of the advancement of ordered goods and services. Currently, 2,200 public institutions have access to this system.

The system also enables the economic operators to respond to the tender online. The bidders are entitled the access their catalogues, so that they easily can modify the description or add prices, products etc. The project has come to an end and is being implemented.

27. Sweden

27.1 Organisations and Institutions

Responsible institution(s) for public procurement policy	National Board for Public Procurement (Nämnden för offentlig upphandling, NOU, www.nou.se), Ministry of Finance • Central government agency under the Ministry of Finance. • Responsible for policy formulation in the area of e-procurement. • NOU is also responsible for day to day operations and for contacts with contracting entities, other organisations and individuals.
Responsible institution(s) for legal aspects	National Board for Public Procurement (Nämnden för offentlig upphandling, NOU, www.nou.se), Ministry of Finance
Responsible institution(s) for technical solutions	Each organisation, central authority, municipality, county council, is responsible for their own solution. Each organisation can follow the specifications, SFTI, but it is not mandatory[153]
Central procurement institution(s)	Swedish Agency for Public Management (Statskontoret)
Other important organisations	The Swedish Association of Local Authorities (Svenska Kommunförbundet) The Swedish Federation of County Councils (Landstingsförbundet)
Type of coordination between different institutions	Public procurement in Sweden is decentralized. However central and local authorities collaborate in different ways. Central authorities, county councils and municipalities work together in a Committee under the name of Single Face To Industry (SFTI). Its programme covers activities like awareness and promotion of eProcurement, development of standards and working practices and support to suppliers The Swedish government has established a co-ordination function for government procurement under The Swedish Agency for Public Management, with one of its main tasks being to coordinate framework contracts for central government authorities. Today, 12 procurement responsible authorities are working together with the co-ordination function in the system for framework purchasing. The system includes some 100 product areas, e.g. for stationery, cars, PC's and furniture[154]

[153] This is the result of a decentralized structure of the Swedish public sector. County councils and municipalities are independent. Central government authorities have budget and goals they must achieve but within that framework they can make their own decisions, for example about technical solutions. Therefore, there are many technical solutions and a somewhat market driven development; progress is dependent on collaboration. Based on information from Irene Andersson, The Swedish Agency for Public Management

[154] Based on information from Irene Andersson, The Swedish Agency for Public Management

27.2 Strategy

The goal of the Swedish Government's IT policy is to make the country a leading information society for all. Electronic commerce including electronic procurement is one area prioritized by the Government because it is an important medium for increasing rates of growth.

Work has taken place at the national level since the mid-1990's to facilitate the introduction of electronic procurement in the public sector.

The Swedish Government has made a commitment to take various measures to stimulate the development, and use, of electronic commerce. The role of the state is to ensure that electronic commerce is developed in a way that benefits both business and consumer. To encourage electronic commerce, the state must be aware of progress in the area, and work towards solving any problems. The Swedish IT policy is based on the principle of market-driven development. The tasks of the public sector are thus to ensure that regulation is in place, but also to set a good example by being progressive in terms of e-procurement, which can help to create a beneficial and more mature climate for e-commerce in general.

Initiatives on e-public procurement are an integrated part of different policies on adoption of the information society, among different publication is:

- "An Information Society for All, a publication" (2004), which is about the Swedish IT-policy

27.2.1 Statement of objectives

While the Swedish government has worked for a number of years to introduce and advance public e-procurement, it has not been possible to identify recent specific objectives in the area due to a decentralised organisation of activities on e-public procurement.

27.2.2 Scope of strategy

Levels of government involved	Only central government is included in the strategy
Legal framework	The national law on public procurement and national law implementing the EC-directives on electronic commerce
Allocated resources	Resources have been spent but there is no information available on the total amount due to the decentralized organisation.
Time frame	Authorities set their own time frames

In order to remove obstacles to the use of electronic signatures, the Swedish government has appointed a working group with the task to conduct a survey of form requirements (e.g. provisions that a communication or documentation must be signed or in writing). The WG presented a report in April 2003, revealing some 800 provisions that do not allow electronic communication or signatures, 180 of which were deemed to be unnecessary obstacles. Each Ministry is responsible for carrying out the necessary changes in legislation.

27.2.3 Existing guidelines

Guidelines have been issued, www.eh.svekom.se/mer/litteratur.html, even though no guidelines from central government.

27.3 Legal framework

27.3.1 Legal status of the use of electronic means in Public Procurement

Some of the current e-procurement systems are assessed as already meeting the requirements of the EU public procurement directives fully.

27.3.2 Implementation of the Directives

The forthcoming EU public procurement directives are expected to be implemented in 2005 and come into force in 2006. The following areas of use of electronic means in the public procurement process are already regulated by national legislation: rules applicable to communication, storage of data and use regarding security (such as electronic signatures).

In Sweden the drafting of the new public procurement legislation has just begun by appointing a committee and experts. The first proposal to a new legislation shall be given in February 2005. Any proposals concerning competitive dialogue, electronic auctions and dynamic purchasing systems can be reported at the latest on June 1st 2005. The final version will be finished during the summer of that year. The group is wide and contains representatives from the main ministries involved and representatives for contracting authorities, supplier and service providers. SMEs, labour unions and an environmental organisation are represented[155].

27.3.3 Status of tools

Public procurement portals	The Swedish government has not established any central electronic public procurement portals as this is deliberately left up to private operators. Several privately owned and operated portals exist instead. Opic and Ajour are two of them that concentrates on public procurement.
	www.opic.com Private portal with information on public tenders. Functionalities are notice and publication of tenders
	www.ajour.se Meeting point for authorities and procuring entities searching for suppliers. The company is a distributor of information about public procurement gathered through a vast and well established network of purchasers. All calls for tenders are structured and distributed through two channels, the printed version AnbudsJournalen and the database www.ajour.se. The functionalities are notices and publication of tenders.

[155] Based on information from Irene Andersson, The Swedish Agency for Public Management

Electronic signature	There are five framework agreements with five suppliers offering electronic signatures in Sweden, but e-signatures are so far only used to a low extent in relation to public procurement. There are no plans to make the use of a qualified electronic signature mandatory to participate in public calls for tenders in Sweden
Electronic catalogues	Electronic catalogues are used in relation to purchase of goods. Some suppliers when submitting a bid they refer to electronic catalogues and give discount on the prices given in these catalogues.
Electronic auctions	E-auctions are not being used.
Dynamic Purchasing Systems	Dynamic Purchasing Systems are not being used.
Framework agreements	Framework agreements are widely used. Framework agreements and electronic catalogues are often combined.

27.3.4 Reference to the relevant legal acts

The act on Public Procurement, www.nou.se/loueng.html

The Act on Electronic Signatures, Lag (2000:832) om kvalificerade elektroniska signaturerhttp://www.pts.se/Sidor/sida.asp?SectionId=1011

The directive 2001/115/EC harmonising the VAT invoicing rules has been implemented in the 3 laws that were affected.

27.4 Current usage of electronic means in Public Procurement

27.4.1 Practical use of electronic means in Public Procurement

According to a survey conducted in 2003, only 15 out of 241 central government authorities had introduced electronic ordering and invoicing, with a further 7 having initiated pilot projects. 76% of the central government authorities indicated that they had no immediate plans to introduce e-procurement. There are no figures to relate to the extent or up-take of e-procurement or the intentions to introduce e-procurement of the individual authorities with the volume of procurement carried out by those authorities.

The survey also showed that 83 of 290 municipalities have introduced systems for electronic procurement in some form, and according to information made available by the Swedish Ministry of Finance, 75 municipalities and 10 counties presently have solutions in place for electronic ordering and invoicing. A further 50 municipalities are planning to introduce electronic procurement, of which 35 have already initiated pilot-studies. Over 70 municipalities envisage the introduction of electronic procurement over the next few years. Of the municipalities that have introduced electronic procurement, they have mainly purchased food and office material.

The total public procurement in Sweden amounts to about SEK 400 billion. Central government is responsible for approximately SEK 85 billion.

The Swedish Agency for Public Management was in 2003 tasked by the government to carry out a yearly monitoring in cooperation with the Local Government Association of the up-take and progress on electronic public procurement. The monitoring is carried out as a web-based questionnaire which is distributed to contracting authorities. The Agency has also presented an action plan concerning electronic procurement. One goal is to a 50 % increase in the use of electronic procurement between 2004 and 2006.

The most significant advantages from the introduction of electronic public procurement for public authorities are expected to be:

- Speeding up of procurement procedures
- Lower transaction costs
- Better procurement statistics and enhanced budgetary control
- Correct prices
- Better usage of existing framework agreements

27.4.2 *Which phases of procurement are covered?*

The status for automating procurement phases in Sweden is as follows:

- Notification about tender (to a large extent today, both above and below threshold value)
- Publication of tender (to a large extent today, both above and below threshold value)
- Management of receipt/submission of tenders (to some extent today, but expected to be increased within the next three years)
- Evaluation of tenders (automated to some extent
- Ordering, increasing, particularly within regional and local authorities
- Invoicing, increasing, particularly within regional and local authorities

Generally, evaluation and management of receipt/submission of tenders are the phases of public procurement that have been automated the least.

Many municipalities are scanning their invoices and they are also developing solutions to be able to handle flows of invoices.

Some phases are not mentioned, for example planning before the start, dissemination of contract information and follow-up incl. statistics. The Swedish Agency for Public Management will in October 2004 open a website with information about all central framework agreements, www.statskontoret.se.

Procuring entities are reluctant to use new methods in procurement unless they feel assured that they comply with the legal framework.

27.5 Raising awareness & Promotion of electronic means

The main objectives appear to concern the development of the standard of Single Face to Industry: In the mid-1990’s, the Swedish experts from national, regional and local agencies started to work on a set of standards called ‘Single Face to Industry’ (SFTI, www.eh.svekom.se). SFTI is an industry standard for electronic commerce in the public sector in Sweden. The purpose of SFTI is to establish a single set of specifications for the interchange of electronic commercial transactions with all public operators, whether at governmental, regional (county council) or local community level.

To achieve this, a platform of co-operation has been organized where representatives for all three levels meet with representatives for the suppliers to develop a shared view of the public procurement processes and agree on common specifications. The objective is that pre-planning, the procurement process, ordering, and the invoicing process shall be done electronically. The processes shall follow the standards that have been produced and adopted under the SFTI concept. It is built on EDI-messages according to the EDI-FACT standards, and can be used along with other standards.

Some recent developments are based on ebXML.

28. United Kingdom

28.1 Organisations and Institutions

The main institutions in the field are:

- The Office of Government Commerce (OGC)
- The Improvement and Development Agency (IDeA)

Responsible institution(s) for public procurement policy	Office of Government Commerce (OGC; www.ogc.gov.uk) is an independent Office of the Treasury reporting to the Chief Secretary.
Responsible institution(s) for legal aspects	Office of Government Commerce (OGC; www.ogc.gov.uk)
Responsible institution(s) for technical solutions	Improvement and Development Agency (IDeA) was established by and for regional and local government in April 1999. The mission is to support self-sustaining improvement from within local government. The IDeA has given local authorities in England and Wales the means to enhance traditional methods of procurement, through IDeA marketplace (www.idea.gov.uk/marketplace/).
Central procurement institution(s)	OGC Buying Solutions (www.OGCbuyingsolutions.gov.uk)
Other important organisations	NHS Purchasing and Supply Agency - responsible for ensuring that the National Health Service makes the most effective use of its resources by getting the best value for money possible when purchasing goods and services. Defence Procurement Agency - an executive agency of the Ministry of Defence, whose task is to procure the equipment for the UK Armed Forces. Small Business Service (SBS)
Type of coordination between different institutions	Procurement is organized as a mixture of a centralized and decentralized approach: • There is a central public procurement body, OGC Buying Solutions. It arranges framework contracts, which can be used by all public authorities in UK. However, the individual public authority is free to arrange individual framework agreements. • Procurement (selection of suppliers) is a responsibility of the individual public authority. • The total procurement through national framework contracts (OGCbuyingsolutions) is approximately 16 million pounds (0.1% of central government procurement). Figures for regional and local level are unknown.

The devolved authorities in Scotland and Wales have their own eProcurement initiatives.

28.2 Strategy

The overall e-procurement vision of the UK government is that all central civil government purchasing transactions should be able to be transmitted securely over the Internet between government and suppliers using interoperable systems based on open standards.

On the national political agenda, the introduction of operational e-public procurement has a medium priority. This reflects a recent increase of priority to this area driven by focus on more efficient procurement procedures.

A specific e-procurement Strategy for Central Civil Government from 2002 exists

It is composed by several strategic documents/sites on www.ogc.gov.uk. It is a central government strategy, but it is an inspiration for regional and local government as well. The strategy is composed of three main elements:

- The Establishment of Framework Agreements: to procure Commercial Off The Shelf (COTS) tools for interoperable systems to e-enable the procurement and sourcing processes, for example electronic tendering, auctions and payment solutions.
- Change Management: to influence policy direction and best practice and to establish a common approach for central civil government over the next 3 years; to help departments/agencies in understanding their business profiles, their procurement needs and in preparing their business cases (e.g. eProcurement Assessment Tool).
- Carrying out a feasibility study for an eHub examining how a single point of entry using common standards of communication language and coding convention might provide a data translation service between government and supplier systems, enable an improved commercial dialogue with suppliers and provide improved management information to government. The development name for this project is Zanzibar.

28.2.1 Statement of objectives

The government has specified an overall objective for the introduction of operational public procurement. The core objective is that:

- Web-enabled tools and techniques shall deliver 250 million pounds value for money improvements to government's commercial relationships during April 2003 – March 2006 (http://www.ogc.gov.uk/index.asp?docid=2364).
- 50% of citizen-facing transactions should be capable of electronic delivery by 2005 and 100% by 2008 (see also UK Online Strategy on www.citu.gov.uk).

28.2.2 *Scope of strategy*

Levels of government involved	Central, regional and local government are included
Legal framework	Information unavailable
Allocated resources	Resources have been spent but there is no information on the amount
Time frame	Information unavailable

28.2.3 *Existing guidelines*

Special guidelines for electronic public procurement have been issued:

- "E-procurement cutting through the hype – A guide to eProcurement for the public sector"; OGC; October 2002
- "Electronic Reverse Auctions"; OGC.

28.3 Legal framework

28.3.1 *Legal status of the use of electronic means in Public Procurement*

It is not known whether the current e-procurement systems will fulfil the requirements of the EU public procurement directives fully, but in forthcoming developments the requirements of the directives will be fully taken into account.

28.3.2 *Implementation of the Directives*

The forthcoming EU public procurement directives are expected to be implemented by the end of January 2006. The following areas of use of electronic means in the public procurement process will be regulated by national legislation: rules applicable to communication, storage of data and use of specific procedures, e.g. e-auctions.

The UK intends to implement the articles of the new EU directives relating to electronic auctions and dynamic purchasing systems, allowing Contracting Authorities to make use of them. Electronic auctions are expected to be used in particular. Buyer profiles to publish tender-related information on a 'buyer profile' are being used by Contracting Authorities in UK.

28.3.3 Status of tools

Public procurement portals	www.OGCbuyingsolutions.gov.uk is the central government procurement portal. It provides information and tools about electronic public procurement and framework agreements, but not yet functionalities of electronic tendering and purchasing[156]
	From CSARSS.NET – the Regional Supplies Service e-procurement site (www.csarss.net) firms and individuals can access potential public procurement business opportunities. On the site suppliers can register company de-tails and login and access procurement opportunities offered by the entire public sector.
	www.supplyinggovernment.gov.uk. Together with the Small Business Service (SBS), OGC has also launched a website – Supplying Government. This website provides a single point for information on selling to government and an access point to advertised contracts, as well as details of the West Midlands SME Procurement Pilot
Electronic signature	An official electronic signature has not been introduced in UK yet, but a pilot project has been conducted by the e-envoy[157] (www.e-envoy.gov.uk). UK is waiting on the EU directives to be finalized, and a digital signature is expected to be introduced within two years
Electronic catalogues	Amongst OGC Buying Solution's e-procurement initiatives, S-Cat and GCat. Both are designed to be used by public institutions (buyer-side) such as Government departments, Agencies, Local Authorities, Educational establishments, Police Forces, NHS bodies, public and privatised Utilities. • S-CAT is a web catalogue giving access to more than 170 service providers. S-Cat has 16 discrete Service Categories covering both IT and Business Consultancy Services. Examples are: IS Strategy Development (1) and Programme and Project Management (2). Before registering at S-CAT, suppliers have passed a tendering and evaluation process, meaning Public Sector discounts has already been negotiated for buyers. • GCAT is an online catalogue with more than 50.000 IT & Telecommunication products. GCAT provides functionalities for online ordering and online payment.

[156] The 'Zanzibar' project, a purchase to pay marketplace, is expected to be launched in 2005.
[157] Now the e-Government Unit

Electronic auctions	A number of public authorities in the UK have already gained experience with electronic auctions, and although expanding rapidly the use is not widespread. In addition to the earlier mentioned guidelines on electronic auctions, the OGC has provided public authorities with an eAuction Decision Tool to evaluate whether an eAuction is suitable for an intended procurement. A dynamic purchasing system has so far not been developed. Both eAuctions and dynamic purchasing are expected to increase with the implementation and greater understanding of the new EU public procurement directives.
Dynamic Purchasing Systems	-
Framework agreements	Framework Agreements are already used extensively in the UK either through central bodies such as OGC Buying Solutions or established directly by government departments and agencies.

28.3.4 Reference to the relevant legal acts

Information unavailable

28.4 Current usage of electronic means in Public Procurement

28.4.1 Practical use of electronic means in Public Procurement

The total public procurement in the UK is approximately 100 billion pounds. Central government is responsible for approximately £16 billion of procurement; the rest is the responsibility of regional and local authorities, including the health care system.

Monitoring of the up-take and progress of e-procurement is monitored on a 6-monthly basis by a questionnaire to all government departments. The following aspects are monitored: Number of procurement transactions and transaction costs, use of various eProcurement tools, and savings achieved. The monitoring is kept as simple as possible to ensure that public institutions actually use it.

The resources allocated by public authorities to introducing operational public procurement are not monitored at national level, but development and maintenance of OGCbuyingsolutions.gov.uk amounts to 16.5 million pounds alone.

28.4.2 Which phases of procurement are covered?

The following is the estimated status for automating procurement phases in the UK:

- Notification about tender (not automated today, but expected to be within three years)
- Publication of tender (to a low extent today, but expected to be within three years)
- Management of receipt/submission of tenders (to a low extent today, but expected to be within three years)
- Evaluation of tenders (not automated, but expected to be within three years)
- Ordering (to some extent, but expected to be within three years)
- Invoicing (to a low extent, but expected to be within three years).

Generally, repetitive purchasing is the phase of public procurement that has been automated the most, whereas individual contracts and invoicing are only automated to a low extent. Repetitive purchasing is done via individual systems for each contracting authority based on technology such as EDI and by use of electronic catalogues.

28.5 Raising awareness & Promotion of electronic means

Within the e-Government Interoperability Framework (e-GIF), UK has standardized a number of areas related to electronic public procurement, including XML schemes, metadata, GCL (Government Category List) and Government Data Standards Catalogue. Zanzibar will provide further standards in the area of electronic procurement.

1. Introduction

1.1 Background, Objective and Methodology

This report contains Part 2 of the Impact Assessment on an Action Plan on e-Public Procurement. The report is carried out by RAMBOLL Management for the Internal Market Directorate-General.

To understand the objective of the impact assessment it is necessary to consider the broader political context, namely the realization of the *Lisbon objectives*: the European Council has set the overall target to develop Europe as the world's most dynamic and competitive economy by 2010. The underlying rationale behind the introduction of e-public procurement is to function as a mean that can improve the functioning of the internal market in the EU work and thereby make a contribution to the realization of the Lisbon objectives. The time horizon for assessing the potential impact of various policy instruments is defined as 2010 in order to align the impact assessment with the objective outlined by the European Commission, which states that "Generalised e-procurement should be achieved by 2010".

This broader context created by the Lisbon objectives means that all possible policy instruments should be assessed in light of their ability to contribute to a better functioning internal market in the EU and thereby to the realization of the Lisbon objectives.

The impact assessment consists of three main elements:

First, ***the baseline scenario***, which is a projection of the current main development trends in the field of e-public procurement based on the findings of Part 1: The baseline analysis.

The basic assumption of the baseline scenario is to provide an assessment of the development of main trends and factors related to e-public procurement until 2010 as they would seem likely to unfold under the influence and dynamics resulting from the transposition of the new public procurement directives into national legislation across the EU member states, but *without* further policy action at the European level.

The baseline scenario serves as a basis for assessing the potential results and impacts of a range of possible policy instruments which are included in two additional scenarios.

Secondly, the report contains ***the balanced approach scenario***. This is a scenario where a focused, and limited number of policy instruments are applied at the European level to ensure full and correct adoption of the new procurement directives at national level in collaboration with the EU member states and to ensure that the implementation of e-public procurement at national level across the EU does not conflict with the fundamental principles of the internal market. This scenario does not include policy instruments that go beyond this level.

Thirdly, the report contains ***the extensive effort scenario***. This is a scenario where a number of policy instruments are applied across the board by the European Commission in collaboration with the member states in order to ensure not only the full and correct adoption of the legal framework at national level and the compliance of e-public procurement systems with the fundamental principles of the internal market, but also to promote the uptake of e-public procurement across the EU.

The research methodology used for this impact assessment follows the European Commission's guidelines for impact assessment. The impact assessment is based on a number of data sources:

- An interview-based questionnaire survey among all 25 EU member states, which were represented by selected experts and officials from central, governmental institutions responsible for and/or deeply involved in the public procurement policy area in the member state.
- A review of existing data, studies and literature in the field. The sources used are listed throughout the report in the footnotes which contain detailed references to the sources.
- A range of interviews with experts from the IT industry, government officials, and managers and experts responsible for existing e-public procurement solutions in Europe (a list of interviewees involved in this type of interview is enclosed as an annex).
- A consultation process with the European Commission services throughout the period of the study.

1.2 Definitions

As Kalakota & Robinson[1] point out, purchasing refers to the specific activities associated with the buying process, whereas procurement is a broader term for all activities associated with obtaining goods and services from a supplier, including requisition, purchasing, transportation, warehousing and inbound receiving processes.

Thus, electronic procurement (e-procurement) can be defined as:

- The electronic integration and management of all procurement activities including purchase request, authorization, ordering, delivery and payment between a purchaser and a supplier[2].

The broad term e-procurement covers a number of different methods of purchase and sale in terms of IT-systems, procedures and underlying technologies. In order to make a distinction between the different methods of e-public procurement, these can be labelled e-tendering (for sourcing) and e-purchasing (for buying)[3]:

Tendering is in this report defined as the process of finding and selecting suppliers of public supplies, works or services. For tenders above the thresholds, this is regulated by the EU procurement directives. Tendering includes the procurement process from publication of tender notices by a contracting authority to award of contract.

[1] R. Kalakota & M. Robinson "e-Business 2.0" (2001), Addison Wesley.

[2] Chaffey, Dave: E-Business and E-Commerce Management (2004), Prentice Hall.

[3] A recent report distinguish between the following e-procurement 'solutions': eTendering, eAuctions, ePurchasing and Procurement cards. See local e-gov (2004): "The Benefits of e-procurement - National e-Procurement Project", Office of the Deputy Prime Minister. www.nepp.org.uk

Thus, *e-tendering* is the use of electronic means throughout the tendering processes. This includes the exchange of all relevant information and documents in electronic format.

Purchasing is the process of purchasing goods, works, services and utilities. This includes the processes from finding a product to invoicing and payment. Thus purchasing includes the process of ordering, but also the final stages of the procurement process (payment). *E-purchasing* is defined as the use of electronic means in the purchasing process.

1.3 Scope of the impact assessment

As illustrated above, e-procurement is a very broad term which involves many different steps. In line with the new EU procurement directives, the focus of this impact assessment is the digitization of the tendering process, i.e. the process from indicative notice/prior information to advertisement of contract award / communication of rejection. However, as the new directive also introduces rules related to e-purchasing (e-auctions and dynamic purchasing systems), the purchasing process is also subject of the analysis, although to a lesser extent.

1.4 Scope for e-Public Procurement

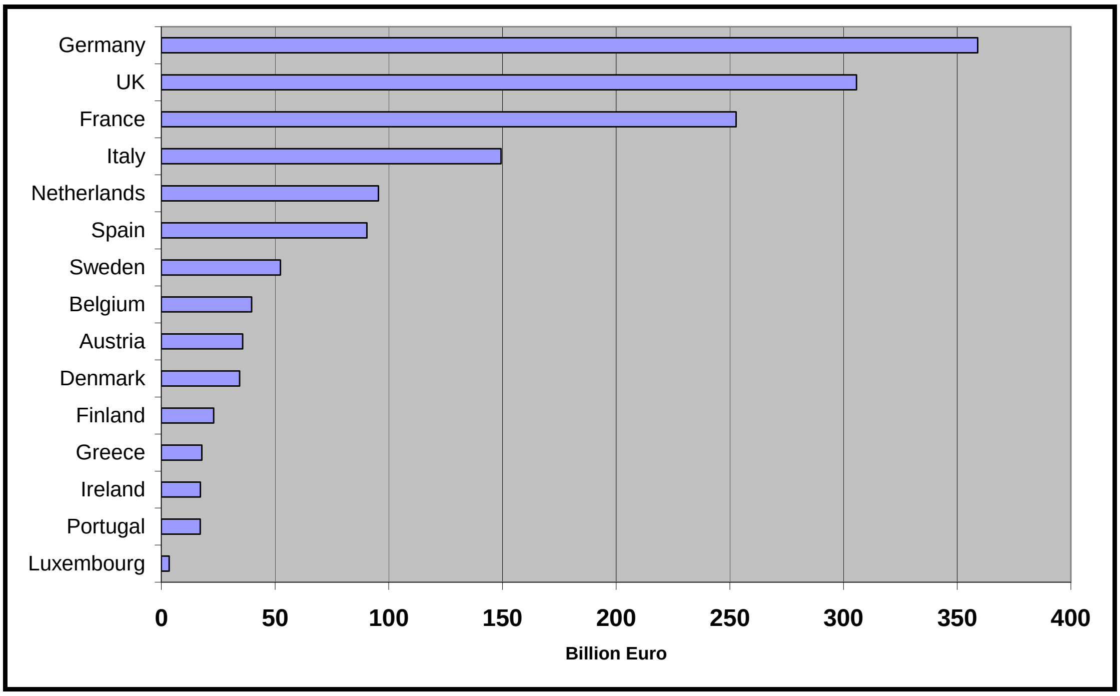
This section describes the scope for e-procurement by outlining some key figures and key characteristics about public procurement in Europe. These data will set the stage for the subsequent analysis.

1.4.1 The total value of public procurement

According to estimates, the total value of public procurement in the EU – i.e. the purchases of goods, services, works and public utilities (incl. defence) - is about €1500 billion in 2002 or about 16% of the Union's GDP[4]. It should be noted that these figures include procurement both above and below the EU procurement thresholds.

[4] DG Internal Market: A report on the functioning of public procurement markets in the EU: benefits from the application of EU directives and challenges for the future. 2004.

Figure 1.1: Total public procurement in 2002 in billion EUR (EU15)



Source: EU Commission, DG Internal Market data

A number of key figures are worth highlighting:

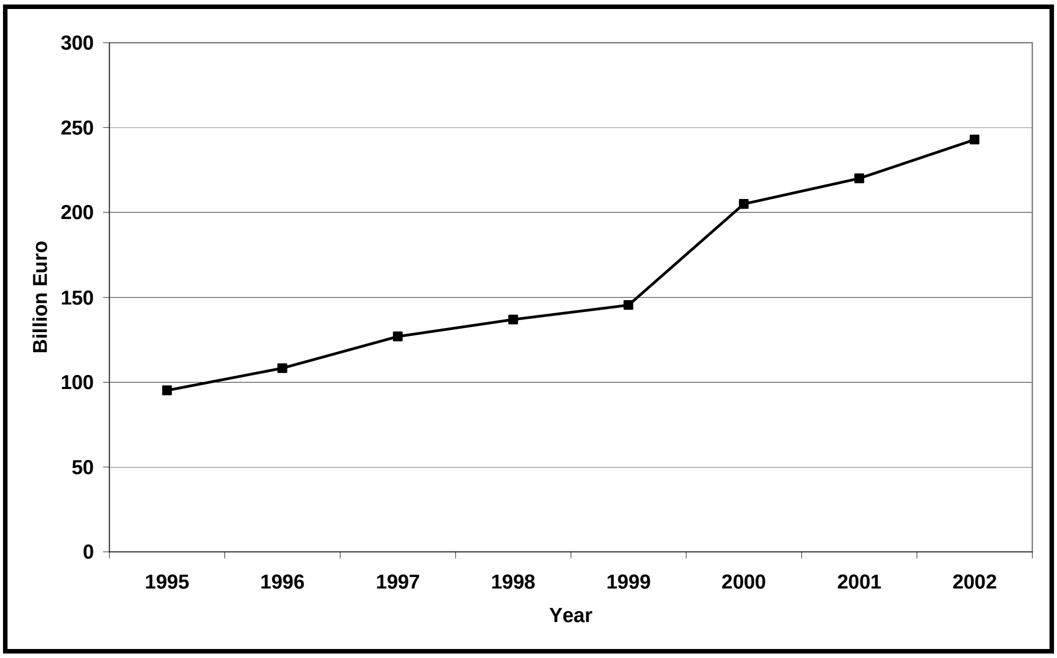
- The value of public procurement in Germany, UK, France and Italy totals approximately 1,070 billion EUR or 71% of the total public procurement in EU-15.
- In the 1995 to 2002 period, public procurement increased by almost a third (31%), from 1,140 billion EUR in 1995 to 1,490 billion EUR in 2002.
- In 2002, 106,346 invitations to tender and 58,513 contract award notices were published.

1.4.2 *Publication of public procurement electronically*

Online publication of contract opportunities can improve fair and open competition enabling suppliers to reap the full benefits of the internal market.

As mentioned earlier, the total amount of public procurement in EU 15 increased by 31% from 1995 to 2002. In the same period, the amount published in the official journal increased far more: over 250% (from 95 billion in 1995 to 243 billion in 2002). The share of public procurement published in the official journal / Tenders Electronic Daily as percentage of the total public procurement in EU-15 increased sharply from approximately 8% to 16%. If this development continues, the procurement published online in TED will reach approximately 25% of the total public procurement in 2010.

Figure 1.2: Estimated total value of public procurement published in the Official Journal. Billion EUR 1995-2002



Source: EU Commission, DG Internal Market data

1.4.3 *Types of procurement*

A closer look at the goods, works and services procured by public institutions in Europe shows that the most important types of procurement, construction work, represent a value of approximately 81 billion EUR or 37% of the total public procurement in the EU. The top three categories (construction, technical and professional services, medical and laboratory devices etc.) represent approximately 113 billion EUR or 52% of the total public procurement in Europe. These sectors are therefore very important in order to reach the goal of generalised use of e-procurement.

Table 1.1: Public procurement published in the official journal by CPV codes – no. of tenders (EU15; 2002 figures)

CPV Code	Description	No. of tenders	Value (billion EUR)	Share of total value
	Total (top 15)	*31,014*	*182.0*	*83.5%*
45	Construction work	10,189	81.3	37.3%
74	Architectural, engineering, construction, legal, accounting and other professional services.	6,625	22.6	10.4%
33	Medical and laboratory devices, optical and precision devices, watches and clocks, pharmaceuticals and related medical consumables.	2,349	9.2	4.2%
90	Sewage- and refuse-disposal services, sanitation and environmental services.	1,153	9.0	4.1%
30	Office and computing machinery, equipment and supplies.	1,966	7.9	3.7%
23	Fibreglass fabrics.	340	7.8	3.6%
72	Computer and related services.	1,013	6.9	3.2%
29	Machinery, equipment, appliances, apparatus and associated products.	1,307	6.2	2.8%
50	Repair, maintenance and installation services.	1,680	5.5	2.5%
60	Land transport services and transport via pipeline services	736	5.2	2.4%
24	Chemicals, chemical products and man-made fibres.	897	5.1	2.4%
35	Tractors	214	4.3	2.0%
40	Electricity, gas, nuclear energy and fuels, steam, hot water and other sources of energy.	147	3.9	1.8%
34	Motor vehicles, trailers and vehicle parts	1,405	3.8	1.8%
15	Food products and beverages	993	3.3	1.5%

1.5 Main drivers

A key point that may be derived from the theoretical literature concerning e-business, of which e-procurement is one element, is that the development of e-business is influenced and determined by a complex interaction between various factors: There is not one single factor that will determine the evolution of e-business and e-public procurement, but rather a plethora of factors that are constantly evolving and influencing each other.

Chaffey[5] distinguishes between the macro- and micro-environment in the 'e-environment' that directly influence organizations (public and private) and

[5] Dave Chaffey "E-business and E-commerce management" (2004), p. 135, Prentice Hall.

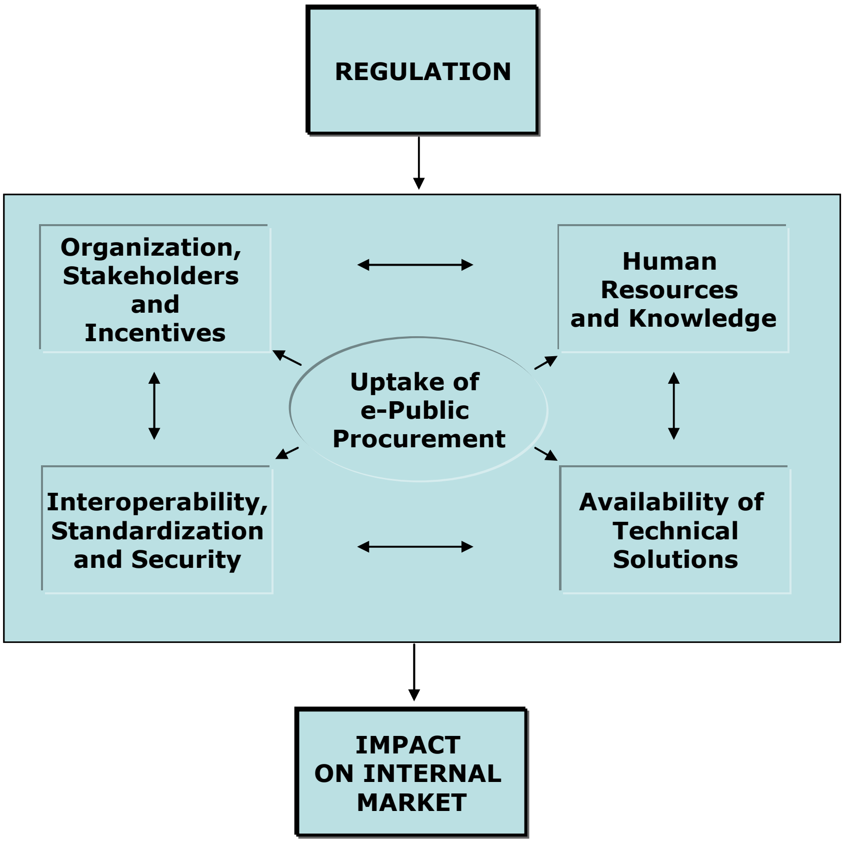
their decisions and behaviour in the field of e-business. Kalakota & Robinson[6] identify 20 different trends that drive e-business, which cut across and include the factors identified by Chaffey, and describe four common threads which are shared by these trends, and which are also influential drivers for the evolution of e-public procurement.

The theoretical literature concerning e-business and e-procurement and the empirical data collected for this study may be condensed into a number of factors which appear to work as the main driving forces that influence and determine the development of e-public procurement.

On the basis of these data and existing theories in the field, a conceptual model has been developed in order to offer a framework for explanation and interpretation of main driving forces in play that determine the evolution of e-public procurement.

The figure below illustrates the flow and interaction between the various driving forces in a logic model that indicates the most important cause and effect links.

Figure 1.3: Main driving forces influencing uptake of e-public procurement and the internal market



REGULATION
Organization, Stakeholders and Incentives
Human Resources and Knowledge
Uptake of e-Public Procurement
Interoperability, Standardization and Security
Availability of Technical Solutions
IMPACT ON INTERNAL MARKET

[6] R. Kalakota & M. Robinson "e-Business 2.0" (2001), Addison Wesley.

While there are natural variations between the EU countries, and differences between the strengths and importance of the drivers, the research findings indicate that this conceptual model is generic and may be applied as a framework for interpreting the processes and experiences in all countries as regards the development of e-public procurement.

As the figure illustrates, regulation is the framework within which all economic operators must work. The next level of drivers is directly influencing the procurement activities in contracting authorities and suppliers and will thus influence the uptake of e-public procurement. Finally, increased uptake of e-public procurement can have a positive impact on the internal market, i.e. through easier access to contract opportunities or lower transaction cost.

The various elements in the model are described in the following.

Regulation
As pointed out by Chaffey (2004), regulation is an important element of the macro-environment for e-business and e-public procurement. The new public procurement directives are, of course, the main factor in this respect is their forthcoming transposition into national legislation that will provide the fundamental framework for the evolution of e-public procurement above the threshold in the coming years. As described in the baseline analysis, implementation of the new procurement directives also raises a number of issues, including co-existence of paper and IT based procurement systems. This poses a risk of uncertainty and could create barriers to cross-border procurement.

The fundamental role of the regulatory framework is shown in the figure above as the basic driver that influences all other factors of the model.

Organization, Stakeholders and Incentives
The factor concerning organization, stakeholders and incentives refers to the (macro-level) institutional model in the field of public procurement, including which public institutions and companies are involved, how their respective roles and responsibilities are defined, and how the interaction between the involved institutions takes place. The main stakeholders in the field include public sector at European level, public sector at national level, local institutions, individual purchasers and companies (large enterprises and SMEs). The organizational set-up and stakeholders are closely linked to the third element – incentives. The organizational set-up influences the configuration of the incentives and vice versa. In this context, incentives are to be understood as the set of motivational factors, which make the various stakeholders act as they do within the defined organizational structure and processes.

Human Resources and Knowledge
Moving from organization and incentives at macro-level (above) to micro-level, the human resources and knowledge factor refers to the availability of strategic and organisational capacity as well as technical ICT skills at micro-level (contracting authorities and companies). This constitutes an important driving force in the diffusion of e-public procurement. Strategic capacity could include the e-business strategy and planning capability of public institutions to generate a market overview and select e-procurement solution. Also the skill to assess compliance of e-public procurement systems with (future) regulation is important at the micro-level. Organisational capacity is in many cases a question of organisational change readiness (i.e. the readiness of employees to employ new working processes, level of experience and trust in using electronic tools). Organisational capacity is also a question of

having the knowledge and skills to re-engineer internal or external workflows to reap the full benefits from e-procurement. Technical ICT skills at micro level are often dependent on the level of experience and trust in use of electronic tools.

While the majority of e-tendering systems are actually fairly simple to use, some are more advanced. Thus, ICT-skills in general as well as specific skills related to the process of electronic procurement of the key employees may be an essential factor to benefit from the advances of electronic procurement.

Studies have shown that lack of IT competences among the employees can be a significant barrier for e-procurement regarding the ability to understand technology and the ability to use the technology[7]. The problem is more significant for SMEs and in the latter stages of the procurement process (e.g. purchasing), where system integration internally and externally requires technical skills as well as redesign of internal business processes.

Interoperability, Standardization and Security

The level of interoperability and standardization of the solutions available is cited by most data sources as the main driving forces that will influence the evolution of e-public procurement. *Interoperability* concerns the existence of interoperable data formats vis-à-vis technical (e.g. 'attributes' and XML schemas) and semantic standards. For suppliers, harmonized demands in terms of tender information and electronic documents can lower the tender cost. Interoperability is especially important in the case of e-purchasing, as it is a pre-condition for making compatible IT systems (which can be both internally with ERP systems and externally with other procurement systems).

To ensure that e-procurement is not creating new barriers to the internal market, interoperability is important in a number of areas, including: across borders and between business-to-business and business-to-government e-procurement systems.

Regulation and standardisation in the field are naturally determining for the level of interoperability. A widespread interoperability will increase electronic procurement, whereas lack of interoperability will constitute a barrier.

Security is also an important issue, as lack of trust in e-procurement security can represent a barrier to suppliers and buyers. Some suppliers and buyers are concerned about using the Internet to transmit confidential information. Possible security flaws in transactions over the open internet will decrease confidence in e-procurement.

[7] OGC "eProcurement Guidance - "Cutting through the Hype" 2002. (http://www.ogc.gov.uk/index.asp?id=2314) and Gartner Group Research,"Strategies for Successful Government E-Procurement", 2003.

Availability of technical solutions – supply and demand for e-public procurement solutions

The availability of adequate and affordable technical solutions is an important driver for uptake of e-public procurement.

As mentioned in the baseline scenario, the directive requirements in terms of technological infrastructure is limited, e.g. a PC with internet access, office software and some sort of security (digital signature). Figures on the up-take of internet etc. show that most authorities and businesses in Europe have this basic infrastructure in place.

Thus, when we refer to adequate solutions we mean technically well functioning, user-friendly systems with the needed functionalities. Development of such systems requires investments of sufficient resources from IT-vendors.

Affordable solutions refer to the availability of reasonably priced solutions in various areas of e-procurement. Thus, it must be assumed that the cost-benefit (business case) of e-procurement is important for the up-take of the solutions. This depends, among other factors, on competition between IT-vendors, and sufficient demand to enable large-scale production. In relation to the demand side, the development in business-to-business e-procurement is also relevant, as the technology can be used for business-to-government e-procurement as well.

E-public procurement can be divided in to buy-side and sell-side applications[8]:

- Buy side applications: Are purchased (in this case) by public authorities and institutions, and provide authorities/institutions with an application to conduct e-tendering. This includes functionalities for publication of prior notices and tender documents, for management of incoming tenders and for evaluation of tenders. Other relevant functionalities are processing of electronic dynamic purchasing or e-Auctions.
- Sell side applications: Basically, no software other than an internet browser, e-mail and office software (word processing and spread sheet) are required at buyer side for participation in e-tendering. However, depending on the way the dynamic purchasing system is organised, an application to organise and structure electronic catalogues, e.g. different formats, different selection of goods/services etc. for different customers can be an advantage.

The market for e-tendering solutions primarily consists of buy side applications. Thus, a number of public institutions (frontrunners) have implemented e-tendering, e.g. procurement portals with information, guidelines and management of tender notices/documents etc. However, in principle, buy-side applications can be simple web pages (for publication) and database/spread sheets (for receipt and registration of tenders).

The market for sell-side e-tendering is more limited as the only technical requirement for participation in an e-tendering process is internet access and a browser. The market for sell-side applications is mainly in the later stages of the procurement process, i.e. web shops[9] or systems for management of electronic catalogues (which is most often done via spread sheets).

[8] Gartner Group, 2003: B2B Buy-Side E-procurement, Internet Commerce: Overview

[9] The supplier's website with access to buying from a product catalogue

Uptake of e-public procurement and impact on the internal market

As illustrated in figure 3.1 previously, the regulatory framework and the four driving forces will influence the up-take of e-public procurement. Furthermore, as illustrated in the figure, increased uptake of e-public procurement can have a positive impact on the internal market.

The table below provides an overview of the outcome and the impact on the internal market of the transformation from paper to IT-based e-tendering processes.

The table illustrates that the publications of tender notices and tender documents notices have a direct impact on the internal market, i.e. through better access to tenders, increased competition and reduced consumer prices. Transforming the remaining phases of e-tendering will provide process savings and lower tender cost, which in turn will increase the motivation for suppliers to participate in public procurement.

Table 1.2: Overview of the outcome and the impact on the internal market of the transformation from paper based to IT-based e-tendering processes

Process to be transformed from paper to IT-based tendering	**Outcome (related to internal market)**	**Impact on the internal market**
➔ Publication of tender notice / access to tender notices ➔ Publication of tender documents / access to tender document	*Main outcome: Easier to identify suppliers / tender opportunities, e.g.:* **Buyer's side benefits:** • Lower publication costs • Buyers reach out to a broader audience of suppliers • Lower search costs **Supplier's side benefits:** • Improved access to tenders, easier to identify business opportunities; lower search costs • Market surveillance costs are reduced; suppliers need only to interface with a few internet portals instead of with all customers	*Increased competition and lower prices (direct impact on the internal market):* ➔ Increased number of bidders for each tender ➔ Better price comparison between suppliers ➔ Increased market transparency ➔ Better access for SMEs in accessing and responding to public tenders ➔ Better access for 'foreign' companies in the tendering process ➔ Increase of cross-border procurement in public sector ➔ Facilitation of the free movement of gods
➔ Expression of interest ➔ Rejection or invitation to tender ➔ Submission of tender ➔ Technical clarification communication ➔ Tender evaluation ➔ Closing of contract ➔ Advertisement of contract award and communication of rejection	*Main outcome: Process savings, lower transaction cost e.g.:* **Buyer's side benefits:** • Time reduction in tasks of receipt, registration and distribution of tenders. Shortening of delays. • Increased efficiency in specifying and issuing tenders. • Automation of the evaluation process. • Automatic rejection of suppliers that fail to meet stipulated fixed criteria. **Supplier's side benefits:** • Suppliers need only to interface with e-procurement portals instead of with all customers. • A system of 'Buyer profiles' would mean reuse of information. • Elimination of costs related to printing and shipment of tenders.	*Increased motivation to participate in public procurement (indirect impact on the internal market):* ➔ Process efficiencies for buyers and suppliers ➔ Reduction of tender costs ➔ Improved quality of tenders

Sources:
Dave Chaffey: "E-business and E-commerce management" (2004).
Office of the Deputy Prime Minister: "The Benefits of e-procurement - National e-Procurement Project". Local eGov (2004).
MOD/Industry Commercial Policy Group: "Defense e-Business – A guide to Commercial Issues". (2004).

The table illustrates that increased uptake of e-public procurement can have a positive impact on the internal market in a number of areas. First and foremost, the electronic notification of tenders will make it easier for suppliers to identify contract opportunities. This will in turn lead to increased competition and lower prices, i.e. because of an increased number of bidders for each tender, better price comparisons between suppliers, increased market transparency etc.

Moreover, using electronic means in the procurement process will enable a number of process savings for buyers and suppliers and lower transaction costs. This will increase the motivation to participate in public procurement due to reduction of tender costs.

It should be noted that the outcome and impact listed in the table are what is considered the *main ones* based on a screening on literature in the field. Moreover, a number of other benefits are also often listed, including:

- A faster tendering process
- Reduction of maverick buying
- Improved statistics
- Improved audit trail

Finally, one source mentions support of green issues (reduction of the use of paper) as a benefit of e-procurement[10].

The following sections analyze the various driving forces in the model. Each driving force is analyzed from three perspectives:

- *Current situation* – What is the current situation of the main points under each driving force?
- *Trends* – What are the existing and emerging trends which these main points create?
- *Influence* – How may these trends impact on the evolution of e-public procurement in Europe until 2010?

[10] MOD/Industry Commercial Policy Group: “Defense e-Business – A guide to Commercial Issues”. (2004).

2. Scenario A: The Baseline Scenario

2.1 Regulation

There are several pieces of legislation that are relevant for the use of electronic public procurement. The new procurement directives are naturally the most important part of the relevant legislation, but other areas including the legislation on digital signatures are also relevant.

The baseline scenario on regulation focuses on the new procurement directives, but includes the expected development in other fields of legislation that is relevant for the use of electronic public procurement.

When considering the baseline scenario in the legal field it is important to note that the static nature of legislation implies that changes must be initiated by the legislators both in the Member States and the EU. The question pertaining to the excepted development in 2010 will, therefore, be concentrated on compliance issues.

2.1.1 Current situation

The former EU procurement legislation consists of the directives on procurement of public supplies, public works, public services and public utilities[11].

- The directives did not contain specific provisions regarding the use of electronic means in the procurement process. None of the four directives allow for, or forbid, the use of electronic means. Written communication is to some extent, however, seen as a prerequisite for the proper documentation of the procurement process. Also, several articles of the directives contain mandatory use of written communication.

The current legal situation in the Member States is that:

- More than half of the Member States have introduced some legislation in the field of electronic procurement
- There are differences in the extent to which the Members States have regulated the use of electronic procurement in national law. Generally, few Member States have regulation covering both rules applicable to communication, storage of data, and the use of specific procedures. Almost half of the Member States have yet to introduce regulation applicable to communication, storage of data and the use of specific procedures.

The differences between the Member States regulation present challenges to the current use of cross-border electronic procurement as businesses will need to understand and comply with specific national rules and requirements when engaging in cross-border procurement[12][13].

[11] The Public Supplies Directive 93/36/EC as amended by Directive 97/52/EC, the Public Works Directive 93/37/EC as amended by Directive 97/52/EC, the Public Services Directive 92/50/EC as amended by Directive97/52/EC, and the Public Utilities Directive 93/38/EC as amended by Directive 98/4/EC.

[12] The fact that that there differences in the Member States regulation of the rules applicable to communication, storage of data, and the use of specific procedures suggest that differences exists between the national rules.

[13] Austria has, for instance regulated the areas communication, storage of data and the use of specific procedures, whereas Germany has only regulated storage of data. See table 2.6 in Part 1 Report for the full detail of which areas are regulated in the Member States

- Generally, there are substantial differences in the level and types of regulation of the electronic procurement process in the Member States. Austria for instance, has regulated the areas regarding communication, storage of data and the use of specific procedures, whereas Germany has only regulated storage of data.

The new directives introduce specific rules for the use of electronic means for communication in the procurement process, thereby providing a coherent framework for the use of electronic public procurement. The new directives also introduce several new procurement processes based on the use of electronic communication.

- The new directives regulation of electronic means for communication in the procurement process eliminates the fundamental legal barriers inherent to the use of different regulation on electronic means in the procurement process of the Member States.

The directives put the use of electronic means on a par with traditional means of communication and information exchange. Technologically, the new directives are neutral and leave the choice of means of communication to the buyers rather than the suppliers[14]. The directives provide suppliers with a legal procedural guaranty and state that the technology used shall be non-discriminatory and as far as possible compatible with the technologies used in other Member States.

2.1.1.1 The timely and correct implementation of the directives

The implementation of the new public procurement directives should be completed by the end of January 2006. The current status in this area is that:

- One Member State expects the directives to be implemented in 2004, 14 Member States expect the directives to be implemented in 2005 and eight Member States expect the directives to be implemented in 2006. Two Member States do not know yet when the directives will be implemented.

- The Member States planning to implement the directives in 2006 will be faced with a very tight implementation schedule, as the directives will have to be implemented in January 2006. The same can be said for Member States planning to implement the directives late 2005. Planned implementations close to the expiry of the implementation period will leave little or no room for unforeseen hindrances or delays if timely implementation is to be achieved. This situation raises concern of hasty, erroneous and non coherent implementation of the directives or delays in the implementation beyond the implementation period.

[14] The Directives makes it clear that the contracting authorities can require the use of electronic means for communications and for accessing documents (Arts 39-42 of the Directive 2004/18 EC)

The new directives do not regulate a new area, but are an adjustment to the already existing procurement for legislation and rules.

- The Member States, therefore, expect the legal implementation of the directives (transposition into laws) to be less cumbersome than the implementation of a completely new directive. However, the application by purchasing entities and integration of electronic means in the procurement process will be an entirely new task in most Member States.

- The consequences of failure to comply with the implementation timeframe will cause several negative side effects. The most obvious and direct effect is legal uncertainty for economic operators within and outside of the member states resulting in lack of uptake of e-procurement. This will cause market fragmentation due to differences in legal regulation and slower development towards a single market for public procurement.

2.1.1.2 Co-existence of different procurement systems

The co-existence of different procurement systems raise problems in relation to the functioning of public procurement.

- The existence of both old and new procurement regulation, where some Member States have implemented the new directives and others still use the existing procurement directives, is likely to cause legal uncertainty among businesses. It will be necessary for the businesses to maintain different workflow systems to cope with legal environments.

- The differences in implementation speed pose the risk that businesses, and in particular SMEs, will not have the necessary information about the implementation of the new procurement directives in other Member States, e.g. procurement rules used in the procurement process in a call for tender in other Member States. This will mean higher cost in bidding across countries.

It is clear that the implementation of the directives will provide an incentive for businesses to participate in electronic procurement. The incentive for business to use electronic procurement is linked to the fact that the contracting authorities use electronic procurement. The implementation of the directive in member states can help achieving a critical mass of contracting authorities requesting tender documents electronically.

- This means that businesses will have a greater incentive to participate in electronic procurement once their respective Member States have implemented the new procurement directives, which in turn will give them more knowledge and experience when bidding under the new rules.

The information to businesses about the new directives for the Member States will, naturally, focus on the national rules implementing the directives.

- This situation poses the risk that business, and in particularly SMEs, in slow implementing countries will not have the necessary knowledge of the new procurement directives to participate in cross-border procurement in Member States that have already implemented the directives.

The combination of the better experience in how to use and inform about the new procurement rules will give businesses from Member States that have implemented the directives, a competitive edge compared with businesses in Member States that have not implemented the directives in electronic procurement. This is particularly the case for SMEs.

The general problems related to the legal coexistence of different procurement rules are linked to the implementation of the new procurement directives and will be subsequently eliminated when all Member States have implemented the directives.

2.1.1.3 The implementation of the specific new electronic procurement processes

The directives introduce the usage of e-auctions and the dynamic purchasing system. These specific procurement processes are optional for the Member States, who may decide whether they should be implemented or not.

Both procurement processes holds a number of advantages in relation to the single market. The Dynamic purchasing system is an open tender process, where tender opportunities are continuously made available to interested companies, which in turn will lower the barriers to enter a competition for companies. The e-auction provides a high level of transparency throughout the bidding process and facilitate test of suppliers. Advantages include stimulation of competition, efficient pricing and innovation.

The current plans in the Member States regarding introduction of dynamic purchasing systems and e-auctions are:

- 23 Member States plan to introduce e-auctions. One Member State has decided not to introduce e-auctions and on is yet undecided wheter or not to introduce the e-action.

- 18 Member States plan to introduce the dynamic purchasing systems. Three Member States report that they will not introduce the system. Four Member States are yet undecided whether to introduce the dynamic purchasing system or not.

The different approaches to the implementation of the electronic auction and the dynamic purchasing system in the Member States will be that businesses in some Member States will be more used to these procurement processes than others. Moreover, the Member States not implementing these options will fail to reap the benefits mentioned above, e.g. lower entry barriers and increased transparency.

2.1.1.4 Compliance of existing systems

An important aspect of the legal situation of the electronic procurement is whether the procurement systems used in the Member States are compliant with the up-coming rules.

- Approximately half of the Member States have reported to have systems compliant with conditions under the new procurement directives. However, the information provided in table 3.12-3.14 in the Part 1 report shows that this feedback is optimistic in relation to the systems considered in table 3.12-3.14[15]

[15] See table 2.5 and tables 3.12-3.14 in the report

- If the Member States do not perform a general examination and upgrading of systems currently used, there will be a strong risk that all the specific requirements related to electronic communication in the directives will not be met and that the systems will continue to be used. Another problem in this aspect is that the detection of lack of compliance will be very difficult for the buyers.

2.1.1.5 The current situation – other relevant regulation

The use of electronic procurement depends on the ability to form electronic contracts. In that respect, the directives on Electronic signature[16] and the Information Society[17] are relevant. These directives must therefore be considered in relation to the current situation. Finally, the combination of electronic procurement with the use of electronic invoicing will provide valuable reduction in the overall transaction costs. The regulation of the electronic invoicing directive[18] is, therefore, of importance to the current legal situation.

- The provisions of the directive on electronic signatures and the Information Society Directive support the completion of electronic contracts.

- The use of electronic signatures has given rise to problems in relation to the recognition of electronic signatures issued by the various national Certification Authorities in other Member States. The lack of cross-border interoperability of electronic signatures creates obstacles to the free movement in the Internal Market and prevents the needed general confidence in electronic transactions.

- Businesses have raised a number of concerns in relation to the electronic invoicing directive, especially with respect to self-billing and electronic invoicing where the directive leaves a large number of options to the Member States. This creates a possibility of differences between the operational environments in for e-public procurement, which companies encounter in the Member States

2.1.2 Trends

A number of Member States have begun to regulate different areas of electronic procurement[19]. The transposition of the directives can be seen as a strong trend towards a harmonized framework for the electronic procurement process at both Community and Member State level.

Especially, in relation to the specific new procurement process (the dynamic purchasing system and the e-auction) it can be noted:

The main part of the Member States expects to implement the e-auction (23 Member States) whereas only 18 Member States plan to introduce the dynamic purchasing systems.

[16] Directive 1999/93/EC on a Community framework for electronic signatures

[17] Directive 2000/31/EC on certain legal aspects of information society services

[18] Directive 2001/115/EC with a view to simplifying, modernising and harmonising the conditions laid down for invoicing in respect of value added tax

[19] See table 2.6 in Part 1 Report

2.1.3 *Influence on electronic public procurement until 2010*

In 2010 it is expected that:

- Although it is likely to expect that not all member states will be able to meet the deadline for transposition and general application of the new directives, the national legal framework for the new EU framework for public procurement is expected to be in place by 2010. With this framework in place, the use of electronic means in the procurement process will be on par with paper-based procurement. With the new directives, most of the main actors in the field (public institutions, suppliers and IT-vendors) regard the legal barriers related to electronic public procurement as limited.

- The specific electronic procurement processes optional to the Member States will not be implemented in all Member States. The Member States which do not implement these options will fail to reap the potential benefits, e.g. lower entry barriers and increased transparency.

- Compliance problems of e-public procurement systems and processes to the requirements of the directives are likely to remain in relation to some contracting authorities as the task of applying the directives widely is significant given the high number of contracting authorities in the EU.

- Cross-border procurement problems are likely to prevail: It seems likely that a mutual recognition system of digital signatures has not been introduced by 2010, and the electronic invoicing systems will continue to be used differently from Member State to Member State. These are factors which have a negative influence on the electronic public procurement across borders in Europe, although a positive development within individual national markets may occur.

2.2 Organisation, Stakeholders and Incentives

2.2.1 *Current situation*

Two main aspects concerning the current situation will be highlighted in the section as they significantly influence the current situation and also seem likely to remain important in the coming years:

- Centralisation vs. decentralisation: Public procurement across the EU member states is to a high extent organized according to a decentralized approach. This could slow down a major transformation to e-public procurement. Uptake will therefore largely be determined by the decisions of individual institutions concerning whether to implement e-procurement solutions.
- Incentive structure: Many important stakeholders in the public sector lack strong incentives that could motivate them to a conversion to e-public procurement. Private businesses have incentives to engage in e-public procurement, but the associated investment and operating costs may create negative incentives for companies

Centralisation vs. decentralisation
The survey conducted in the baseline analysis shows that public procurement across the EU is generally organised in a manner that follows the decentralised approach. This structure means that the level and the speed of uptake of e-public procurement across the EU will mainly be determined by the individual institutions and the extent to which they decide to use e-public procurement instead of traditional, paper-based procurement.

Incentive structure
The survey among member states in the Part 1 report shows that, in the view of the central administration, the promotion of e-public procurement is mainly driven by central, governmental institutions while other public stakeholders at regional and local level do not presently share their interest. The study also revealed that the resistance to change towards e-public procurement is a widely shared concern in almost all member states. The findings of this survey are similar to those of previous studies in the field: Previous findings show that employees often resist changes within their organization partly because they are afraid of loosing their jobs and partly because they find it difficult to change their normal work procedures. Behaviour and competences on organizational level need to be changed both in the public sector entities and in the suppliers companies, as both private and public organizations experience this barrier[20]. In addition to this, the apparent resistance to change should also be considered in the context of human resources, as a lack of the relevant competences needed to operate e-public procurement within different organizations can be a significant barrier for e-procurement as this would influence the ability to understand and to use technology.[21] This leads to a feeling of insecurity and a tendency to rely on old processes. An aspect which is further elaborated on in the section concerning human resources and knowledge.

Another recent study shows that although e-procurement system projects are rife with opportunities to empower first-line supervisors and managers — and often the business case assumes that first-line managers will take on currently centralized responsibilities, the current situation is that many employees are not ready or properly trained to manage these new responsibilities[22].

To understand the resistance it is helpful to analyse the incentive structure in terms of the benefits and disadvantages for the single employee, the public institution, the companies and the entire public sector in a country and at the European level.

[20] KPMG Consulting “Analyse af statslige indkøb” Copenhagen (2000) (p. 35) and Ramboll Management “Analysis of electronic public procurement pilot projects in the European Union” 2000 (p. 27).

[21] OGC “eProcurement Guidance - "Cutting through the Hype” 2002 (http://www.ogc.gov.uk/index.asp?id=2314).

[22] Gartner Group Research ”Strategies for Successful Government E-Procurement”, 2003, p.4-5.

Table 2.1: Basic incentive structure in public and private sector – aggregate level, institutional level and individual level

	Benefit of electronic procurement	**Disadvantage of electronic procurement**
Entire public sector at European level	Substantial	Marginal
Entire public sector at national level	Substantial	Marginal
Institution	Mixed	Mixed
Individual purchaser	Marginal	Substantial
Large enterprise	Substantial	Marginal
Small –and medium sized enterprise	Mixed	Mixed

The table above shows that there is an asymmetric incentive structure connected to the introduction of e-public procurement in the public sector where the positive incentives to introduce e-public procurement that exist at the aggregated level (national and European level) are not necessarily shared by other stakeholders at the institutional level and at the level of the individual purchaser. At these levels, the negative incentives might be stronger than the positive. Moreover, whereas larger enterprises have substantial incentives to introduce e-procurement, the benefits for smaller enterprises are more limited. A description of the incentives at each level is provided below.

Incentives for public sector at the European/national level

For the public sector as a whole (at national as well as European level) and for the individual institution, e-public procurement has a potential for a number of benefits, which provide incentives for the introduction of e-procurement (see table 2.1 above):

- Increased competition, more efficient public procurement markets and lower prices (increased number of bidders, better price comparison, increased market transparency etc.)
- More efficient public sector (process efficiencies for public institutions)
- More efficient business sector (process efficiencies for private enterprises)
- Improved audit trail.

What is also worth noticing is that the disadvantages are marginal, and primarily related to initial investments in the introduction of e-tendering.

Incentives for the individual public institution (central, regional and local level)

The potential benefits for the individual institution, which provide the incentives to push for conversion to e-public procurement, are:

- Increased competition and lower prices.
- Process savings (time reduction, increased efficiency in specifying and issuing tenders, automation of evaluation and rejection of suppliers).
- A faster tendering process
- Improved statistics on procurement.

However, for the individual institution there will be disadvantages related to transformation of the procurement process. One example is the open invitation to tender and the following labour intensive evaluation, which means that there in some cases, is a lack of incentives for buyers to diversify the supplier base. Also, some institutions might have to invest in new systems in order to implement e-Tendering system (although this is not a specific requirement in the directives).

Depending on the relative strengths of the costs and benefits, the cost factor may prevent the conversion to e-public procurement. The general rule of thumb is that the smaller the institution and the smaller the procurement volume, the stronger is the relative importance of the costs. The benefits listed remain largely the same for institutions at central, regional or local level.

Incentives for the individual purchaser

The potential benefits for the individual purchaser, which provide the incentives to push for conversion to e-public procurement include:

- Improved statistics on procurement
- Conformity with procurement law or internal procurement guidelines
- Time savings

However, despite these potential advantages the disadvantages, and hence the negative incentives, by introducing e-public procurement might be even stronger seen from the perspective of the individual purchaser.

First of all, many e-procurement systems do not represent the fastest and most convenient method of procurement. The failure of streamlining the entire notification process related to TED is an example of this. E-procurement systems needs to be designed intelligently to provide users with a sufficient increase in convenience (or value-added), otherwise traditional means of communication will often be the preferred method.

Another aspect is that a shift to electronic procurement means that the individual purchasers have to deal with changing circumstances, a re-organization of internal workflows and new working tasks (e.g. adjustment and maintenance of web page and re-structuring of tender format). These changes mean that the purchasers have to build up new competencies, which implies a distinctive change. Moreover, and most important, individual purchasers stand to lose their power as information and decision 'gate-keepers' in the institutional procurement process and possibly their jobs[23]. According to the sources used for this study, this is the single most important barrier to the introduction of e-public procurement.

This factor may also provide an explanation of why some processes in the contracting authorities are automated to a higher extent than other processes: The Part 1 report shows that sourcing (notification, publication and submission of tenders) and payments to a higher extent are automated, and these procurement phases can be managed and implemented from the central level in organization of the contracting authorities.

Contrary to this is procurement (evaluation of tenders, ordering) which generally is not automated to any significant extent, and these phases in the procurement cycle need involvement from the decentralized levels in the organization of the contracting authorities and therefore imply a more extensive change process for the contracting authorities.

Finally, the public sector should not be considered as one uniform entity with aligned interests as regards e-public procurement: While the various levels

[23] Interview data from Germany and Denmark; interview in Berlingske Tidende 4 July 2004 with the former director for the procurement portal Gatetrade in Denmark.

of governments (national, regional, local) and the EU Commission basically share the same incentives (i.e. cost reduction as a result of more efficient procurement process, improved the quality of the procurement statistics, enhanced budgetary control, a more efficient public sector with better service or cost reductions) to introduce e-public procurement, there are differences between these levels of government as regards the incentives that speak against introducing e-public procurement. This observation is confirmed in the Part 1 report where the introduction of e-public procurement is primarily seen by the member states as a mean to achieve efficiency gains in the national public sector while the European dimension in terms of improved competitiveness and increased cross-border trade (which are very important drivers for the European Commission and for the development of the internal market in Europe) in comparison do not stand out as very important objectives for the member states.

Incentives for large vs. small private companies
As regards the large as well as small enterprises, their incentive to engage in e-Tendering and e-Purchasing is first and foremost to meet demands from customers of using electronic means.

Other advantages, especially for large companies, include (see table 2.1):

- Easy access to public sector markets within and beyond national borders.
- Reduction of market surveillance costs.
- Time reduction (i.e. due to reuse of information by using a system of buyer profiles).
- Suppliers need only to interface with e-procurement portals instead of with all customers.
- More transparent evaluation of tenders
- Elimination of costs related to printing and shipment of tenders.
- Reduction of market entry costs

However, there are a number of disadvantages, and hence negative incentives, by introducing e-public procurement for especially small enterprises:

- E-procurement can threaten the business model of an enterprise, especially for retail companies or intermediaries.
- E-tendering means a substitution of the interaction with customers from personal to digital communication. Transparent procurement processes highlights the costs of elements such as personalised and flexible service.
- E-tendering is often a part of a process of consolidating the supplier base (and the selection of goods), and thereby increase volume on each supplier and cut cost. This means lower unit prices, which is often an advantage to large companies.
- E-marketplaces increase competition and lower prices.

As seen from the disadvantages above, there are a number of reasons why SMEs are hesitant towards e-procurement. Whether the gains will be judged to be sufficiently high will be determined by customer demands, the importance of the customer and the willingness of the single company to innovate (and in some cases identify new business models).

2.2.2 Trends

Centralization vs. decentralization
A general trend in public management is the implementation of a decentralised procurement structure in most countries. This will ensure ownership and budgetary responsibility in the individual institutions. However, the implica-

tion is that the transformation to e-public procurement is slowed down by the decentralized approach to procurement: Because the responsibility for the use of public funding is decentralised to individual institutions, they will be able to decide whether they want to use e-public procurement or not. Therefore, the pace of transition to e-public procurement may be held up by the individual buyers, who choose not to use electronic means in procurement, e.g. because they consider the transition costs too high, because their procurement volume lacks sufficient critical mass in order to obtain added value from the transition to e-public procurement or because they lack the necessary skills to handle e-public procurement.

The decentralised approach also includes a risk of development of many different e-procurement systems, which would mean the creation of additional barriers and costs for suppliers. This is the result of the decentralisation of the responsibility for the use of e-public procurement to the individual buyers, which would allow these to develop their own e-procurement systems, causing different requirements for suppliers.

Within the decentralized approach a couple of countries involve private companies, private investment and/or sector specific organisations in the design, planning, implementation and daily management of electronic procurement. An involvement of such partners on one side has a positive influence on e-procurement, but on the other side seems to improve the complexity of the projects.[24]

Incentive structure
The incentive structure described above is firmly rooted and difficult to change. In particular the individual purchasers lack incentives to push for e-public procurement, but also institutions may lack the incentives to introduce e-public procurement. The general trend may be described as a lack of strong incentives for key stakeholders in the public sector to introduce e-public procurement while the incentives for suppliers to embark on the more advanced phases of e-public procurement seem to be a mixture of positive and negative incentives.

However, there are initiatives underway which could turn out to be effective in addressing some aspects of the problems concerning the absence of positive incentives. There are some examples that e-public procurement systems are financed, developed and established at the centralized governmental level and will be made available for use to institutions at the decentralized level and SMEs at no or low cost.

This approach would address the problem identified in the draft action plan which mentions that tools for centralizing purchases and exploiting economies of scale are not yet fully developed in the member states. Such ‘plug-and-play’ solutions (which currently are being developed in the UK (the Zanzibar project) and already exist in Italy (Consip)) would reduce the start-up costs for the individual institutions while at the same time allowing more institutions to participate in e-public procurement even if they rarely have the need to carry out tenders. Moreover, the proliferation of this type of solutions would bring some clarity and transparency into the national markets as it would be easier for suppliers to navigate between a few main e-public procurement portals and systems as opposed to many systems and solutions at the institutional level.

[24] Rambøll Management “Analysis of electronic public procurement pilot projects in the European Union” 2000 (p. 144).

One of the elements under consideration in the Zanzibar project in the UK is to allow public institutions to keep the savings realized through e-public procurement and leave it to the discretion of the individual institution to dispose of the saved funds for other purposes. This would create a strong incentive for institutions to adopt e-public procurement and seek cost-effective solutions.

2.2.3 Influence on electronic public procurement until 2010

A decentralised procurement structure is implemented in most countries to ensure ownership and budgetary responsibility of the individual institutions. This set-up is expected to be maintained and expanded further (to other member states or more institutions) in the following years as this is a general trend in public management. This constitutes a barrier to the uptake of e-public procurement as this is an area where network effects are very significant[25]. The value of e-procurement systems increases at an exponential rate with the up-take of e-procurement in other institutions, including both buyers and suppliers (the bigger the network, the greater its critical mass and hence its value[26]). Thus, the decentralised procurement structure could delay the up-take of e-procurement which could call for co-ordinated initiatives at national and EU-level to increase the network of institutions using e-procurement.

The underlying incentive structure for the various stakeholders involved will not counter the barriers posed by the decentralized public procurement structure, but will serve to reinforce them.

This means, in conclusion, that there is a lack of strong drivers in favour of e-public procurement at the institutional and individual level (purchaser) and in SMEs (supplier), and these factors will impede the conversion to e-public procurement in the public sectors in the majority of EU member states.

The implication of this incentive structure, where reluctance, and possibly even resistance, to e-public procurement at the institutional and individual level can be expected, is that it is necessary to consider how other types of positive incentives can be developed and integrated into the institutional set-up of e-public procurement systems.

2.3 Interoperability, Standardization and Security

2.3.1 Current situation

Interoperability, standardisation and security are key issues in electronic public procurement to enable exchange of data between enterprises and public institutions. However, it is also important to realise that standards are particularly important in procurement processes with a significant exchange of business documents, e.g. purchasing and invoicing. Simple one-way communication such as online advertisement of tenders and publication of tender documents can be conducted on existing web pages and accessed through generally available software (browsers). As illustrated in the OSI

[25] Tapscott, Don, 2000: Digital Capital – Harnessing the Power of Business Webs. Nicholas Brealey Publishing.

[26] Ibid.

model[27] (please refer to the baseline analysis), more extensive exchange of data in e-procurement require standards in a number of different areas or 'layers' in a data network.

The current areas of problems with interoperability in e-tendering include[28]:

- Different classifications of products (CPV, UNSPSC, EAN).
- Different digital signature formats

In the area of e-purchasing, where more extensive interaction between buyers and suppliers take place, the interoperability problems are more significant. The most important areas are:

- Use of different underlying format for exchange of data, i.e. which protocols are used (i.e. different XML formats).
- Different semantics or DTD (document Type Definition)[29].
- Different 'attribute' standards, i.e. different definitions of the content of business documents. Examples are tender documents request (e-Tendering) or e-catalogues (e-Purchasing).

The different standards are a consequence of the existence of many different actors in the area, including CEN/ISSS, IDA (DG Enterprise), UN/CEFACT, OASIS / UBL, RosettaNet, national standardisation bodies etc. The fact is that each of these defines standards or guidelines for e-procurement, which are not directly compatible. Another problem is that the publication of a standard does not secure a wide adoption of the standard by IT-vendors (in e-procurement solutions) or by end users (contracting authorities and companies).

Thus, basically two challenges exist in the area of standardisation and e-procurement:

1. To define (global) standards to support the various processes of e-procurement (e-tendering, e-ordering and e-invoicing) in areas where business documents are transferred between IT-systems of the buyer and IT-systems of the supplier.
2. To promote the use of standards by IT-vendors and end users instead of proprietary standards.

Regarding (1), standards are currently being developed by a number of actors. Some of these are public, i.e. IDA (DG Enterprise) and UN/CEFACT, and others are non-public, non-profit consortiums, i.e. OASIS UBL and RosettaNet. Some standardisation initiatives are national (like eGIF in UK); others are international (like OASIS UBL). The consequence is that different standards are developed, which can cause fragmentation in different areas:

- Business to government / Business to business: While UN/CEFACT and IDA to a large extent are driven by public actors; other initiatives are industry consortiums such as OASIS and RosettaNet. This poses the risk that incompatible standards are implemented in the public and private sector.
- National / International: Because of the lack of international standards, some EU member states are developing their own formats for exchange of

[27] www.whatis.com & Miller, Rachelle L.: "The OSI Model: An Overview", GSEC Practical Assignment Version 1.2e.
[28] Eylen, Hilde Van and others: Transborder eProcurement Study: Public eProcurement – Initiatives and experiences, borders and enablers (2002).
[29] Also called semantic interoperability, see IDA: European Interoperability Framework for Pan-European eGovernment Services. IDA working document version 4.2 (2004).

business documents[30] (though usually, to the extent possible, based on internationally agreed formats such as UBL).

Initiatives have been put in place to address these problems, most notably initiatives by UN/CEFACT to develop an open XML based framework and the IDA XML schemas initiative:

- In 1999, UN/CEFACT launched an initiative to develop an open XML based framework, enabling the global use of electronic business information. The initiative was named ebXML and undertaken in conjunction with OASIS (Organization for the Advancement of Structured Information Standards).
- Under the IDA programme, the IDA eProcurement XML schemas initiative have been launched. The initiative "aims at proposing a set of generic XML schemas to support the automation of data exchanges in the different phases of electronic public procurement"[31].

Regarding the UN/CEFACT initiative, it is supported by the general development where XML is being promoted by a number of different organizations as the standard to share business documents. However, the current situation is that "many projects or standards (EDIFACT, X12, RosettaNet, UBL and other national, regional or industry specific initiatives) have developed electronic order and invoice messages. All the message definitions are very similar in essence but all have significant differences."[32] Many different implementations of XML exist, and the key IT-vendors have introduced their own Document Type Definitions based on XML, e.g. Ariba cXML, Oracle XML and SAP XML.

As mentioned, there is are also national initiatives trying to enhance the use of e-procurement through defining standards, e.g. the e-GIF project in UK (which is also inspired by the OASIS UBL model) and the OIOXML project in Denmark (based on UBL). The e-GIF defines the technical policies and specifications governing information flows across government and the public sector in the United Kingdom. Under the eGIF initiative, XML Schemas for different phases of the procurement process has been developed.[33]

The IDA XML schema initiative has been launched to address the problem of the many different XML standards. Apart from being a new Pan European standard, the IDA initiative is also intended to be used as a 'common denominator', a common basis for mapping of different existing standards[34]. The table below provides an overview of published IDA e-procurement XML schemas.

[30] WS/ePRO Secretariat: First draft of the CEN workshop Agreement on eProcurement.

[32] IDA (2004): IDA e-procurement XML schemas initiative - e-Ordering and e-Invoicing phases.
[33] See http://www.govtalk.gov.uk/schemasstandards/egif_document.asp?docnum=874
[34] IDA (2004): IDA e-procurement XML schemas initiative - e-Ordering and e-Invoicing phases.

Table 2.2: Published Ida XML schemas

Procurement phases	IDA XML Schemas	Interoperability
e-Tendering	√	
• Dynamic purchasing system	√	
• e-Auction	÷	
e-Awarding	√	
e-Ordering	√	
e-Catalogue	÷	
e-Invoicing	√	
Classification systems		÷
e-Signature		÷

IDA XML schema have been published in the following areas: e-Tendering, e-Awarding, e-Ordering and e-Invoicing, but so far not in the area of e-Auctions and eCatalogues.

The new procurement processes dynamic purchasing systems, which is introduced with the forthcoming EU directives, is described in the e-Tendering and e-Awarding IDA XML schemas. So far, e-Auctions are not described. The argument by IDA for not developing e-Auctions XML schemas is that e-Auctions will be conducted at web sites, and will not require the same exchange of business documents between different electronic systems as the other procurement phases.

Two other important areas with interoperability problems are classification systems and e-Signature. The status regarding e-Catalogues, classification systems and e-Signature is shortly described below.

Electronic catalogues:
There are a number of different formats when it comes to electronic catalogues. Hence, different e-procurement systems have defined different catalogue standards which suppliers need to adjust to. [35] A survey among 251 respondents mainly from private enterprises in Europe shows that the amount of different eCatalogue formats applied is very high. More than 20 different eCatalogue formats were used by the respondents, and on top of this comes a number of proprietary eCatalogue formats[36].

The initial set of procurement documents in UBL 1.0 does not include a document type for catalogues, but there are data elements for catalogue references in some of the other documents, such as Purchase Order. There are also catalogue-related data elements in the UBL library. However, UBL as it stand, does not have any UBL business document schemas specifically for catalogue management. xCBL (which provided the starting point for UBL) does contain such a catalogue schema, and it has long been part of the plans for future development. It is believed that a UBL catalogue schema will be adopted for UBL 1.1, which is projected for delivery in mid-2005.

In general, it would be an advantage to suppliers (and buyers) if catalogue formats were more standardized, so that they only have to develop one product catalogue to be used on an European scale.[37]

Classification systems

[35] IDA (2002): Public eProcurement. Iniatives and experiences.
[36] CEN/ISSS WS/eCAT: Multilingual catalogue strategies for eCommerce and eBusiness. Combined report. Version 2004-02-17.
[37] IDA (2002): Public eProcurement. Iniatives and experiences.

Different classification systems for public procurement are being used in Europe, the most important ones being:

- The CPV (Common Procurement Vocabulary) establishes a classification system for public procurement aimed at standardising the references used by contracting authorities and entities to describe the subject of procurement contracts.
- UNSPSC (The United Nations Standard Products and Services Code)[38] is an open, non-proprietary system of codes and standardised descriptions for classifying all goods and services.

CPV has been translated into 25 languages and has a clear versioning. CPV was not initially designed for e-procurement, and according to an IDA analysis is "not detailed enough to determine product groups or to define the products in the catalogue"[39].

Currently, CPV is primarily used in the initial stages of the procurement process; to draw up tender notices. Contrary, UNSPSC is used to carry through the ordering process since it is possible to classify subjects more detailed than with CPV[40]. Irish health sector studies support this. They have found that the CPV codes do not meet the need for financial reporting in terms of costing etc. and therefore are not suitable for e-purchasing.[41]

e-Signature

Member States all over Europe are currently establishing national based e-Signature systems, which are generally not technically compatible with systems in other countries[42]. Other recognised digital signatures could be global standards such as Verisign and Globalsign.

The current situation is that national specifications are often only published in the national language which could be a potential market barrier: e.g. for a small municipality in Estonia who receives a tender with a digital signature from a Belgian firm - in French. How shall the municipality evaluate if this is based on generally accepted standards? There are also technical complications: what if the municipality has installed an e-tendering system and the digital signature from Belgium is not compatible with this system?

Member states have taken very different approaches to the establishment of a digital signature infrastructure. Some use hardware based systems (signature cards and card readers provided by trust centres as in Germany) and other countries use software based systems (i.e. Denmark).

Specific problems exist in this field of digital signature. For a company to obtain a Danish digital signature, a specific CVR / SE number is needed, which is only provided to Danish companies.

Various standards are being promoted in the field of digital signatures, including the X509 for certificate authentication. X509 is a basic interoperability standard, and currently used by most of the market players for electronic signatures based on PKI[43].

[42] E.g. the OCES developed in Denmark OCES is basically a definition of fields and the content of these fields.

[43] Dumortier, Joe et al.: The legal and market aspects of digital signatures (2003), Leuven University.

According to some sources, and as mentioned in the Baseline Scenario, security can represent a barrier to suppliers and buyers[44]. Some suppliers and buyers are concerned about using the Internet to transmit confidential information.

Various approaches to developing secure systems have emerged in e-procurement, including digital certificates and digital signatures. Both use encryption of data to protect the information when transported over the public internet. Two main methods of encryption exist: secret-key (symmetric) encryption and public-key (asymmetric) encryption[45].

The security level of an encrypted system is directly affected by the length of encryption/decryption keys, and the current versions of the Data Encryption Standard (DES) adopt 122-bit or 168-bit keys[46]. The security level of an encrypted system is measured in the time it would take for someone to break the encryption. Thus, no encrypted system is 100% secure.

2.3.2 *Trends*

While standards have been developed in some areas, the implementation of these are only just starting. Various barriers exist in the use of available standards:

- Lack of incentives for IT-vendors like SAP and Oracle to implement XML schema standards in their e-procurement solutions.
- Lacking demand for standards among end-users. Implementing standards will sometimes mean higher cost of an e-procurement solution, because international standards are often a framework which needs to be completed in the individual case.
- Industries and specific (large) companies which are not using standards because they prefer to establish their own developed, do not feel they suit their specific needs, which is especially an argument for large companies that want to develop their own message format (Document Type Definitions).

There are indications that XML will gain a larger market share in the future when it comes to document standards. Specifically, UBL seems to be the standard preferred by many actors in the public sector at the moment.

Additionally, the current trend in standards within electronic catalogues is an advance in the use of UNSPSC instead of CPV. However, as described earlier, CPV holds a number of advantages regarding language, clear versioning etc.

To summarize, there is currently no sign that a uniform standard for underlying format, attributes, classification and digital signature at EU-level will emerge if no action is taken by standardisation bodies and the EU Commission.

2.3.3 *Influence on electronic public procurement until 2010*

With the current fragmentation in key areas such as different schemes, electronic catalogues, classifications and digital signatures, and with the current pace of standardization, the development towards world wide agreed standards will be very slow.

The limited implementation of developed standards constitutes another problem. The inconsistent use of standards by main operators is expected to keep constituting a problem in the area of e-public procurement. Moreover, public administrations in member states or regions are often hesitant to agree on a common set of standards or common use of a specific system, which would minimize the problem with different standards.

In the area of electronic signatures, standards are lacking in two areas: security standards and interoperability standards[47]. It is very complicated to agree on one common standard at EU level and obtaining acceptance from all the different authorities and sectors and their specific needs and demands whereas creating a system of 'mutual recognition' of national digital signatures in EU might be easier.

Security will remain an important issue in the future. No IT system is 100% secure, and it is likely, especially with an expected increase in transactions, that attacks will occur. Such cases will create distrust towards systems and decrease confidence in e-procurement. The development in this area changes from day to day, which means that it is also important that the situation is monitored closely, and that action is taken swiftly when needed.

2.4 Human Resources and Knowledge

2.4.1 *Current situation*

Currently, there is no general data from EU25 on the human resources and knowledge related to e-public procurement. However, some lessons learned exist at country level which can provide elements to an assessment of the current situation in this area. The key aspects regarding the current status and the evolution of e-public procurement are:

- Knowledge
- Use of ICT
- Skills

Knowledge
Currently the knowledge on the benefits of introducing operational e-public procurement in public institutions and private enterprises is limited. Several sources emphasize that it is important to disseminate the knowledge – and preferable solid evidence and documentation – of the cost/benefit ratio and the benefits related to electronic public procurement. This concerns the benefits related to more efficient working processes and lower transaction costs, but also benefit better management of the procurement process, added value, more competence for employees, faster acquisition time etc[48].

[47] Dumortier, Joe et al.: The legal and market aspects of digital signatures (2003), Leuven University.
[48] Rambøll Management (2000): “Analysis of electronic public procurement pilot projects in the European Union”, p. 5-6; and case interviews conducted in Denmark and Germany

Use of ICT
Indirectly, the general access to computers and Internet are important variables for a successful introduction of operational e-public procurement throughout Europe. Data from Eurostat show that 84% of enterprises in EU15 had access to the Internet in 2003 compared to 70% in 2001. Moreover that 45% of all households in EU15 had access to the Internet in 2003 increasing from 36% in 2001. [49] These findings are indicators of the increasing ICT-awareness and -readiness of the European people.

Specifically, an assessment in the e-Business W@tch from March 2003 shows that 93% of all employees from the seven sectors surveyed work in companies that use computers, and 87% in companies with Internet access. [50] This indicates a high degree of e-readiness in European businesses and that the very basic conditions regarding the human resource capacities for the application and use of e-public procurement are in place in the companies.

However, this overall observation needs to be complemented by more nuances: First, recent data show that while the general internet penetration in SMEs is high, a large share of the smaller segment of the SMEs (with less than 20 employees) still do not have high-speed internet access even in France which is among the best equipped European countries in terms of the penetration of the business sector by high-speed internet access[51]. The comparatively low penetration of high-speed internet access in the smallest companies implies a risk that these companies will effectively opt out of e-public procurement because participation in e-public procurement procedures is too cumbersome (which e.g. require up- and downloading large files which is difficult, if at all possible, without state of the art high-speed internet access), except for the more simple phases of the procurement cycle (notification and publication of tenders).

Secondly, a large number of the public sector institutions in Europe, which in a generally decentralized procurement structure are responsible for their own procurement, only purchase goods and services in small amounts that are below the threshold value defined by the public procurement directives and nationally defined threshold values for smaller purchases. In general, the incentive for public institutions to engage in e-public procurement grows stronger with the volume and number of transactions that the individual institutions makes on an annual basis (the higher the volume and the number of transactions, the better the return on investment made by the public institution). Consequently, the incentive for many public institutions (especially smaller institutions) to engage in e-public procurement and acquire the necessary skills and knowledge does not currently seem very strong.

Skills
The skills needed to operate simple e-tendering procedures are limited assuming that the user is fairly used to IT (please refer to table 2.1 in Part 1; the baseline analysis). However, for more advanced systems such as Dynamic Purchasing Systems (using e-Catalogues), e-Purchasing and e-Invoicing, the requirements are higher. It should be noted that the use of

[49] Eurostat, Structural indicators, Innovation and Research, Level of Internet access. See http://europa.eu.int/comm/eurostat

[51] Ministry of Industry of France, "Digital Economy Task Force, E-commerce Scoreboard Update", April 2004, p. 21

advanced e-procurement system is not a requirement of the directives and the directives explicitly stipulates that e-procurement systems do not conform with the legislation if they constitute a market access barrier.

In the recent years the importance of e-skills has increased. Nonetheless, in 2004, the European Commission has calculated that while over 70% of the EU workforce regards computer skills as important for their employment situation, only about 27% of the workforce has received job-related computer training.[52] These figures indicate that a skills shortage might occur in the workforce, but it is at the same time important to bear in mind that ICT skills at user level are very often acquired through informal on-the-job-training and everyday usage, which is a factor that will counter the occurrence of a skills shortage.

More specifically concerning e-public procurement, an evaluation of the experiences with implementing e-public procurement systems for the public authorities in Sweden has concluded that the most critical factors of implementing the systems are related to recruitment of skilled staff and to the development of training programmes for the employees of the public authorities.[53] To be effective such training programmes would need to be a mixture of awareness raising and the IT skills needed to operate e-public procurement systems. In this regard they would need to address the implications of the new legal framework and disseminate experience and knowledge on good public procurement practice.

Several initiatives have been taken already on a national level to increase the skills of the public and private employees working with e-public procurement. In UK, The Improvement and Development Agency on procurement (IDeA) has recently expanded its free procurement advisory service and developed a range of new services. During 2004, IDeA will publish comprehensive practice guidance and programs on different aspects of procurement together with a wide range of resources[54]:

- Training of member/managers and project teams
- Sustainability and local government procurement
- Skills framework for local government procurement
- Addressing e-procurement

Furthermore, findings in Ireland show that SMEs are ill prepared to take on the advantages of the opportunities presented by public and private e-procurement. Therefore, the Irish Chamber of Commerce is taking practical steps to help SMEs meet the e-business challenge, e.g. an SME e-procurement training programme in 2003. The programme is set up to prepare Irish businesses for the introduction of e-procurement, particularly within the public sector. The programme provides seminars, online training and guides. [55]

[55] See the ”SME E-procurement Training Programme” 18 May 2004 on www.chambersireland.ie

Recent experiences from Denmark are in line with the Irish view that SMEs need to upgrade their skills and knowledge to better exploit the possibilities of advanced e-public procurement (again: please note that these a not a requirement of the new directives).

A development project for SMEs aiming at improving the capacities and possibilities for SMEs to take part in e-commerce concluded that SMEs have a number of general needs that must be covered adequately in order to effectively exploit the opportunities in e-commerce, including e-procurement, but that these needs are not presently covered sufficiently[56].

As regards skills and knowledge, this includes knowledge and competences in relation to IT strategy, IT project design, management and implementation and IT solutions, which, at a more specific level, can be translated into the following skills needs, where the 60 SMEs participating in the Danish e-commerce development project generally do not have sufficient capacity:

- Upgrading of the skills of management and administrative staff for IT use and general understanding of the use of IT in the business processes of the firm
- Ability to assess, and possibly upgrade, enterprise resource planning (ERP) systems
- Management and implementation of costumer relationship management (CRM) systems and sales
- Development of IT strategy, including the decision to outsource IT development and day-to-day IT operations to suppliers
- Ability to integrate and mainstream IT into critical business processes in the value chain, e.g. logistics, procurement, sales, production, marketing and after sales service.

Although a firm has the possibility to outsource some of these tasks there still need to be a certain level of knowledge in the firm to make informed strategic and operational decisions and manage the suppliers to which tasks are outsourced.

2.4.2 Trends

Knowledge

It is expected that knowledge on e-public procurement will increase in public institutions and in companies following the market development in the field where companies will continue to adopt e-business, including e-procurement, on the B2B market in order to achieve efficiency gains[57]. However, there will be a continued demand for specific documentation on the effects of e-public procurement in order to convince all stakeholders – especially smaller public entities, line units in larger public institutions, purchasers and SMEs – about the business case for e-public procurement and the potential in introduction of operational e-public procurement.

[56] Ministry of Science and Technology of Denmark, ”Genvej til e-handel” (in English: Shortcut to e-commerce), unpublished note, May 2004, prepared by RAMBOLL Management. The project included 60 Danish SMEs from different business sectors who received coaching and advisory services in order to improve their capacities to exploit and participate in e-commerce.

[57] Ministry of Industry of France, ”E-commerce Scoreboard Update”, April 2004, p. 54

Use of ICT
The development of common ICT penetration and usage is increasing, and it is expected that that there will be a continuation of the ICT penetration in the wider public including the workforce in all countries. However, the current situation with a marked difference in ICT infrastructure and capacity between the smallest SMEs with less than 20 employees and larger companies might be the harbinger of a future trend where this segment of companies is constantly lacking behind the larger companies concerning ICT upgrades and investments that are needed at regular intervals. If this trend materializes the implication is that the small companies are poorly equipped to take advantage of the opportunities that e-public procurement offers. As mentioned above, there seems to be a general lack of IT and e-business related skills in SMEs, which require a certain amount of investments in time and resources on the part of the companies to eradicate, and such input factors are typically sparse in particular in the small companies with less than 20 employees.

Skills
It is likely that the demand for training in the field of e-public procurement from both public and private stakeholders will increase in the near future. The tendency seen today in the countries with relatively developed e-public procurement initiative is that national authorities and organization will provide different training programmes and awareness raising efforts. It seems therefore realistic to expect that more initiatives of this kind will be initiated at the national level across the member states.

2.4.3 Influence on electronic public procurement until 2010

Knowledge
Over the coming years both contracting authorities and SMEs will continue to demand concrete documentation of the business case for e-public procurement, since the present evidence is somewhat anecdotal. In interviews conducted for this study, this factor has been highlighted as the single most important precondition for the evolution of e-public procurement, and it was stressed that if this kind of documentation is not provided it can be expected that the willingness to engage in e-public procurement will develop slowly and incrementally.

Use of ICT and skills
As mentioned above, the skills needed to operate simple e-tendering procedures are limited. Moreover, the directives clearly states that an e-procurement system does not conform to the legislation if they represent a market access barrier, which is the case if systems operation exclude enterprises from participation in tenders.

The existing trends concerning the use of ICT and the relevant skills seem to point in the direction that may influence the development of e-public procurement positively until 2010: the general inflow of a new workforce with IT-skills on the labour market, combined with an on-going upgrading of the IT-skills of the existing work force, decrease the importance of the human resource skills barrier. A successful introduction of the new systems among the larger procurers will create experience with the use of electronic procurement that might be used by other contracting authorities. Such experience will feed the need for documentation of the benefits described above and create a certain snowball effect, but where the size of the snowball and its speed will depend on the ability to get the messages and evidence on e-public procurement across to the stakeholders. Furthermore, there will be an ongoing upgrading of computer skills in both the public and private sector which will follow in the wake of the general introduction of e-public procurement. Concerning the need to upgrade skills and knowledge in the public institutions it seems likely that national guidelines on the use of (advanced) electronic procurement, including the implications for institutions of the new legal framework are likely to emerge and thereby reduce the risks relating to the complex nature of the electronic procurement rules.

For more advanced e-procurement, there is a risk that in particular the small enterprises (with less than 20 employees) will not be able to participate in e-public procurement, especially in the phases that include two-way communication flows between buyer and supplier. This is due to a shortage of the relevant skills and knowledge in this segment of SMEs (including strategic skills), which is of a rather fundamental nature and therefore not likely to disappear.

These differences between the smallest companies on one side and larger companies on the other side might be reinforced as e-public procurement systems become more advanced with the proliferation of e.g. e-catalogues, e-auctions and dynamic purchasing systems and with the continuous development of e-procurement software.

2.5 Availability of technical solutions – supply and demand for e-public procurement solutions

The availability of technical solutions is an important driver for uptake of e-public procurement. The availability of cheap as well as well functioning, user-friendly systems is important to both buyers and suppliers. Thus, the cost-benefit (business case) of e-procurement is important for the up-take of the solutions.

2.5.1 Current situation

Five key aspects regarding the current status for the availability of technical solutions in e-public procurement are listed below:

- *Development of e-tendering systems:* Some development of e-tendering systems is taking place, but the pace is slow. Examples include eVergabe (Germany), Ixarm (Italy) and CAT365 (Spain).
- *Development of e-purchasing systems (ordering):* Some e-purchasing systems in the public sector have been established, but the development in this area is also slow.
- *Functionalities of e-procurement systems:* E-procurement is a part of integrated applications which offer a range of procurement functionalities.
- *Cost of e-public procurement:* The cost of the core e-procurement technology is decreasing, but the total cost of implementations is fairly stable.
- *Business case for e-public procurement:* The business case for e-procurement in the public sector: The business case (costs versus benefits) for buyers and suppliers of e-procurement applications is not evident today and innovative technical solutions and business models are needed to improve this and reach critical mass.

These five aspects are briefly described below:

Development of e-tendering systems:
A number of public institutions in Europe are currently implementing e-government portals or e-procurement systems, i.e. Catalonia (CAT365) and Bremen (GOVERNIKUS). Public portals for e-tendering can help facilitate the transformation from paper based to e-procurement processes.

In the survey of the member states (Part 1 report, section 3), 16 of the 25 respond that they have established an e-public procurement system of some form. It should be mentioned that this does not mean that e-procurement systems has been widely adopted in these Member States; only that some 'live' systems are operating. In 9 Member States important portals or e-marketplaces for public sector procurement have not been identified: Cyprus, Greece, Lithuania, Luxemburg, Poland, Portugal, Slovakia, Slovenia and Spain.

So far, most emphasis has been put on the first phase of e-tendering: Notification about tenders. Even though a number of Member States mention that download of tender documents is a functionality in some implemented systems today, it is the conclusion from the interviews that this is something that is very seldom used in tender procedures. The same is the case with the later stages of the e-tendering process (receipt of electronic tenders, evaluation of tender etc.).

Currently, the usage of the e-tendering systems in Europe is limited. The table below provide an overview of the usage of some of the relatively few 'live' systems in Europe.

Case box: Examples of current use of e-tendering portals in Europe

	No. of invitations to tender	Procurement volume published
eVergabe, Germany	n.a.	507 million EUR (2003)
Ixarm & Achats, France	Appr. 3,600	Appr. 10 billion EUR*
The Trading House Hansel, Finland	200 tenders	168 million EUR

* Calculated. Spending in military sector is 15 and 17 billion EUR per annum

Ixarm & Achats is by far the most used e-Tendering portal in terms of procurement volume published on the web page. The two other portals have a limited published procurement volume – i.e. when comparing the published tender volume on e-Vergabe with the total procurement volume in Germany.

Development of e-purchasing systems (ordering):
Before the burst of the dot com bubble, it was believed that business-to-business market places would be a successful business model, and according to estimates, 1.000-1.500 marketplaces was set up world wide[58]. Only few of these are continuing, and mostly in large industries such as metals, chemicals and cars, airplanes and retail, i.e. World Wide Retail Exchange (retail sector), Convisint (the automotive sector) or Aeroxchange (airline sector). Generally, the most successful market places are identified in sectors where orders are generated automatically (by stock management systems / supply chain management systems).

Examples of successful electronic market places in the public sector in Europe are few. Some of the better examples of a public sector electronic market place are Consip (Italy) and GCAT/SCAT (UK). Some of the relatively

[58] The Economist, May 15th-21st 2004: Special report: E-commerce takes off

large portals (in terms of investments) are mentioned below, but even these struggles in terms of achieving a sustainable amount of procurement.

Case box: Examples of current use of e-marketplaces (purchasing) in Europe

	No. of invitations to tender	Procurement volume	No. of trans-actions	Transaction volume
Consip, Italy			450 (2003-2004)	1.5 mills. EUR (2003-2004)
DOIP, Denmark			n.a.	6.4 mills. EUR (2003-2004)
GCAT, UK			n.a.	10 mills. EUR (2003-2004)

All the three e-ordering marketplaces have a limited number of transactions and transaction volume as compared to the total public procurement in the three countries. The figures clearly show that critical mass has not been reached at any of these ‘frontrunner’ e-market places. An example of the problems facing market places is the case of DOIP (Denmark), where the owner Gatetrade decided to sell off the operation in July 2004 after investments of approximately 30 million EUR over the past 4 years without achieving a sufficient amount of transactions and procurement volume.

The financing and business model of the portals and market places differ, and the following different business models can be identified:

- The system is entirely publicly financed. The buyers and suppliers can use the service for free (i.e. Consip in Italy).

- The portal or market place is financed by the buyer. The suppliers can use the service for free (i.e. Ixarm & Achats in France).

- The portal or market place is (mainly) financed by the users. Buyers and suppliers pay sign-on fees, subscription costs and transaction costs. (i.e. DOIP).

The experience so far is that initial and operating costs are barriers vis-à-vis use of the more advanced portals or market places by buyers as well as suppliers. Generally, public co-financing of public portals/market places is very important to reach critical mass, at least in the transition period.

Functionalities of e-procurement systems
The key e-procurement vendors offer e-procurement as part of integrated solutions with a number of procurement functionalities: e.g. / Ariba Procurement Solutions, Oracle E-Business Suite, PeopleSoft Enterprise eProcurement and mySAP Business Suite.

These solutions have separate applications for ordering (e.g. Ariba Buyer, Commerce One Buy and Oracle iProcurement) and sourcing (Ariba Sourcing and Oracle Sourcing), with functionalities such as auctions, negotiations, evaluation of tenders etc.

The new procurement procedures introduced with the new EU directives, E-Auctions and Dynamic Purchasing Systems, are, to some extent, already integrated in the e-procurement systems of the big vendors today, i.e. the Oracle iProcurement have integrated e-Auction functionality.

Cost of e-public procurement
The market for e-procurement solutions has matured in recent years from pilot/development projects to ‘live’, operating systems. In many areas of e-business, cheap standard systems and/or hosted solutions have emerged (e.g. the web shop market). The leading IT-vendors have developed e-business ‘solutions’, e.g. mySAP Business Suite and Oracle E-Business Suite. They are increasingly developing standardised out-of-the box solutions, even sector-specific, to reduce implementation cost of e-procurement systems. This is partly done to move ‘down’ marketwize in terms of company size and even the big IT-vendors are now targeting companies with less than 500 employees.

The cost of e-procurement technology / software has fallen during the last couple of years, but this element constitutes only approximately 10-20% of the total cost of an electronic procurement implementation[59]. Other cost elements are hardware and implementation, including business process re-engineering and back-end integration. The consequence is that the total price of electronic public procurement systems is relatively stable, and software vendors have focused on integrating more functionality into electronic procurement systems.

If electronic procurement is done via an intermediary (portal/market place) other key cost factors are registration fees, periodical fees and charges as a percentage of procurement is carried out.

Enterprises are faced with a number of different costs when implementing e-procurement, and the various cost elements can add up to a significant level altogether.

Software related requirements associated to simple e-tendering are primarily a word processor / spread sheet, internet browser and an e-mail system. In principle, free accessible open source software can be used for e-tendering (i.e. office suites, browsers and e-mail applications). For the later stages of e-procurement (i.e. e-catalogue management tools), open source software is not available. Generally, the software cost for suppliers in e-Tendering are limited, and issues such as update, support, learning resources etc. is to be considered carefully when it comes to specialized business software such as e-procurement.

Software applications are the core tool for suppliers in e-procurement, so access to user friendly, cheap solutions with the required functionality are very important for suppliers. Promotion of open source software in both stages of the procurement process could have an immediate impact on suppliers access to e-procurement. However, it is very uncertain if supporting open source software in the field of i.e. e-Catalogues is a cost-efficient policy action. Other issues such as update, support, learning resources etc. is a disadvantage in the open source software model when it comes to specialized business software as e-procurement.

[59] Although very dependent on the individual implementation. Source: Interview with IT-vendors, including Oracle and SAP.

Below is an illustration of the costs facing suppliers when entering into e-procurement with a public institution as buyer[60] with the purpose of exchanging business documents, i.e. orders or invoices? The example is based on evidence from Denmark, but the cost structure is largely the same as in other European countries, which have established public procurement marketplaces.

Case box: Cost of e-procurement (ordering) for suppliers. Example from Denmark.

Integration with financial system, picture databases etc.: from EUR 3,000 and upwards depending on system, automatisation level, functionalities etc.

Sign on fee, portals: EUR 1,500[61] (DOIP), EUR 800-2,400 (RAKAT)[62], and EUR 700 (KMD).

Annual fee: EUR 1,500 (DOIP[63]), EUR 800-2,400 (RAKAT)[64], EUR 700 (KMD).

Transaction costs: From EUR 0.03 (RAKAT) to 2% of turnover (DOIP).

In some cases, upgrading of the ERP system to a newer or more widely used software package can be a pre-requisite for automated and integrated e-procurement.

Total:
Implementation costs: from EUR 6,000 (excl. revisions in ERP system)
Annual costs: EUR 3,000 (fixed) + variable costs according to turnover and number of transactions

As evident from the table, implementation cost and running costs are considerable for an SME, especially when the use of the systems by public authorities is often limited.

Business case for e-public procurement
According to estimates[65], approximately 100 public institutions at national, regional or local level have implemented e-tendering or e-ordering procurement systems. According to another estimate, less than 1% of orders and 5% of procurement value are done electronically[66]. Whereas significant savings are possible, the implementation cost and cost of operation of e-procurement systems combined with the low up-take of e-procurement among buyers, makes it difficult to document significant savings from implementing advanced e-public procurement systems. The roll out of e-public procurement systems are slowed down because especially buyers face complex and resource intensive implementations.

The introduction of the EU directives is likely to improve the business case somewhat, e.g. by removing legal uncertainty and making it clear that the contracting authorities can require the use of electronic communication for accessing documents and for submission of offers.

[60] The example is based on evidence from the project conducted by Rambøll Management, 2003-2004: Implementation of e-commerce in 60 SMEs, Danish Ministry of Science, Technology and Innovation.

[61] If a framework contract has already been signed with a public institution, this fee is zero.

[62] EUR 800 per message format (order, order confirmation and invoice).

[63] 6-10 users, 1.001-5.000 catalogue lines.

[64] EUR 800 per message format (order, order confirmation and invoice).

[65] Rambøll Management estimate based on various sources (IT-vendors, portals and key contact points in member states)

[66] Interview with Oracle.

The development of e-procurement solutions is evolutionary rather than fundamental. However, to reach a significantly higher level of up-take, the development of innovative technical solutions and business models is needed.

2.5.2 *Trends*

The expected trends in the five key areas described in the section above may be summarized as follows:

Development of e-tendering systems:
E-portals for sourcing are still in the establishment phase. The trend is pointing upwards, with significant new portals expected to be launched within the next couple of years. This means that technology experience will be accumulated and the solutions further developed.

Development of e-purchasing systems (ordering):
E-purchasing systems and market places are also in a development phase, both in regard to the technology, but also the business model applied. Several market places and purchasing systems suffer from lack of turnover and lack of interest from buyer side (public institutions).

Functionalities of e-procurement systems
The market for e-procurement has changed in recent years. Customers are more reluctant towards buzz-words and smart features and more focused on sector references. The major IT-vendors have already developed support for most of the procurement procedures, including eAuction, dynamic purchasing systems etc. The development efforts of the major IT-vendors are directed towards getting the systems to work swiftly and better, and more integrated procurement solutions, making the shift between tendering, purchasing and payment easier.

Cost of e-public procurement
Historically, the cost of e-procurement technology / software has been decreasing along with development of more standardised solutions, but these represent only approximately 10-20% of the total cost of implementing and operating an e-procurement system. Other cost factors such as external IT-consultancy is not expected to drop, which means that the total cost of e-procurement implementations is fairly stable.

Concerning a possible emergence of open source solutions, this should mainly reduce the cost of the ‘core’ e-procurement technology, whereas consultancy related to implementation should remain at the same level as today. Thus, it is unlikely that open source systems would be significantly cheaper than ‘closed-core’ solutions as SAP and Oracle. It should also be kept in mind that the software cost for suppliers in e-Tendering are limited, and requirements are mainly related to simple tools such as a word processor / spread sheet, internet browser and e-mail system. Currently Open Source software of sufficient quality exists in these areas, but the use is very limited. For the later stages of e-procurement (i.e. e-catalogue management tools), open source software is not available.

The introduction of new procurement procedures and requirements related to security in the new public procurement directives is not expected to increase the cost of e-public procurement systems significantly, because the technology already exist and is integrated in many systems.

Business case for e-public procurement
Whereas the cost side of e-public procurement is not expected to change significantly, the benefit side is expected to improve along with an increasing up-take of e-public procurement. The important factor is reaching a critical mass of buyers and suppliers using e-tendering or e-procurement market-places.

2.5.3 *Influence on electronic public procurement until 2010*

Development of e-tendering systems:
E-portals for sourcing are still in the establishment phase. The trend is pointing upwards, with tendering portals being implemented in many Member States at the moment. This means that experience with the technology will be accumulated and the solutions further developed and optimised. The continued development of the e-tendering technology will facilitate the implementation of systems, thus contributing to the establishment of a more competitive and transparent public procurement market.

Development of e-purchasing systems (ordering):
The establishment of a number of national and regional and public sector market places (e.g. Consip in Italy and Zanzibar in UK) is expected to increase the penetration of market places in public sector procurement. Some of the major public procurement markets in Europe will reach a critical mass of suppliers, while reaching critical mass in smaller markets or in less technologically mature countries (including Eastern Europe) will be difficult. This development will delay that of more efficient public procurement markets in Europe.

Functionalities of e-procurement systems
The development in the field will move towards more integrated procurement solutions, integrated sourcing / tendering, ordering and payment systems. Functionalities such as dynamic purchasing systems and e-auctions are expected to be integrated in the major e-procurement systems by key IT-vendors in the market. However, lacking focus on this market from IT-vendors means that more fundamental innovation of systems and solutions is limited.

Cost of e-public procurement
The cost of an e-public procurement implementation is most significant at buyer side (public institutions). A maturing market for e-procurement solutions will provide more standard, out-of-the box solutions which will mean cheaper technology/software. While the cost of technology/software is expected to decrease from the current level, and the market is expected to offer cheaper, out-of-the-box solutions, the total cost of buy-side public procurement is not expected to be significantly lower level than the current, due to the fact that the cost of technology only constitutes a relatively small part (10%) of the total costs.

Thus, high implementation and operational costs of transition from paper-based to e-procurement regimes will continue to provide a barrier for e-public procurement, and SMEs will still be faced with a cost barrier regarding e-public procurement (in e-purchasing). The high level of investments required to implement e-public procurement is expected to slow down the up-take of electronic means in public procurement. Costs for suppliers related to obtaining advanced digital signatures for the participation in public call for tenders may impede cross-border trade/competition within the EU.

Business case for e-public procurement

Whereas the cost side of electronic public procurement is not expected to change significantly, the business case is expected to improve somewhat due to higher penetration of electronic public procurement among buyers and suppliers. It remains, however, to be seen in which markets (member states or sectors) e-public procurement will reach critical mass, and thus constitute a sound business case. Thus, in some smaller markets, the potential of increased competition, more transparent markets and more cross-border procurement will not be realized. However, if the development, acquisition and operational costs are partly or fully covered by national funding, the business case for the individual contracting authority and the individual supplier will improve considerably.

2.6 Uptake of e-public procurement and impact on the internal market

Based on the analysis of the above determinants in the field of e-public procurement up to year 2010, in this final section of the baseline scenario we summarize our estimate of the expected development regarding up-take of e-public procurement and the impact on the internal market *without* further policy action at European level.

The regulatory framework and the four driving forces will influence the uptake of e-public procurement. Furthermore, increased uptake of e-public procurement can have a positive impact on the internal market.

As illustrated previously in section 3, especially the publication of indicative notices and tender notices have an impact on the internal market, i.e. through increased competition and reduced consumer prices. Transforming of the remaining phases of e-tendering will mostly provide process savings, and not directly influence the advance of the Internal Market.

2.6.1 Uptake of e-public procurement

According to a study, the total public procurement market in the EU – i.e. the purchases of goods, services and public works by governments and public utilities - is estimated at about 16% of the Union's GDP or €1500 billion in 2002[67]. In 2002, 106,346 invitations to tenders and 58,513 contract award notices were published. The share of contract awards published in the official journal and subsequently also in the Official Journal (which is online via the TED database) has been growing steadily in recent years, from 8.4% in 1995 to 16.2% in 2002[68].

If establishment of procurement portals and market places are used as an indicator for the up-take of electronic public procurement, the trend is pointing upwards, but with large uncertainty regarding the development for electronic ordering. The establishment of e-tendering portals seems to be an increasing trend in Europe with 16 of the 25 Member States having established some sort of electronic procurement, most of these with focus on notification about tenders and publication of tenders.

[67] 03/02/2004: A report on the functioning of public procurement markets in the EU: benefits from the application of EU directives and challenges for the future.

[68] Ibid.

The main target group for e-procurement systems (both tendering and ordering) in Europe can be estimated at approximately 1,000 public institutions: the number of administrative divisions (states, provinces or regions) with a population of more than 200.000 in 2004 is 400[69]. On top of that figure come larger government institutions, health sector institutions (hospitals), education (Universities) and the utility sector. According to estimates, approximately 100 public institutions at national, regional or local level have currently implemented e-tendering or e-ordering procurement systems, equivalent to 10% of the total. The use of these systems remains unclear. According to another estimate, less than 1% of order transactions and less than 5% of order value of public procurement are conducted electronically today[70].

If we take a closer look on the supplier side, the following pattern appears:

In 2003, 19% of European companies made online sale (employment weighed figures)[71]. This activity includes all sale activities and not only electronic public procurement, but can be seen as an indicator on the 'e-maturity' in the supplier base of public procurement. There is virtually no difference in figures for online selling between small, medium and large enterprises: 16% (0-49 employees), 22% (50-249 employees) and 18% (250+ employees) [72].

Procurement online by companies is not directly linked to public procurement (where private enterprises are suppliers), but is also an indicator of the general e-maturity of the supplier base. The share of European companies that procure online ('procurement of at least some their direct or indirect production goods online') is considerably higher than the share for online sale: 50% in 2003 (employment weighed figures)[73]. The adoption by small enterprises is lower than large enterprises: 36% (0-49 employees) compared to 61% (250+ employees) [74].

It should be noted that these figures count for all companies that confirm that they procure/sell at least some of their goods online, and it does not necessarily mean that they have a substantial online procurement or sale. The implication is that a much lower number of companies have a substantial procurement/sale online. The level of online sale by these is still very low, and more than 40% of the companies estimate that the share of online sales is less than 5% (as % of their total sales) [75].

Diffusion of online selling in EU companies has increased year by year since 1993, from around 0% in 1993 to 17% in 2003. Even though this includes all online sale activities, and not only electronic public procurement, this is an indicator of an increasing 'e-maturity' in the supplier base of public procurement. However, according to various surveys, the upward trend for selling online slowed down in 2001-2003 (Eurostat, E-business Watch)[76].

[76] E-Business Watch: The European e-Business Report – A portrait of e-business in 15 sectors of the EU economy, 2003 edition.

As described in the baseline analysis, the uptake of e-procurement is concentrated in two phases today: sourcing (finding suppliers and products via internet) and payment[77]. A high level of automatisation of the sourcing process was a finding from the survey among member states (see Part 1 report, section 3.3). Payment is also done electronically to a large extent (via various national banking systems). Ordering is a very complex process to automate (see Part 1 report, section 3.3), because it involves a lot of communication and interaction between buyers and suppliers. Another factor explaining the level of automatisation in the various phases is the decentralized/centralized nature of decision making pertaining to the specific procurement process, as mentioned in the previous section on organization.

Actors are currently doing efforts to automate all phases of procurement, including sourcing, tendering, ordering and payment. In the medium and long term, this is expected to be reflected in an increased use of electronic means in all procurement phases. Increased benefits of e-public procurement and support of a more integrated procurement process are market factors that imply an increased penetration of electronic public procurement in all phases of the procurement cycle.

The trends in electronic public procurement point upwards, especially for e-tendering, whereas significant uncertainty remains as to the development in up-take of electronic purchasing in the public sector. According to estimate, 5-10% of orders (transactions) and 25% of value will be conducted online in 2010[78]. The nature of public procurement is also limiting the potential of electronic public procurement: the most successful electronic procurement systems are seen in large industries such as metals, chemicals and cars, airplanes and retail were orders that are generated automatically (by stock management systems / supply chain management systems). Another issue is regional differences and public institutions in some regions (e.g. in Eastern Europe) are busy implementing financial systems, whereas e-procurement is not high on the agenda.

As mentioned throughout the report the issue of the potential efficiency gains is at the core of the discussion concerning e-public procurement. The savings are roughly expected to occur in three main areas:

- Savings on the purchasing price
- Savings on the administrative costs for the buyers
- Savings on the administrative costs for the suppliers

However, to date only scattered and anecdotal evidence exist concerning the savings actually realized. The table below compiles some figures from various countries and e-public procurement operations. The table only includes data on savings on purchasing price and on administrative costs for buyers, as it has not been possible to identify any empirical data on the actual administrative savings for suppliers.

[77] Interview with Oracle.
[78] Interview with Oracle.

Table 2.3: Influence of e-procurement on purchasing prices and administrative costs

	Purchasing price (buyers)	Administrative costs (buyers)	Product price and administrative costs (suppliers)
E-tendering			
OGC buying Solutions, UK[79] (e-tendering)	20-25% estimated average savings when buying online*		
General Delegation for Armament, Ministry of Defence, France[80]		31% decrease in administrative costs[81]	
e-eVergabe, Germany			0% savings on prices and process[82]
E-purchasing			
OGCbuying Solutions, UK (e-purchasing)		28-90£ savings per procurement transaction	
New Zealand e-Business portal (e-purchasing)		36.67$ savings per procurement transaction	
CONSIP, Italy[83] (e-purchasing)	36% estimated average savings when buying online*		
NC E-Procurement @ Your Service[84] (e-purchasing) (Dec. 2003)	7.24 % decrease in price 3-23% realised savings from using term contracts (e-catalogues)		
Kaufhaus des Bundes, Germany	10 % savings on price of goods[85]		
E-auction			
DOIPEI e-auction, Denmark[86]	18% realised savings		85.7 % savings on process[87]
Pilot test e-auction in the framework of the National e-Procurement Program, Portugal (Dec. 2003)	25% savings in the purchase of paper for a month		
Essex Marketplace[88] (e-auction)	53 % realised savings resulting from e-auctions on goods 26% saving on IT consumables[89] 25% saving on stationery[90]		
NHS Purchasing and Supply Agency (e-auction, OGC G-Cat)	31% savings from IT hardware e-auction (total)		
Wales Health Supplies[91] (e-auction)	10% lowered purchase price*		

** expected savings*

When the figures in the table above are used as a basis for estimating a conservative figure for the savings of introducing e-tendering, it is possible to estimate the total potential for annual public savings on the purchasing price and the administrative costs. In this context, e-tendering is online publication of prior notices and tender documents.

The table above shows that there are examples of savings in the range of 3% - 53% on the purchasing price and that there are examples of realized administrative costs savings of 31% per tender (and 40 EUR – 130 EUR for purchasing transactions). Based on the relatively conservative figures of 5% savings on the purchasing price and 50 EUR savings per invitation to tender the administrative costs are used in the calculations in the table below to estimate the potentials at the aggregated level for buyers (for EU15 only as there are not yet procurement statistics available for EU25).

Table 2.4: Estimated annual savings on purchasing price and administrative costs for buyers (based on 2002 figures for EU15) of introducing e-tendering

Savings on purchasing price	**Savings on administrative costs (buyers)**
▪ Total value of public procurement in the EU15: 1,500 Billion EUR ▪ Value of e-public procurement at a 25% level uptake in the public sector in EU15: 375 Billion EUR ▪ Range of savings realized today: Between 10% - 53% ▪ Conservative estimate for savings on purchasing price: 5% ▪ Estimated total savings calculation: 375 Billion EUR / 5%	▪ Total annual number of public procurement transactions in the EU (above and below threshold): 665,000 ▪ Estimated number of e-public procurement transactions at a 25% level uptake: 166,000 ▪ Savings per invitation to tender: 31% realized (40 EUR – 130 EUR per transaction) ▪ Conservative estimate for savings on administrative costs per transaction: 40 EUR ▪ Calculation for estimated total savings on administrative costs: 166,000 X 40 EUR
Estimated total savings on purchasing price: 19 Billion EUR per year (for EU15)	**Estimated total savings on administrative costs: 6.6 Million EUR per year (for EU15)**

The calculations above show that the potential savings seem to be considerable at the aggregate European level, even under a conservative estimate: Annual savings of introducing e-Tendering 19 billion EUR on the purchasing price and administrative costs savings of 6.6 million EUR. Please note that savings of introducing e-Ordering are not included in these figures.

It should, however, be noted that the figures should be considered a rough estimate, and especially the estimate for the savings on administrative costs is based on very few empirical data.

2.6.1.1 Summary of the up-take of e-procurement

The main target group for e-procurement systems in Europe can be estimated at approximately 1,000 public institutions. According to estimates, approximately 10% of these have currently implemented e-tendering or e-purchasing systems, but the use of the systems are so far limited. Even in the no-action scenario, the trend for e-procurement will point upwards, but until 2010, the penetration of e-procurement will be very uneven in the various steps of the procurement process. Based on the figures presented in the previous sections, we can expect the following situation in 2010:

Table 2.5: Assessment of the use of electronic means in the various procurement processes (above threshold)*

	Expected use in 2010	**Comment**
Notification about tenders	Generalised	E-notification of tenders is already significant in many Member States. E-publication in TED is expected to reach 25% of all procurement in 2010.
Publication of tender documents	Significant	Not very widespread in Member States today, used by some EU institutions. Documents may be made available relatively easy online.
Submission of tenders with digital signature	Some	Nearly no use today in Member States or EU institutions.
Evaluation of tenders	Low	Nearly no use today in Member States or EU institutions.
Ordering	Some	E-ordering represents less than 1% of transactions and less than 5% of value today. 5-10% of order transaction and less than 25% of volume will be electronic
Invoicing	Significant	E-invoice is only covered by very few e-procurement systems. Benefits of invoicing are high. E-banking is very widespread in companies Currently extensive focus on e-invoicing.

* Assessment based on data presented in the baseline analysis (e.g. table 3.7 and 3.8) and the baseline scenario.

The table illustrates that:

- The goal of generalised use of electronic means in public procurement is only expected to be reached in the notification phase. This means that contract opportunities will be advertised online, but not necessarily that the tender notices are distributed electronically by the contracting authority.
- A lower, but still significant, use of electronic means is expected in the publication of tender documents and invoicing.
- For the remaining phases, public procurement is not expected to reach critical mass.

Another aspect regarding up-take is the country dimension. In many smaller countries and markets, e-public procurement will not reach critical mass beyond the initial phases concerning notification about tenders and publication of tender documents, which is important if e-procurement is to constitute a sound business case. Thus, in many smaller markets, the potential of increased competition, more transparent markets and more cross-border procurement will not be realized.

As illustrated previously in table 3.1, increased up-take of e-public procurement can have a positive impact on the internal market, e.g. by increasing transparency, easy access to tender opportunities and decreased tender cost.

As described in the previous section, even without any further action at EU level, it is expected that the up-take of e-procurement will increase in all phases due to the on-going optimization of business processes. However, it is not expected that the current development is strong enough to ensure generalised use of e-procurement by 2010 besides from the initial notification of tenders (not including the work flow behind notification). Moreover, it is expected that the problems regarding nationally based solutions in areas such as digital signatures and e-invoicing will prevail in the no-action scenario.

2.6.2 *Impact on the internal market*

Based on the analyses presented in previous sections, we summarize our estimate of the impact on the internal market *without* further policy action at the European level.

The direct economic impact on the internal market of the trend concerning uptake will be that the potential savings of approximately 19 billion EUR on purchasing price (for EU15), due to a more transparent and efficient market for public procurement, will not be realised.

Below we describe the main trends related to the five driving forces in the conceptual model and their expected influence on the internal market. The description includes the impact on selected parameters which are important aspects of the evolution of the internal market, including the economic and the social impact on the internal market.

Regulation – impact on the internal market

- The new directives regulation of electronic means for communication in the procurement process eliminates the fundamental legal barriers inherent to the use of different regulation on electronic means in the procurement process in the Member States.
- Delays in transposition and application of the directive will cause legal uncertainty for economic operators, market fragmentation due to differences in legal regulation and slower development towards a single market for public procurement.
- Compliance problems of e-public procurement systems and processes to the requirements of the directives are likely to remain in relation to some contracting authorities.
- Cross-border procurement problems are likely to prevail, e.g. in the area of digital signatures and electronic invoicing. These are factors which have a negative influence on the electronic public procurement across borders in Europe, although a positive development within individual national markets may occur.
- Although certain fragmentation risks exist (from erroneous or differences in transposition and implementation) the new legal framework will contribute further to the harmonization of the framework for procurement in Europe.

- A coherent and uniform legal framework for e-public procurement across the EU will be beneficial for transparency and competition. The introduction of a legal framework, and the legal procedural guaranty regarding non-discrimination, will be beneficial for SMEs as well as for larger companies.

Organization, Stakeholders and Incentives – impact on the internal market

- The decentralized procurement structure means that it will be too costly for many small public entities to acquire their own e-procurement solutions. The potential procurement savings may not be exploited to their full potentials because of the decentralized procurement structure.
- Whether small public entities realize the potential for administrative savings depends on the availability of cheap and convenient electronic solutions which are made available by central authorities or coordinating bodies for users at the decentralized level. If such systems and solutions are not available, e-public procurement will not be attractive for many small institutions because the costs of acquiring, operating and maintaining systems will be too high compared to the potential gains.
- E-public procurement will not automatically entail cost savings for businesses: First, the decentralized procurement structure means that many contracting authorities will use different systems and formats to which companies must adapt, which will increase administrative costs and other transaction costs. Second, many, especially small, public institutions will continue to use traditional, paper-based procurement, which means suppliers must be able to operate both electronic and paper-based procedures in parallel
- Because the decentralized procurement structure might slow down the mainstreaming of e-public procurement, the trend towards increased competition and transparency is likely to be slowed down correspondingly

Interoperability, Standardization and Security – impact on the internal market

- The introduction of electronic means in the first phases of the procurement cycle will open the European market to more competition and make the market more transparent as information about business opportunities are more easily available. These phases will not, or only marginally, become influenced negatively by interoperability and standardization issues. Interoperability and standardization problems will be connected to more advanced processes of e-tendering and e-purchasing.
- Continued interoperability problems, in the more advanced processes, are lack of standards and lack of the use of existing standards, which will continue to be barriers for cross-border trade and European competitiveness. The problem is especially expected in fields such as product classification, digital signature, electronic catalogues, e-invoicing and legal tender documents.
- The slow progress in the field of interoperability and standardization will maintain high prices for e-procurement solutions for public institutions. There is lacking incentive for IT vendors in the market to converge around established standards. Moreover, interoperability and standardization is crucial for the level of administrative and transaction costs of companies.

- The existence and mainstreaming of established standards is of particular interest to SMEs as the smaller companies find it important to decrease sale and transaction cost related to the participation in public procurement.
- Security will remain an important issue in the future. Cases of security problems may create distrust towards systems and decrease confidence in e-procurement.

Human Resources and Knowledge - impact on the internal market

- Contracting authorities and suppliers have used for the introduction of e-procurement as a mean to streamline administrative business processes. They will look for this potential when they decide how and to what extent they should engage in e-public procurement. Lower cost of e-procurement will increase interest on both sides.
- There is a lack of management skills in relation to achieving administrative savings on the introduction of e-public procurement and using this as a tool to reengineer and streamline the organization of procurement processes.
- There is a lack of knowledge and documentation about the business case for e-public procurement and the possible benefits from e-public procurement which might impede or prevent the conversion to e-public procurement among buyers and suppliers.
- There is a risk that the segment of the smallest companies (less than 20 employees) will opt out of the general evolution of e-public procurement because participation is too cumbersome.

Availability of technical solutions – impact on the internal market

- The evolution of e-public procurement technology and solutions in the market will not entail significantly reduced total costs for public institutions as technology investments only account for 10-20% of the total of the introduction of e-public procurement.
- The major e-procurement vendors are targeting the larger government administrations (states, provinces or regions) or institutions, health sector institutions (hospitals), education (Universities) and the utility sector.
- It is expected that the e-public procurement systems and solutions become increasingly advanced and with improved functionalities, but no fundamental innovations are currently emerging.
- Some of the major public procurement markets in Europe will reach a critical mass of contracting authorities and suppliers using electronic means, while reaching critical mass in smaller market or in less technologically mature countries (including Eastern Europe) will be difficult. This development will delay the development of more efficient public procurement markets in Europe.
- Within some national markets where e-public procurement is likely to evolve faster than at the aggregated European level, there might be a positive influence on the competitiveness of the suppliers operating in those markets. Although such trends do include a risk of fragmentation of the European market, which would not be beneficial for the development of European competitiveness as a whole, there might also be a positive spill-over of inspiration and experiences from the front runner countries to other member states.

2.7 Conclusion for the Baseline Scenario

The basic assumption of the baseline scenario is to provide an assessment of the development of main trends and factors related to e-public procurement until 2010 as they would seem likely to unfold under the influence and dynamics resulting from the transposition of the new public procurement directives into national legislation across the EU member states, but without further policy action at the European level.

The purpose of the baseline scenario is to serve as a basis for assessing the potential results and impacts of the actions proposed in the draft action plan. The time horizon until 2010 is chosen in light of the stated objective from the European Commission that "Generalized e-procurement should be achieved by 2010".

According to estimates, the total value of public procurement in the EU – i.e. the purchases of goods, services, works and public utilities (incl. defence) - is about €1500 billion in 2002 or about 16% of the Union's GDP. These figures include procurement both above and below the EU procurement thresholds.

From 1995-2002, the share of public procurement published in the official journal / Tenders Electronic Daily as percentage of the total public procurement in EU-15 increased sharply from approximately 8% to 16%. If this development continues, the procurement published online in TED will reach approximately 25% of the total public procurement in 2010.

The theoretical literature concerning e-business and e-procurement and the empirical data collected for this study may be condensed into a number of factors which appear to function as the main driving forces that influence and determine the development of e-public procurement. The drivers identified are:

- Regulation
- Organization, Stakeholders and Incentives
- Interoperability, Standardization and Security
- Human Resources and Knowledge
- Availability of technical solutions

Regulation is the framework within which all economic operators must work. The next level of drivers is directly influencing the procurement activities in contracting authorities and suppliers and will thus influence uptake of e-public procurement. Finally, increased uptake of e-public procurement can have a positive impact on the internal market, i.e. through easier access to contract opportunities or lower transaction cost.

The conclusion on the main findings below is structured under the following headings:

1. Issues of importance for the implementation of the requirements set out in the EU legislation
2. Issues of importance for the achievement of generalized use of e-public procurement and for meeting the Lisbon objectives
3. Overall conclusion

The implementation of the basic legislative framework is the first important step and milestone for the future use and development of e-public procurement. A smooth transition to the new legislative framework will be beneficial for e-public procurement and is therefore a crucial short-term objective, while a slow implementation marred by erroneous interpretations by the EU member states will have the opposite effect.

The vision of the Lisbon objectives about bringing Europe to a leading position in the global economy is the overall and long-term development objective. E-public procurement has (through its potentially positive influence on efficient use of public funds and the development of the internal market) the possibility to contribute to this end and vision.

Issues of importance for the implementation of the requirements set out in the EU legislation

- There are indications that delays in transposition and application of the directive might occur. Delays will cause legal uncertainty for economic operators and market fragmentation due to differences in legal regulation.
- Compliance problems of e-public procurement systems and processes to the requirements of the directives are likely to remain in relation to some contracting authorities.
- Cross-border procurement problems can be expected to prevail, e.g. in the area of digital signatures and electronic invoicing.
- The introduction of e-public procurement is mainly driven from the national level in the EU member states while especially smaller regional and local levels are not yet actively involved all member states. Although e-pubic procurement generally seems to be part of national strategies, many member states have not yet taken concrete steps in the field, and many have not devoted funds to the introduction of e-public procurement.

Issues of importance for the achievement of generalized use of e-public procurement and for meeting the Lisbon objectives

- Lacking incentives and the decentralized procurement structure might slow down the transformation to generalized use of e-public procurement. The decentralized procurement structure means that it will be too costly for many small public entities to acquire their own e-procurement solutions.
- Interoperability and standardization problems will be connected to more advanced processes of e-tendering and e-purchasing. Interoperability problems are especially expected in fields such as product classification, digital signature, electronic catalogues, e-invoicing and legal tender documents. Formal requirements for paper-based certificates posed by contracting authorities etc. are important barriers for administrative efficiency gains.
- Security will remain an important issue in the future. Cases of security problems may create distrust towards systems and decrease confidence in e-procurement.
- There is a lack of management skills in relation to various areas, including reengineering and streamlining procurement processes and possible benefits from e-public procurement. There is a risk that the segment of the smallest companies (less than 20 employees) will opt out, or fall behind, of the general evolution of e-public procurement because of a lack of operational skills and knowledge about e-public procurement.

- The total cost of installing e-public procurement technology and solutions is likely to remain unchanged.
- It is expected that the e-public procurement systems and solutions become increasingly advanced and with improved functionalities, but no fundamental innovations are currently emerging.
- E-procurement vendors are targeting the larger government administrations (states, provinces or regions) or institutions, health sector institutions (hospitals), education (Universities) and the utility sector.
- Some of the major public procurement markets in Europe will reach a critical mass of contracting authorities and suppliers using electronic means, while reaching critical mass in smaller market or in less technologically mature countries (including Eastern Europe) will be difficult.

3. Scenario B: The Balanced Approach Scenario

3.1 Introduction

The balanced approach scenario is a scenario by a focused, and limited number of policy instruments are applied at the European level. The main objective is to ensure full and correct adoption of the new procurement directives at the national level in collaboration with the EU member states and to ensure that implementation of e-public procurement at national level across the EU does not conflict with the fundamental principles of the internal market. This scenario does not include policy instruments that go beyond this level.

The analysis includes:

- Identification of possible policy instruments. The impact assessment includes a range of possible policy instruments which were identified in the course of the study in the written data sources as well as in the consultations with the European Commission, member states representatives and other experts.
- The ability of the outlined policy instruments to address and overcome the problems and barriers identified in the baseline scenario.
- The potential impact of the outlined policy instruments. This assessment will take into consideration the associated costs and benefits as well as the policy instruments' potential contribution to the objectives described previously (correct implementation, compliance with internal market principles and contribution to improved competitiveness and Lisbon objectives).

Finally, the section will comment on the possible roles and influence of the main stakeholders (European Commission, Member States) and will conclude by presenting recommendations on the policy instruments to be prioritized at the European level based on an assessment of the most appropriate mix of policy instruments.

3.2 Identification of possible policy instruments and problems addressed

A range of policy instruments were identified during the course of the study and their potential impact will be assessed under this scenario. The table below gives an overview of how the policy instruments are linked to problems identified in the baseline scenario.

Overview of linkages between problems identified and policy instruments

Problems identified	Policy Instruments
Delays in transposition and application of the directive will cause legal uncertainty for economic operators, market fragmentation due to differences in legal regulation and slower development towards a single market for public procurement.	- Issuing of interpretive document on the new directives - Monitoring by the European Commission of implementation of the new directives in national legislation - Support from the European Commission to member states in the legal transposition process (consultations, information)
Compliance problems of e-public procurement systems and processes to the requirements of the directives are likely to remain in relation to some contracting authorities.	- Support from the European Commission to member states in the legal transposition process (consultations, information) - Establishment of European voluntary accreditation scheme which member states may use to ensure that their e-public procurement systems comply with the requirements of the new directives - Development of guidelines and evaluation tools to provide contracting authorities with dynamic and cost-efficient models to ensure that their e-public procurement systems comply with the requirements of the new directives
Certain fragmentation risks exist as a consequence of possible erroneous or differences in transposition and implementation of the new legal framework.	- Issuing of interpretive document on the new directives - Monitoring by the European Commission of implementation of the new directives in national legislation - Support from the European Commission to member states in the legal transposition process (consultations, information)

As indicated in the table, each of the problems identified in the baseline scenario would be addressed by different policy instruments, which would serve to provide different contributions to solving or alleviating the problems. The potential impact of each policy instrument on problems identified will be elaborated in the following section.

This mix of policy instrument are a combination of various support and control instruments which share the immediate objective of ensuring the timely and correct implementation of the new directives into national legislation and into the practices applied in the member states.

The survey among member states (described in the baseline analysis) shows that most member states expect to implement the new directives before the end of 2005, while six member states expect the directives to be implemented in 2006.

As pointed out in the baseline scenario, the six member states face a very tight implementation schedule as the deadline expires at the end of January 2006, but also for the other member states it remains to be seen whether the timely implementation, which member states generally seem to expect, also can be reached in practice. In this respect the general track record of the member states (as pointed out in the most recent issue of the Internal Market Scoreboard of July 2004) is not too promising as the transposition deficit remains significant and encompasses almost 9% of the internal market directives for the EU15 countries, only. This indicates that delay in the transposition of the new procurement directives is not only a theoretical risk but could well be the case also for the new procurement directives. On the other hand, electronic procedures have been used for some time in many of the member states, and the new directives do not regulate a completely new area but are adjustments to the existing procurement legislation and rules, which are factors that should ease the implementation process.

However, in this respect it is also important to distinguish between the formal implementation of the new directives into national legislation, and the implementation into the practice of procurement and e-public procurement, as pointed out in the baseline scenario: Although timely and correct formal transposition into national legislation is ensured by a member state, it is no guarantee for the practical application in day-to-day operations of contracting authorities if the legislation is not followed up by tools to support and enforce compliance by contracting authorities.

As regards the correct transposition of the directives into national legislation the statistics show that this remains a serious problem for the application of internal market legislation[92]. The number of infringement cases has not decreased nor has the time to solve the cases been reduced. These experiences concerning the transposition of internal market directives across the board show that a situation with erroneous implementation of the new procurement directives could easily occur.

Moreover, in respect of the aim of ensuring that all existing systems live up to the requirements of the directives, the baseline scenario referred to a review of a sample of e-public procurement systems (which according to IDA represent current ‘good practice’ in European context). This review showed that while these systems did meet a number of the requirements of the directives, there were also various aspects where they did not. As the sample represents the most advanced segment of existing solutions, the result of the review can be seen as an indication that others, less advanced, existing solutions across Europe will also encounter problems in this respect.

In sum, this indicates that in light of the existing and past experience with the implementation of the internal market directive into national legislation in the member states, it is not unlikely that delays and erroneous implementation will occur in the case of the new procurement directives. Seen from this perspective there is a rationale for the European Commission to take action in close collaboration with the member states, which are given a leading responsibility for the implementation of the legislative framework.

[92] European Commission, DG Internal Market, “Internal Market Scoreboard”, July 2004.

3.3 Assessment of potential impact on the Internal Market

Policy instruments: Interpretive document from the European Commission on the new directives and support to member states in the legal transposition process
Policy instruments that concern the dissemination of information and guidance of and to the various stakeholders in the member states seem to have the potential for immediate, short term impact: Improved level of information in the relevant target audience among the member states.

There is clearly a need to convey the contents of the new directives in an easily accessible style to the many different stakeholders in the private and public sector at regional and local levels for several reasons: To mobilize interest in e-public procurement, to ensure that public authorities in the member states, contracting authorities and private suppliers have sufficient information, to prevent errors and misinterpretations to the extent possible, and to promote alignment with the content of the directives among both existing and new e-public procurement system. The latter purpose would be an important mean to counter the existing opacity of e-public procurement systems which hinders accessibility.

In this respect, some of member states interviewed have underlined the potential value-added ???? of an interpretive communication that could bring further clarification into the field. Such clarification could e.g. be achieved by describing and explaining in very concrete and operational terms how the directives' rule that means of communication. Systems and tools used in operational systems are *non-discriminatory, generally available and interoperable* should be interpreted so that it becomes clear when these requirements are met in a satisfactory manner.

As regards the costs and benefits related to these policy instruments, it is our assessment that the associated costs seem to be very limited while the benefits are potentially significant:

The potential benefits are:

- The considerable size of the relevant target audience across Europe that could benefit from the clarification and information dissemination efforts, and, second, the saved costs that would result from avoiding errors in the legal transposition and the practical application of e-public procurement.

The potential costs are:

- The costs, which would mainly consist of working time by European Commission staff and experts and costs of development of various publications, are limited compared to the above mentioned benefits.

The potential impact on problems identified in the baseline scenario:

- Through the guidance of member states, an interpretive document could serve to prevent delays in transposition to national legislation which could be caused by errors in legal interpretation of the directive.
- The interpretive document could also contribute to legal harmonization between the member states and the prevention of potential fragmentation risks in the internal market caused by legal differences between the member states.

Policy instrument: Monitoring of implementation of the new directives in national legislation
The European Council have repeatedly pointed to the fact that correct and timely transposition of internal market directives into national law is a legal obligation for all member states, and that member states who do not adhere to these obligations deprive businesses and citizens of their rights and of the full economic benefits of a properly functioning internal market[93]. According to the European Council, the impact is that the competitiveness of the European economy as a whole will be weakened.

The implementation of the new procurement directives is only a first step in the process, and more significant barriers need to be overcome in order to make e-public procurement work as a real engine behind the development of a well-functioning and integrated internal market. But in view of the point made above by the European Council it is clear that correct and timely transposition of the directives it is a crucial step which, if it is missed, will have implications for the functioning of the internal market: The timely and correct implementation of the new procurement directives is a necessary, although not sufficient, precondition that needs to be in place in order to achieve progress in the field and make e-public procurement work as a tool that supports the evolution of the internal market. If the establishment of this basic precondition for e-public procurement turns out to be lengthy and problematic, it will put a brake on the evolution of the internal market. Moreover, if the listed policy instruments can contribute to a higher degree of alignment of existing and new e-public procurement policies, programmes and systems in the member states with the new directives, it will be supportive as a mean to promote coherence and harmonization and hinder the development of nationally fragmented markets for e-public procurement.

However, as a mean to counter these problems, the potential impact of monitoring the implementation process in the member states in order to ensure a timely implementation of the directives seems limited: Although it is evident that the European Commission should monitor the timely progress of the implementation at national level as part of the Commission’s obligations, there is, effectively, very little that the European Commission can do to speed up a lengthy and delayed transposition at national level, apart from applying soft measures such as raising the issue with its counterparts at the national level and publicize the status for the implementation of the directives across member states in order to motivate the laggards to follow suit.

In view of this perspective our assessment is that although it is an evident task for the European Commission to monitor the development in the member states and raise any issues with the particular member states, it does not seem realistic to expect that such an activity would have significant influence on the process of ensuring compliance in the member states. The European Commission would to a high extent rely on the information processed or made available by the member states, and is thus faced by an even greater information problem than the member states.

As regards the related benefits and costs, these may be summarized as follows.

The potential benefits are:

[93] Conclusions of European Council summits in Stockholm (March 2001), Barcelona (March 2002) and Brussels (March 2004).

- Monitoring could work as an early warning system with elements of national legislation conflicting with the requirements of the directives could be identified early on, clarified or eliminated. This could prevent situations of non-compliance of national legislation with the new public procurement directives as well as further delays.

The potential costs are:

- The costs of establishing a monitoring system and procedures appears to be limited as it would mainly consist of the working time of European Commission staff and government staff in the member states. However, the main concern here is not the magnitude of the related costs but rather whether it is at all possible for the European Commission to establish and conduct monitoring that would serve as a mean to realize the potential benefits described above.

The potential impact on problems identified in the baseline scenario:

- Monitoring of the implementation of the new directives in national legislation could give member states an incentive for timely implementation and thereby serve to prevent delays in transposition to national legislation.
- Monitoring could also feed information from member state level to the European Commission which could serve to prevent errors or misinterpretations of the directives.

Policy instrument: Establishment of a voluntary accreditation scheme

The costs connected to measures taken at member state level to ensure that the implementation of the directives' requirements beyond the mere legal implementation and into the e-public procurement systems and practices may be considerable: It seems realistic to expect that there will be legal compliance problems related to many existing e-public procurement solutions, although it is not possible to estimate to what extent these problems will be grave or minor violations of the legal requirements. Judging from the consultations with member states it seems to be a complicated matter to ensure that all existing e-public procurement solutions comply with the new directives. One of the difficulties faced in this area is that it is not the systems themselves but the way in which the systems are used that creates problems of compliance.

Even if national authorities at the central, governmental level wished to ensure that all existing solutions (and the following procurement practices) in the country were in compliance, central authorities (especially in the larger member states where many solutions exist at various levels of government and levels of technical sophistication) would face considerable barriers and costs in their attempt to do so: First, it will be laborious, at least in some member states, to identify all the existing solutions. Secondly, the resources needed to conduct a review of the level of compliance could be extensive and therefore difficult to mobilize. Thirdly, it will, especially in the large member states, be an extensive task to ensure and enforce compliance, which would also require considerable resources and in practice be very difficult.

In light of these barriers and costs, a likely and feasible approach for member states to follow would be to take a reactive rather than a proactive line of action. This includes publicizing and disseminating information about the legal requirements to relevant stakeholders and then addressing the problems in cases where they would be brought to the attention of the central authorities (e.g. through complaints).

The potential impact of the introduction of a voluntary accreditation scheme should be considered in this context. Moreover, there seems to be both potential benefits and potential costs related to the introduction of a European scheme for certifying compliance of e-public procurement tendering devices and systems with the new procurement directives.

The potential benefits are:

- An accreditation scheme might boost confidence in e-public procurement among buyers as well as suppliers. At present there seems to be some amount of uncertainty among e.g. public authorities responsible for e-public procurement solutions in the member states concerning the implications of the new procurement directives. The introduction of an accreditation scheme would provide national authorities with a tool to ensure compliance with the legal requirements when new solutions are developed.
- Increased transparency across the European market, provided that it is a European accreditation scheme – national accreditation schemes might be helpful within the national market but they seem unable to bring significantly more transparency to the European market as a whole.

The potential costs are:

- The present market size for e-public procurement may be too small to stir sufficient interest in an accreditation scheme among contracting authorities and take a long time to influence the development of e-public procurement.
- The experience from previous standardization efforts is that it typically takes a long time. The same might be the case for a voluntary accreditation scheme, which includes the risk that once the scheme is established it may be overtaken by the general technological and market development in the field which would make the scheme obsolete. Moreover, it can be difficult to obtain agreement concerning the more precise strategy and content of an accreditation scheme.
- There would be considerable costs involved in the establishing, marketing and day-to-day operation of a voluntary accreditation scheme. The exact costs would depend on the level of ambition and scope of the operation.

The potential impact on problems identified in the baseline scenario:

- An accreditation scheme could potentially help to alleviate and prevent compliance problems in existing and new e-public procurement systems and processes in the member states.

Policy instrument: Development of guidelines and evaluation tools to provide contracting authorities with dynamic and cost-efficient models to ensure that their e-public procurement systems comply with the requirements of the new directives

An alternative to the establishment of a voluntary accreditation scheme could be a set of detailed guidelines and evaluation tools for contracting authorities. The guidelines should address the practical operationalisation of the requirements in the directive related to interoperability, accessibility etc.

These should be continuously updated, thereby ensuring a dynamic and flexible minimum and non-binding ‘standard’ for e-public procurement systems. Evaluation tools could provide contracting authorities with a set of self-assessment questions that could indicate if a given e-procurement system fulfils the requirements of the directive.

These guidelines and evaluation tools could be developed either by the European Commission and then distributed among the member states or developed and distributed solely by the member states.

As mentioned in the previous section, the costs connected to measures taken at institutional level to ensure that the implementation of the directives' requirements beyond the mere legal implementation and into the e-public procurement systems and practices may be considerable.

Given the expected difficulties in ensuring that all existing e-public procurement solutions comply with the new directives, it is important to distribute clear and practical knowledge to contracting authorities about e-public procurement. The guidelines should be developed with the purpose of minimizing legal compliance problems related to many existing e-public procurement solutions.

The one-off cost involved in development of guidelines and evaluation tools would be relatively limited if these are developed centrally by the European Commission (depending on the concrete design). They would consist in research, development and draft of the guidelines and possible meetings and coordination with member states and other stakeholders. Likewise, the running cost involved in continuously updating the document would be limited if this is done by the European Commission. Both one-off and running costs would increase if each member states were to develop their own guidelines and evaluation tools.

The potential benefits are:

- The evaluation tools would provide national authorities with a tool to ensure compliance with the legal requirements when new solutions are developed.
- The guidelines and evaluation tools would quickly provide contracting authorities with hands-on, practical guidance on how to comply with requirements of directives.
- The guidelines and evaluation tools would minimize legal compliance problems related to many existing e-public procurement solutions.
- Guidelines could enable IT vendors and software developers with an opportunity to reduce the costs of developing electronic solutions as they would be able to follow outlined guidelines and models closely.
- Finally, they could help minimizing compliance costs for contracting authorities by avoiding misinterpretations and thus unnecessary investments and development costs.

The potential costs are:

- There would be costs involved in establishing, marketing and continuously updating guidelines and evaluation tools. The exact costs would depend on the level of ambition and scope of operation. Both one-off and running costs would increase significantly if all member states were to develop their own guidelines and evaluation tools and in addition it would be influenced by the interpretations of the individual member state.

The potential impact on problems identified in the baseline scenario:

- Similar to the accreditation scheme described above, the existence of guidelines and evaluation tools could potentially help alleviate and prevent compliance problems in existing and new e-public procurement systems and processes in the member states, but at a lower cost than the accreditation scheme.

3.4 Issues and barriers not addressed by the policy instruments

The previous analysis argues that the outlined possible policy instruments will address some of the issues and barriers identified in the baseline scenario. While the application of the policy instruments will play an important role as means to ensure that the legislation adopted in the member states do not conflict with the requirements of the directives and the fundamental principles of the internal market, there are a number of problems and issues that can be expected to remain as the outlined policy instruments will not exercise any significant influence, if any at all, on these issues and problems.

Overview of issues and problems not addressed by the policy instruments:

- **Barriers to cross-border procurement:** Cross-border procurement problems can be expected to prevail, e.g. in the area of digital signatures and electronic invoicing.
- **Need to include all levels of government in member states:** The introduction of e-public procurement is mainly driven from the national level in the EU member states while, especially, smaller regional and local levels are not yet actively involved in all member states. Although e-public procurement generally seems to be part of national strategies, many member states have not yet taken concrete steps in the field, and many have not devoted funds to the introduction of e-public procurement.
- **Lack of clear incentives:** Lacking incentives and the decentralized procurement structure might slow down the transformation to generalize use of e-public procurement. The decentralized procurement structure means that it will be too costly for many small public entities to acquire their own e-procurement solutions.
- **Interoperability problems will continue to exist:** Interoperability and standardization problems will be connected to more advanced processes of e-tendering and e-purchasing. Interoperability problems are especially expected in fields such as product classification, digital signature, electronic catalogues, e-invoicing and legal tender documents. Formal requirements for paper-based certificates posed by contracting authorities etc. are important barriers for administrative efficiency gains.
- **Security problems could undermine trust:** Security will remain an important issue in the future. Cases of security problems may create distrust towards systems and decrease confidence in e-procurement.
- **Barriers for small companies:** There is a lack of management skills in relation to various areas, including reengineering and streamlining procurement processes and possible benefits from e-public procurement. There is a risk that the segment of the smallest companies (less than 20 employees) will opt out of the general evolution of e-public procurement because it is considered too cumbersome.
- **No guarantee for cost reduction for public institutions:** The evolution of e-public procurement technology and solutions in the market will not entail significantly reduced total costs for public institutions.
- **Uneven development in the internal market:** Some of the major public procurement markets in Europe will reach a critical mass of contracting authorities and suppliers using electronic means, while reaching critical mass in smaller market or in less technologically mature countries (including Eastern Europe) will be difficult.

3.5 Stakeholders’ roles and potential influence

In conclusion, the following points concerning the roles and potential influence of the European Commission and the member states deserve to be highlighted:

- The European Commission can apply the policy options described above to facilitate the timely and correct implementation. However, beyond support and facilitation the possibilities of the European Commission to influence the process are relatively limited.

- The main responsibilities for implementation as well as main capacities to ensure the timely and correct implementation of the new directives lie with the member states. This concerns both the implementation of the directives into national legislation as well as the practical implementation of the requirements of the directives into the existing and new e-public procurement systems and into procurement practices.

3.6 Recommendations

The Consultant's overall assessment and recommendation of the policy instruments considered in this scenario is provided in the table below.

Summary of benefits and costs and recommendations

Policy Instrument	Potential Benefits	Potential Costs	Recommendation
Interpretive document and support (consultation, information) to member states	- Potentially very important as means to prevent errors and misinterpretations	- Very limited administrative costs (staff working time)	- Implement
Monitoring of implementation of new directives in the member states	- Prevent conflicting and non-compliant legislation - Avoid further delays	- Monetary costs are limited, but unclear if monitoring can be done effectively and serve the purpose	- Implement
Voluntary accreditation scheme	- Once established the scheme could increase transparency and boost confidence	- Relatively costly and long lead time until established	- Await development in the field to assess demand and need at later stage
Best practice examples and guidelines	- Quickly provide contracting authorities with hands-on, practical guidance on how to comply with requirements of directives	- Limited costs for establishment, marketing and updating of tools	- Implement

The overall assessment is that the various policy instruments considered (with the voluntary accreditation scheme as the notable exception) are necessary means supporting the legal and practical implementation of the requirements of the new directives.

In this respect the policy instruments which aim at supporting the legal and practical implementation throughout the member states appear to have a better chance of exercising a positive influence on the member states compared to controlling mechanisms such as monitoring. Together with the dynamic effects of the new directives these policy instruments would be able to make a positive contribution to the generalization of e-public procurement across the internal market in the 25 member states although they are clearly not a guarantee against future problems in terms of delays and legal and practical non-compliance.

However, given the importance of the range of significant issues and barriers which are not likely to be addressed by the policy instruments, this mix of instruments cannot be expected to sufficiently ensure that e-public procurement will work as a main contributor towards the realization of the Lisbon objectives by 2010.

In this context it should be noted that the time frame of 2010 might be too short for assessing all the potential benefits of the new directives and supporting policy instruments. The transformation of public procurement procedures and practices (including back-office and inter-organizational work flows) to an electronic platform is a very comprehensive task. It will, to mention just one example from the baseline scenario, require significant public funding from the member states to implement generalized use of e-public procurement in all phases of the procurement cycle. E-public procurement is thus almost by nature an area which will evolve slowly and incrementally. The policy instruments assessed in this scenario will not be able to change this fundamentally by 2010. This is not because the policy instruments are inefficient or because their implementation lack rationale, but because they are trying to influence a policy field where many different and complex driving forces determine the evolution and outcome, which only partially can be influenced through the application of policy instruments at European and national level.

4. Scenario C: The Extensive Effort Scenario

4.1 Introduction

The extensive effort scenario is a scenario, where a number of policy instruments are applied across the board by the European Commission in collaboration with the member states. The purpose is to ensure not only the full and correct adoption of the legal framework at the national level and the compliance of e-public procurement systems with the fundamental principles of the internal market, but also to promote the uptake of e-public procurement across the EU.

The impact assessment of the possible policy instruments applied under this scenario follows the structure and methodology used in scenario B and includes:

- Identification of possible policy instruments. The impact assessment includes a range of possible policy instruments which were identified in the course of the study in both the written data sources as well as through consultations with the European Commission, member states representatives and other experts.
- The ability of the outlined policy instruments is to address and overcome the problems and barriers identified by the baseline scenario.
- The potential impact of the outlined policy instruments. This assessment will take into consideration the associated costs and benefits as well as the potential contribution of the policy instruments' vis-à-vis the objectives described previously (correct implementation, compliance with internal market principles and contribution to improved competitiveness and the Lisbon objectives).

The impact assessment of the policy instruments follow the same logic applied in the baseline scenario: This means that four of the driving forces used in the baseline scenario provide the organizing principle for this scenario in order to ensure consistent linkages between the issues identified in the baseline scenario and the policy instruments considered under the extensive effort scenario.

4.2 Organization, stakeholders and incentives

4.2.1 Identification of possible policy instruments and problems addressed

During the course of the study two policy instruments were identified which would address the problems relating to the driving force concerning *organization, stakeholders and incentives.*

- Changing procurement instruments and processes to achieve simplification and efficiency gains
- Surveillance of the public procurement market in Europe

The table below gives an overview of how the policy instruments are linked to problems in the field that were identified by the baseline scenario.

Overview of linkages between problems identified and policy instruments

Problems identified	Policy Instruments
The decentralized procurement structure means that it will be too costly for many small public entities to acquire their own e-procurement solutions. The potential procurement savings may not be exploited to their full potential because of the decentralized procurement structure.	Changing procurement instruments and processes to achieve simplification and efficiency gains
E-public procurement will not automatically entail cost savings for businesses because many contracting authorities will use different systems and formats which will increase administrative costs and other transaction costs, and many, especially small, public institutions will continue to use traditional, paper-based procurement.	Changing procurement instruments and processes to achieve simplification and efficiency gains
Because the decentralized procurement structure might slow down the generalized use of e-public procurement, the trend towards increased competition and transparency is likely to be slowed down correspondingly	Surveillance of the public procurement market in Europe

The baseline scenario highlights the importance of the administrative costs for businesses caused by the public procurement procedures. Moreover, administrative costs and 'red tape' connected to the traditional paper-based public procurement procedures is not only considerable for the economic operators but also for the contracting authorities. A main point that arises from the baseline scenario is that e-public procurement will not – if no further policy instruments and actions are applied – automatically entail cost savings for businesses because many contracting authorities will use different systems and formats to which companies must adapt, and this will increase administrative and other transaction costs. In addition to this, many, especially small, public institutions will continue to use traditional, paper-based procurement, which means suppliers must be able to operate both electronic and paper-based procedures in parallel.

4.2.2 *Assessment of potential impact on the Internal Market*

Policy Instrument: changing procurement instruments and processes to achieve simplification and efficiency gains.
The present situation across Europe is that although there are many common general features about the existing procurement instruments and procedures (both above and below threshold) there are also many different procedures and formats to which economic operators must comply. The existence of these differences makes access to participation more cumbersome for businesses and entails administrative costs, not only in cross-border procurement but even within national boundaries. Changing and streamlining these instruments and procedures could, from a logical point of view, follow the steps below:

- Analysis of current procurement procedures, assessment of the value-added steps and formats in order to provide a baseline for reengineering and streamlining.

- Development of formats and descriptions of procurement processes to be used by all contracting authorities for procurement above and below threshold.
- Implementation in member states.

It should be stressed that all phases would need to be carried out in close collaboration between the European Commission and its member states. At the same time the leadership of the European Commission is required, as a centralized approach and solution is needed in order to bring real value from the streamlining and reengineering. The member states have a crucial role because the actions cannot be followed through without them, but the European Commission needs to define and lead the work aimed at increasing the efficiency of procurement processes, modernizing procurement instruments and administrative processes.

The European Commission is in a unique position to take action in the field as it will be able to initiate, lead and influence efforts in the field, which no single member state, or groups of member states, can carry through.

In order to ensure buy-in and subsequent implementation from the member states it is necessary to involve member states from the beginning and throughout this revision and streamlining process. An alternative solution would be that the European Commission carries out this process alone, or with a minimum of consultations with member states. However, while this solution would be quicker there is also a risk that it would weaken the solutions, as member states might not feel the same obligation to comply with these.

The vision for this policy instrument could be to ensure that any individual supplier would only need to develop the administrative, financial and other types of formal company information once and then this information could be reused from one tender to the next and would be available both in a paper version and an electronic format.

The potential impact would therefore consist of administrative savings and efficiency gains for businesses as well as for contracting authorities.

Moreover, initiatives in this field could serve to address the barriers for conversion to e-public procurement which are created by the generally decentralized organization of procurement across Europe, which was highlighted and analyzed by the baseline scenario: Simplified administrative procurement procedures and easy-to-use solutions and formats that are made available for local and regional contracting authorities at no or very limited costs by central authorities in the member states, or developed by the European Commission in collaboration with the member states, could play an important role in overcoming the lack of positive incentives of especially small public institutions as regards the conversion from paper-based procurement to e-public procurement. As pointed out by the baseline scenario the costs of acquiring, operating and maintaining e-public procurement solutions may easily be higher than the economic benefits for institutions with a small procurement volume. Efforts to simplify procurement procedures and practices and integrate electronic tools into new, updated procedures can potentially reduce costs for buyers, thereby making e-procurement more attractive and accessible to public institutions with a small procurement volume.

However, although the availability of such ‘plug-and-play’ solutions is a necessary precondition for overcoming the lack of positive incentives for decentralized users, it is not a guarantee for increased uptake among contracting authorities at the decentralized level (the experience from Italy, where Consip is an example of this type of solution, shows that use is so far limited, despite the free use of the tool).

While administrative savings are highly desirable in their own right, they might also have positive spill-over effects on the internal market: The reduction of administrative compliance costs related to participation in public procurement for companies would allow companies to spend a greater share of their resources on their core business. Such a development trend would allow companies with a professional administration to exploit the potential efficiency gains which would follow in the wake of the implementation of the above suggested actions, thereby making these companies more competitive compared to companies with relatively weak capacities in the administrative section[94].

Moreover, increased transparency and accessibility in the procurement market would be expected to lead to more competition as the number of participating economic operators is likely to increase. However, the paradox is that if such a process were unleashed it could lead to a situation where the increased transparency and competition also might lead to increase in the number of tenders submitted. This could increase the transaction costs of contracting authorities that are charged with handling the tendering procedure and the evaluation of tenders.

The potential benefits and costs are listed below. The overall assessment is that although there will be potential costs and work involved, the costs would be justified by the potential benefits and are relatively insignificant compared to the size of the public procurement market in the EU and the potential benefits.

The potential benefits are:

- Improved transparency and simplification of the public procurement market through the harmonization and streamlining of procurement procedures and practices.
- Improvement of the access for suppliers to public procurement opportunities, in particular for cross-border procurement.
- Administrative cost savings for suppliers and for contracting authorities.

The potential costs are:

- The work process related to the streamlining and reengineering could potentially turn out to be rather lengthy and time consuming as it will share similarities with standardization work
- There will information and marketing costs as the simplified procedures etc. would need to be introduced
- There will be one-off costs for contracting authorities to adjust their procurement procedures, templates etc.

[94] The general experience from the efforts undertaken in Denmark to reduce the administrative burdens on businesses that are caused by regulation shows that the more professionalized the administrative sections of the companies are, the easier it is for the companies to comply with the administrative requirements of the regulation. In other words, the administrative compliance costs are relatively smaller for companies with a professional and efficient administration.

The potential impact on problems identified by the baseline scenario:

- Changing procurement instruments and processes to achieve simplification and efficiency gains would to some extent address the problems with the high costs related to the acquisition of e-public procurement systems: Simplification and streamlining could potentially enable the emergence of cheaper solutions in the market due to the potential for scale economies that would be opened through the greater harmonization across countries in procurement instruments and processes.
- In a wider perspective simplification of procurement procedures and a resulting increase in use by contracting authorities of identical or e-public procurement systems that to some extent share harmonized features could have a positive influence on the problem identified concerning the lack of cost savings for companies.

Policy Instrument: Surveillance of the public procurement market in Europe

Improved competitiveness among the economic operators in Europe is an important objective of the internal market. Public procurement plays an important role in this respect as the fundamental philosophy of public procurement is to make the market transparent and accessible to all interested and capable economic operators and thereby ensuring that the suppliers are constantly exposed to competitive forces which in turn is expected to have a positive spill-over effect on their competitiveness. More competitive markets result in improved efficiency among enterprises, a rationalization of industrial structure and a setting of prices closer to the cost of production. In light of these potential benefits it is seems appropriate to monitor the evolution of the public procurement market in the wake of e-public procurement to better understand its practical impact on competition and identify any unintended, negative effects which call for action in order to counter and correct them.

Possible concrete actions in this field could include the definition of thematic studies and methodology for surveying the effects on competition, which would include the identification of monitoring indicators. Actions under this policy instrument would have to be undertaken in close cooperation between the European Commission and competition authorities of the member states because a coordinated effort would be needed (and it would be the task of the European Commission to ensure this) and the monitoring and surveillance would be most efficient if carried out by the national competition authorities.

Potential benefits are:

- Early information about unintended negative effects on competition would provide an opportunity for early and timely corrective action, e.g. before these effects become permanent or expand into large scale.

Potential costs are:

- Costs for monitoring activities carried out by the European Commission and competition authorities of the member states and studies conducted on a regular basis.

The potential impact on problems identified in the baseline scenario:

- Establishment of surveillance and monitoring mechanisms could provide more information about the potential problem concerning a slow, or no, progression towards increased competition in public procurement markets which was identified by the baseline scenario as a possible outcome of the decentralized procurement structure.

4.2.3 *Issues and barriers not addressed by the policy instruments*

The table below lists the issues and barriers identified by the baseline scenario which are not likely to be addressed by the policy instruments treated above. As it can be seen from the overview provided below, the issues which are not addressed are those closely linked to and caused by the decentralized procurement structure. In this respect it is important to stress that the decentralized procurement structure is a factor which is very difficult to address through policy instruments. This is partly because it is a very fundamental structural characteristic across Europe, but also because it serves another important objective namely the creation of budgetary responsibility at institutional level, as the decentralization of procurement responsibility to individual institutions goes hand in hand with the responsibility managing the institution’s budget and financial resources.

Overview of issues and problems not addressed by the policy instruments:

- **Lack of critical mass in the procurement volume undermines incentive for e-procurement aimed at small public institutions:** The decentralized procurement structure means that it will be too costly for many small public entities to acquire their own e-procurement solutions. The potential procurement savings may not be exploited to their full potential because of the decentralized procurement structure.
- **Availability of “plug-and-play” solutions for decentralized users will influence uptake level:** Whether small public entities realize the potential for administrative savings depends on the availability of cheap and convenient electronic solutions which are made available by central authorities or coordinating bodies for users at decentralized level. If such systems and solutions are not available, e-public procurement will not be attractive for many small institutions because the costs of acquiring, operating and maintaining systems will be too high compared to the potential gains.
- **Decentralized procurement structure likely to affect competition negatively:** Because the decentralized procurement structure might slow down the generalized use of e-public procurement, the trend towards increased competition and transparency is likely to slow down correspondingly.

4.3 Interoperability, standardization and security

4.3.1 Identification of possible policy instruments and problems addressed

The baseline scenario identified the following problems in the area of standardisation in relation to e-public procurement:

- Interoperability and standardization problems will be connected to more advanced processes of e-tendering and e-purchasing. The problem is especially expected in fields such:
  - Product classification
  - Digital signature
  - Electronic catalogues
  - E-invoicing and
  - Legal tender documents.

- Security will remain an important issue in the future. Cases of security problems may create distrust towards systems and decrease confidence in e-procurement.

Overview of linkages between problems identified and policy instruments

Problem identified	**Possible policy instrument**
Lacking interoperability in the field of product classification	Revise and promote the use of CPV vocabulary in EU and internationally
Lacking interoperability in the field of e-signatures	Promote interoperability and standards for different levels of electronic signatures
Lacking interoperability in the field of electronic catalogues	Promote interoperability and standards for electronic catalogues
Lacking interoperability in the field of e-invoices	Promote interoperability and standards for e-invoices
Interoperability of legal tender documents	- (Described under previous section "Organization, stakeholders and incentives")
Interoperability and standardization connected with the more advanced processes of e-tendering and e-purchasing	Provide funding for international standardization initiatives
Cases of security problems may create distrust towards systems and decrease confidence in e-procurement	Monitoring of the development in the area of security

4.3.2 Problems addressed by the policy instruments

As described in the baseline analysis and the baseline scenario, interoperability, standardisation and security are key issues in electronic public procurement to enable exchange of data between enterprises and public institutions. There is a lack of interoperability in various areas which represent a significant barrier to the use of electronic means in some procurement processes and creates obstacles to the free movement in the Internal Market.

Table 2.1 in the baseline analysis illustrates different requirements related to different e-procurement processes. Simple processes such as dispatch of information do not offer any interactivity between participants and complexity and requirements are relatively low. More advanced electronic tendering systems requires more advanced equipment.

Simple one-way communication such as online advertisement of tenders and publication of tender documents can be conducted on existing web pages and accessed through generally available software (browsers), whereas standards are particularly important in procurement processes with a significant exchange of business documents, e.g. purchasing and invoicing.

Below comments are made on each of the six problems and policy instruments mentioned in the table above.

Lacking interoperability in the field of product classification
Product classification is among other things used for searching and comparing offered products on markets and for statistical purposes. Thus, product classification systems are very important in e-procurement[95]. Revision and promotion of the use of CPV vocabulary in EU and internationally is a possible instrument in this area. A recent analysis from CEN/ISSS[96] promote the viewpoint that CPV makes it easier for potential suppliers to identify the procurement contracts and that CPV facilitates fast and accurate translation of contract notices for publication in the EC Official Journal.

The existence of the problem with lack of product classification standards has been confirmed by the analysis carried out in relation to the Baseline Analysis and the Baseline Scenario.

However, the question is whether the proposed instrument does in fact meet the problem with a lack of product classification standards? The situation today is that the update of CPV is too slow (the last update is from 2003). CPV is based on a tree structure comprising of codes of up to nine digits. To make the task of filling in notices easier, many contracting authorities choose to report notices with only a couple of digits, providing only information on the overall division of group products. This in consequence makes the search functionality for suppliers much less precise and useable. CPV is only providing classes, but no product attributes, so it can be used only to classify types of products and not for search based on product characteristics. UNSPSC is currently the preferred standard for electronic catalogues, but, like CPV, only provides classes, and not attributes (which are important for e-catalogues)[97]. Development of product attributes to CPV should be considered in relation to the promotion of CPV internationally.

Thus, for many reasons, CPV needs to become much more dynamic and updated if the use of it is to be increased. A fundamental revision of CPV is expected to be a very comprehensive task. Moreover, a secretariat needs to be established with the necessary resources to conduct continuous updates.

If it is possible to develop a CPV that meets the needs of e-procurement better, the next step *could* be to extend CPV with a set of product attributes. It is important that a development of attributes to CPV is conducted in close partnership with the international standardisation consortiums, so that the classification is shared with international business partners and increases the possibilities of use.

[95] CEN/ISSS WS/eCat: Multilingual catalogue strategies for eCommerce and eBusiness Combined report, Version 4.2 (2004)

[96] CEN/ISSS WS/eCat: Multilingual catalogue strategies for eCommerce and eBusiness Combined report, Version 4.2 (2004)

[97] CEN/ISSS WS/eCat: Multilingual catalogue strategies for eCommerce and eBusiness Combined report, Version 4.2 (2004)

Lacking interoperability in the field of e-signatures
There is a lack of cross-border interoperability of electronic signatures. This creates obstacles to the free movement in the Internal Market. Problems in this area are likely to prevail (and even increase as the use of digital signatures becomes more widespread) if no action is taken. It is therefore appropriate to promote interoperability and standards for different levels of electronic signatures.

Lacking interoperability in the field of electronic catalogues
There are a number of different formats in use in Europe when it comes to electronic catalogues. Although some advances are done in establishing an electronic catalogue based on UBL, the development in this area is very slow.

Lacking interoperability in the field of e-invoices
Tools for e-payment and e-invoicing are very much developed in a national context in Europe, i.e. because of the nationally based financial sector, different tax systems etc. Interoperability is far away in this area.

Interoperability and standardization connected with the more advanced processes of e-tendering and e-purchasing
It is very important that standardisation work in e-procurement is done in a broader international context by promoting international standards in all possible areas.

Development of a European interoperability framework should take into account the broader international aspect by promoting international standards in all possible areas (e.g. electronic catalogues), and promoting European standards where appropriate (e.g. digital signature, PKI or e-signatures).

Cases of security problems may create distrust towards systems and decrease confidence in e-procurement
Security will remain an important issue in the future. No IT system is 100% secure, and it is likely, especially with an expected increase in transactions, that problems will occur. Such cases will create distrust towards systems and decrease confidence in e-procurement. The development in this area changes from day to day, which means that it is also important that the situation is monitored closely, and that action is taken swiftly when needed.

4.3.3 Assessment of potential impact on the Internal Market

All actions listed in the table above address problems of lacking interoperability and standards in a number of key phases of the procurement cycle, from digital signature to e-payment and e-invoice, and will, if implemented, facilitate the exchange of data between enterprises and public institutions.

It would be a significant advantage to suppliers and buyers if standards were agreed upon and interoperability problems reduced (notably for advanced procurement processes). The main benefit for the individual company would be time savings and reduction of costs of e-procurement software. For buyers, benefits would especially be connected with increased competition and lower prices.

However, to agree on common standards at EU level and obtaining acceptance from all the different authorities and sectors and their specific needs and demands is very complicated. Thus, immediate impacts are generally not likely.

Even though the immediate impacts are limited due to the often very extensive time required to agree on standards, the potential (long term) advantages of the internal market could be significant and include:

- Increased motivation to participate in public procurement due to reduction of implementation and operation costs.
- Better access for companies in accessing and responding to public tenders
- Facilitation of cross border transactions leading to increased competition and lower prices.

The benefits of the effort are potentially significant, whereas the cost of defining standards is relatively modest.

The actions proposed to be undertaken by the EU Commission are primarily support and promotion of the *development* of standards, whereas the role of the Member States and industry is to implement these. It is important to emphasize the role of the Member States and Industry as the *implementation* of developed standards constitutes an important problem. Thus, in the area of e-procurement (e.g. EDI) standards have been developed without being supported sufficiently by main actors, which means that they will not have any impact.

Below comments are made on the individual policy instruments and the expected cost and benefits of the initiative.

Policy instrument: Revise and promote the use of CPV vocabulary in EU and internationally

The potential benefits are:

- Easier to identify procurement contracts which will lower search costs for suppliers and increase transparency of the public procurement market.
- Faster and more accurate translation of contract notices for publication in the EC Official Journal
- Improvement of procurement statistics and monitoring of the public procurement market.

The potential costs are:

- Revision of the vocabulary and ongoing management of a CPV secretariat. The cost depends upon he level of ambition (e.g. update frequency, development of product attributes etc.).
- The immediate impact is uncertain given the time needed to make CPV a dynamic tool in e-Tendering.

The potential impact on problems identified in the baseline scenario:

- If implemented correctly, the action may potentially reduce the confusion about different product classification standards, especially in the e-tendering phase, where CPV is dominating.
- Even though CPV is updated more frequently, a number of challenges will still remain (reporting of right and detailed CPV codes, expand the use to e-ordering etc.).

Policy instrument: Promote interoperability and standards for different levels of electronic signatures

The potential benefits are:

- Buyers and suppliers only need to support one signature standard or format.
- Lower transaction costs in the economy as a whole, as well as savings for individual businesses.
- Reduced integration cost and maintenance.
- The availability of an open signature standard or format can help avoid dependence of a single IT-supplier. The result is increased competition among IT-suppliers.
- Increased motivation to participate in public procurement due to reduction of implementation and operation costs.
- Facilitation of cross border transactions leading to increased competition and lower prices.

The potential costs are:

- Creation of the format or standard itself.
- Possible revisions in installed base of IT-systems.
- If the process of agreeing on a common standard or format is drawn out, there is a risk that the result is passed by the market development before published.

The potential impact on problems identified in the baseline scenario:

- The instrument addresses the two basic challenges in the area of interoperability and standardisation in relation to electronic signatures: Definition of formats or standards, mutual recognition of signatures and promotion of the use of these. The instrument will reduce the interoperability problem, but does not ensure a widespread use of a specific format or standard.

- The possibility of imposing defined formats and a system of mutual recognition should be considered, e.g. member state level or EU-level.

Policy instrument: Promote interoperability and standards for electronic catalogues

The potential cost and benefits of promoting interoperability and standards for electronic catalogues are very similar to electronic signatures.

The potential benefits are:

- Buyers and suppliers only need to support one catalogue standard or format.
- Lower transaction costs in the economy as a whole, as well as savings for individual businesses.
- Reduced integration cost and integration maintenance.
- The availability of an open catalogue standard or format can help avoid dependence on a single IT-supplier. The expected result is increased competition among IT-suppliers.
- Increased motivation to participate in public procurement due to reduction of implementation and operation costs.

- Facilitation of cross border transactions leading to increased competition and lower prices.

It should be added that for especially e-catalogues, it is very important that no specific European standard is developed, but that the initiative are based in the international organisations in the field (i.e. OASIS UBL).

The potential costs are:

- Creation of the XML-schema or standard itself.
- Possible revisions in installed base of IT-systems.
- If the process of agreeing on a common standard or format is drawn out, the risk is that the result is passed by the market development before published.

The potential impact on problems identified in the baseline scenario:

- The instrument addresses the basic problem in the area of interoperability in relation to electronic catalogues: definition of formats or standards and promotion of the use of these. The instrument will reduce the interoperability problem, but does not ensure a widespread use of a specific format or standard.

Policy instrument: Promote interoperability and standards for e-invoices

Generally, the same assessment as with interoperability or a standard for e-catalogues applies, but e-payments and e-invoicing is potentially an even stronger driver for e-procurement.

The potential benefits are:

- Buyers and suppliers only need to support one invoice format.
- Lower transaction costs in the economy as a whole, as well as savings for individual businesses.
- Reduced integration cost and integration maintenance.
- The availability of an open invoice standard or format can help avoid dependence on a single IT-supplier. The result is increased competition among IT-suppliers.
- Increased motivation to participate in public procurement due to reduction of implementation and operation costs.
- Facilitation of cross border transactions leading to increased competition and lower prices.

The potential costs are:

- Creation of the invoice format or standard itself.
- Possible revisions in installed base of IT-systems.
- If the process of agreeing on a common standard or format is drawn out, there is a risk that the result is passed by the market development before published.

The potential impact on problems identified in the baseline scenario:

- The instrument addresses the basic problem in the area of interoperability of e-invoices: definition of formats or standards and promotion of the use of these. The instrument will reduce the interoperability problem, but does not ensure a widespread use of a specific format or standard.

Policy instrument: Provide funding for international standardization initiatives

In general, increased interoperability of e-procurement would be a significant advantage to suppliers and buyers. Interoperability increases buyers' incentives to conduct e-procurement, which have a positive influence on cross-border procurement and free movement on the internal market.

The potential impact on problems identified in the baseline scenario:

- The instrument addresses the problem of possible different standards between EU-countries and other countries.

Policy instrument: Monitoring of the development in the area of security

Security will remain an important issue in the future. No IT system is 100% secure, and it is likely, especially with an expected increase in transactions, that attacks will occur. Such cases will create distrust towards systems and decrease confidence in e-procurement. The development in this area changes from day to day, which means that it is also important that the situation is monitored closely, and that action is taken swiftly when needed.

The potential benefits are:

- Early information about security problems would provide an opportunity for early and timely corrective action, e.g. before these problems is expanded into large scale and decrease trust in e-procurement.

The potential costs are:

- Costs for monitoring activities carried out by the European Commission and security authorities in the member states and studies conducted on a regular basis. The cost of this activity can be substantial.

The potential impact on problems identified in the baseline scenario:

- Monitoring of the security situation could serve to reduce security problems somewhat, but the dynamic development in the field makes it very difficult to estimate the impact of monitoring.

4.3.3.1 Issues and barriers not addressed by the policy instruments

The policy instruments address the two basic challenges in the area of interoperability and standardisation in relation to e-procurement: Definition of formats or standards and promotion of the use of these by IT-vendors and end users. Whereas the actions proposed will certainly reduce the problems of existence of different formats or standards, the use of these are still left to the individual member state, contracting authority and IT-vendor.

Once acceptable standards have been developed, the possibility of imposing these in public procurement on different levels should be considered, e.g. member state level or EU-institutions. Thus, implementing one format or standard in the various steps of the procurement process across EU-institutions would be a major step in the right direction. This could also be promoted as a possible standard for member state level.

Actors should be very careful that formats and standards do not impede competition and innovation and slow development.

4.4 Human Resources and Knowledge

4.4.1 Identification of possible policy instruments

During the course of the study two policy instruments were identified which would address the problems relating to the driving force concerning *human resources and knowledge.*

- Awareness and information dissemination activities targeted at economic operators (especially SMEs) and contracting authorities.
- Provision of training opportunities for economic operators and contracting authorities (including seminars, e-learning etc.)

The table below gives an overview of how the policy instruments are linked to problems in the field that were identified by the baseline scenario.

Overview of linkages between problems identified and policy instruments

Problems identified	Policy Instruments
There is a lack of management skills in relation to achieving administrative savings on the introduction of e-public procurement and using this as a tool to reengineer and streamline the organization of procurement processes.	- Awareness and information dissemination activities - Provision of training opportunities
There is a lack of knowledge and documentation about the business case for e-public procurement and the possible benefits from same which might impede or prevent the conversion to e-public procurement among buyers and suppliers.	- Awareness and information dissemination activities - Provision of training opportunities
There is a risk that the segment of the smallest companies (less than 20 employees) will opt out of the general evolution of e-public procurement because participation is too cumbersome.	- Awareness and information dissemination activities - Provision of training opportunities

As outlined by the baseline scenario, the availability of knowledge and technical/organisational capacity by contracting authorities as well as by companies constitutes an important factor in the development of e-public procurement. Efforts to improve the level of knowledge could include topics such as e-business strategy in general and e-procurement systems in particular, but also topics such as public procurement and regulation are important. Lack of knowledge or technical capacity could also lead to resistance to change, and thus barriers for uptake and implementation of e-public procurement.

One of the important conclusions from the baseline scenario is a lack of management skills in relation to various areas, including knowledge about reengineering and streamlining procurement processes and possible benefits from e-public procurement among both contracting authorities and economic operators.

As regards the economic operators, the baseline scenario highlighted a risk that the segment of the smallest companies (less than 20 employees) will opt out of the general evolution of e-public procurement because of lack of operational skills and knowledge about e-public procurement and because participation is, or appears to be, too cumbersome and costly.

Moreover, on the part of the contracting authorities, there is a vast number of procurement officials (the number of contracting authorities in the EU is estimated to be somewhere between 20,000 and 30,000) who need training in and information about e-public procurement in order to promote the use and uptake of e-public procurement in the generally decentralized procurement structure of Europe.

Another important conclusion from the baseline scenario is that there is a lack of knowledge and documentation about the business case for e-public procurement and the possible benefits which could impede or prevent the conversion to e-public procurement among contracting authorities and suppliers. Training and, in particular, awareness activities would therefore need to address this issue.

Given this context the possible policy instruments in the field of human resources and knowledge would seem to address a demand among economic operators, especially SMEs, as well as contracting authorities which would have to be met in order to move towards generalized use of e-public procurement.

4.4.2 Assessment of potential impact on the Internal Market

Policy instrument: Awareness and information dissemination activities targeted at economic operators (especially SMEs) and contracting authorities

Monitoring of SME participation would provide a first step in addressing the potential risk of excluding SMEs from the more advanced parts of e-public procurement and in this context assess the training needs and demands. The member states have a potentially important role to play in terms of raising awareness and knowledge within the SME business community. The member states and business associations are closer to the SME business communities in the 25 countries than the European Commission and they need therefore to play a main role in the field.

However, efforts in the field should preferably be taken in collaboration between the European Commission, member states and industry associations (who would play an important role as information “ambassadors” in a network based communication strategy) to ensure both effective outreach to the constituencies in the respective member states and a certain level of harmonization in the messages communicated to the SME community, e.g. concerning the use of standard e-procurement systems based on existing standards, in order to prevent fragmentation in the internal market.

The potential benefits are:

- Increased awareness among economic operators and contracting authorities which could have a potentially positive impact on the uptake of e-public procurement.

The potential costs are:

- Limited costs of designing awareness programmes, marketing activities and costs of implementing same.

The potential impact on the problems identified by the baseline scenario:

- The awareness raising activities will address the problems concerning lack of knowledge about the potential in e-procurement but it is evident that they cannot be expected to eradicate such problems completely.

Policy instrument: Provision of training opportunities for economic operators and contracting authorities (including seminars, e-learning etc.)

Training could be administrated at different levels, e.g. at EU, national or local level, and it could be implemented in various forms e.g. training of e-procurement users, train-the-trainers, training by e-learning, 1-1 consulting programmes where companies are provided with the opportunity to have individual guidance from professional service firms and experts.

A generic training programme targeted at companies (SMEs) to increase awareness and concrete knowledge of potentials with e-public procurement for SMEs could contain issues such as:

- Introduction to ”public procurement basics”
- E-business strategy
- E-tendering, electronic auctions, dynamic purchasing systems
- Establishing buyer profiles, using procurement portals and developing electronic catalogues
- Trends among contracting authorities in adopting electronic public procurement
- Available electronic procurement solutions – price, functionalities etc.
- Return on investment calculations
- Etc.

A generic training programme targeted at public authorities to support implementation of electronic procurement systems could contain issues such as:

- Regulation in the field of electronic procurement
- Standards
- E-tendering, electronic auctions, dynamic purchasing systems
- Using procurement portals vs. own electronic procurement system
- Available electronic procurement solutions – price, functionalities etc.
- Training in actual usage of electronic procurement systems
- Etc.

The potential benefits are:

- Increased knowledge within the European business community and within contracting authorities which is a precondition for exploiting the potentials of e-public procurement in terms of increased competition, public savings and reduced administrative costs.

- For suppliers, training programmes have the potential to translate into long term benefits such as:
  - Organisational change as a result of introduction of new systems/services
  - Increased market share in existing business areas
  - Increased productivity/efficiency
  - Reduction in operation costs
  - Increased product or service quality
  - Increased exposure to the European market
  - New skills and technical knowledge

The potential costs are:

- Costs of designing training programmes, marketing activities and costs of administrating and implementing the activities.

The potential impact on the problems identified in the baseline scenario:

- The awareness raising activities, the training programmes will address the problems concerning lack of knowledge, lack of management and operational skills and give small companies a more positive view on the possibilities in e-public procurement, but the training programmes cannot be expected to eliminate these problems.

4.4.3 Issues and barriers not addressed by the policy instruments

Assuming that the training and awareness activities are carefully designed and responds to the need of economic operators and contracting authorities, the policy instruments described would seem to cover the major issues identified in the field of human resources and knowledge. The most important remaining problem in this field would therefore be the effective outreach to relevant target groups, which is a major challenge, given the scale of the target groups. While carefully designed training and awareness activities would address the issues of information and content, it is in practical terms not possible to reach out to all parts of the relevant target groups. Information and training possibilities can be made available, but if for example economic operators are not aware that they have a need for information in the first place, it is difficult to bring the relevant information across to them.

4.5 Availability of technical solutions

4.5.1 Identification of possible policy instruments and problems addressed

The baseline scenario identified the following problems in the area of technical solutions in relation to e-public procurement:

- The major e-procurement vendors are targeting the larger government administrations (states, provinces or regions) or institutions, health sector institutions (hospitals), education (universities) and the utility sector.
- It is expected that the e-public procurement systems and solutions become increasingly advanced and with improved functionalities, but no fundamental innovations are currently emerging.
- Some of the major public procurement markets in Europe will reach a critical mass of contracting authorities and suppliers using electronic means, while reaching critical mass in smaller market or in less technologically mature countries (including Eastern Europe) will be difficult.

Overview of linkages between problems identified and policy instruments

Problem identified	Possible policy instrument
- The major e-procurement vendors are targeting the larger government administrations or institutions - It is expected that the e-public procurement systems and solutions become increasingly advanced and with improved functionalities, but no fundamental innovations are currently emerging.	- Develop a fully electronic system for the local processing and validation of notices - Support development and innovation of simple and cost-efficient electronic public procurement systems
- Some of the major public procurement markets in Europe will reach a critical mass of contracting authorities and suppliers using electronic means, while reaching critical mass in smaller market or in less technologically mature countries (including Eastern Europe) may be difficult.	- Improve functioning and user friendliness of TED and promote use of TED above and below threshold

4.5.2 Problems addressed by the policy instruments

As described in the baseline scenario, the availability of adequate and affordable technical solutions is an important driver for uptake of e-public procurement. The basic technology such as a PC, internet access, and digital signature is a pre-requisite for e-procurement, and to increase the up-take of e-procurement, it is important to spur development and innovation of new and innovative solutions.

The instruments suggested include improvement of TED, development of a fully electronic system for electronic processing and validation of notices and support development of simple and cost-efficient electronic public procurement systems.

The first policy instrument is the development of a fully electronic system for local processing and validation of notices. The action addresses the problem of high transaction costs and low efficiency associated with paper-based procedures. This issue has been described extensively in the baseline analysis and the baseline scenario and a number of cases show that e-procurement can result in significant savings in both purchasing prices and administrative costs. The problem is that electronic processing of notices is done to a limited degree today.

The second policy instrument, to support the development of simple and cost-efficient electronic public procurement systems, address the problem described in the baseline scenario that the development of e-tendering and e-purchasing systems is relatively slow compared with other types of IT-applications. Another problem is that the market for simple e-procurement systems, targeted at small institutions or small companies, is a focus area for the large IT-vendors (which represent the major part of IT-investments). Thus it could be argued that there is a market failure that could justify government intervention.

The third instrument deals with the problem of lacking functioning and user-friendliness of TED. As described in the baseline scenario, the current version needs improvement to provide users with a sufficient increase in convenience (or value-added), otherwise traditional means of communication will often be the preferred method.

4.5.3 Assessment of potential impact on the Internal Market

Software applications are the core tool for suppliers in e-procurement, so access to user friendly, cheap solutions with the required functionality are very important to suppliers. Development of simple solutions in the procurement process could have an immediate impact on supplier's access to e-procurement. However, it is uncertain if supporting development of solutions is a cost-efficient policy action. Issues such as update, support, learning resources etc. also need to be clarified.

Systematic publication in TED of procurement opportunities above and below the threshold values would be a step in opening the European procurement markets for competition beyond the national markets. For many SMEs tender opportunities below the threshold value are more accessible as the comparatively smaller sizes of the contracts make these easier to handle especially for the smallest segments of SMEs. Provided that the publication of procurement opportunities below threshold is accompanied by standardized procurement procedures, formats and administrative requirements, it will reduce administrative costs for companies. Such changes could in the long term also facilitate cross-border participation in tendering below the threshold values.

Policy instrument: Develop fully electronic system for the local processing and validation of notices

The potential benefits are:

- Lower development costs (software) of electronic public procurement system.
- Process savings, time reduction in handling of notices and reuse of information.
- Increased motivation to participate in electronic public procurement which could increase openness of European procurement markets for competition.

The potential costs are:

- Development of e-procurement system. These costs are moderate.
- Risk of market distortion resulting from EU or government support to development of IT-system.

The potential impact on problems identified by the baseline scenario is:

- The proposed instrument represents a step towards improving the increased availability of technological solutions.
- The instrument will reduce the cost connected with using or implementing e-procurement systems and help improve the profitability of IT-investments for the individual institution.
- If substantial resources are allocated, the initiative could catalyse innovation and development in the area, but it can not ensure an increased focus by major e-procurement vendors on smaller government administrations or institutions.

Policy instrument: support development and innovation of simple and cost-efficient electronic public procurement systems

The potential benefits are:

- Lower development costs (software) of electronic public procurement system.
- Increased motivation to implement electronic public procurement for contracting authorities and suppliers which could increase openness of European procurement markets for competition.

The potential costs are:

- EU or member state financing of development of a procurement system.
- Risk of market distortion resulting from EU or government support to development of IT-systems.

The potential impact on problems identified in the baseline scenario is:

- The proposed instrument represents a step towards improving the availability of technological solutions.

- The instrument will reduce the cost connected with using or implementing e-procurement systems and help improve the profitability of IT-investments for the individual institution.

- If substantial resources are allocated, the initiative could catalyse innovation and development in the area, but it can not ensure an increased focus from major e-procurement vendors on smaller government administrations or institutions.

Policy instrument: improve functioning and user friendliness of TED and promote use of TED above and below threshold

The potential benefits are:

- Process savings because of lower publication cost, especially for contracting authorities (who has the reporting obligation).
- Increased motivation to participate in electronic public procurement.
- Facilitation of cross-border participation in tendering.
- Opening the European procurement markets for competition beyond the national markets.

The potential costs are:

- Development of a new web-interface. These costs are relatively limited.

The potential impact on problems identified by the baseline scenario is:

- The instrument will first and foremost provide process savings.
- The problem regarding achievement of critical mass will also, to some extent, be addressed by the initiative, although it will not solve the problem without supplementary action.

4.5.4 Issues and barriers not addressed by the policy instruments

The availability of adequate and affordable technical solutions is an important driver for uptake of e-public procurement. To increase the up-take of e-procurement, it is important to spur development and innovation of new and innovative solutions. The proposed actions represent a step towards improving the increased availability of technological solutions.

The overall framework in which the application of these instruments will take place is that the business case for e-public procurement for some contracting authorities, as well as for some suppliers, is not sufficiently strong. Assuming that the policy instruments are carefully designed and responds to the need of contracting authorities and small companies, the policy instruments will reduce the cost connected with developing e-procurement systems, and thereby help to improve the profitability of IT-investments for the individual institution.

It should however be noted that even though public support can help increase the availability of cheap and well-functioning, user-friendly systems, the area is first and foremost driven by market forces and not government action, and the importance of action on the part of IT-vendors and other economic operators should thus be emphasized.

Finally, to avoid possible conflicts and market distortion, a possible intervention involving government support to development of e-procurement systems must be carried out very carefully.

4.6 Stakeholders' roles and potential influence

As the comments to the various possible policy instruments in the previous sections have showed, it is evident that the application and implementation of the policy instruments is not the sole responsibility of the European Commission: The actions and contributions of other stakeholders – associations in the European business community and the member states, standardization bodies – will also greatly influence, and in some areas determine, the outcome and effect of the future implementation of the policy instruments.

To complement this overall observation, some comments concerning the roles and potential influence to the possible policy instruments may be added. The comments are organized below under the four driving forces.

Organization, Stakeholders and Incentives

- Streamlining and simplifying procurement procedures and practices must have the European Commission in a leading role in order to adopt a harmonized and coordinated approach. The member states would need to be actively involved throughout the work process

- Surveillance of the evolution of the public procurement market in Europe with a special focus on competition issues could be carried out at country level by national competition authorities, but the monitoring and surveys should take place in a format defined by the European Commission in order to allow for comparative analysis at aggregated European level.

Interoperability

- Promotion of interoperability must have the European Commission in a leading role in order to adopt a harmonized and coordinated approach. The member states would need to be actively involved throughout the work process.

- IT –vendors and contracting authorities play a very important role in that of following and implementing standards, formats etc. These actors are crucial if the current inconsistent use of standards and formats should be reduced.

- It should, however, be noted that even though public support can help increase the availability of cheap and well-functioning, user-friendly systems, the area is first and foremost driven by market forces and not government action, and the importance of action on the part of IT-vendors and other economic operators should therefore be emphasized.

Human Resources and Knowledge

- Awareness raising activities should preferably be designed and implemented at member state level and should reach out to both existing and potential suppliers and to contracting authorities at all levels of government (national, regional, local). The European Commission could contribute to these activities through co-financing of seminars and conferences.

- As regards training opportunities and programmes the planning of the detailed content of the programmes would have to be done close to the operational level at national level, but could take its starting point in a generic training kit developed by the European Commission. A model for the financing of the training activities could be the co-financing from the European Commission of public or private institutions (e.g. business associations, professional associations for lawyers and others) that carry out the training activities. The most cost-efficient way to carry out the training activities would seem to be that national authorities responsible for public procurement and/or for information society programme activities take on a leading and coordinating role.

Availability of Technical Solutions

- This supply of technical solutions is an area which is largely driven by market forces.

- A targeted effort by the EU Commission and member states can increase the availability of cheap, well-functioning and user-friendly systems. The European Commission can coordinate action in the field and the member states would need to be actively involved.

- Even though public support can help increase the availability of cheap and well-functioning, user-friendly systems, IT-vendors and other economic operators are very important in this area.

4.7 Recommendations

The Consultant's overall assessment and recommendation for the policy instruments considered in this scenario is provided below.

Summary of benefits and costs and recommendations – Policy Instruments related to *Organisation, Stakeholder and Incentives*

Policy Instrument	Potential Benefits	Potential Costs	Recommendation
Changing procurement instruments and processes to achieve simplification and efficiency gains	- Key policy instrument for achieving administrative savings	- Depending on scope and level of ambition (which preferably should be high) costs and working time could be significant	- Implement
Surveillance of the public procurement market in Europe	- Early identification and prevention of competition issues and problems	- Monetary costs are limited if implemented e.g. as a basic, low cost semi-annual survey among national competition authorities	- Implement as a pilot activity and evaluate value-added after 1-2 years

Summary of benefits and costs and recommendations – Policy Instruments related to *Interoperability, standardization and security*

Policy Instrument	Potential Benefits	Potential Costs	Recommendation
Revise and promote the use of CPV vocabulary in EU and internationally	- Easier to identify procurement contracts which will lower search costs and increase transparency - Improvement of procurement statistics and monitoring of the public procurement market.	- Revision of the vocabulary and on-going management of a CPV secretariat.	- Implement
Promote interoperability and standards for different levels of electronic signatures	- Buyers and suppliers only need to support one standard or format. - Lower transaction costs in the economy as a whole, as well as savings for individual businesses.	- Development of the standard or format itself. - Possible revisions in installed base of IT-systems.	- Implement

Policy Instrument	Potential Benefits	Potential Costs	Recommendation
Promote interoperability and standards for electronic catalogues	- Buyers and suppliers only need to support one standard or format. - Lower transaction costs in the economy as a whole, as well as savings for individual businesses.	- Development of the standard or format itself. - Possible revisions in installed base of IT-systems.	- Evaluate current development and consider possible actions
Promote interoperability and standards for e-invoices	- Buyers and suppliers only need to support one standard or format. - Lower transaction costs in the economy as a whole, as well as savings for individual businesses.	- Development of the standard or format itself. - Possible revisions in installed base of IT-systems.	- Implement
Provide funding for international standardization initiatives	- Increased interoperability in e-procurement	- Funding of standardisation bodies	- Implement
Monitoring of the development in the area of security	- Prevention of possible security problems. - Increase trust in e-procurement.	- Relatively modest cost	- Implement

Summary of benefits and costs and recommendations – Policy Instruments related to *Human Resources and Knowledge*

Policy Instrument	Potential Benefits	Potential Costs	Recommendation
Awareness and information dissemination activities targeted at economic operators and contracting authorities	- Awareness raising is the first step towards increase in uptake of e-public procurement	- Some, but relatively limited, costs for conferences, seminars etc.	- Implement
Provision of training opportunities for economic operators and contracting authorities	- Improved knowledge (strategic and operational) which is an important precondition for increase in uptake of e-public procurement	- Financial costs will be significant as training activities would be rolled out in 25 countries - Generic training formats could promote cost-efficiency.	- Implement

Summary of benefits and costs and recommendations – Policy Instruments related to *Availability of technical solutions*

Policy Instrument	Potential Benefits	Potential Costs	Recommendation
Improve functioning and user friendliness of TED and promote use of TED above and below threshold	Process savings because of lower publication cost Facilitation of cross-border participation in tendering.	- Development of new web-interface. Costs are relatively limited.	- Implement
Develop fully electronic system for the local processing and validation of notices	- Process savings, time reduction in handling of notices and reuse of information.	- Development cost - Risk of market distortion	- Conduct feasibility study and consider pilot activity in the area
Support development and innovation of simple and cost-efficient electronic public procurement systems	- Lower cost (software and implementation) of electronic public procurement system	- Development cost - Risk of market distortion	- Conduct feasibility study and consider pilot activity in the area

5. Conclusion

Increased uptake of e-public procurement can have a positive impact on the internal market in a number of areas. First and foremost, the electronic notification of tenders will make it easier for suppliers to identify contract opportunities. This in turn will lead to increased competition and lower prices, because of an increased number of bidders for each tender, better price comparisons between suppliers, increased market transparency etc. is possible.

Moreover, using electronic means in the procurement process will enable a number of process savings for buyers and suppliers and lower transaction costs. This will increase the motivation to participate in public procurement due to reduction of tender costs.

The main target group for e-procurement systems in Europe can be estimated at approximately 1,000 public institutions. According to estimates, approximately 10% of these have currently implemented e-tendering or e-purchasing systems, but the use of the systems are so far limited.

5.1 Potential Impact of the Baseline Scenario (Scenario A)

Even in the baseline (no-action) scenario, the trend for e-procurement will point upwards, but until 2010, the penetration of e-procurement will be very uneven in the various steps of the procurement process. In 2010 it can be expected that:

- The goal of generalized use of electronic means in public procurement is only expected to be reached in the notification phase. This means that contract opportunities will be advertised online, but not necessarily that the tender notices are distributed electronically by the contracting authority.
- A lower, but still significant, use of electronic means is expected in the publication of tender documents and invoicing.
- For the remaining phases, public procurement is not expected to reach critical mass.

Another aspect regarding up-take is the country dimension. In some smaller countries and markets, e-public procurement will not reach critical mass, which is important if e-procurement is to constitute a sound business case. Thus, in these markets, the potential of increased competition, more transparent markets and more cross-border procurement will not be realized.

It is therefore expected that e-procurement will proceed to some extent in the public sector, but the pace of the conversion to e-public procurement will be incremental and slow and many contracting authorities will continue to use paper-based procurement.

The direct economic impact will be that the potential savings of approximately 19 billion EUR on purchasing price (for EU15) due to a more transparent and efficient market for public procurement will not be fully realized.

Given the combined effects of the current trends, e-public procurement in Europe does not seem to become a sufficiently powerful driver that can contribute to the realization of the Lisbon objectives, if no further action is taken.

5.2 Potential Impact of the Balanced Approach Scenario (Scenario B)

The policy instruments in the field of regulation are considered in view of their ability to ensure that the requirements set out in the EU legislation are met. The overall assessment is that the range of activities forms a useful mixture of support measures and control mechanisms undertaken by the European Commission. Based on the analyses made it seems likely that delays and compliance problems will occur in the member states. Although it is yet too early to predict the scope of this type of problems it is appropriate to establish measures early on that can push for timely implementation, prevent some compliance problems and promote harmonization.

Support to the implementation of the new procurement directives will contribute further to the harmonization of the framework for procurement in Europe. It will eliminate the fundamental legal barriers inherent to the use of different regulation on electronic means in the procurement process in the Member States. It will remove legal uncertainty for economic operators and decrease market fragmentation. The policy instruments will be beneficial for transparency and competition. The application of the instruments will be beneficial for SMEs as well as for larger companies as they will contribute to the speedy implementation of the new legal framework across the EU.

An important final point concerning the actions taken under this policy option is that the main responsibility for meeting the requirements of the legislation now lies with the member states.

5.3 Potential Impact of the Extensive Effort Scenario (Scenario C)

The overall assessment of the range of possible policy instruments is that they generally represent steps in the right direction in terms of achieving generalized use of e-public procurement in 2010. They are expected to support the uptake of e-procurement.

The range of instruments will significantly increase the pace of the conversion to e-public procurement. Increased uptake of e-public procurement can have a positive impact on the internal market in a number of areas. The policy instruments will contribute to the development towards a more open and transparent European market and make information about business opportunities more easily available. Moreover, the increased use of electronic means in the procurement process will enable a number of process savings for buyers and suppliers and lower transaction costs. This will increase the motivation to participate in public procurement due to a reduction of tender costs.

The evolution of e-public procurement is likely to follow the pattern known from previous waves of technology penetration. This implies that the growth pace will be incremental until it reaches a critical point after which the pace will increase and it will follow an exponential growth pattern. The policy instruments applied under this scenario are likely to contribute to this process so that the critical point is reached sooner than in the baseline scenario. From this perspective, the application of the policy instruments will make a contribution to the realization of the Lisbon objectives.

5.4 Comparison of the three scenarios

The main points from the three scenarios are condensed and summarized in the table below which serves as a tool for comparing the three scenarios on a set of central parameters.

Central parameters	Scenario A: Baseline Scenario	Scenario B: Balanced Approach	Scenario C: Extensive Effort
Main positive impact	The new procurement directives and general migration in the market will contribute to the uptake of e-public procurement.	Policy instruments will speed up legal and practical implementation in member states. Efforts will ensure that major compliance problems are avoided in the Internal Market.	The mix of policy instrument will address problems across the board. Efforts will speed up the process towards generalized use of e-public procurement.
Main negative impact	Many problems and barriers remain unresolved and uptake will be slow.	The policy instruments under this scenario will only make a marginal, however positive, difference to the already existing pace of evolution.	Some barriers and problems will remain, mainly because it is not possible to address all the problems due to their nature and structural characteristics.
Costs	No direct costs, but many indirect costs as potentials are not exploited and major barriers remain.	Limited direct costs to ensure legal and practical compliance with Internal Market principles.	The combined mix of policy instruments will entail considerable costs. However, in light of the potential benefits, the investment costs seem justified. Economies of scale can be achieved through concerted and coordinated effort at the European level.
Influence on main objective: Generalized use of e-public procurement as a contribution to the Lisbon objectives	The dynamics of the regulatory reform will make a contribution as electronic means are put on par with paper-based procurement. This will provide an incentive for uptake of e-public procurement. However, generalized use will not be achieved in Europe by 2010.	As in the baseline scenario, it is not likely that generalized use will be achieved by 2010. There will, however, be a positive contribution in terms of speeding up the establishment of the enabling legal framework in the Internal Market.	The mix of policy instruments will contribute to the pace in the uptake of e-public procurement. Although it is not certain, it is possible that generalized use could be achieved in Europe by 2010.

5.5 Recommendations for policy instruments

Based on the analyses carried out under the various scenarios, the Consultant recommends that the following mix of policy instruments are given priority in the European Commission's action plan for e-public procurement:

- Interpretive document and support (consultation, information to member states)
- Monitoring of implementation of new directives in the member states
- Best practice examples and guidelines
- Changing procurement instruments and processes to achieve simplification and efficiency gains
- Revise and promote use of CPV vocabulary in EU and internationally

- Promote interoperability and standards for different levels of electronic signatures
- Promote interoperability and standards for e-invoices
- Provide funding for international standardization initiatives
- Monitoring of the development in the area of security
- Awareness and information dissemination activities targeted at economic operators and contracting authorities
- Provision of training opportunities for economic operators and contracting authorities
- Improve functioning and user friendliness of TED and promote use of TED above and below threshold

Moreover, three policy options could be implemented as pilot activities, and the outcome of these activities should determine to what extent further activities under these policy instruments are launched:

- Surveillance of the public procurement market in Europe
- Develop fully electronic system for local processing and validation of notices
- Support development and innovation of simple and cost-efficient e-public procurement systems

Finally, two policy instruments could potentially be useful under specific circumstances in the future, but need further consideration in light of the future evolution of e-public procurement in Europe in order to consider their value added. It is therefore recommended that the following policy instruments are not applied in the first phase of the action plan but continue to be subject to consideration:

- Voluntary accreditation scheme at European level
- Promote interoperability and standards for different levels of electronic catalogues.

Annex 1: List of interviewed persons

List of EU member states representatives interviewed for the survey among member states

Winkler, Martina, Bundeskanzleramt (Austria)

Mertens, Michel, Federal ICT Service (Belgium)

Kotris, David, Ministry of Informatics (Czech Republic)

Kountouris, Steliosm, Public Procurement Department, Treasury of the Republic of Cyprus (Cyprus)

Larsen, Marianne K., Chief Counsellor, Danish Competition Authority (Denmark)

Kiisel, Märt, Chief Specialist, Ministry of Finance, State Aid and Public Procurement division (Estonia)

Aarla, Tarja, Ministry of Trade and Industry (Finland)

Alviset, Christophe, Sous-directour de l'Informatique et des Nouvelle Technologies, Ministère de l'économie, des finances et de l'industrie (France)

Moreau, Olivier, Représentant du Ministère de l'Economie, des Finances et de l'Industrie, Ministère de l'économie, des finances et de l'industrie (France)

Arlt, Annett, Bundesminsterium für Wirtschaft und Arbeit (Germany)

Spatharis, Panagiotis, Ministry of Development (Greece)

Tatrai, Dr. Tünde, Prime Minister's Office, E-government Center (Hungary)

Noone, Billy, The Department of Finance Public Procurement Policy Unit (Ireland)

Colaccino, Davide, Dipartimento per le Risorse strumentali Premier Office (Italy)

Bergs, Valdis, Information department, Procurement Monitoring Bureau of Latvia (Latvia)

Pumputis, Ainis, Public Procurement Office (Lithuania)

Nosbusch, Marc, Ingénieur-informaticien, Ministry of Public Works (Luxemburg)

Sluis, Sander J. van, Ministry of Economic Affairs of the Netherlands (Netherlands)

Dennis Attart, Principal, EU Unit, Department of Contracts (Malta)

Bartolo, Bernard, Principal Officer, EU Unit, Department of Contracts (Malta)

Piasta, Dariusz, director, Public Procurement Office, European Integration Department (Poland)

Mantas, Maria de Fatima, Consultora Juridica Assessora, Ministry of Finance (Portugal)

Camacho, Maria de Lourdes, Direcção-Geral do Património do Estado, Ministry of Finance (Portugal)

Malnárová, Rozália, Chairman, Office for Public Procurement (Slovakia)

Campa, Margit, Undersecretary, Ministry of Finance, Sector for Public Procurement and Concessions (Slovenia)

Matas, Saso, Ministry of Finance, Sector for Public Procurement and Concessions (Slovenia)

I have no experience with this tool	140	(33.9%)

Section 3

Which, if any, significant problems or barriers have you encountered - or do you anticipate - when using electronic means whilst participating in public procurement in your own country? Please tick the appropriate box(es).

		%
Incompatible IT standards	123	(29.8%)
Inappropriate design of tendering systems	181	(43.8%)
Lack of IT skills	58	(14%)
Inappropriate security arrangements	106	(25.7%)
High adjustment costs	66	(16%)
Inadequate legal framework	97	(23.5%)
Insufficient commercial benefits	86	(20.8%)
My business is not suited for electronic trade	42	(10.2%)
The necessity of reorganising our company	35	(8.5%)
Other	21	(5.1%)
No barriers encountered	50	(12.1%)
I don't know	52	(12.6%)

Which, if any, significant problems or barriers have you encountered - or do you anticipate - when using electronic means whilst participating in public procurement in other EU Member States? Please tick the appropriate box(es).

		%
Incompatible IT standards	119	(28.8%)
Inappropriate design of tendering systems	135	(32.7%)
Lack of IT skills	52	(12.6%)
Inappropriate security arrangements	84	(20.3%)
High adjustment costs	53	(12.8%)
Inadequate legal framework	102	(24.7%)
Insufficient commercial benefits	54	(13.1%)
My business is not suited for electronic trade	31	(7.5%)
The necessity of reorganising our company	25	(6.1%)
Linguistic barriers	141	(34.1%)
Other	21	(5.1%)
No barriers encountered	14	(3.4%)
I don't know	121	(29.3%)

Which other factors do you think may limit the generalised use of electronic public procurement? Please tick the appropriate box(es).

		%
Different rules in Member States	248	(60%)
Lack of information on how electronic tendering works	193	(46.7%)
Complex rules in tendering procedures	212	(51.3%)
Unsatisfactory rules on the security of data transmission	121	(29.3%)
Lack of trust in electronic tools	118	(28.6%)
Risks involved in doing business electronically	104	(25.2%)
Fear of corrupt practices	131	(31.7%)
Other	16	(3.9%)
None of the above	15	(3.6%)
I don't know	20	(4.8%)

Are you aware that the recently adopted European Directives on public procurement introduce, for the first time, the use of electronic means in public procurement?

		%
Yes	221	(53.5%)
No	145	(35.1%)
I don't know	47	(11.4%)

Do you believe that the new rules on the use of electronic means in public procurement will resolve the concerns you mentioned earlier?

		%
Yes	48	(11.6%)
No	62	(15%)
I don't know	102	(24.7%)

In which fields do you think the European Commission should further undertake action in order to resolve the concerns you mentioned earlier? Please tick the appropriate box(es).

		%
Environment for secure transactions	142	(34.4%)
Standardisation of forms and documents	278	(67.3%)
Remove obstacles to crossborder transactions	127	(30.8%)
Interoperability between electronic procurement systems	167	(40.4%)
Standardisation of electronic tools	194	(47%)
Modernisation of the legal environment	182	(44.1%)

a. The use of electronic means in public procurement makes the process:

		%
less transparent	42	(10.2%)
more or less the same	162	(39.2%)
more transparent	175	(42.4%)
No opinion	34	(8.2%)

b. Electronic means in public procurement provides:

		%
less security	57	(13.8%)
more or less the same	218	(52.8%)
more security	86	(20.8%)
No opinion	52	(12.6%)

c. The use of electronic means in public procurement:

		%
increases transaction costs	27	(6.5%)
more or less the same	82	(19.9%)
decreases transaction costs	266	(64.4%)
No opinion	38	(9.2%)

d. Using electronic means in public procurement makes the process:

		%
slower	9	(2.2%)
more or less the same	86	(20.8%)
faster	287	(69.5%)
No opinion	31	(7.5%)

e. The use of electronic means in public procurement makes it:

		%
harder to find information	26	(6.3%)
more or less the same	58	(14%)
easier to find information	300	(72.6%)
No opinion	29	(7%)

f. Using electronic means in public procurement will help:

		%
competition to increase	215	(52.1%)
more or less the same	136	(32.9%)
competition to decrease	25	(6.1%)
No opinion	37	(9%)

g. Using electronic means in public procurement creates:

		%
less business opportunities within the Internal Market	30	(7.3%)
more or less the same	131	(31.7%)
more business opportunities within the Internal Market	205	(49.6%)
No opinion	47	(11.4%)

h. Using electronic meas in public procurement:

		%
makes international co-operation more difficult	1	(0.2%)
more or less the same	33	(8%)
enhances international co-operation	77	(18.6%)
No opinion	10	(2.4%)

i. L'utilisation de moyens électroniques pour les marchés publics:

		%
limits access to new markets	22	(5.3%)
more or less the same	88	(21.3%)
allows easier access to new markets	272	(65.9%)
No opinion	31	(7.5%)

Section 4.2

How advanced is your country in the move from paper based means to electronic means in the area of public procurement?

		%
Procedures are all based on paper based means	56	(13.6%)
Electronic means are starting to be used in public procurement	262	(63.4%)
Electronic means are generally used in public procurement	35	(8.5%)
Procedures are all based on electronic means	3	(0.7%)
I don't know	57	(13.8%)

In what way do you think that electronic means should be introduced in public procurement within the EU?

		%
Immediately	128	(31%)
Progressively	246	(59.6%)
Maybe in 5 years..	12	(2.9%)
Never	8	(1.9%)
No opinion	19	(4.6%)

In which sectors do you think that the use of electronic means in public procurement will create most opportunities?

		%
Manufacturing	96	(23.2%)
Services	250	(60.5%)
Construction	103	(24.9%)
Trade	186	(45%)
No opinion	74	(17.9%)

In your opinion, how will a generalised use of electronic means in public procurement impact on SME's?

		%
SME's will have more opportunities to penetrate new markets	206	(49.9%)
The increase of competition will squeeze SME's margins	129	(31.2%)
SME's risk loosing long-term business relationships	116	(28.1%)
SME's are outcompeted by larger companies	89	(21.5%)
SME's will have lower bidding costs	151	(36.6%)
Other	10	(2.4%)
None of the above	12	(2.9%)
I don't know	67	(16.2%)

IP/04/1095

Brussels, 13th September 2004

Public procurement: Commission consults on how Europe can make the most of electronic procurement

The European Commission has launched an on-line consultation aimed at identifying opportunities and challenges in electronic public procurement. This is part of the process of drawing up an Action Plan to help make sure Europe's economy gets the maximum possible benefit from the implementation of the new provisions on electronic public procurement included in the legislative package of procurement Directives adopted in February 2004 (see IP/04/150) The deadline for responses is 15 October. Public procurement is a key sector of the EU economy accounting for about 16% of GDP. Modernising and opening up procurement markets across borders – including through the expansion of electronic procurement - is crucial to Europe's competitiveness and for creating new opportunities for EU businesses.

Internal Market Commissioner Frits Bolkestein said: "I ask all businesses with an interest in public procurement to respond to this consultation. Well organised electronic procurement can improve the business environment, save businesses' and contracting authorities' time and taxpayers' money and help Europe to meet the Lisbon objectives. We want to know about the views and experiences of those at the sharp end – the businesses which tender for public contracts - so that we can make sure the new Directives are implemented in a way that releases the full potential of electronic procurement."

The European Commission has identified electronic public procurement as an area where large gains can be achieved and encourages the use of electronic means. Using information technology appropriately can contribute to reducing costs, improving efficiency and removing barriers to trade, which will ultimately result in savings for taxpayers. The Directives adopted in February 2004 as part of the legislative package to modernise public procurement provide a legal framework aimed at boosting the development and use of electronic procurement.

The Commission intends to issue an Action Plan in order to help Member States to remove obstacles to electronic public procurement, increase efficiency and modernise public procurement markets. As part of its preparations, the Commission needs input from businesses on existing barriers, expectations and challenges in electronic procurement. For example: what are businesses' experiences of and views on searching online for tender opportunities, using electronic marketplaces, online access to tender documents and on the electronic submission and signature of offers?

The Commission invites all interested businesses and business organisations to respond to its survey. By using its Interactive Policy Making (IPM) consultation tool for this exercise the Commission is making it as easy and time efficient as it possibly can.

Stakeholders will find a presentation and links to the consultation questionnaire on the Commission's Your Voice in Europe site -
http://europa.eu.int/yourvoice/consultations -
a recently re-launched one-stop shop giving access to Commission consultations and their results across all policy areas.
For general information on EU policy and legislation on public procurement, please visit the Commission's Europa web site at:

http://www.europa.eu.int/comm/internal_market/publicprocurement/index_en.htm

Software simulators for eProcurement

Learning demonstrators – January 2005 (EN)

The objective of the learning demonstrators is to help software editors and contracting authorities in Europe to develop eProcurement systems in line with the EU legislative framework. The demonstrators show also the application of the Functional Requirements.

Two set of demonstrators have been developed:
- Static demonstrators. They are web pages with fixed scenarios to show a possible implementation of a compliant eProcurement system. They can be used on-line in this web site or downloaded and installed.
- Dynamic demonstrators. Software application with more flexible features than the static demonstrators to allow the experimentation in more real conditions. In order to be used they have to be downloaded and installed.

Download the supporting documents for the demonstrators

IDA eProcurement Workshop May 2004

The IDA eProcurement Workshop 'Paving the way for European Interoperability' took place in Brussels on May 11, 2004. The IDA Unit would like to thank the 140 workshop attendees for helping to make the day a success.

Paving the way for European Interoperability
An IDA eProcurement Workshop, May 11 2004

Representatives from the public and private sectors gathered for **IDA's eProcurement Workshop** in Brussels on May 11th to discuss past accomplishments and identify priorities for potential eProcurement actions in view of the Commission's eProcurement Action Plan.

The workshop focused on issues of interoperability and compliance that are central to the further development of eProcurement in Europe and shed light on experience gained from existing initiatives. The European Commission, and in particular representatives from the IDA Unit, DG Internal Market and DG Information Society, provided an introduction to interoperability issues and invited the Member States to disseminate examples and solutions in the afternoon session. In addition, Internet connections were made available during lunch and the afternoon coffee break for participants to conduct demonstrations.

For more information about the structure of the workshop, please see the Workshop Programme. The Workshop Presentations and Proceedings have also been made available below.

NEWS

25-FEB-05
The African Development Bank and the Nordic Development Fund have been included in joint website for e-GP.

25-FEB-05
The draft of the new

Welcome to the Multilateral Development Banks e-GP Website

Electronic Government Procurement (e-GP) solutions have been proven to produce transparency and significant savings for those countries able to implement them successfully.

e-GP is a very effective tool in the fight against corruption, the promotion of integration and the stimulation of greater productivity not only at government level, but also in small and medium enterprises.

At the beginning of 2003, an e-GP working group was created under the Multilateral Development Banks (MDBs) Procurement Harmonization Process.Since then, the Asian Development Bank, the Inter-American Development Bank, and the World Bank have achieved a very high degree of harmonization in their approach to providing technical advice and support to their member countries in developing their e-GP strategies and solutions.

This website provides a single entry point to all the information developed and all the tools created under the e-GP Working Group.

We hope this resources serve you to plan your strategy and achieve the benefits that e-GP puts at hand.

Regards,

The e-GP Working Group.

Public Procurement

Public Procurement Revision of the directives on review procedures

Revision of the Public Procurement Remedies Directives

- **Overview**
- **Public Consultations**
  - with companies, lawyers, professional associations and non-governmental organisations
  - with contracting authorities
  - European Business Test Panel Questionnaire
- **Background documents**

Overview

Legal and practical problems businesses and lawyers may be encountered when using national review procedures to challenge decisions made by public authorities awarding contracts. The aim of the revision of the Public Procurement Remedies Directives in 2004 is to make progresses in some areas. Providing clear and effective procedures for seeking redress in cases where bidders consider contracts have been unfairly awarded is crucial to making sure contracts ultimately go to the company which has made the best offer, and therefore to building confidence among businesses and the public that public procurement procedures are fair. EU law on public procurement aims to increase competition and transparency in order to create opportunities for businesses, better value and higher quality services for the taxpayer.

Public Consultations

With companies, lawyers, professional associations and non-governmental organisations

The European Commission has launched an eight-week Internet consultation on the legal and practical problems businesses and lawyers may encounter when using national review procedures to challenge decisions made by public authorities awarding contracts. The consultation uses three separate on-line questionnaires aimed at different target groups.

- Press release
- On-line consultation Closed (29.2.2004)
- Results of the consultations
  - of economic operators

- ○ of lawyers
- ○ of professional associations and non-governmental organisations

With contracting authorities

Consultation with the contracting authorities prior to revision of the "remedies" Directives in the field of public procurement - Closed (14.4.2004)

COMMISSION LAUNCHES CONSULTATIONS WITH INTERESTED CIRCLES ON OPERATION OF NATIONAL REVIEW PROCEDURES IN PUBLIC PROCUREMENT FIELD

IPM INTERACTIVE POLICY MAKING

So as to be able to evaluate the operation of national review procedures in the field of public procurement since the entry into force of the Directives concerned (**89/665/CEE** and **92/13/CEE**), the Commission is launching three on-line consultations in the eleven official languages of the European Union with the aim of gathering information from tenderers and their representatives.

These three on-line consultations will be accessible through the Commission portal **http://europa.eu.int/yourvoice** from 22.10.03 until 29.02.04.

The first on-line questionnaire is directed at companies which have tendered for public-procurement contracts in their Member State of origin or in other Member States and which, after encountering difficulties in the public contract award process, have considered initiating or actually have initiated review proceedings.
- **Questionnaire**

The second questionnaire for completion on-line is aimed at professional associations and non-governmental organisations representing the interests of economic operators established in the European Union and engaged in one or more sectors of activity. These associations and organisations are invited to complete a questionnaire for each Member State concerning which they are able to supply information.
- **Questionnaire**

The third on-line questionnaire is targeted at lawyers who, acting for their clients, have gained experience of national review procedures in the field of public procurement in one or more of the 15 Member States.
- **Questionnaire**

You should fill in just one of the three questionnaires, according to the category of interested party to which you belong. However, professional associations and non-governmental organisations should complete a separate questionnaire for each Member State concerning which they wish to provide comments on review procedures.

Filling in the companies' questionnaire will not take more than 15 minutes, and will enable you to make a concrete contribution towards improving Community legislation on reviews concerning public contract award procedures.

In the light of the results of these consultations, which will make it possible to take initial stock of the application of the "review" Directives, the Commission could present, in the second half of 2004, a proposal for an amending Directive aimed at improving the application of Community legislation on public procurement by clarifying and/or bolstering existing provisions.

If you would like to help promote this on-line consultation exercise, please include a link on your webpages.

This consultation is subject to a **Data Privacy Statement**.

IP/03/1455

Brussels, 27th October 2003

Public procurement: Commission consults on how rejected bidders can challenge decisions

The European Commission has launched an eight-week Internet consultation on the legal and practical problems businesses and lawyers may encounter when using national review procedures to challenge decisions made by public authorities awarding contracts. The consultation uses three separate on-line questionnaires aimed at different target groups. The aim is to assess what has been achieved so far in the operation of national review procedures and in which areas further progress is still needed, with a view to revision of the Public Procurement Remedies Directives in 2004. Providing clear and effective procedures for seeking redress in cases where bidders consider contracts have been unfairly awarded is crucial to making sure contracts ultimately go to the company which has made the best offer, and therefore to building confidence among businesses and the public that public procurement procedures are fair. EU law on public procurement aims to increase competition and transparency in order to create opportunities for businesses, better value and higher quality services for the taxpayer. Public procurement accounts for some 16% of EU GDP.

Internal Market Commissioner Frits Bolkestein said: "I would urge all businesses, associations and lawyers with an interest in public procurement to respond to this consultation. Both the strategy agreed by the March 2000 Lisbon European Council to make Europe more competitive and the Commission's Internal Market Strategy lay great stress on expanding cross-border public procurement opportunities and this consultation is a key part of that. We can only know where things are going wrong, and where necessary take measures to put them right, if those on the front line tell us about their experiences."

By using the Commission's Interactive Policy Making consultation tool for this exercise, and by providing specific sets of questions for each group of stakeholders, the Commission is making it as easy and time efficient as it possibly can for them to respond. The first on-line questionnaire is intended for enterprises which have tendered for public contracts and have faced difficulties in bringing legal actions against public authorities on the basis of the Remedies Directives. The second questionnaire is intended for business associations and non-governmental organisations representing the interests of tenderers. The third questionnaire is intended for lawyers who have experience of national review procedures.

This consultation is open to these three categories of stakeholders until 15 December 2003. The results will be taken into account in the revision of the Remedies Directives, which is scheduled to take place in the second half of 2004.

Business associations, chambers of commerce, Bar Associations and Law Societies and other interested parties are invited to reply to the relevant questionnaire and to inform their members about the consultation.

All replies to the questionnaires will be taken into account, in assessing what has been achieved so far in the operation of national review procedures and in which areas further progress is still needed to improve the effectiveness of remedies and therefore to improve the practical application of EU public procurement law in all Member States.

Stakeholders will find a presentation and links to the three questionnaires at:

http://europa.eu.int/yourvoice/consultations

The quick and user-friendly questionnaires use the Commission's Interactive Policy Making (IPM) tool (see IP/01/519), which aims to improve governance by using the Internet for collecting and analysing reactions.

The results will be published in March 2004 on the Commission's "Your Voice in Europe" Internet site

http://europa.eu.int/yourvoice/consultations

which is a recently relaunched one-stop shop giving access to Commission consultations and their results across all policy areas. The statistical reports on responses will be available by January 2004. More detailed qualitative analyses of the results will be available on the same site in May 2004.

The current Remedies Directives (89/665/EEC as amended by 92/50/EEC in the case of supplies, works and services and 92/13/EEC in the case of the water, energy, transport and telecommunications sectors) require Member States to ensure that review procedures are available at least to any person having or having had an interest in obtaining a given public contract and having been or likely to be injured by an alleged infringement. Decisions of the contracting authorities which are in breach of the law must be subject to effective and rapid remedies through courts and/or administrative bodies. In all Member States, such remedies must include, in particular, the possibility of taking interim measures (such as suspension of the award procedure in question), the setting aside of unlawful decisions and discriminatory technical, economic and financial specifications in the invitation to tender, and the compensation of injured parties.

II. Experience in the field of public procurement

Total Responses : 44 on 44

On average, how many public contracts a year does your company bid for in the Member State in which it is established? compulsory

more than 80	16
between 6 and 15	9
between 16 and 30	6
between 51 and 80	5
between 31 and 50	4
fewer than 5	3
don't know	1

Of this average, what percentage of public contracts exceeded the Community value thresholds laid down in the directives on public contracts (Directives 93/36/EEC, 93/37/EEC, 92/50/EEC, as amended by Directive 97/52/EC, and Directive 93/38/EEC, as amended by Directive 98/4/EC)? compulsory

more than 40 %	15
between 0 and 5 %	10
don't know	8
between 11 and 15 %	3

between 6 and 10 %	2
between 31 and 35 %	2
between 36 and 40 %	2
between 16 and 20 %	1
between 26 and 30 %	1
between 21 and 25 %	0

The requirement to provide the contracting authority with prior information

Total Responses : 44 on 44

This procedure allowed a settlement to be made in a dispute which you had with the contracting authority concerning the correctness of the award procedure, without recourse to litigation compulsory

not applicable	13
in a minority of cases	11
in no cases	9
in the majority of cases	5
don't know	5
in all cases	1

This procedure did not affect your entitlement to an effective pre-contractual review compulsory

not applicable	14
in all cases	8
in the majority of cases	7
in a minority of cases	6
in no cases	5
don't know	4

This procedure allowed the contracting authority to prevent an effective review before the contract was signed because of a "race to sign the contract" incentive effect compulsory

not applicable	14

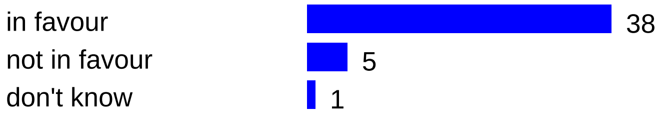
in no cases	7
in a minority of cases	6
in all cases	1

New prerogatives concerning reviews in the general interest

Total Responses : 44 on 44

Are you in favour of a provision in national legislations for a national authority (already in existence or to be set up, but independent of the contracting authority) to have the power to bring matters before the court or the body specialised in review procedures, where an infringement of Community law on public procurement has been detected? Such a referral by this national

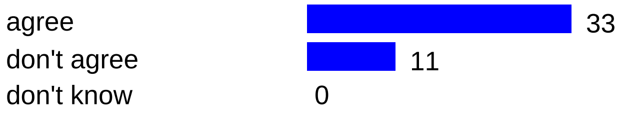
authority acting in the general interest could be made with the particular aim of having provisional measures applied, illegal decisions set aside or sanctions imposed which are effective, proportionate and have a deterrent effect (in the form of financial penalties). compulsory



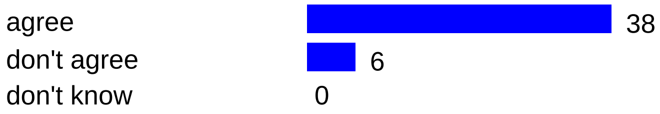
Advantages

Total Responses : 44 on 44

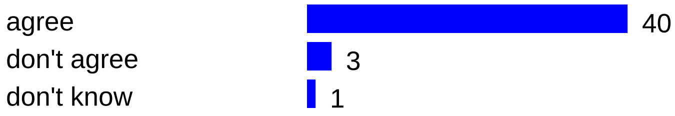
This authority (whatever its status in national law) could play a useful role for those persons who do not have a sufficient interest in acting and who could report to this authority infringements of Community law on public procurement detected by a contracting authority compulsory



This authority (whatever its status in national law) could play a useful role in the event of infringements which are difficult to detect by potential bidders (for example, the conclusion of a contract by direct agreement without publication of a notice in the Official Journal of the European Union) compulsory



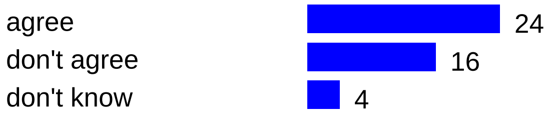
This authority (whatever its status in national law) could play a useful role in the event of repeated infringements by a contracting authority of Community law on public procurement or of serious infringements of Community law on public procurement (particularly where the contracting authority has intentionally violated such rules) compulsory



Disadvantages

Total Responses : 44 on 44

Risk of multiplying the number of review procedures, thereby impeding the carrying out of public contracts, to the detriment of successful bidders in particular compulsory



The complainant is not familiar with the procedure employed by the authority compulsory

agree	18
don't agree	13
don't know	13

The fear that decisions by this authority to institute or not institute proceedings in the general interest might be made on a discretionary basis compulsory

agree	20
don't agree	18
don't know	6

The brief period between the notification of an award decision and the signing of the contract

Total Responses : 44 on 44

Has your company already been faced with the situation of being deprived of the possibility of seeking a review to have interim measures taken (such as the suspension of the award procedure) and to have illegal decisions set aside, on the grounds that the contract had been signed, this without your having been notified previously by the contracting authority of the decision regarding the award of the contract and the rejection of your bid? (only one answer possible) compulsory

never	22
rarely	10
often	10
systematically	2

If you consider that a specific clause should be inserted in a directive, how long do you think the minimum period should be between the notification of an award decision and the signing of the contract, in order to strike a balance between the need to guarantee the effectiveness of the review and the concern not to unnecessarily delay the carrying out of public contracts? compulsory

between 15 and 30 calendar days	20
between 11 and 14 calendar days	17
10 calendar days	6
less than 10 calendar days	1
don't know	0

Taking into account your answer to the previous question, do you think there is a need for a shortened period in the case of accelerated procedures, due to a possible urgent need to sign the contract? compulsory

yes	22

no	20
don't know	2

What do you think this shortened period should be? field optional

10 calendar days	8
5 calendar days	5
8 calendar days	3
3 calendar days	1
don't know	1

The speed of applications for an interim order

Total Responses : 44 on 44

How do you assess the speed of applications for an interim order relating to award procedures for public contracts? compulsory

positive	26
negative	15
very negative	2
excellent	1

How long, on average, does it take to obtain an interim order in the case of reviews concerning public contract award procedures? compulsory

don't know	15
between 11 and 20 days	9
between 21 and 30 days	8
10 days or less	5
over 90 days	3
between 31 and 60 days	2
between 61 and 90 days	2

The suspensive effect of pre-contractual reviews

Total Responses : 44 on 44

If your national legal system does not provide for a review to have an automatic suspensive effect on the contract award procedure to which it refers, in the majority of cases involving your company, were the reasons for the court or the special review body refusing the suspension of the procedure based on: (several answers possible) compulsory

the consideration of the probable consequences of the suspensive measure on the public interest?	13
the consideration of the probable consequences of the suspensive measure on other interests which might suffer?	12

not applicable	11
procedural reasons?	9
don't know	9
other reason(s)	2

Do you think that a directive should provide for an automatic suspensive effect? compulsory

yes	22
no	18
don't know	4

What do you think would be a reasonable period of suspension? field optional

between 11 and 15 calendar days	8
between 21 and 25 calendar days	4
between 16 and 20 calendar days	3
more than 25 calendar days	3
don't know	2
10 calendar days or less	1

Why do you think that the directive should not provide for an automatic suspensive effect? field optional

This would result in an increase in dilatory and/or vexatious reviews and would unduly delay the carrying out of public contracts, to the detriment of the successful bidders and/or the public interest	12
An automatic suspension would be particularly detrimental to the successful bidder and/or the public interest where the review is manifestly inadmissible or unfounded	10
don't know	1
for other reasons (give details)	0

Claims for damages

Total Responses : 44 on 44

Have you already brought actions seeking damages? (only one possible answer) compulsory

never	26
sometimes	15
often	3

Why have you never brought actions seeking damages? (several answers possible) field optional

The high cost of court proceedings for damages, which is disproportionate to the actual amount of damages expected	12
The difficulty in proving that the company had good or very good chances of winning the contract	11
The fear of not being treated fairly in the event of future contract procedures	11
The low amount of damages awarded by the judicial or quasi-judicial authority	3
The obligation under your national legal system to obtain beforehand the annulment or the declaration of illegality of the contested decision made by the contracting authority	2
don't know	2
other reason (give details)	1

If you have occasionally or frequently brought actions seeking damages, have these actions been a success? field optional

partial success	8
total failure	8
total success	1

Why have these actions not been a total success? (several answers possible) field optional

The difficulty in proving that the company had good or very good chances of winning the contract	8
The fear of not being treated fairly in the event of future procurement procedures	8

The high cost of court proceedings for damages, which is disproportionate to the actual amount of damages expected	5
The obligation under your national legal system to obtain beforehand the annulment or the declaration of illegality of the contested decision made by the contracting authority	4
The low amount of damages awarded by the judicial or quasi-judicial authority	2
don't know	2
not applicable	2
other reason (give details)	2

The "remedies" directives authorise the Member States to limit claims for damages once the contract has been signed If your legal system provides for this limitation, are you satisfied with this system? compulsory

not applicable	22
no	16
yes	6

Please give your assessment of the possible advantages in limiting claims for damages once the contract has been signed Calling into question a signed contract would be contrary to the public interest and to the successful contractor because it would incur costs for interrupting or suspending the contract which are disproportionate to the interests of the bidder bringing the claim field optional

don't agree	17
agree	16
don't know	10

Reasons for dissatisfaction

Total Responses : 44 on 44

The chances of success of a claim for damages are more limited than those of a claim for suspension / annulment field optional

agree	9
don't know	4
don't agree	0

The amount of damages awarded is insufficient to offset the

damage suffered by the company and to cover the legal costs incurred field optional

agree	11
don't agree	1
don't know	0

The possibility of suspending or annulling an award procedure when the latter offers the possibility of obtaining the annulment or cancellation of the concluded contract would encourage contracting authorities to respect the Community law on public procurement field optional

agree	11
don't know	2
don't agree	0

Special sectors: a sanction consisting of the payment of a sufficiently large sum

Total Responses : 44 on 44

In the special sectors (water, energy, transport and telecommunications), some Member States have included the possibility of providing for the payment of a sufficiently large sum (a "fine"), as a protective measure and/or sanction, instead of the imposition of provisional measures and the annulment of illegal decisions If you have brought actions in those Member States which have opted for such a mechanism in the special sectors, have you found this mechanism to be (only one answer possible): compulsory

not applicable	21
don't know	15
impossible to answer because the number of reviews employing this mechanism is insignificant and/or your company has never had occasion to put it into practice	4
totally ineffective compared with the mechanism of imposing provisional measures and the annulment of illegal decisions?	2
as effective as the mechanism of imposing provisional measures and the annulment of illegal decisions?	1
less effective?	1

IV. Cross-border reviews

Total Responses : 44 on 44

Have you already attempted to seek a review in a Member State, other than the one in which your company is established, when

your company has bid for a contract being awarded by a contracting authority in this other Member State? compulsory

no	41
yes	3

What are the reasons your company has never sought a review in a Member State, other than the one in which it is established? (several answers possible) field optional

Your company has never bid for a contract being awarded by a contracting authority in another Member State	19
Your company did not have confidence in the national appeal procedures of the contracting authority's Member State, particularly regarding the impartial handling of your company's appeal	8
Your company did not possess sufficient knowledge of the national appeal procedures of the contracting authority's Member State	6
Your company had doubts regarding the effectiveness of the national appeal procedures of the contracting authority's Member State	3
don't know	3
other reason (give details)	1

In which Member State(s), other than the one in which your company is established, have you sought a review regarding public procurement? field optional

ES - Spain	2
DA - Denmark	1
AT - Austria	0
BE - Belgium	0
DE - Germany	0
EL - Greece	0

Your company was dissuaded or found it impossible to seek one or more reviews	0
Your company was completely successful as regards its initial demands	0
Your company was partially successful as regards its initial demands	0
Your company was completely or partially successful but was not able to win the contract whose award procedure was contested	0
Your company was completely or partially successful but was not able to win subsequent contracts awarded by the same contracting authority	0
Your company did not obtain what you consider it was entitled to	0

Why was your company dissuaded or found it impossible to seek one or more reviews in this Member State? field optional

Because of the high cost of the procedure (including lawyer's fees)	0
Because the contracting authority concluded a contract by direct agreement without publishing a notice, thus depriving your company of the possibility of knowing in time of the existence and/or the content of the contract which was likely to be contested	0
Because you were not confident that your company's appeal would be handled impartially	0
Because you were not confident that the national appeal procedures were effective	0
Because of the considerable length of time elapsing between the presentation of the appeal and the delivery of the judgment	0

Because of the concern that your company would be at a disadvantage in the event of future public procurement procedures from the same contracting authority	0
Because of the ineffectiveness in national law of a review which was sought after the contract had been signed	0
don't know	0
other reason (give details)	0

Why didn't your company obtain what you consider it was entitled to? field optional

The contract was signed before review was sought	0
The contract was signed after review was sought but before the body responsible for the review delivered judgment	0
The body responsible for the review considered that your company did not possess a sufficient interest in acting	0
The body responsible for the review refused to annul the decisions of the contracting authority which you considered illegal	0
The amount of damages awarded was insignificant compared with the damage which you believed you had suffered	0
The contracting authority was not found to be responsible because of the difficulty in proving a causal link between the illegality of the award procedure and the damage suffered by your company	0
don't know	0
other reason(s) (give details)	0

How would you rate the speed of applications for an interim order

in this Member State? field optional

excellent	0

Revision of the directives on review procedures in the field of public procurement

Lawyers

I. Information about the law firm (Background information)

Total Responses : 57 on 57

Which Member State's law does your firm practise compulsory

DE - Germany	17
BE - Belgium	8
FR - France	8
UK - United Kingdom	5
IT - Italy	4
PT - Portugal	4
AT - Austria	3
SV - Sweden	3
ES - Spain	2
FI - Finland	1
LU - Luxembourg	1
NL - Netherlands	1
DA - Denmark	0
EL - Greece	0
IE - Ireland	0

II. Experience in reviews concerning public contract award procedures

Total Responses : 57 on 57

On average, how many reviews concerning public contract award procedures does your firm deal with per year in the Member State whose law it practises? compulsory

between 6 and 15	22
fewer than 5	14
between 16 and 30	10
more than 30	10
don't know	1

Of this average, what percentage of reviews concerning public contract award procedures public contracts exceeded the Community value thresholds laid down in the directives on public

contracts (Directives 93/36/EEC, 93/37/EEC, 92/50/EEC, as amended by Directive 97/52/EC, and Directive 93/38/EEC, as amended by Directive 98/4/EC)? compulsory

more than 40 %	46
between 0 and 5 %	4
between 36 and 40 %	2
between 11 and 15 %	1
between 21 and 25 %	1
between 26 and 30 %	1
between 31 and 35 %	1
don't know	1
between 6 and 10 %	0
between 16 and 20 %	0

The requirement to provide the contracting authority with prior information

Total Responses : 57 on 57

This procedure allowed a settlement to be made in a dispute which you had with the contracting authority concerning the correctness of the award procedure, without recourse to litigation compulsory

not applicable	22
in no cases	17
in a minority of cases	13
in the majority of cases	4
don't know	1
in all cases	0

This procedure did not affect your entitlement to an effective pre-contractual review compulsory

not applicable	23
in no cases	11
in a minority of cases	8
in all cases	6
in the majority of cases	6
don't know	3

This procedure allowed the contracting authority to prevent an effective review before the contract was signed because of a "race to sign the contract" incentive effect compulsory

not applicable	23
in a minority of cases	12
in no cases	12

in the majority of cases	5
don't know	3
in all cases	2

Interest in acting and injured rights of bidders

Total Responses : 57 on 57

Has your firm already been presented with one of these grounds for inadmissibility? compulsory

no	36
yes	19
don't know	2

Among the two grounds for inadmissibility mentioned above, a lack of interest in obtaining a contract has been cited: field optional

in a minority of cases	9
in the majority of cases	5
in no cases	4
in all cases	0

Among the two grounds for inadmissibility mentioned above, the fact of not having been victims or not risking being victims of an alleged infringement has been cited: field optional

in a minority of cases	10
in the majority of cases	5
in no cases	2
in all cases	1

Have one or more of your requests for review been declared inadmissible when they involved a contract awarded without prior notice or call for competition? compulsory

no	50
yes	7

In one or more of the cases in which your requests for review have been declared inadmissible when they involved a contract awarded without prior notice or call for competition, were the grounds based on (several answers possible): field optional

other reason (give details)	3
the fact that because your client did not produce an expression of interest in obtaining the contested contract, he was not interested in acting?	2
the lack of evidence demonstrating an interest in acting?	1

Please indicate why the reviews sought by your firm have never been declared inadmissible field optional

The body responsible for review procedures has always declared admissible your requests for review	21
You have never attempted to seek such a review	18
don't know	4

New prerogatives concerning reviews in the general interest

Total Responses : 57 on 57

Are you in favour of a provision in national legislations for a national authority (already in existence or to be set up, but independent of the contracting authority) to have the power to bring matters before the court or the body specialised in review procedures, where an infringement of Community law on public procurement has been detected? Such a referral by this national authority acting in the general interest could be made with the particular aim of having provisional measures applied, illegal decisions set aside or sanctions imposed which are effective, proportionate and have a deterrent effect (in the form of financial penalties). compulsory

in favour	35
not in favour	20
don't know	2

Advantages

Total Responses : 57 on 57

This authority (whatever its status in national law) could play a useful role for those persons who do not have a sufficient interest in acting and who could report to this authority infringements of Community law on public procurement detected by a contracting

authority compulsory

agree	37
don't agree	19
don't know	1

This authority (whatever its status in national law) could play a useful role in the event of infringements which are difficult to detect by potential bidders (for example, the conclusion of a contract by direct agreement without publication of a notice in the Official Journal of the European Union) compulsory

agree	39
don't agree	12
don't know	6

This authority (whatever its status in national law) could play a useful role in the event of repeated infringements by a contracting authority of Community law on public procurement or of serious infringements of Community law on public procurement (particularly where the contracting authority has intentionally violated such rules) compulsory

Administrative authorities which have powers of mediation/conciliation

Total Responses : 57 on 57

If, in the Member State in question, administrative authorities specialising in public procurement have been set up with powers to mediate/conciliate with the contracting authorities, have you had occasion to call on them to amicably resolve a dispute which your clients had with the contracting authority? compulsory

not applicable	22
no	18
yes	13
no opinion	4

How do you rate the effectiveness of these administrative authorities which have powers of mediation/conciliation? field optional

average	6
unsatisfactory	3
good	2
excellent	1

What advantages/disadvantages did you discover when you had occasion to call on such authorities? field optional

low cost of the procedure	9
a pragmatic solution resulting in a good compromise, in the interests of both the injured bidder and the contracting authority, without jeopardising the basic principles of Community law on public procurement	6
a swift process	5
the fact that decisions made by this type of authority are not of a	

binding nature does not encourage the contracting authorities to follow its recommendations, particularly in the case of politically sensitive issues	5
This system has not resulted in a resolution of most of the cases you have brought and in fact has led to a delay in settling disputes because it has been necessary to appeal to the body responsible for review procedures	4
the fact that these administrative authorities were not sufficiently independent of the contracting authority meant that satisfactory compromise solutions could not be found for the different interests in play	3
does not have a suspensive effect on review deadlines	3
a slow process	2

Why haven't you called on the specialised administrative authorities which have powers of mediation/conciliation? field optional

the fact that decisions made by this type of authority are not of a binding nature does not encourage the contracting authorities to follow its recommendations, particularly in the case of politically sensitive issues	8
does not have a suspensive effect on review deadlines	8
This system has not resulted in a resolution of most of the cases you have brought and in fact has led to a delay in settling disputes because it has been necessary to appeal to	5

the body responsible for review procedures	
other reason (give details)	4
the fact that these administrative authorities are not sufficiently independent of the contracting authority meant that satisfactory compromise solutions could not be found for the different interests in play	3

Advantages and disadvantages of judicial and non-judicial bodies

Total Responses : 57 on 57

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is an administrative authority without the status of a court, what disadvantages have you noted?

compulsory

not applicable	35
the administrative authority arrives at decisions rapidly but these are often contested and must therefore be referred to a higher level for review, thus slowing down the process for arriving at a useful decision	12
the administrative authority is not independent and may be inclined to make decisions of a political nature which have no legal basis	9
other reason(s) (give details)	8
the administrative authority does not scrupulously apply the adversarial principle	6
the administrative authority is not sufficiently competent in public procurement matters	3
the administrative authority does not arrive at decisions rapidly	2

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is an administrative authority without the status of a court, what advantages have you noted? (several answers possible) compulsory

not applicable	34
the review is handled rapidly	15
the authority is specialised	10
the costs of the procedure (including lawyer's fees) are not high	7
the review is handled impartially, respecting the adversarial principle	4
other reason(s) (give details)	2

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is a court, what disadvantages have you noted? (several answers possible) compulsory

the body is the ordinary court and not specialised in public procurement matters	21
a slow process	16
the costs of the procedure (including lawyer's fees) are too high	13
not applicable	13
other reason(s) (give details)	10
is influenced by considerations which are not of a strict legal nature	9
does not respect the adversarial principle	4
partiality	4
don't know	4

Please indicate the average time taken to handle the review field optional

between 20 days and 2 months	2
more than a year	1

between 2 and 6 months	0
between 6 months and a year	0

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is a court, what advantages have you noted? (several answers possible) compulsory

the review is handled impartially, respecting the adversarial principle	32
the review is handled rapidly	19
one or more specialised chambers or courts have been set up	18
not applicable	10
the costs of proceedings (including lawyer's fees) are not high	4

The brief period between the notification of an award decision and the signing of the contract

Total Responses : 57 on 57

Have you already been faced with the situation of being deprived of the possibility of seeking a review to have interim measures taken (such as the suspension of the award procedure) and to have illegal decisions set aside, on the grounds that the contract had been signed, this without your client having received prior notification from the contracting authority of the decision regarding the award of the contract and the rejection of your bid? compulsory

never	28
rarely	13
often	11
systematically	5

Do you think that the only solution which will allow injured bidders to initiate a pre-contractual review is to stipulate, by means of an amending directive, a minimum period between the notification of an award decision and the actual conclusion of the contract? compulsory

yes	47
no	7
don't know	3

Why? field optional

there are other possible solutions which result in a useful review	5
The Alcatel Judgment of the Court of Justice (Case C-81/98), which interpreted the "remedies" directives currently in force, is sufficient to oblige Member States to provide for a minimum period in their legislation	1

If you consider that a specific clause should be inserted in a directive, how long do you think the minimum period should be between the notification of an award decision and the signing of the contract, in order to strike a balance between the need to guarantee the effectiveness of the review and the concern not to unnecessarily delay the carrying out of public contracts? compulsory

between 11 and 14 calendar days	21
between 15 and 30 calendar days	20
10 calendar days	12
don't know	4
less than 10 calendar days	0

Taking into account your answer to the previous question, do you think there is a need for a shortened period in the case of accelerated procedures, due to a possible urgent need to sign the contract? compulsory

yes	32
no	22
don't know	3

What do you think this shortened period should be? field optional

5 calendar days	13
10 calendar days	7
3 calendar days	4
8 calendar days	4
don't know	1

The speed of applications for an interim order

Total Responses : 57 on 57

How do you assess the speed of applications for an interim order relating to award procedures for public contracts in the Member State in question? compulsory

positive	39
negative	10
excellent	8
very negative	0

How long, on average, does it take to obtain an interim order in the case of reviews concerning public contract award procedures? compulsory

10 days or less	15
between 11 and 20 days	15
between 31 and 60 days	11
between 21 and 30 days	6
don't know	5
over 90 days	4
between 61 and 90 days	1

The suspensive effect of pre-contractual reviews

Total Responses : 57 on 57

If your national legal system does not provide for a review to have an automatic suspensive effect on the contract award procedure to which it refers, in the majority of cases involving you, were the reasons for the court or the special review body refusing the suspension of the procedure based on: (several answers possible) compulsory

the consideration of the probable consequences of the suspensive measure on the public interest?	22
not applicable	19
the consideration of the probable consequences of the suspensive measure on other interests which might suffer?	16
other reason(s)	10
a bar to proceedings by virtue of the signing of the contract	9
don't know	5

the time limit?	4
the incompetence of the judicial or quasi-judicial authority	4

Do you think that a directive should provide for an automatic suspensive effect? compulsory

yes	31
no	23
don't know	3

What do you think would be a reasonable period of suspension? field optional

more than 25 calendar days	10
between 11 and 15 calendar days	7
between 21 and 25 calendar days	4
10 calendar days or less	3
between 16 and 20 calendar days	3
don't know	3

Why do you think that the directive should not provide for an automatic suspensive effect? field optional

This would result in an increase in dilatory and/or vexatious reviews and would unduly delay the carrying out of public contracts, to the detriment of the successful bidders and/or the public interest	17
An automatic suspension would be particularly detrimental to the successful bidder and/or the public interest where the review is manifestly inadmissible or unfounded	17
don't know	0
for other reasons (give details)	0

Claims for damages

Total Responses : 57 on 57

Have you already brought actions seeking damages for an injury arising from an irregularity in a public contract award procedure? compulsory

sometimes	27
never	20
often	10

Why have you never brought actions seeking damages? (several answers possible) field optional

The difficulty in proving that the company had good or very good chances of winning the contract (proof of a causal link between the illegality of the award procedure and the damage suffered)	10
The high cost of court proceedings for damages, which is disproportionate to the actual amount of damages expected	10
The fear of not being treated fairly in the event of future procurement procedures	10
The obligation under your national legal system to obtain beforehand the annulment or the declaration of illegality of the contested decision made by the contracting authority	4
Other reason (give details)	4
The low amount of damages awarded by the judicial or quasi-judicial authority	3
don't know	2

If you have replied "sometimes" or "often", have these actions been a success? field optional

partial success	28

total failure	8
total success	0

If applicable, why have these actions not been a total success? (several answers possible) field optional

The difficulty in proving that the company had good or very good chances of winning the contract	32
The high cost of court proceedings for damages, which is disproportionate to the actual amount of damages expected	15
The fear of not being treated fairly in the event of future procurement procedures	12
The low amount of damages awarded by the judicial or quasi-judicial authority	11
The obligation under your national legal system to obtain beforehand the annulment or the declaration of illegality of the contested decision made by the contracting authority	7
Other reason (give details)	5
not applicable	3
don't know	0

The "remedies" directives authorise the Member States to limit claims for damages once the contract has been signed If your legal system provides for this limitation, are you satisfied with this system? compulsory

not applicable	27
yes	16
no	14

Please give your assessment of the possible advantages in limiting claims for damages once the contract has been signed field optional

Calling into question a signed contract would be contrary to the public interest and to the successful contractor because it would incur costs for interrupting or suspending the contract which are disproportionate to the interests of the bidder bringing the claim	10
other assessment (give details)	5
don't know	0

Reasons for dissatisfaction

Total Responses : 57 on 57

The chances of success of a claim for damages are more limited than those of a claim for suspension / annulment field optional

agree	13
don't agree	2
don't know	1

The amount of damages awarded is insufficient to offset the damage suffered by the company and to cover the legal costs incurred field optional

agree	10
don't agree	5
don't know	1

The possibility of suspending or annulling an award procedure when the latter offers the possibility of obtaining the annulment or cancellation of the concluded contract would encourage contracting authorities to respect the Community law on public procurement field optional

agree	14
don't agree	1
don't know	1

According to the state of the work carried out in connection with the contract, it may sometimes be proportionate to obtain the annulment or termination of the contract concluded, in view of the

serious nature of the offence field optional

don't know	1

Post-contractual reviews: what alternative is there to calling into question the signed contract?

Total Responses : 57 on 57

Do you think that another solution would be to limit the possibility of calling the contract into question to and for a reduced period (from one to six months), following the signing of the contract? compulsory

no	31
yes	26

Special sectors: a sanction consisting of the payment of a sufficiently large sum

Total Responses : 57 on 57

In the special sectors (water, energy, transport and telecommunications), some Member States have included the possibility of providing for the payment of a sufficiently large sum (a "fine"), as a protective measure and/or sanction, instead of the imposition of provisional measures and the annulment of illegal decisions If you have brought actions in those Member States which have opted for such a mechanism in the special sectors, have you found this mechanism to be (only one answer possible): compulsory

not applicable	41
don't know	11
impossible to answer because the number of reviews employing this mechanism is insignificant and/or your company has never had occasion to put it into practice	4
as effective as the mechanism of imposing provisional measures and the annulment of illegal decisions?	1
less effective	0
totally ineffective compared with the mechanism of imposing provisional measures and the annulment of illegal decisions?	0

Special sectors: attestation and conciliation

Total Responses : 57 on 57

In the special sectors (water, energy, transport and telecommunications), have you had experience of contracts awarded by contracting authorities which benefitted from an attestation stating at a given time that their public contract awarding procedures are in accordance with the Community law in this field and with the national rules transposing this law? compulsory

no	30
Not familiar with this mechanism	25
yes	2

If you have had experience of this attestation mechanism, has it been shown that those contracting authorities which benefitted from it committed fewer irregularities in contract awarding procedures than contracting authorities which did not benefit from it? field optional

don't know	1
not applicable	1
yes	0
no	0

In the special sectors, have you already requested the use of the conciliation mechanism provided for in Articles 9 to 11 of Directive 92/13/EEC ? compulsory

no	52
don't know	4
yes	1

IV. Cross-border reviews

Total Responses : 57 on 57

Have you already attempted, directly or through a local representative or through a foreign firm which is part of your network, to seek a review in a Member State, other than the one whose law your firm practises, when one of your clients has bid for a contract being awarded by a contracting authority in this other Member State? compulsory

no	45
yes	12

What are the reasons you have never attempted to seek, directly or indirectly, a review in a different Member State from the one in which you practise law? (several answers possible) field optional

You have never been given a case requiring a cross-border review	37
You do not possess sufficient knowledge of the national appeal procedures of the contracting authority's Member State	4
other reason(s) (give details)	3
You have doubts regarding the effectiveness of the national appeal procedures of the contracting authority's Member State	2
You do not have confidence in the national appeal procedures of the contracting authority's Member State, particularly regarding the impartial handling of your appeal	1
don't know	1

In which Member State(s), other than the one whose law you practise, have you sought a review regarding public procurement? field optional

How would you rate the effectiveness of the reviews which you sought in this Member State? field optional

excellent	0
positive	0
negative	0
very negative	0
don't know	0

Please indicate what situation your client found himself in in this Member State field optional

Your client was dissuaded or found it impossible to seek one or more reviews	0
Your client was completely successful as regards his initial demands	0
Your client was partially successful as regards his initial demands	0
Your client was completely or partially successful but was not able to win the contract whose award procedure was contested	0
Your client was completely or partially successful but was not able to win subsequent contracts awarded by the same contracting authority	0
Your client did not obtain what you consider he was entitled to	0

Why was your client dissuaded or found it impossible to seek one or more reviews in this Member State? field optional

Because of the high cost of the procedure (including lawyer's fees)	0
Because the contracting authority concluded a contract by direct agreement without publishing a notice, thus depriving your client of the possibility of knowing in time of the existence	0

and/or the content of the contract which was likely to be contested	
Because your client was not confident that his appeal would be handled impartially	0
Because your client was not confident that the national appeal procedures were effective	0
Because of the considerable length of time elapsing between the presentation of the appeal and the delivery of the judgment	0
Because of the concern that your client would be at a disadvantage in the event of future public procurement procedures from the same contracting authority	0
Because of the ineffectiveness in national law of a review which was sought after the contract had been signed	0
don't know	0
other reason (give details)	0

Why didn't your client obtain what you consider he was entitled to? field optional

The contract was signed before review was sought	0
The contract was signed after review was sought but before the body responsible for the review delivered judgment	0
The body responsible for the review considered that your client did not possess a sufficient interest in acting	0
The body responsible for the review refused to annul the decisions of the contracting authority which you considered illegal	0
The amount of damages	

awarded was insignificant compared with the damage which your client believed he had suffered	0
The contracting authority was not found to be responsible because of the difficulty in proving a causal link between the illegality of the award procedure and the damage suffered by your client	0
don't know	0
other reason(s) (give details)	0

How would you rate the speed of applications for an interim order in this Member State? field optional

excellent	0

banking and investment services	3

II. Member State in question

Total Responses : 37 on 37

In the context of this questionnaire, for which Member State can you provide information concerning the operation of national review procedures in the field of public procurement? compulsory

DE - Germany	11
FR - France	5
BE - Belgium	4
SV - Sweden	4
AT - Austria	3
IT - Italy	3
NL - Netherlands	3
ES - Spain	2
LU - Luxembourg	1
PT - Portugal	1
DA - Denmark	0
EL - Greece	0
FI - Finland	0

IE - Ireland	0
UK - United Kingdom	0

The requirement to provide the contracting authority with prior information

Total Responses : 37 on 37

The national legislation of certain Member States requires the person seeking a review to provide the contracting authority with prior information. If the legislation of your Member State provides for such a requirement, what, in your opinion, are the positive or negative effects? compulsory

not applicable	16
This procedure allows a settlement to be made in a dispute which the economic operator has with the contracting authority concerning the correctness of the award procedure, without recourse to litigation	9
This procedure did not affect the entitlement of the bidder to an effective pre-contract review	7
other positive or negative effects noted	6
don't know	1
This procedure allowed the contracting authority to prevent an effective review before the contract was signed because of the "race to sign the contract" incentive effect	0

Interest in acting and injured rights of bidders

Total Responses : 37 on 37

Have the members of your association/organisation already been presented with one of these grounds for inadmissibility? compulsory

yes	18
no	10
don't know	9

Among the two grounds for inadmissibility mentioned above, a lack of interest in obtaining a contract has been cited: field optional

don't know	7
in a minority of cases	5
in the majority of cases	3
in all cases	1
in no cases	1

Among the two grounds for inadmissibility mentioned above, the fact of not having been victims or not risking being victims of an alleged infringement has been cited: field optional

don't know	7
in a minority of cases	6
in the majority of cases	3
in no cases	1
in all cases	0

Have there already been cases in which reviews sought by your members have been declared inadmissible when they involved a contract awarded without prior notice or call for competition? compulsory

no	20
yes	17

In one or more of the cases in which reviews sought by your members have been declared inadmissible when they involved a contract awarded without prior notice or call for competition, were the grounds based on ... (several answers possible) field optional

don't know	6
the lack of evidence demonstrating an interest in acting?	5
other reason (give details)	5
the fact that because your members did not produce an expression of interest in obtaining the contested contract, they were not interested in acting?	3

Please indicate why the reviews sought by your members have never been declared inadmissible field optional

The body responsible for review procedures has always declared admissible your members' requests for review	7
To your knowledge, your members have never attempted to seek such a review	5
don't know	5

New prerogatives concerning reviews in the general interest

Total Responses : 37 on 37

Are you in favour of a provision in national legislations for a

national authority (already in existence or to be set up, but independent of the contracting authority) to have the power to bring matters before the body responsible for review procedures, where an infringement of Community law on public procurement has been detected? Such a referral by this authority acting in the general interest could be made with the particular aim of having provisional measures applied, illegal decisions set aside or sanctions imposed which are effective, proportionate and have a deterrent effect (in the form of financial penalties). compulsory

in favour	25
not in favour	12
don't know	0

Advantages

Total Responses : 37 on 37

This authority (whatever its status in national law) could play a useful role for those applicants who do not have a sufficient interest in acting and who could report to this authority infringements of Community law on public procurement detected by a contracting authority compulsory

agree	23
don't agree	13
don't know	1

This authority (whatever its status in national law) could play a useful role in the event of infringements which are difficult to detect by potential bidders (for example, the conclusion of a contract by direct agreement without publication of a notice in the Official Journal of the European Union) compulsory

agree	24
don't agree	13
don't know	0

This authority (whatever its status in national law) could play a useful role in the event of repeated infringements by a contracting authority of Community law on public procurement or of serious infringements of Community law on public procurement (particularly where the contracting authority has intentionally violated such rules) compulsory

agree	26
don't agree	11
don't know	0

Disadvantages

Total Responses : 37 on 37

Risk of multiplying the number of review procedures, thereby impeding the carrying out of public contracts, to the detriment of successful bidders in particular compulsory

agree	18

don't agree	18
don't know	1

The complainant or his lawyer is not familiar with the procedure employed by the authority compulsory

agree	18
don't agree	16
don't know	3

The fear that decisions by this authority to institute or not institute proceedings in the general interest might be made on a discretionary basis compulsory

don't agree	17
agree	15
don't know	5

Administrative authorities which have powers of mediation/conciliation

Total Responses : 37 on 37

If, in the Member State in question, administrative authorities specialising in public procurement have been set up with powers to mediate/conciliate with the contracting authorities, have your members had occasion to call on them to amicably resolve a dispute with the contracting authority? compulsory

not applicable	18
yes	13
no	3
no opinion	3

On the basis of your members' experience, how do you rate the effectiveness of these administrative authorities which have powers of mediation/conciliation? field optional

good	4
average	3
unsatisfactory	3
excellent	2

What advantages/disadvantages appeared when your members had occasion to call on such authorities? field optional

a swift process	6
the fact that decisions made by this type of authority are not of a binding nature does not encourage the contracting authorities to follow its recommendations, particularly in the case of	5

politically sensitive issues	
low cost of proceedings	4
does not have a suspensive effect on review deadlines	4
a pragmatic solution resulting in a good compromise, in the interests of both the injured bidder and the contracting authority, without jeopardising the basic principles of Community law on public procurement	3
This system has not resulted in a resolution of most of the cases brought by your members and in fact has led to a delay in settling disputes because your members have subsequently been obliged to appeal to the body responsible for review procedures	3
in the cases involving your members, the fact that these administrative authorities were not sufficiently independent of the contracting authority meant that satisfactory compromise solutions could not be found for the different interests in play	2
a slow process	0

Why don't your members call on the specialised administrative authorities which have powers of mediation/conciliation? field optional

the fact that these administrative authorities are not sufficiently independent of the contracting authority means that your members cannot find satisfactory compromise solutions for the different interests in play	1
the fact that decisions made by this type of authority are not of a binding nature does not encourage the contracting authorities to	1

follow its recommendations, particularly in the case of politically sensitive issues	
This system has not resulted in a resolution of most of the cases brought by your members and in fact has led to a delay in settling disputes because it has been necessary to appeal to the body responsible for review procedures	1
does not have a suspensive effect on review deadlines	1
other reason (give details)	1

Advantages and disadvantages of judicial and non-judicial bodies

Total Responses : 37 on 37

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is an administrative authority without the status of a court, what disadvantages have your members noted? (several answers possible) compulsory

not applicable	22
other reason(s) (give details)	7
the administrative authority arrives at decisions rapidly but these are often contested and must therefore be referred to a higher level for review, thus slowing down the process for arriving at a useful decision	5
the administrative authority is not sufficiently independent and may be inclined to make decisions of a political nature which have no legal basis	3
don't know	3
the administrative authority is not sufficiently competent in public procurement matters	1
the administrative authority does not arrive at decisions rapidly	0
the administrative	

authority does not scrupulously apply the adversarial principle	0

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is an administrative authority without the status of a court, what advantages have your members noted? (several answers possible) compulsory

the review is handled rapidly	16
not applicable	16
the authority is specialised	13
the review is handled impartially, respecting the adversarial principle	10
the costs of proceedings (including lawyer's fees) are not high	5
don't know	2
other reason(s) (give details)	2

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is a court, what disadvantages have your members noted? (several answers possible) compulsory

the costs of proceedings (including lawyer's fees) are too high	13
not applicable	10
other reason(s) (give details)	9
the body is the ordinary court and not specialised in public procurement matters	7
a slow process	6
don't know	3
is influenced by considerations which are not of a strict legal nature	1
partiality	1
does not respect the adversarial principle	0

Please indicate the average time taken to handle the review field optional

more than a year	3
between 20 days and 2 months	1
between 6 months and a	

year	1
between 2 and 6 months	0

If, in the Member State in question, the body which is responsible for reviews at first instance and entitled to take provisional measures and annul illegal decisions is a court, what advantages have your members noted? (several answers possible) compulsory

the review is handled impartially, respecting the adversarial principle	25
the review is handled rapidly	12
one or more specialised chambers or courts have been set up	11
not applicable	9
the costs of proceedings (including lawyer's fees) are not high	4
don't know	1

The brief period between the notification of an award decision and the signing of the contract

Total Responses : 37 on 37

Have your members already been faced with the situation of being deprived of the possibility of seeking a review to have interim measures taken (such as the suspension of the award procedure) and to have illegal decisions set aside, on the grounds that the contract had been signed, this without their having been notified previously by the contracting authority of the decision regarding the award of the contract and the rejection of their bid? (only one answer possible) compulsory

rarely	13
never	8
don't know	8
often	7
systematically	1

Do you think that the only solution which will allow injured bidders to initiate a pre-contractual review is to stipulate, by means of an amending directive, a minimum period between the notification of an award decision and the actual conclusion of the contract? (only one answer possible) compulsory

yes	30
no	6
don't know	1

Why? field optional

There are other possible solutions which result in	4

a useful review	
The Alcatel Judgment of the Court of Justice (Case C-81/98), which interpreted the "remedies" directives currently in force, is sufficient to oblige Member States to provide for a minimum period in their legislation	3

If you consider that a specific clause should be inserted in a directive, how long do you think the minimum period should be in order to strike a balance between the need to guarantee the effectiveness of the review and the concern not to unnecessarily delay the carrying out of public contracts? compulsory

between 15 and 30 calendar days	16
between 11 and 14 calendar days	13
don't know	5
10 calendar days	2
less than 10 calendar days	1

Taking into account your answer to the previous question, do you think there is a need for a shortened period in the case of accelerated procedures, due to a possible urgent need to sign the contract? compulsory

yes	18
no	14
don't know	5

What do you think this shortened period should be? field optional

10 calendar days	6
5 calendar days	4
8 calendar days	4
don't know	2
3 calendar days	1

The speed of applications for an interim order

Total Responses : 37 on 37

How do you assess the speed of applications for an interim order relating to award procedures for public contracts in the Member State in question? compulsory

positive	26
excellent	5
negative	5
very negative	1

In the experience of your members, how long, on average, does it take to obtain an interim order in the case of reviews concerning public contract award procedures? compulsory

10 days or less	12
between 31 and 60 days	6
between 11 and 20 days	5
don't know	5
between 21 and 30 days	4
over 90 days	4
between 61 and 90 days	1

The suspensive effect of pre-contractual reviews

Total Responses : 37 on 37

If the national legal system you are commenting on does not provide for a review to have an automatic suspensive effect on the contract award procedure to which it refers, in the majority of cases involving your members, were the reasons for the body responsible for review procedures refusing the suspension of the procedure based on: (several answers possible) compulsory

not applicable	14
a bar to proceedings by virtue of the signing of the contract	10
the consideration of the probable consequences of the suspensive measure on the public interest?	9
the consideration of the probable consequences of the suspensive measure on other interests which might suffer?	9
don't know	3
other reason(s)	2
the time limit?	1
the incompetence of the judicial or quasi-judicial authority	0

Do you think that a directive should provide for an automatic suspensive effect? compulsory

yes	18
no	11
don't know	8

What do you think would be a reasonable period of suspension? field optional

between 11 and 15 calendar days	6

more than 25 calendar days	5
don't know	3
between 16 and 20 calendar days	2
between 21 and 25 calendar days	2
10 calendar days or less	0

Why do you think that the directive should not provide for an automatic suspensive effect? field optional

This would result in an increase in dilatory and/or vexatious reviews and would unduly delay the carrying out of public contracts, to the detriment of the successful bidders and/or the public interest	9
An automatic suspension would be particularly detrimental to the successful bidder and/or the public interest where the review is manifestly inadmissible or unfounded	8
don't know	1
for other reasons, (give details)	0

Claims for damages

Total Responses : 37 on 37

Have your members already brought actions seeking damages for an injury arising from an irregularity in a public contract award procedure? (only one answer possible) compulsory

sometimes	19
often	10
don't know	8
never	0

Why have they never brought actions seeking damages? (several answers possible) field optional

The difficulty in proving that the company had good or very good chances of winning the contract (proof of a causal link between the illegality of the award procedure and the damage suffered)	0
The low amount of	

damages awarded by the judicial or quasi-judicial authority	0
The high cost of court proceedings for damages, which is disproportionate to the actual amount of damages expected	0
The obligation under the national legal system to obtain beforehand the annulment or the declaration of illegality of the contested decision made by the contracting authority	0
Your members' fear of not being treated fairly in the event of future procurement procedures	0
don't know	0
Other reason (give details)	0

If you have replied "sometimes" or "often", have these actions been a success for your members? field optional

partial success	28
total success	0
total failure	0

If applicable, why have these actions not been a total success? field optional

The difficulty in proving that the company had good or very good chances of winning the contract (proof of a causal link between the illegality of the award procedure and the damage suffered)	22
Your members' fear of not being treated fairly in the event of future procurement procedures	19
The high cost of court proceedings for damages, which is disproportionate to the actual amount of damages expected	12
The low amount of damages awarded by the judicial or quasi-judicial authority	8
The obligation under the national legal system to	

obtain beforehand the annulment or the declaration of illegality of the contested decision made by the contracting authority	8
don't know	2
Other reason (give details)	2

The "remedies" directives authorise the Member States to limit claims for damages once the contract has been signed If the legal system you are commenting on provides for this limitation, are your members satisfied with this system? compulsory

yes	12
no	10
not applicable	9
don't know	6

Please give your assessment of the possible advantages in limiting claims for damages once the contract has been signed field optional

Calling into question a signed contract would be contrary to the public interest and to the successful contractor because it would incur costs for interrupting or suspending the contract which are disproportionate to the interests of the bidder bringing the claim	9
other assessment (give details)	2
don't know	0

Reasons for dissatisfaction

Total Responses : 37 on 37

The chances of success of a claim for damages are more limited than those of a claim for suspension / annulment field optional

agree	8
don't agree	1
don't know	1

The amount of damages awarded is insufficient to offset the damage suffered by the company and to cover the legal costs incurred field optional

agree	6
don't agree	3

don't know	1

The possibility of suspending or annulling an award procedure when the latter offers the possibility of obtaining the annulment or cancellation of the concluded contract would encourage contracting authorities to respect the Community law on public procurement field optional

agree	7
don't know	2
don't agree	1

According to the state of the work carried out in connection with the contract, it may sometimes be proportionate to obtain the annulment or termination of the contract concluded, in view of the serious nature of the offence field optional

agree	8
don't agree	1
don't know	1

Post-contractual reviews: what alternative is there to calling into question the signed contract?

Total Responses : 37 on 37

Do you think that another solution would be to limit the possibility of calling the contract into question to contracts of the ongoing type and for a reduced period (from one to six months), following the signing of the contract? compulsory

no	20
don't know	9
yes	8

Special sectors: a sanction consisting of the payment of a sufficiently large sum

Total Responses : 37 on 37

In the special sectors (water, energy, transport and telecommunications), some Member States have included the possibility of providing for the payment of a sufficiently large sum (a "fine"), as a protective measure and/or sanction, instead of the imposition of provisional measures and the annulment of illegal decisions If your members have brought actions in those Member States which have opted for such a mechanism in the special sectors, have they found this mechanism to be: compulsory

not applicable	20
don't know	14
as effective as the mechanism of imposing provisional measures and the annulment of illegal decisions?	1
totally ineffective	

compared with the mechanism of imposing provisional measures and the annulment of illegal decisions?	1
impossible to answer because the number of reviews employing this mechanism is insignificant and/or your members have never had occasion to put it into practice	1
less effective	0

Special sectors: attestation and conciliation

Total Responses : 37 on 37

In the special sectors (water, energy, transport and telecommunications), have you had experience of contracts awarded by contracting authorities which benefitted from an attestation stating at a given time that their public contract awarding procedures are in accordance with the Community law in this field and with the national rules transposing this law? compulsory

no	37
yes	0

If you have had experience of this attestation mechanism, has it been shown that those contracting authorities which benefitted from it committed fewer irregularities in contract awarding procedures than contracting authorities which did not benefit from it? field optional

yes	0
no	0
not applicable	0
don't know	0

In the special sectors, have your members already requested the use of the conciliation mechanism provided for in Articles 9 to 11 of Directive 92/13/EEC ? compulsory

don't know	26
no	11
yes	0

Cross-border reviews

Total Responses : 37 on 37

What, in general, are the difficulties faced by the companies or interests which you represent, such as the case of a company seeking review in a Member State, other than the one in which the company is established, when it has bid for a contract being awarded by a contracting authority in this other Member State? compulsory

not applicable	21
In all or most of their reviews, they did not obtain what they consider they were entitled to	8
The bidders were dissuaded or found it impossible to seek one or more reviews	7
All or most of the reviews were partially successful as regards their initial demands	1
All or most of the reviews were completely successful as regards their initial demands	0
All or most of their reviews were completely or partially successful as regards their initial demands but it was not possible to win the contract whose award procedure was contested	0

What is/are the reason/reasons they were dissuaded or found it impossible to seek one or more reviews in this Member State? field optional

don't know	3
The contracting authority concluded a contract by direct agreement without publishing a notice, thus depriving them of the possibility of knowing in time of the existence and/or the content of the contract which was likely to be contested	2
They were not confident that their appeal would be handled impartially	1
The ineffectiveness in national law of a review which was sought after the contract had been signed	1
other reason(s) (give details)	1
They were not confident that the national appeal procedures were effective	0
The considerable length of time elapsing between the presentation of the appeal and the delivery	0

of the judgment

Why didn't they obtain what they should have obtained according to their analysis of the Community law applicable? field optional

don't know	4
The contract was signed before review was sought	2
The body responsible for the review considered that the bidder did not possess a sufficient interest in acting	2
The contracting authority was not found to be responsible because of the difficulty in proving a causal link between the illegality of the award procedure and the damage suffered by the bidder	1
The contract was signed after review was sought but before the body responsible for the review delivered judgment	0
The body responsible for the review refused to annul the decisions of the contracting authority which your members considered illegal	0
The amount of damages awarded was insignificant compared with the damage assessed	0
other reason(s) (give details)	0

Public Procurement

Public Procurement Revision of the directives on review procedures Consultation with the contracting authorities

Consultation with the contracting authorities

prior to revision of the "remedies" Directives in the field of public procurement

- **Consultation**
- **Questionnaire**

Consultation

es da el it nl pt fi sv

The present consultation aims to collect the views of the contracting authorities (among which local municipalities or public bodies) on the operation of national review procedures and on proposals to improve the effectiveness of those procedures in the field of public procurement.

Directives 89/665/EEC *(review procedures / public supply and public works contracts in traditional sectors)* and 92/13/EEC *(review procedures / public contracts in the water, energy, transport and telecommunications sectors)* were designed to ensure effective implementation of the Directives on public procurement procedures. The opening up of public contracts to Community competition requires considerably stronger guarantees of transparency and non-discrimination, the effectiveness of which depends in particular on effective, rapid remedies at national level in the event of infringement of Community law on public procurement or of national rules transposing that law.

It has emerged, however, that not all public purchasers in the Member States are implementing Community law on public procurement procedures in a satisfactory manner. The fact that only a small percentage of calls to tender are published (16.2% for the European Union in 2002) and that the figure varies appreciably from one Member State, type of contracting authority and sector of activity to another (1), shows that the Directives are not yet fully effective. Clearly, it is not possible in this situation to take full advantage of genuine competition between potential tenderers throughout the Community.

Moreover, initial consultations launched by Commission departments with the Member States, economic operators and their representatives have revealed that the operation of national review procedures does not always make it possible to correct failures to respect Community law on public procurement effectively or quickly. It has also become apparent that the effectiveness of review mechanisms in the public procurement field varies appreciably from one Member State to another, which may discourage some economic operators from tendering for public contracts.

The process of revising the "remedies" Directives, which will not be launched until the ?public procurement? package is in force and the process of consulting all the interested parties is complete, will provide an opportunity to reassess and reinforce the effectiveness of the remedies provided for in Directives 89/665 and 92/13, as and where necessary.

At this early stage, the Commission departments feel that any amendments should merely adapt and improve certain provisions of the ?remedies? Directives, without altering the philosophy and principles which underlie them. For example, the principle of the Member States? procedural autonomy will not be called into question. Member States will, in particular, retain the power to select a court, tribunal or independent authority competent to hear challenges relating to Community law on public procurement in accordance with their national law. However, the unsatisfactory situation brought about mainly by the very heterogeneous operation of Member States? national review procedures, and recent developments in case law (2), require clarification of or greater precision in the existing legislative framework, in order to ensure that there are sanctions which are effective and proportionate and which have a deterrent effect on infringements of Community law on public procurement, especially the most serious infringements (direct award of contracts without prior notification).

Adoption of the "legislative package" coordinating public procurement procedures will require technical adjustments to the ?remedies? Directives, namely, references to the new Directives. Essentially, therefore, the proposal to amend the Directive, if adopted by the Commission, should clarify or strengthen the existing provisions.

Having exchanged views with the Member States? representatives in the Advisory Committee for Public Contracts, and the economic operators and their representatives (lawyers and professional associations) on several occasions since 2003 using the Interactive Policy Making (IPM) tool (3), the Commission departments would now like to know what lessons the contracting authorities (e.g. local authorities and bodies under public law) draw from the operational procedures and mechanisms provided for in Directives 89/665 and 92/13 since they came into force.

Questionnaire

The Commission departments have therefore drawn up a questionnaire (below) to enable the members to provide feedback, point by point. The contracting authorities are asked to complete the questionnaire and return it by 15 June 2004 (closed).

1. **Article 1(3), 1st sentence, of Directives 89/665 and 92/13** stipulates that review procedures should be available at least to any person having or having had an interest in obtaining a particular public contract (1st condition) and who risks or has risked being harmed by an alleged infringement (2nd condition).
   - If your national legislation restricts review procedures to this category of person, who must satisfy these two conditions, what lessons do you draw you from that restriction?
   - If your national legislation does not apply these two conditions, what advantages or disadvantages do you see in such a situation?

2. **Article 1(3), final sentence, of Directives 89/665 and 92/13** states: "In particular, the Member States may require that the person seeking the review must have previously notified the contracting authority of the alleged infringement and of his intention to seek review."
   - If your national legislation provides for prior information of this kind, what lessons do you draw from the operation of this provision? If your national legislation does not provide for such information, what are your views on a mechanism of this kind?

3. **Article 2(1.a) and (1.b) of Directive 89/665**
   - In the light of the Alcatel (4) judgment, in which the Court of Justice interpreted Article 2(1.a) and (1.b) of Directive 89/665, should the ?remedies? Directives explicitly provide for a minimum period between the notification of an award decision and actual conclusion of a public contract?
   - What should be the minimum period in which a contractor who has been harmed by an award decision can take action against it in order to have the signing of the contract suspended in good time?
   - Do you think there should be a shortened period for seeking review in the context of an accelerated procedure, given that the signing of the contract might be urgent?

4. **Article 2(1.c) and Article 2(5) and (6) of Directive 89/665 and Article 2(1.d) and final sentence of Directive 92/13** concern the award of damages.
   - In your view, are these provisions satisfactory?
   - What, in your opinion, are the main obstacles encountered by contractors harmed by decisions when they bring an action for damages?
   - Do you think it would be useful to lower/eliminate these obstacles?

5. Under **Article 2(3) of Directive 89/665 and Article 2(3) of Directive 92/13**, review procedures need not necessarily have automatic suspensory effects on the award procedures to which they relate.

   - If your national legal system provides for automatic suspensory effects, what lessons do you draw from the operation of this mechanism?
   - If your national legal system does not provide for automatic suspensory effects, what advantages/drawbacks do you see in giving the authority competent for review procedures the power to suspend or uphold the award procedure?

6. Under **Article 2(4) of Directive 89/665 and of Directive 92/13**, Member States may allow the competent authority, when it examines whether measures are appropriate, to take account both of the likely consequences of such measures for all parties liable to be harmed, and of the public interest, and to decide not to take such measures if their disadvantages might outweigh their advantages. A decision not to take interim measures is not prejudicial to other rights enjoyed by the person seeking those measures.

    - If your national legal system provides for such a limitation, how would you assess its application to reviews which concern you?

7. **Article 2(5) of Directive 89/665 (and Article 2(1), final sentence, of Directive 92/13)** allows for a contested decision by a contracting authority to be set aside (?set aside or declared illegal? in Directive 92/13).
    - If your national legal system provides for such a procedure, what advantages/disadvantages have you observed?

8. **Article 2(6), 2nd sentence, of Directive 89/665 and Article 2(6), 2nd sentence, of Directive 92/13** allow the Member States to limit remedies to the granting of damages once the contract has been concluded.
    - If your legal system provides for this limitation, how have you found it?
    - If your legal system makes it possible for injured parties to obtain the suspension or setting aside, or an injunction cancelling an unlawful public contract, what lessons do you draw from it?
    - If these possibilities are not offered by your Member State?s legislation, what do you think of them?

9. **Article 2(8) of Directive 89/665 and Article 2(9) of Directive 92/13** allows for the authorities competent for review procedures not to be judicial in character, provided that they justify the measures which they take in writing and that those measures may be the subject of review by a court or tribunal within the meaning of Article 234 of the EC Treaty.
    1. If your national legal system provides for or has, in the past, provided for obligatory prior administrative and/or hierarchical review, what lessons do you draw from it? If there is or has been such an obligation, how does/did it fit in with Article 2(1.a) of Directive 89/665, which provides for a review permitting interim measures to be taken at the earliest opportunity and by way of interlocutory procedures?
    2. If your national legal system involves independent authorities specialising in public contracts, what lessons do you draw from their operation?
    3. Do you think that authorities (independent of the contracting authority) which already exist in certain Member States (for example, an independent administrative authority, whether specialised or not, a Court of Auditors, Ombudsman, Public Prosecutor, Prefect etc.) or which might be created in future, should be given new prerogatives, so as to improve implementation of Community law on public procurement? These new prerogatives might, for example, consist in the power to refer a matter to a competent judicial or quasi-judicial authority for public procurement if there is an alleged infringement of the relevant Community law, particularly with a view to securing interim measures, the cancellation of unlawful decisions, or sanctions which are effective and proportionate and which have a deterrent effect.

    What do you see as the advantages and disadvantages of such a proposal?

10. **Other**

- What other limitations or difficulties have you encountered in the mechanism created by Directives 89/665 and 92/13?
- What improvements would you suggest?

Høring af de ordregivende myndigheder forud for ændringen af direktiverne om klageprocedurer i forbindelse med offentlige kontrakter

Denne høring har til formål at indhente oplysninger om ordregivende myndigheders (lokale myndigheders og offentligretlige organers) holdning til, hvordan de nationale klageprocedurer i forbindelse med offentlige kontrakter fungerer, og forslag til, hvordan disse procedurer kan gøres mere effektive.

Direktiv 89/665/EØF (*klageprocedurer i forbindelse med offentlige indkøbs- samt bygge- og anlægskontrakter*) og 92/13/EØF (*klageprocedurer i forbindelse med offentlige kontrakter inden for vand- og energiforsyning samt transport og telekommunikation*) blev vedtaget med henblik på at sikre effektiv håndhævelse af direktiverne om fremgangsmåderne ved indgåelse af offentlige kontrakter. Adgangen til på fællesskabsplan at konkurrere om offentlige kontrakter har nemlig krævet en betydelig udvidelse af foranstaltningerne til at sikre gennemsigtighed og ikke-forskelsbehandling, hvis virkninger især afhænger af, om der findes effektive og hurtige klageprocedurer på nationalt plan i tilfælde af overtrædelse af fællesskabslovgivningen om offentlige kontrakter eller de nationale regler, der omsætter denne lovgivning.

Det har imidlertid vist sig, at ikke alle offentlige indkøbere i medlemsstaterne anvender fællesskabslovgivningen om fremgangsmåderne ved indgåelse af offentlige kontrakter på tilfredsstillende måde. Det forhold, at kun en ringe procentdel af alle udbudsbekendtgørelser offentliggøres (16,2 % på EU-plan i 2002), og at dette tal varierer betydeligt alt efter medlemsstat, ordregivende myndighed og sektor[1], viser, at direktiverne endnu ikke virker helt efter hensigten. Det er klart, at det i denne situation ikke er muligt at udnytte de fordele, der ville være til stede, hvis der var reel konkurrence mellem alle potentielle tilbudsgivere på fællesskabsplan.

Det fremgår desuden af Kommissionens første høringer af medlemsstaterne og de økonomiske aktører og deres repræsentanter, at den måde, hvorpå de nationale klageprocedurer fungerer, ikke altid gør det muligt at rette op på overtrædelser af fællesskabslovgivningen om offentlige kontrakter på en effektiv og hurtig måde. Det er endvidere blevet konstateret, at der er betydelig forskel i effektiviteten af klageprocedurerne i forbindelse med offentlige kontrakter fra den ene medlemsstat til den anden, og det kan betyde, at nogle økonomiske aktører måske ikke finder det fuldt betryggende at ansøge om tildeling af offentlige kontrakter.

I forbindelse med ændringen af direktiverne om klageprocedurer, der i givet fald først vil finde sted efter ikrafttrædelsen af lovpakken om offentlige kontrakter og høringen af samtlige berørte parter, vil der blive mulighed for at revurdere og styrke effektiviteten af de klageprocedurer, der er omhandlet i direktiv 89/665/EØF og 92/13/EØF, på områder, hvor det er nødvendigt.

[1] Jf. "*A report on the functioning of public procurement markets in the EU : benefits from the application of EU directives and challenges for the future*" af 3. februar 2004, der kun foreligger på engelsk, på følgende websted: http://www.europa.eu.int/comm/internal_market/en/publproc/general/public-proc-market-final-report_en.pdf

På dette indledende stadium er det Kommissionens opfattelse, at de ændringer, der skal gennemføres, kun bør sigte mod at tilpasse og forbedre visse bestemmelser i direktiverne om klageprocedurer uden at ændre det grundsyn og de principper, der ligger bag deres vedtagelse. Der vil således ikke blive sat spørgsmålstegn ved princippet om medlemsstaternes ret til at anvende deres egne processuelle regler. Medlemsstaterne vil bl.a. fortsat have mulighed for at afgøre, hvilken retsinstans eller uafhængig myndighed der i henhold til national retspleje skal kunne afgøre klagesager i forbindelse med fællesskabslovgivningen om offentlige kontrakter. Den utilfredsstillende situation, der især skyldes medlemsstaternes meget forskellige nationale klageprocedurer, og den seneste udvikling i retspraksis[2] gør det imidlertid nødvendigt at afklare og præcisere den eksisterende retlige ramme, så der kan pålægges effektive, rimelige og afskrækkende sanktioner for overtrædelse af fællesskabslovgivningen om offentlige kontrakter, især for de groveste overtrædelser (direkte tildeling af kontrakter uden forudgående offentliggørelse).

Herudover vil der i forbindelse med vedtagelsen af lovpakken om samordning af fremgangsmåderne ved indgåelse af offentlige kontrakter skulle foretages tekniske tilpasninger af direktiverne om klageprocedurer i form af henvisninger til de nye direktiver. Forslaget til ændringsdirektiv vil således – hvis Kommissionen beslutter at vedtage det - i alt væsentligt skulle udformes som en afklaring eller en styrkelse af de eksisterende bestemmelser.

Kommissionen ønsker nu, efter gentagne gange siden 2003 at have hørt og orienteret medlemsstaternes repræsentanter i Det Rådgivende Udvalg for Offentlige Aftaler samt de økonomiske aktører og deres repræsentanter (advokater og brancheorganisationer) ved hjælp af værktøjet interaktiv politikudformning[3], at vide mere om, hvilke erfaringer de ordregivende myndigheder (f.eks. lokale myndigheder og offentligretlige organer) uddrager af den måde, hvorpå de i direktiv 89/665/EØF og 92/13/EØF omhandlede klageprocedurer har fungeret, siden de trådte i kraft.

Med henblik herpå har Kommissionens tjenestegrene udarbejdet et spørgeskema (se nedenfor), der kan give den strukturerede oplysninger om hvert enkelt punkt. De ordregivende myndigheder bedes udfylde dette spørgeskema og returnere det til den kompetente tjenestegren i Kommissionen inden den 15. juni 2004 på følgende adresse:

SPØRGESKEMA

1/ **Artikel 1, stk. 3, første punktum, i direktiv 89/665/EØF og 92/13/EØF** bestemmer, at der skal være adgang til klageprocedurer i det mindste for personer, der har eller har haft interesse i at få tildelt en bestemt kontrakt (1. betingelse), og som har lidt eller vil kunne lide skade som følge af en påstået overtrædelse (2. betingelse).

Hvis den danske lovgivning har begrænset klageadgangen til denne kategori af personer, der opfylder disse to betingelser, hvilke erfaringer uddrager De da af denne begrænsning?

Hvis de to betingelser vedrørende personer, der indleder klageprocedurer, ikke er medtaget i den danske lovgivning, hvilke fordele eller ulemper har De da bemærket som følge heraf?

2/ **Artikel 1, stk. 3, andet punktum, i direktiv 89/665/EØF og 92/13/EØF** bestemmer følgende: "Medlemsstaterne kan navnlig kræve, at en person, der ønsker at anvende en sådan procedure, på forhånd har underrettet den ordregivende myndighed om den påståede overtrædelse og om, at vedkommende agter at indgive klage."

Hvis den danske lovgivning indeholder en sådan bestemmelse om forhåndsoplysning, hvilke erfaringer uddrager De da af den måde, denne bestemmelse fungerer på? Hvis der ikke er fastsat en sådan bestemmelse i den danske lovgivning, hvad mener De da om en sådan ordning?

3/ Bør der i direktiverne om klageprocedurer som følge af Domstolens dom i *Alcatel*-sagen[4] om fortolkning af **artikel 2, stk. 1, litra a) og b), i direktiv 89/665/EØF** udtrykkeligt fastsættes en minimumsfrist mellem meddelelsen af tildelingsbeslutningen og den faktiske indgåelse af en offentlig kontrakt? Hvor lang en frist bør den skadelidte virksomhed under alle omstændigheder råde over for at kunne klage over tildelingsbeslutningen, hvis den skal kunne nå at få suspenderet indgåelsen af kontrakten? Finder De det i den forbindelse nødvendigt med en kortere klagefrist som led i en fremskyndet procedure i tilfælde, hvor kontrakten skal indgås meget hurtigt?

4/ **Artikel 2, stk. 1, litra c), og artikel 2, stk. 5 og 6, i direktiv 89/665/EØF og artikel 2, stk. 1, litra d), og artikel 2, stk. 1, andet afsnit, i direktiv 92/13/EØF** indeholder bestemmelser om skadeserstatning. Finder De disse bestemmelser fyldestgørende? Hvilke hovedhindringer støder skadelidte virksomheder efter Deres mening på, når de anlægger sag med krav om skadeserstatning? Ville det efter Deres mening være hensigtsmæssigt at begrænse/fjerne disse hindringer?

5/ **Artikel 2, stk. 3, i direktiv 89/665/EØF og artikel 2, stk. 3, i direktiv 92/13/EØF** bestemmer, at klageprocedurerne ikke nødvendigvis skal have automatisk opsættende virkning for de udbudsprocedurer, som de vedrører. Hvis der i det danske retssystem er fastsat bestemmelser om en sådan automatisk opsættende virkning for visse procedurer,

[4] Jf. EF-Domstolens dom af 28. oktober 1999, sag C-81/98.

hvilke erfaringer mener De da der kan uddrages af den måde, disse bestemmelser fungerer på? Hvis der ikke er fastsat bestemmelser om automatisk opsættende virkning i det danske retssystem, hvilke fordele og ulemper finder De da der kan være forbundet med, at den instans, der er ansvarlig for klageprocedurerne, kan have beføjelse til at afgøre, om indgåelsen af kontrakten skal suspenderes eller ej?

6/ **Artikel 2, stk. 4, i direktiv 89/665/EØF** og i direktiv 92/13/EØF bestemmer, at medlemsstaterne kan foreskrive, at den ansvarlige instans, når den undersøger, om der skal træffes midlertidige foranstaltninger, kan tage hensyn til de sandsynlige følger af sådanne foranstaltninger for alle interesser, som vil kunne skades, samt til almenvellet, og beslutte ikke at give sit samtykke hertil, når de negative følger af sådanne foranstaltninger vil være større end fordelene. En beslutning om ikke at tillade midlertidige foranstaltninger berører ikke de øvrige rettigheder, som den person, der anmoder om disse foranstaltninger, måtte gøre krav på.

Hvis der i det danske retssystem er fastsat en sådan begrænsning, hvordan bedømmer De da den konkrete anvendelse heraf i forbindelse med de klagesager, der berører Dem?

7/ **Artikel 2, stk. 5, i direktiv 89/665/EØF** (og artikel 2, stk. 1, andet afsnit, i direktiv 92/13/EØF) giver medlemsstaterne mulighed for at gøre adgangen til klage med krav om skadeserstatning betinget af, at den anfægtede beslutning fra den ordregivende myndighed annulleres (i direktiv 92/13/EØF, at den annulleres eller erklæres ulovlig). Hvis der i det danske retssystem er fastsat en sådan procedure, hvilke fordele og ulemper har De da konstateret i den forbindelse?

8/ **Artikel 2, stk. 6, andet afsnit, i direktiv 89/665/EØF og artikel 2, stk. 6, andet punktum, i direktiv 92/13/EØF** giver medlemsstaterne mulighed for at bestemme, at klageadgangen efter indgåelsen af kontrakten begrænses til krav om ydelse af skadeserstatning. Hvis der i det danske retssystem er fastsat en sådan begrænsning, hvilke erfaringer uddrager De da heraf? Hvis det i det danske retssystem er muligt for den skadelidte part at få ulovlige offentlige kontrakter suspenderet, annulleret eller ophævet, hvilke erfaringer uddrager De da heraf? Hvis lovgivningen i Danmark ikke omfatter sådanne muligheder, hvad mener De da herom?

9/ **Artikel 2, stk. 8, i direktiv 89/665/EØF og artikel 2, stk. 9, i direktiv 92/13/EØF** bestemmer, at de myndigheder i første instans, der er ansvarlige for klageprocedurerne, kan være andre instanser end retsinstanser, forudsat at de foranstaltninger, som disse myndigheder træffer, begrundes skriftligt og kan indbringes for en instans, der er en ret som omhandlet i EF-traktatens artikel 234.

9-1 Hvis der i det danske retssystem er fastsat eller tidligere har været fastsat en forpligtelse til forudgående administrativ klageadgang, hvilke erfaringer uddrager De da heraf? I bekræftende fald, hvordan fungerer/fungerede denne form for klageadgang i forhold til artikel 2, stk. 1, litra a), i direktiv 89/665/EØF, i henhold til hvilken der kan træffes midlertidige foranstaltninger som hastesag?

9-2 Hvis der i det danske retssystem findes uafhængige forvaltningsorganer, der specielt beskæftiger sig med offentlige kontrakter, hvilke erfaringer uddrager De da af den måde, disse organer fungerer på?

9-3 Bør disse myndigheder (som er uafhængige i forhold til den ordregivende myndighed), der allerede findes i nogle medlemsstater (f.eks. specialiseret eller ikke specialiseret uafhængigt administrativt organ, rigsrevision, ombudsmand, offentlig anklager, amtmand osv.), eller som vil kunne etableres, efter Deres mening tildeles nye beføjelser med henblik på at forbedre håndhævelsen af fællesskabslovgivningen om offentlige kontrakter? Der kunne f.eks. være tale om beføjelser til at indbringe en sag for den kompetente domstol eller domstolslignende myndighed, hvis der konstateres overtrædelser af fællesskabslovgivningen om offentlige kontrakter, navnlig med henblik på midlertidige foranstaltninger, annullering af ulovlige beslutninger eller pålæggelse af effektive, rimelige og afskrækkende sanktioner.

De bedes anføre, hvilke fordele og ulemper der efter Deres opfattelse er forbundet med et sådant forslag.

10/ Hvilke andre begrænsninger eller vanskeligheder har De oplevet i forbindelse med den ordning, der blev indført med direktiv 89/665/EØF og 92/13/EØF? Hvilke forbedringer vil De foreslå?

A report on the functioning of public procurement markets in the EU: benefits from the application of EU directives and challenges for the future

03/02/2004

EXECUTIVE SUMMARY

Economic reforms pay off. This working document presents evidence of the positive impact of Internal Market rules on the performance of public procurement markets over the past ten years. Indicators show positive developments in market transparency, increased cross border competition and price savings derived from the implementation of public procurement directives.

Public procurement directives have effectively increased transparency. The number of invitations to tender and contract award notices published both doubled between 1995 and 2002. However, only 16% of the estimated public procurement is published. Transparency rates vary between Member States and for different government levels and sectors.

New data suggest that previous studies may have underestimated the actual dimension of cross-border procurement. In a sample of firms involved in procurement activities, 46% carried out some type of cross-border procurement. However, direct cross-border procurement remains low, accounting for just 3% of the total number of bids submitted by the sample firms. The rate of indirect cross-border public procurement is higher, with 30% of the bids in the sample being made by foreign firms using local subsidiaries.

It is important to note that domestic firms and foreign subsidiaries have similar rates of success when bidding for contracts in the country where they are located (30 and 35% respectively). This confirms the importance in Europe of bidding for contracts through subsidiaries.

The new evidence also suggests that public procurement prices paid by public authorities are lower when the directives are applied. Although price dispersion for homogenous products remains quite large, the application of procurement rules appears to reduce prices by around 30%. Case studies of "typical" public procurement goods show that in general, the directives helped to increase intra EU competition. Import and export prices of these goods converged over time. For instance, in the case of small iron and steel rails export price dispersion dropped from around 21% in 1988-92 to 7% in 1998-2002. However further savings are still possible (for the six case studies considered, the equivalent of almost 12% of the value of intra-EU trade in these goods could still have been saved in 1998-2002).

Given the economic importance of public procurement markets the importance of these improvements is clear. In 2002 the total EU procurement market was worth €1.5 trillion or over 16% of EU GDP. Further improvements would contribute to increase efficiency in public spending and budget deficit control.

In conclusion, there is overwhelming evidence that the current directives have actively contributed to reform in the public procurement markets. Remaining concerns about the significant costs of complying with procurement rules are addressed by the new legislative package and e-procurement offers new possibilities for cost reductions. Further performance improvements will be possible if these measures are effectively implemented.

INTRODUCTION

Public authorities are significant market players as buyers of goods and services. Before the creation of the Internal Market, national, regional and local authorities favoured domestic suppliers. This was not only incompatible with the Treaty provisions requiring the creation of a single Internal Market but also had negative macro and microeconomic implications for the European economy.

- As recently recalled in the report on the quality of public finances[1], competitive public procurement practices are essential for efficiency in public spending. Competitive, transparent procurement markets help public authorities acquire cheaper, better quality goods and services at lower costs. As a result both the value of taxpayers' money and the allocation of resources are improved.

- Open, non-discriminatory and transparent procedures can also help boost the competitiveness of firms operating in public procurement markets. Only firms confronted by foreign competitors at home will be able to perform efficiently and compete successfully in foreign markets and withstand foreign competition at home.

Over the years public procurement directives have been progressively implemented[2] but the monitoring of public procurement markets presents multiple difficulties. Nevertheless, "ad hoc" studies conducted in 1996 and 1999 together with the Cardiff reports on economic reform between 1999 and 2002 presented regularly updated indicators[3].

In this working document an account of the performance of public procurement markets is given using new indicators. This new evidence suggests that legislative changes introduced in public procurement markets over the last ten years have had their intended effect in increasing transparency and competition. In particular, quantitative information is presented on areas where it has been particularly scarce in the past such as price levels and cross-border procurement activities. The purpose of this document is to analyse and investigate the impact that existing economic reforms have had on the Internal Market. The document does not put forward any political initiatives, but concentrates instead on presenting results which, as will be seen, clearly show that economic reforms work, providing significant savings for the public purse.[4]

This new information is particularly useful on the occasion of the adoption of the new legislative package up-dating, streamlining and improving the existing directives. Prompt

and appropriate implementation by Member States of the new legislative package will simplify procedures and cut administrative costs, building on the existing improvements and in turn further increasing transparency and competition and reducing costs and remaining inefficiencies in the public sector.

The document examines the expected impact of measures aimed at increasing competition in public procurement markets in their logical sequence. After a short section on the quantitative importance of public procurement in the EU, section three presents indicators showing the evolution of transparency in European procurement markets. Section four presents evidence suggesting that increased transparency has been followed by increased cross-border competition. Indirect cross-border procurement through subsidiaries appears more extensive and important than previously thought, suggesting that earlier figures on the importance of the EU's overall cross-border procurement activities were underestimated. However, more direct cross-border procurement is still possible. Section five presents evidence suggesting that, thanks to the directives on transparency and cross-border competition, public authorities are actually paying lower prices. The final section before the conclusion discusses additional dimensions of market performance including specific impacts on Small and Medium Enterprises (SMEs), environmental and social issues and transaction costs.

THE IMPORTANCE OF PUBLIC PROCUREMENT

According to Commission estimates, total public procurement amounted to €1500 billion in 2002 accounting for 16.3 % of the Union’s GDP. For the last eight years this share has remained stable. The importance of total public procurement by Member State varies significantly: from 11.9% of GDP in Italy to 21.5% in the Netherlands[5].

Not all public procurement is subject to the obligations established by EU directives. Some activities (e.g. the purchase of warlike material for the defence sector) are excluded and purchases below thresholds only need to meet the general rules of the Treaty, not the publication requirements included in the directives. Estimating the percentage of total public procurement subject to publication procedures is very difficult. However, only 16% of public procurement is published (see Table 2 on page 8). Thus, transparency still needs to increase in the future in order to improve market performance in public procurement markets.

[5] Estimates of the total importance of public procurement for OECD economies and for the EU vary depending on the methodology used for their calculation and on the definition of public procurement used. A survey published by the OECD in 2001 (OECD, *Government procurement: A synthesis Report*, 2001) estimated government procurement for central, local and social entities at 9.24 % of GDP for the EU and 9.17% for OECD countries. If defence expenditure is deducted, the percentage is 8.03% for the EU and 7.57% for OECD countries.

Table 1	**Total Procurement as a Percentage of GDP**

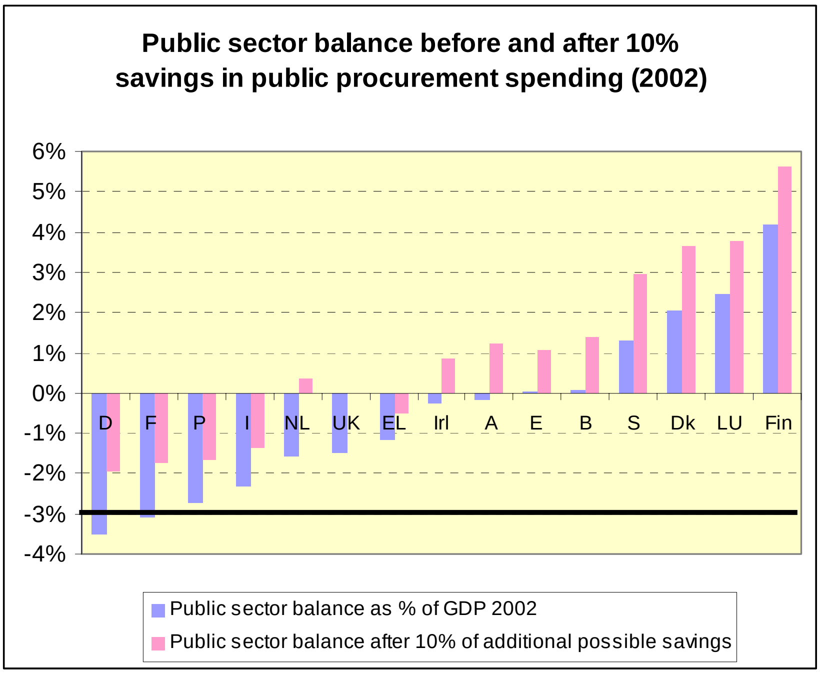
Source: Internal Market Directorate General

It is important to have an idea of the magnitude of the potential savings that may result from improvements to the public procurement market. For example, if we assume that Member States could save 10% of their public procurement expenditure and look at the impact of these savings on the magnitude of government budget balances, we can see that these hypothetical savings would have a non-negligible impact, as shown in Figure 1[6].

Figure 1



Source: Internal Market Directorate General

[6] These figures are given to show the importance of public procurement in terms of size as compared to public deficits. The 10% figure, as will be shown later in the paper, is conservative, being well below the potential savings that recent studies suggest are possible. This figure has been applied on a country by country basis to the estimated public procurement expenditure which is currently not fully transparent. The purpose of this example is purely illustrative and is not meant to have any implications for public finance or budget policy issues.

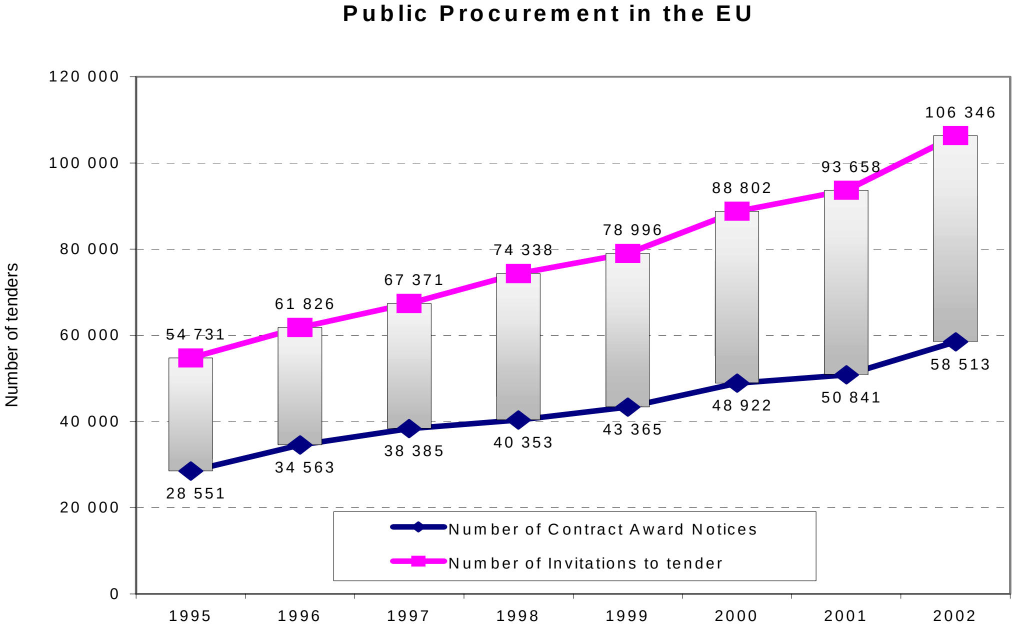
The results are quite remarkable: three countries would turn their budget deficits into surpluses and no euro zone Member State would run a public sector deficit that breaks the 3% limit.

INCREASING TRANSPARENCY IN PUBLIC PROCUREMENT MARKETS TO FOSTER COMPETITION

Transparent and predictable procurement procedures improve economic efficiency by promoting competition amongst domestic and foreign suppliers. They can also contribute to fostering private investment by lowering risk because transparency and predictability of market mechanisms are crucial factors influencing business decisions on how and where to invest and generate value added.

Transparency also enhances the competitiveness of local producers by establishing a market-launch base which is especially good for SMEs. Stronger competition brings down costs, improves quality and delivery terms and fosters the introduction of innovations. Conversely, in procurement environments closed to competition and dominated by vested interests, economic incentives disappear, "dominant" local players are relaxed about minimising costs and prices rise above competitive market clearing levels. Such local producers have no incentive to strive for a competitive edge and compete for contracts abroad.

Figure 2



Source: Internal Market Directorate General MAPP Database

EU public procurement directives give a prominent role to transparency, considering it fundamental to the elimination of distortions and discrimination in these markets. They require that invitations to tender with an expected contract value above established thresholds are published in the Official Journal.

Figure 2 clearly demonstrates the relationship between the introduction of EU directives and increased transparency in EU procurement markets. Between 1995 and 2002, the number of invitations to tender published in the Official Journal as required by the directives has almost doubled, while the estimated size of procurement markets has increased around 30%. The number of notices published has been growing at an annual rate close to 10%. In 2002, the number of invitations to tender published was 15% higher than the previous year.

Another important element of transparency is the publication of the final outcome of public procurement procedures. In a competitive environment, free of collusive practices, competitors can monitor the results of tendering processes and improve their future bids. This too puts downward pressure on prices over time. The number of contract award notices published in the Official Journal has been growing steadily in recent years. Although the number of contract award notices is around half the number of invitations to tender, it more than doubled between 1995 and 2002.

In 2002, 38% of contract award notices published in the Official Journal corresponded to supplies contracts, 37% were for services and public works accounted for only 19%. Local authorities published over 36,000 of the total 58,513 contract award notices. Central governments and utilities published over eight and six thousand respectively.

There is great variation in transparency rates[7] across countries, government levels and sectors. Transparency rates are significantly affected by differences in public institutions' and governments' administrative and organisational characteristics. For instance, increasing administrative decentralisation tends to produce more frequent and disaggregated tendering, which, in principle would tend to reduce the average value of each purchase. This might increase the share of public procurement falling below the thresholds and therefore not needing publication. However other factors linked to administrative practices and/or habits also play a part, and they could offset or reinforce this trend. Therefore a higher degree of administrative decentralisation is not necessarily more or less compatible with high levels of transparency – other government and administrative practices should also be taken into consideration.

As can be seen from Table 2, Greece, Spain and the UK have the highest transparency rates with 46, 24 and 21% of their public procurement published as a percentage of the estimated total procurement value (2002 figures). At the other end of the scale are Germany, the Netherlands and Luxembourg. Whilst some Member States appear to have more transparent markets than others, a high rate of transparency does not necessarily indicate that a Member State is consistently publishing at a high level. For example, this

[7] Transparency is defined here as the value of procurement published in the Official Journal as a percentage of estimated total public procurement.

measure is highly influenced by large fluctuations in a country's government spending – large public works projects (e. g. bridges, motorways, airports) can significantly increase the transparency rate for the years affected.

The average estimated share of the total procurement value actually published is 16.2%, equivalent to 2.6% of EU GDP. Although this rate has increased over the last ten years, further improvements are necessary.

Table 2 **Transparency Rates by Member State (%)**

CROSS-BORDER PROCUREMENT: A MORE DETAILED PICTURE

Fostering cross-border activity in public procurement markets is a major challenge for Internal Market rules. Increased transparency would be pointless if it failed to make procurement markets more contestable especially by increasing the number of foreign bidders. Eliminating any kind of domestic bias and discrimination in favour of domestic producers and opening up markets to foreign firms is essential to foster more cross-border procurement activities. Ensuring similar chances of success to foreign and domestic bidders is the ultimate test of a level playing field.

Cross-border procurement can take place in different ways. Direct cross-border procurement occurs when firms operating from their home market bid and win contracts for invitations to tender launched in another Member State. Indirect cross-border activities arise when firms bid for contracts through subsidiaries, i.e. when their foreign affiliates bid for tenders launched by authorities of a country different from the home country where the firm has its headquarters or where the parent company is located.

Until now, procurement indicators to measure cross-border activity have been inadequate. Information collected from the Multidimensional public procurement data base (MAPP), built up using data from the Tenders Electronic Daily database (TED)[8], indicated very weak direct cross-border procurement activity (around 1,5%). A survey conducted in 1999 indicated that in approximately 10% of total procurement there was some form of indirect cross-border procurement.

Table 3 Previous Measurements of Cross-border Public Procurement

Sources	Direct cross-border procurement	Indirect cross-border procurement	Methodology – measurement
Eurostrategy Consultants 1999.	1.8%	8.5%	Survey of 2000 firms. Estimated import penetration in public sector consumption (data for 1998)
Single Market Review 1997	3%	7%	Survey – Estimated import penetration (data for 1994)

In a recent study[9], over 1500 firms actively involved in procurement were asked about the domestic or cross-border nature of their activities. These firms were asked if they only submitted proposals to public institutions in the country where they were located or if they also put in bids abroad. In the latter case, they were asked to say if they made bids abroad directly (without any sort of intermediary) or only through a subsidiary[10] or via both (i.e. with a subsidiary and directly)[11].

This gives the categories defined in Table 4. Cross-border activity occurs in the following cases:

[8] All public tenders exceeding specific contract values must be published in the Supplement to the Official Journal of the European Union. Since July 1998, the printed edition of the Official Journal S is no longer available. It is now available exclusively in electronic format and is accessible on the internet by accessing the 'TED' tender database ('TED internet application', 'TED' = Tenders Electronic Daily).

[9] COWI. "Monitoring Public Procurement in the European Union using Firm Panel Data". Lot 1. Final report July 2003. This study is based on questionnaires addressed to a sample of firms from Austria (60 firms), Belgium (60 firms), Denmark (60 firms), France (360 firms), Germany (450 firms), Ireland (40 firms), Spain (120 firms) and the UK (360 firms). The targeted sample of firms was drawn from nine economic areas corresponding to Common Procurement Vocabulary sectors 24 (chemicals), (29 (machinery), 30 (office equipment), 33 (medical products), 34 (motor vehicles), 50 (motor repair), 45 (construction), 74 (business services) and 90 (sewage). These sectors account for 66% of all published tenders.

[10] Firms were asked to identify themselves as "**domestic**" or "**subsidiary**" firms. Firms are identified as “**domestic**” if they are located in the country where their headquarters is based. “**Subsidiaries**” are firms located in a country different from where their headquarters or parent companies are based.

[11] A few firms answered saying that they only bidded abroad.

- first, whenever a subsidiary bids or is awarded a contract. This may occur in the country where the subsidiary is located, or in any other Member State. All such activities are considered indirect cross-border procurement;

- secondly, a procurement activity is considered to be cross-border if a firm that is not a subsidiary bids or is awarded a contract in a country other than the one in which it is based. In this case, cross border procurement may occur either directly - the firm bids from its home base - or indirectly - through a subsidiary located abroad.[12]

This allows the measurement of cross-border activity in terms of the number of firms bidding at home or abroad; the number of proposals made by domestic or by foreign firms; and the success rate of firms bidding in their own country of origin or abroad.

Table 4 Cross-border Public Procurement Activities of Firms Included in Study Sample

	Number of answers to this question from firms in the sample[13]	Number of proposals	Average number of proposals per firm	Share of total proposals
Firms submitting proposals to public institutions in the country where they are located only				
Proposals to home country by domestic firms	416	49 498	119	40%
Proposals to home country by foreign owned subsidiaries	98	13 984	143	11%
Firms submitting proposals to public institutions in the country where they are located AND/OR in other EU Member States DIRECTLY AND/OR through a SUBSIDIARY				
Proposals to home country by domestic firms	213	32 438	152	26%
Proposals to home country by foreign owned subsidiary firms	67	15 762	235	13%
Proposals to other EU Member States directly	207	4 155	20	3%
Proposals to other EU Member States through subsidiary	162	7 345	45	6%
Total		123 182		

Source: Internal Market Directorate General using COWI data

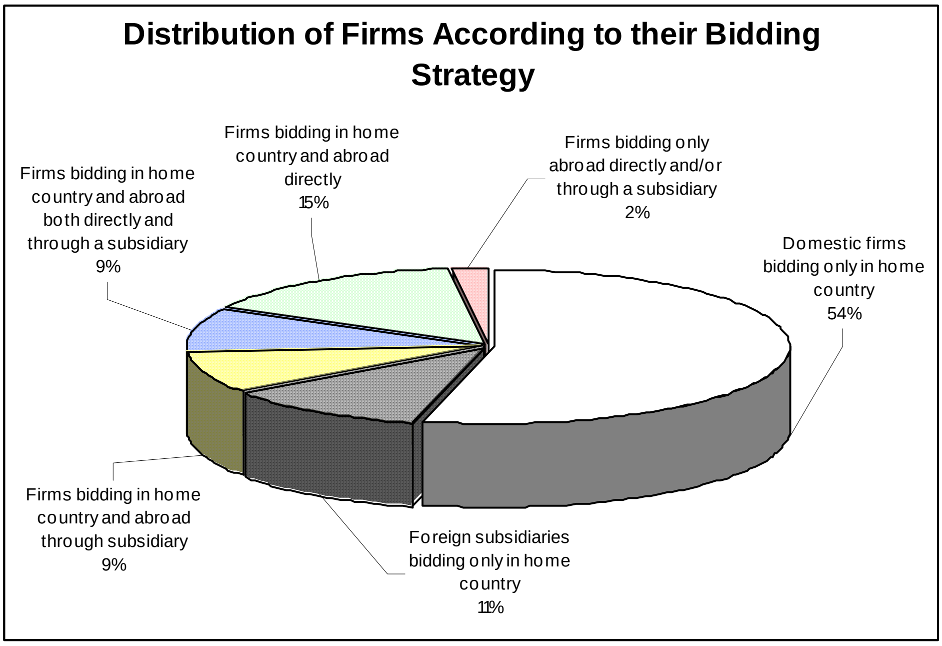
[12] Notice that we call home country the country where a firm is located, be it a subsidiary or not. This should be distinguished from the home base of the firm that is the country where the headquarters of the firm is located.

[13] The figures in this column relate to the number of times that a firm has submitted a proposal within a given category. So, if a firm has submitted more than one proposal it appears the corresponding number of times, making the total of this column greater than the number of firms who answered this question.

i. There are a considerable number of firms involved in cross-border procurement

Approximately 54% of all the firms in the sample are domestic firms bidding exclusively for contracts in their home country. This means that 46% of all firms in the sample carry out some sort of cross-border procurement activity, generally involving the use of a subsidiary. Only 15% of firms bid both at home and abroad directly. The relative extent of cross-border procurement, as reflected by the number of firms included in this sample, seems greater than suggested by the few previous surveys available until now. However, the number of firms involved exclusively in cross-border procurement is relatively low.

Figure 3



Source: Internal Market Directorate General using COWI data

Bidding abroad through subsidiaries is clearly a dominant strategy. Having a physical presence in the target market or access to some local expertise or inputs may be a necessity or an advantage if a firm wants access to public procurement markets. This would partially explain the high occurrence of this strategy. However, in so far as this is not the case, these figures would indicate that there is still considerable scope for the development of direct cross-border procurement.

The intensity of cross-border procurement is similar across sectors except for medical products and motor vehicles. International procurement activities in medical products are much more frequent than in other sectors and much less frequent in motor vehicles: 67% of firms in this sector bid for contracts in their base market only.

Across countries there are also some differences too, but they should be interpreted with caution. Table 5 shows that Spanish firms are more reluctant to bid abroad than the sample average. The share of foreign subsidiaries operating in the UK (19%) and France (16%) only is higher than average (11%), whilst in Germany it is relatively low (6%).

Table 5 Firms Submitting Proposals to Public Institutions - Compared across Countries

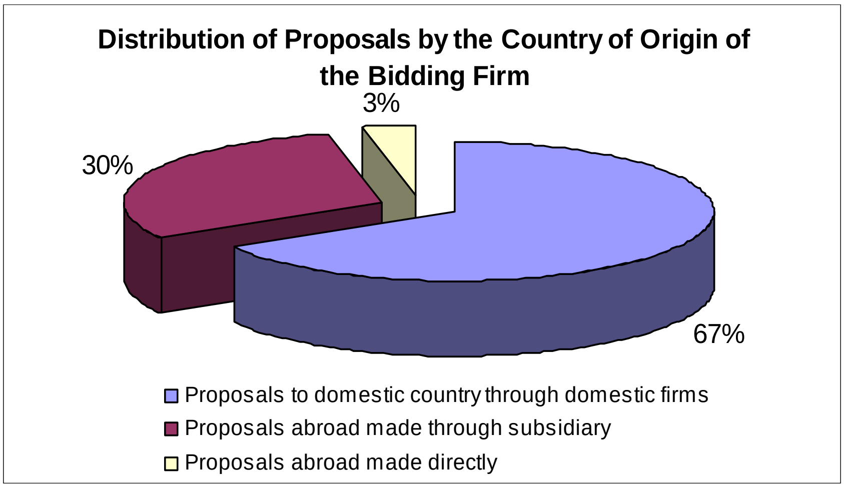
	In the Home Country		In other EU Member States
	Domestic firms	Foreign owned subsidiary firms	Both domestic and foreign owned firms bidding both at home and abroad directly and/or through a subsidiary
Austria	54%	2%	44%
Belgium	19%	12%	70%
Denmark	58%	6%	36%
France	56%	16%	29%
Germany	51%	6%	43%
Ireland	-	-	-
Spain	75%	11%	14%
UK	51%	19%	30%
Total	**54%**	**11%**	**35%**

Source: COWI Report

ii. Most proposals are still coming from domestic firms, but indirect bidding is significant

Most (67%) of the total number of bids submitted by firms in the sample are proposals submitted by "national" firms in their own home countries, 30% are proposals from subsidiaries in other countries and only 3% are direct cross-border procurement. Compared to the previous figures, these show greater "home bias", but they still reflect higher levels of cross-border procurement than previously recorded. This confirms the real importance in Europe of bidding for contracts through subsidiaries.

Figure 4



Source: Internal Market Directorate General using COWI data

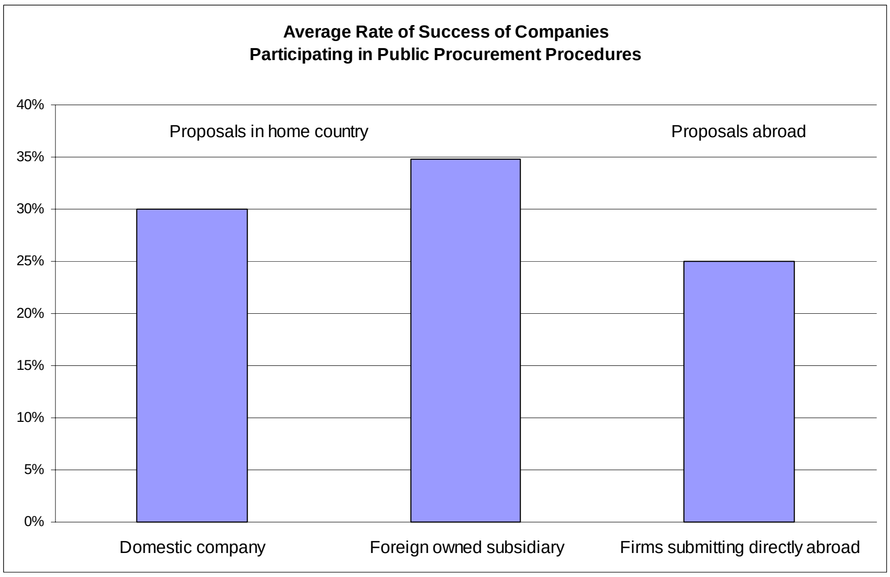
Further confirmation of this phenomenon is provided by the high bidding frequency of subsidiaries compared to domestic firms. On average, subsidiaries presented one and a half times as many proposals as domestic firms. However, when direct cross-border procurement is included, the bidding average of firms operating across borders drops significantly to around one third of the number of proposals submitted by domestic firms.

iii. There are minor differences in the success rates of domestic and foreign firms

A main objective of public procurement policy makers is to ensure a level playing field where bids from domestic and foreign firms have similar chances of success. Firms were asked to report the number of cases when they were awarded contracts after bidding. Dividing that number by the number of proposals submitted by each firm allows the calculation of the "average rate of success" for a given firm.[14]

The "average" rate of success in each category shows clearly that cross-border public procurement operations are not necessarily confronted with lower chances of success. Foreign subsidiaries bidding in the country where they are located tend to have a slightly higher rate of success than domestic firms bidding for contracts in their own home country. However, the rate of success is clearly lower for proposals submitted in a country different to the home base of the bidder. Once again, direct cross-border procurement seems to be at a disadvantage.

Figure 5



Source: Internal Market Directorate General using COWI data

All in all, these figures seem to suggest that public procurement markets are relatively open to foreign competition, especially from subsidiary firms located in countries launching invitations to tender. However, direct cross-border procurement from the home base of foreign companies is far less frequent.

[14] We then calculate the mean of those averages for each category of firms.

THE IMPACT OF PUBLIC PROCUREMENT RULES ON PRICES

The ultimate test of the effectiveness of public procurement legislation is the impact on prices actually paid for goods and services by public procurement authorities. If transparency and competition in the bidding process are increased but this does not result in lower prices and more value for money, discrimination may have been eliminated but the social benefits from more and fairer competition are insignificant.

Measuring the impact on prices of procurement rules is difficult[15]. Results from two exercises looking at the issue[16] are presented here. In both cases, the results seem to suggest that application of the procurement directives effectively reduces prices.

i. *The application of procurement directives effectively reduced the prices of goods and services purchased by a sample of 1000 public authorities*

In an exercise commissioned by the Internal Market Directorate General, 1000 contract awarding authorities were asked about the prices actually paid in 2002 for a list of carefully defined goods, services and works[17]. In practice, it was difficult to collect information about cases when EU procurement rules were effectively applied[18]. Therefore, it was decided that procurement directives would be considered to have been applied in those cases where an invitation to tender was published and at least one bidder replied. Equally, it was decided that they were not applied when there was a direct allocation of the contract without any tendering process.

A first look shows significant variation in the prices paid for the same products in different purchases by different authorities. For instance, in Figure 6, for the office supplies group of goods, 95% of prices vary from 0.5 to 5 times the EU average price. For services such as cleaning, the variation is also quite significant. Even for highly homogeneous products like fuel, the range of variation is quite large[19]. To what extent can the application of procurement directives explain these differences? And are prices effectively lower when the directives are applied?

[15] It requires collecting information on similar prices of goods actually paid by authorities (i.e. not simple catalogue prices) for comparable goods and services.

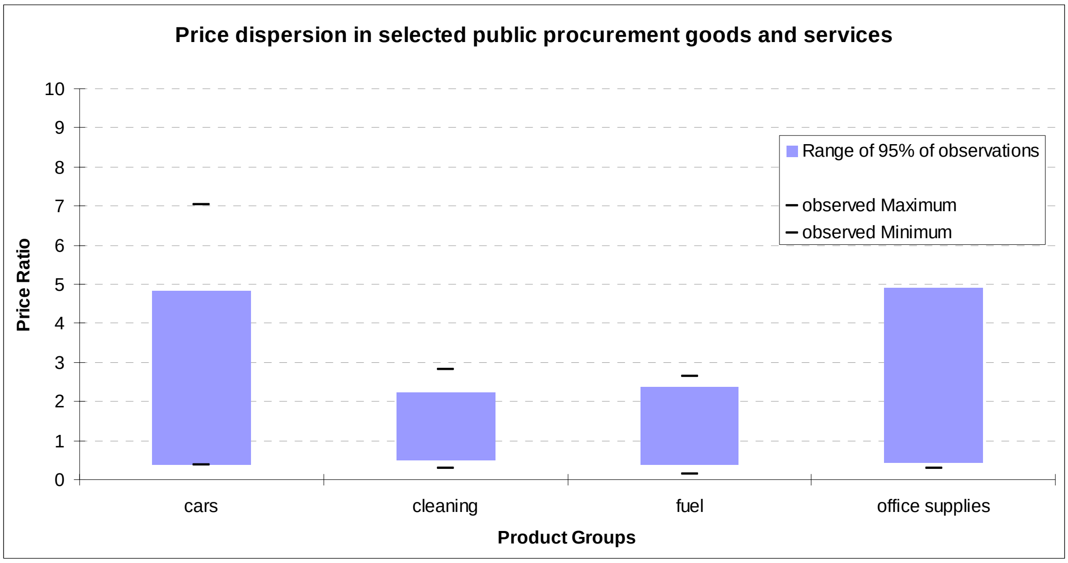
[16] The first one is based on a survey of approximately 1000 procurement authorities who were asked about the prices actually paid excluding VAT for a list of goods and services. The second one is based on intra EU trade in relatively homogeneous "typical" public procurement goods.

[17] COWI. "Monitoring Public Procurement in the European Union using Public Authorities Panel Data" Lot 2, Final report July 2003. The goods were carefully selected to avoid distortions in the measurement for prices due to qualitative differences. In addition, a quality variable was introduced to double check for quality differences.

[18] In order to isolate the impact of the application of Internal Market procurement rules, authorities were asked to indicate when EU procurement rules were applied and when national rules or no rules were applied. Respondents had difficulties in identifying exactly which rules were applied in each case. In practice, invitations to tender are always subject to compliance with national rules, whether the coordinating provisions of the Directives apply or not.

[19] It should be noted that price variation is observed not just across but also within countries.

Figure 6



Source: Internal Market Directorate General using COWI data

A first simple comparison of the means of price observations collected in this survey shows that the prices effectively paid in purchases where procurement rules were not applied were approximately 34% higher than prices when the rules are applied. This difference is statistically significant.

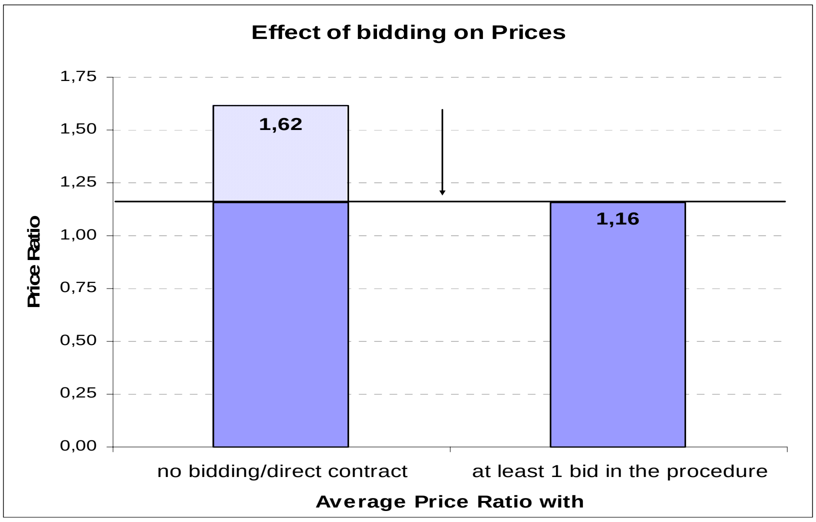
However this first evidence is not sufficient to conclude the positive impact of the procurement rules on prices. Other characteristics of the purchase have to be taken into account because they may have an influence on the price. For example, it is logical to assume that purchases of large quantities of goods lead to discounts or scale effects which may reduce the price paid per unit. Since the application of directives is compulsory for purchases above a given threshold, the lower price may be due to the larger average size of purchases when the directives are applied and not necessarily to more competition resulting from the application of the directives. Thus, a simple comparison of average unit prices may not be enough to conclude that the directives have had a positive impact on prices.

Econometric techniques have been used to control for possible interference from other factors. Several exercises conducted to isolate the impact of the application of public procurement directives suggest that the application of these rules by authorities in the sample has effectively reduced the price they paid. In addition, these exercises suggest that the price paid when the directives are not applied is around 40%[20] higher than when they are (see Figure 7). This result is statistically significant and controls for the impact of the quantity ordered and other factors. This means that even taking into account

[20] Depending on the calculation the prices paid without the directives are 40% higher than when the directives are applied (1.62/1.16); alternatively it can be said that the reduction due to the application of the directives is almost 30% (subtract 1.62 from 1.16 and divide the result by 1.62).

differences in the order of magnitude of the purchase, open competitive bidding for public procurement as required by the directives is, as expected, an effective cost-cutting measure.[21] Quantity also has the positive impact expected: public institutions which ordered an amount 25% larger than the average paid on average approximately 7% less per unit.

Figure 7



Source: Internal Market Directorate General using COWI data

The COWI study also includes an econometric exercise to identify the explanatory factors behind the differences in prices paid in procurement purchases within the same country[22]. The study concludes that:

- once again, prices are lower in those cases where there are one or more tenders than in those cases where there is a direct purchase;

- there seems to be a U-shape relationship between the prices paid and the level of government: local and national institutions pay relatively higher prices than regional authorities;

- the level of professionalism and the organisation of the purchases have an important influence on the prices that public institutions pay for goods and services. Public institutions with a purchasing department that centrally organises the public procurement for the institution pay on average slightly lower prices;

[21] The impact of having more than one bid on price reductions appears particularly significant in the acquisition of goods. Some country differences also appear to be significant in some econometric specifications, but this may be due to country specific factors not linked to differences in the application of procurement rules.

[22] The results reported above correlate number of bids, quantity and other possible explanatory variables with the dispersion in procurement prices with respect to the EU average price for each good and service. The COWI price dispersion is measured with respect to the national average price.

- firm size and the domestic or foreign nationality of the firm to which the contract is awarded do not seem to have any significant effect on the price actually paid.

A corollary: changing the thresholds

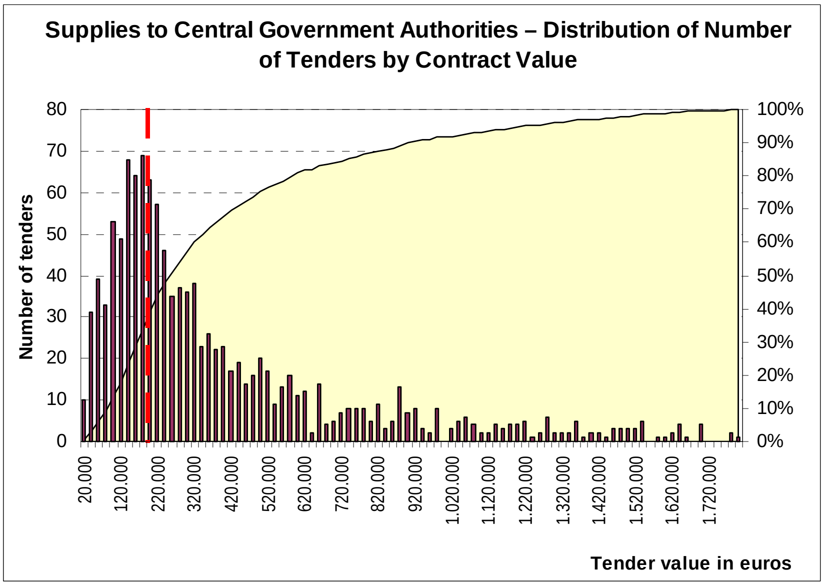
One of the features of the public procurement directives is that their application is compulsory when public authorities launch invitations to tender for contracts with an expected value above pre-established thresholds. Since 2004, these thresholds range between approximately €150.000 for public supplies and service contracts and roughly €6.000.000 for works. There are various justifications for the thresholds:

- first, procurement procedures entail compliance and administrative costs for the public institutions and tendering costs for the bidding firms. If the value of the contract is relatively low for the type of purchase in question, it is assumed that the potential benefits from greater competition do not compensate for those costs;

- in addition, increased transparency in procurement markets may not result in greater cross-border competition if the value of the contract does not make it worthwhile for foreign firms to tender and cover the additional costs that cross-border provision necessarily implies.

It has been argued that the current thresholds should be raised. Evidence presented above suggests that this will result in higher procurement prices especially if their mere existence has a significant effect on the procurement behaviour of public institutions launching invitations to tender. If public authorities do tend to organise tendering in ways that avoid the application of EU procurement rules, it seems unwise to increase thresholds as the 40% price mark-up could be applied to a large number of purchases.

Figure 8



Source: Internal Market Directorate General

Figure 8 shows that the threshold has an influence on the distribution of invitations to tender by value or size. Administrations and institutions tend to comply with the directives by concentrating a large number of purchases just below the threshold for each kind of operation and thereby avoiding procedural costs and publication. This suggests that if thresholds are raised less invitations to tender would be published and the prices paid by authorities for goods and services may be higher than necessary.

In addition the new legislative package and other Community initiatives in this area for the introduction of electronic procurement are intended to reduce compliance costs. In this context, claims to raise thresholds are hard to justify.

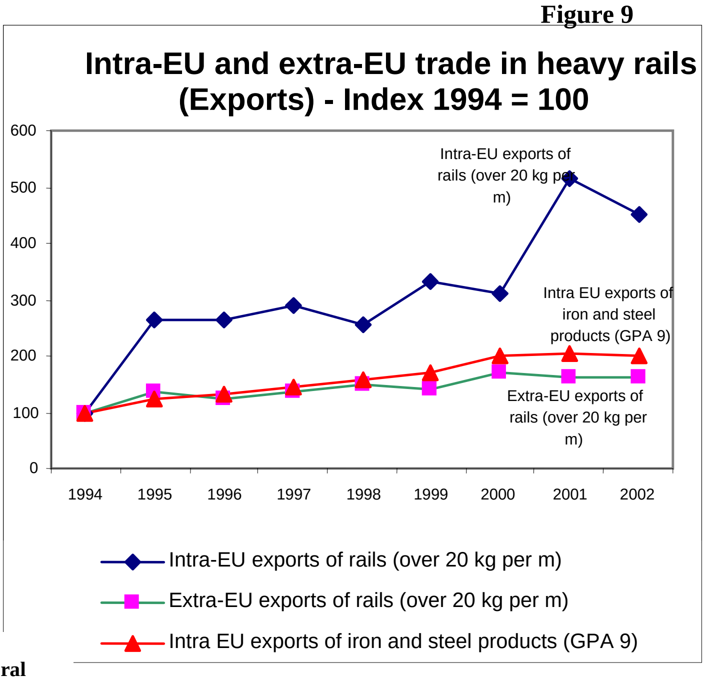
ii. Evidence shows that the export price of comparable procurement goods converged after the introduction of procurement directives

Analysis has also been undertaken of intra EU trade flows for seven goods that can be considered as "typical" public procurement goods, i.e. goods that are mainly purchased by public authorities. Relatively homogeneous goods were selected in order to facilitate price comparisons. These goods are preparations for X-ray examinations, iron or steel railway rails, smaller rails for trams, iron and steel seamless pipes of a kind used for oil or gas pipelines, fire fighting vehicles, railway tank wagons and syringes for medical usage.[23]

Apart from one case (syringes), the progressive introduction of directives since the mid 1990s seems to have had a similar effect on these goods. The graphs below illustrate the results for iron or steel railway rails (heavy rails).

- Although trade has varied depending on the evolution of sector specific factors, in general, intra-EU trade for these goods seems to have expanded relatively faster than extra-EU trade for the same product category and trade for related goods that are largely traded between private parties only. This would seem to suggest that the introduction of the procurement directives has contributed to foster trade in these products among Member States, effectivelv

Figure 9



Source: Internal Market Directorate General

[23] The analysis has been carried out using EUROSTAT COMEXT data for eight digit product categories CN 30063000, CN 73021031, CN 73021039, CN 73041090, CN 87053000, CN 86061000 and CN 90183110.

opening those markets to competition within the EU.

- Export and import prices[24] for these goods have converged over time eliminating price differences. In the case of heavy rails, this convergence has been fairly steady – from over 15% in 1988-92 to 12% in 1998-2002.[25] For small rails the price convergence was more pronounced – from 21% in 1988-92 to 7% in 1998-2002. This suggests that, at least for these products, the introduction of the directives has been followed by progressive cross-border market integration in these mainly public procurement markets.

Figure 10

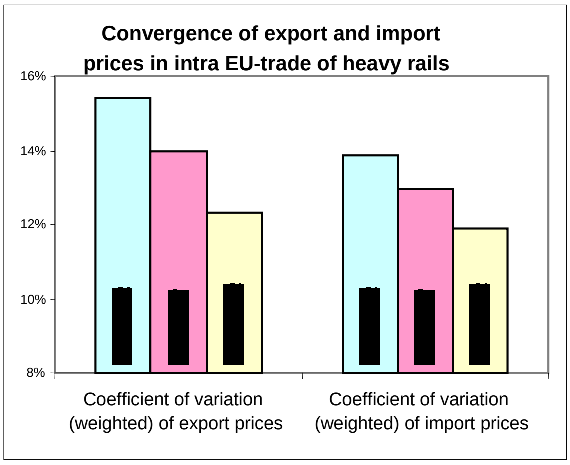


Figure 11

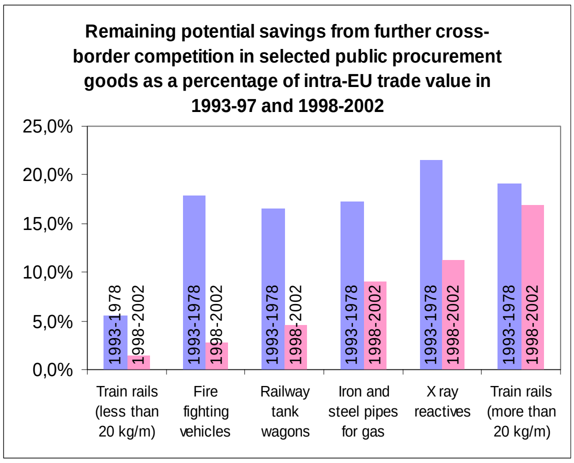

Source: Internal Market Directorate General

- In spite of this price convergence, the analysis of trade flows suggests that there are still further possibilities for savings in these markets. Figure 11 shows the potential savings as a percentage of the actual value of imports that could have been achieved if trade had occurred at the second lowest export price instead of the actual export price. For just these six goods, this could have accounted for almost 12% of the total value of intra-EU trade in these goods in 1998-2002 (over 400 million euros).

- Potential savings are much lower now than before the introduction of the directives and this is further evidence of their positive impact on the performance

[24] Actually, these are export and import unit values.

[25] Both weighted and unweighted coefficients of variation have been calculated to take into account the relative importance of exports to different EU destination from each Member State. The results hold with very minor variations in both cases. Bilateral differences in export and import unit prices have been calculated and they suggest that the possibilities for cross-country price discrimination have been reduced. Given that these are relatively homogenous goods, these results can hardly be explained by increased homogeneity in the composition of exports and imports.

of these markets. Nevertheless, the remaining potential savings are still quite important.

OTHER DIMENSIONS OF MARKET PERFORMANCE

The Commission also considers other dimensions of the performance of public procurement markets. These include access to these markets by SMEs; the consideration of environmental and social issues; and transaction costs.

i. Public procurement and SMEs

Most public procurement contracts are awarded to SMEs. Two recent Commission studies with different objectives and methodologies show similar results in this regard. A study conducted for the Enterprise Directorate General using TED-MAPP data shows that approximated 78% of the successful enterprises awarded contracts in 2001 were SMEs[26]. A study for the Internal Market Directorate General shows that the SMEs have a significantly higher success rate than large enterprises.

However, it is difficult to assess market performance in this area. Some may argue that although SMEs win a higher share of all public procurement contracts awarded, these firms represent a still higher share of the total number of firms in the market. Others may argue that although SMES represent 99.8% of the total number of firms in the Union, by the nature of their activities, they tend to be less active in procurement activities than in the economy as a whole.

For these reasons, it is more useful to present additional factual information on the situation of SMEs in public procurement markets here rather than to try and issue an overall assessment.

- Although the overall success rate of SMEs is higher, their chances of success in cross-border procurement are much lower. SMEs acting as subsidiaries of foreign firms still have a high rate of success but the difference with respect to large enterprises is not very significant in statistical terms. In the case of direct cross-border procurement it is not significant.

- Sectoral differences have an important influence on the access of SMEs to procurement contracts. They are particularly well represented in the construction sector and less so in the business services sector.

- As one would have expected, SMEs have relatively easier access to contracts with local authorities.

[26] European Commission "SMEs access to public procurement", Brussels 2003, published on the website http://europa.eu.int/comm/enterprise/entrepreneurship/craft/index.htm

ii. Environmental[27] and social issues

Environmental and social issues have been the subject of increasing attention in the context of public procurement rules. In 2002, two Communications provided detailed information on the views held by the Commission on the consideration that should be given to these important issues.

The recent studies commissioned by the Internal Market Directorate General[28] on the performance of public procurement markets shed additional light on these matters.

- First, firms included in the sample report that they find environmental clauses in the public tenders to which they submit proposals approximately 40% of the time. There are no perceptible differences across countries and this frequency does not seem to be affected by the application of EU directives.

- In addition, the analysis of prices reported by public authorities seems to suggest that introducing environmental clauses does not increase the prices actually paid for the supplies, services or works.

- Firms report that social clauses are less frequently found in tenders (around 20%). However, they are more frequently found in Denmark, especially when EU directives are applied.

- There is some evidence suggesting that the introduction of social clauses results in slightly higher prices actually paid by authorities.

iii. Transaction costs in public procurement markets remain significant

The above discusses the different sources of benefits found in public procurement markets as a result of the directives. However, any evaluation of market performance must also take into account the costs of operating in these markets for firms and authorities. There are costs associated with making procurement markets more transparent and competitive. Transaction cost minimisation is essential to ensure good market performance.

The two studies[28] recently carried out for the Internal Market Directorate General of the European Commission include comments from firms and authorities. These comments reflect concern for the relatively significant costs incurred by both firms and authorities in complying with procurement rules.

Although some firms reported an improvement in transparency in public procurement, many considered that their chances were still not equal when bidding from abroad. All firms emphasised that formal procurement procedures were costly due to the paperwork

[27] For additional information see the study commissioned by the Environment Directorate General to ICLEI "State of Play of Green Public Procurement in the European Union", Final report, Freiburg, July 2003, published on the website www.iclei.org/ecoprocura/network.

[28] See footnotes 9 and 17.

required when submitting a tender. In particular, they complained about the amount of non-bid related information required by the authorities.

There are some nuances on the comments depending on their nationality. German and Austrian firms were particularly negative. They complained about excessively strict specifications that effectively excluded some competitors from the process. They also argued that the importance given to price may be disproportionate and that in the long run, the cheapest bid could be more expensive for the purchasing institution, especially with regard to technical products.

British, Austrian and German firms were more aware of EU directives regulating procurement markets. British firms usually commented positively on environmental clauses, while firms from other countries had mixed views. Only Spanish firms complained about payment delays.

Comments varied significantly across firms of different size. Firms with 50 or more workers felt that electronic media and e-procurement were the solution to the heavy procedural costs involved in bidding. Very small firms did not mention electronic solutions as a way out of the problems they faced in these markets.

Authorities also found procurement procedures too complicated and relatively inflexible, particularly as regards price negotiations. Spanish authorities were relatively more positive towards EU procurement rules. Although some firms openly acknowledged that rules were "necessary in order to prevent manipulation and corruption", many considered that excessive procedural requirements resulted in "competitive formalism".

Some firms mentioned that the existence of different directives for different types of procurement activities (works, supplies, services) complicated tendering processes. They welcomed proposed changes in the new procurement legislation package.

Authorities in several member states also pointed out that the new legislative package was likely to contribute to solving many of the problems raised by firms and authorities in the surveys. The significant procedural simplifications that it will bring about and the important effort to consolidate rules should result in lower costs and cuts in red-tape.

In addition, Community efforts to improve the use of e-procurement in line with Internal Market rules should result in further cost reductions to firms and authorities. E-procurement can increase transparency and procedural efficiency without prejudice to competition. This should allow for easier cost comparisons and examination of tenders.

However, the costs associated with the introduction of e-procurement should not be underestimated either for firms or authorities. In particular, the up-front costs of shifting to an electronic procurement system may become an obstacle for smaller firms. Moreover, it is necessary to ensure that national uncoordinated e-procurement solutions do not "fragment" the market.

For these reasons, in 2004 the Commission will present an Action plan for the introduction of coordinated e-procurement in the EU aimed at reducing procurement costs and contributing to further integration in procurement markets.

Sector-specific measures: the case of the Healthcare sector

Sector-specific measures can contribute to improvements in the performance of some procurement markets. A recent paper by the CEN presents an analysis of the potential for savings and improved productivity in the use of resources in public tendering in the field of EU healthcare expenditure. This is the result of a workshop on hospital procurement and e-commerce for the Healthcare sector in January 2002.

EU Member States spend between 5% and 10% of GDP on healthcare. In absolute terms, this spending has been increasing for many years and all Member States are experiencing growing pressure on their health services. This trend is likely to continue in the future due to: demographic developments; the population's growing expectations of the quality of healthcare; and the complexity of new medical technology.

Although standardisation for purchasing and logistics systems across Europe could contribute to better control pricing and quality in all aspects of the purchasing cycle, it is only realistic to focus on a few processes within the cycle. Public tendering processes across Europe have much in common, as illustrated by the experiences of the European Generic Article Register project (EGAR) over the last year and a half. Tendering utilises significant resources and the project found the lack of standards to be universal[29]*.*

The potential for savings and improved productivity in the use of resources for public tendering is great. The EGAR project found that in Norway, the use of a generic register improved the tendering process and communications between purchasers and suppliers significantly. Lack of standards such as correct article descriptions and information, created a significant and often unnecessary workload for trading partners. Within the tendering processes significant benefits were obtained through the use of more automated tender solutions based on generic standards. Based on experience from Norway EGAR benefits should include:

- *workload reduction of more than 50% in creating and evaluating tenders;*
- *quicker responses to suppliers and shorter contract negotiations;*
- *price reductions between 10 and 25 % depending on product areas;*
- *more accurate basis for ordering systems;*
- *one generic number and article description relating to one or more actual articles from one or more suppliers;*
- *improved statistics based on the generic article level;*
- *significantly reduced transaction costs;*
- *greater compliance with EU rules by public purchasers; and*
- *a more open environment and improved interaction between hospital buying departments and suppliers due to the standardisation at generic level.*

[29] In a sense but on a different scale, the common procurement vocabulary (CPV) has the same purpose of reducing costs by standardising the nomenclature.

CONCLUSIONS

There is overwhelming evidence showing that the procurement directives have contributed to increased transparency in public procurement markets. The new evidence, based on a sample of firms and public authorities, suggests that increased transparency has effectively resulted in more cross-border competition, price convergence and lower prices for goods and services purchased by public authorities.

Therefore, it seems reasonable to conclude that when effectively implemented the current legislative public procurement package actually contributed to reform the public procurement environment.

Most importantly, this evidence shows that economic reforms work and pay off. It is important to show this in a clear and thorough manner at a time when new economic reform proposals are being discussed.

Of course, problems remain and the new legislative package should reduce transaction costs. E-procurement offers new possibilities for cost reductions. If promptly adopted and effectively implemented by Member States, these measures will contribute to improve still further the performance of our public procurement markets.

10. Providing more and better information 31

Part C: Getting the best out of the enlarged Internal Market 33

Part D: Building the Internal Market in an International Context 35

Part E: Monitoring 37

Conclusion 38

Introduction

This Strategy sets out what the European Union needs to do over the next three years to derive maximum benefits from the Internal Market after enlargement. The Commission has already described the achievements of the Internal Market over the last decade[1]. This analysis shows the significant benefits that a properly functioning Internal Market can and does bring, but it also shows that the Internal Market does not yet function optimally in a number of ways and that sizeable benefits are therefore being missed. A fresh impetus is required to eliminate remaining weaknesses and allow the Internal Market to deliver its full potential in terms of competitiveness, growth and employment.

Part A : Context

1. The role of the Strategy in the EU's economic reform process

The European Council of 20 and 21 March 2003 recognised the importance of the Internal Market Strategy as one of the key economic policy co-ordination instruments at EU level, alongside the Broad Economic Policy Guidelines (BEPG)[2] and the Employment Guidelines (EG)[3]. The actions set out in the Internal Market Strategy must therefore be seen in conjunction with the actions suggested in the BEPG and the EG[4]. All three of these instruments have been streamlined and given a three-year perspective in order to ensure a more comprehensive, efficient and coherent approach to economic reform in the EU[5].

The Internal Market Strategy will be an important input into the new Competitiveness Council. In addition, the Commission is presenting a number of other policy documents which are relevant to competitiveness, including the Communication on Industrial Policy in an Enlarged Europe[6], the Green Paper on Entrepreneurship[7], the Communication on Innovation Policy[8], and "Investing in Research: an Action Plan for Europe."[9] This will allow the Competitiveness Council to consider the relationship between the different strands of its work and enable it to set the overall framework for competitiveness, as requested by the European Council.

[1] The Commission estimates that the Internal Market has delivered 2.5 million extra jobs and nearly €900 billion in extra wealth. See "The Internal Market – Ten Years without Frontiers", SEC(2002) 1417 of 7.1 2003.

[8] COM (2003) 112 final of 11.3.2003.

[9] COM (2003) 226 of 30.4.2003.

This Strategy should also be seen as a response to the European Parliament's recent report on the Internal Market Strategy[10]. This report stressed that improving the functioning of the Internal Market should be a top priority for the Union and called for a major new initiative to speed up the delivery of key reforms.

2. Why a new Strategy now?

The Commission sees **three main reasons why the EU needs to make a determined push now to improve the Internal Market**: -

– The sub-optimal performance of the Internal Market is one of the challenges that stands between the EU and the **realisation of the ambitious objective it set itself at Lisbon in 2000**. It is necessary to take decisive action quickly. We know that it can take several years before adopted measures produce real impacts on the ground. In order for the EU to become the most competitive and dynamic knowledge based economy in the world by 2010, the measures needed to create a genuinely unified and integrated market must be adopted very soon.

– It is urgent to develop an effective strategy to strengthen the Internal Market, because **enlargement is only a year away**. Enlargement offers unprecedented opportunities for both existing and new Member States, but it is not without risks. The Internal Market is perpetually vulnerable to fragmentation and enlargement will be a moment of heightened vulnerability, unless we strengthen all our key policy instruments and concepts so that they continue to work well, or better, in a Union of 25 countries[11]. Only then can the potential gains which enlargement offers be realised.

– The EU, in common with other parts of the world, is currently facing a slowdown in economic growth and job creation. This makes it all the more essential to press ahead with **structural reforms in order to increase the capacity of our economies to grow**. Removing the bottlenecks in the Internal Market will put Europe in a much better position to face up to the ever stiffer competition from emerging economies. It will also leave the Union better protected against future fluctuations in the economic cycle and provide it with a stronger economic basis to deal with the **huge challenges of an ageing population**.

3. A more focused approach

When adding a few extra floors to a building - which is what enlargement will do to the EU - it is essential to ensure that its foundations are sufficiently strong. The Strategy, therefore, **focuses very firmly on strengthening the "basics" or "fundamentals" of the Internal Market**; removing obstacles to trade in goods and services, ensuring that agreed rules are correctly implemented and effectively enforced, cutting red tape, tackling tax barriers, expanding procurement opportunities.

The problems to be tackled are in many cases old ones that have resisted earlier attempts to solve them. But covering familiar problems does not mean "business as usual". The Commission is putting forward some fresh ideas and calling for stronger political determination to deliver results for both business and consumers.

[10] Harbour Report, A5-0026/2003.

[11] 28 with the EEA countries.

Not all the proposed actions, of course, are new. Much vital work is already in the pipeline and in some cases already well advanced (for example, the Financial Services Action Plan, the political agreement on a Community Patent) and this Strategy calls for their early adoption or completion. Other proposed actions are outlined here but will need to be the subject of further examination and impact assessment before the Commission is able to make concrete proposals. Yet other actions are for the Member States themselves to implement. Further detail on all the proposed actions, including the timetable, can be found in the annex[12].

4. A shared agenda

As the Internal Market's regulatory framework takes shape, the emphasis is shifting towards the Member States who have to make the Internal Market work in practice – on a daily basis. The Internal Market belongs to them – not the Commission. It is they who must implement Internal Market law promptly and correctly, inform their citizens and businesses of their rights, and resolve problems as and when they occur. It is they who must act according to the letter and the spirit of the Internal Market, refraining from putting in place national laws which conflict with Internal Market principles. To fulfil their role successfully, they must co-operate more closely amongst themselves and with the Commission.

In order to be effective, therefore, this Strategy must be viewed not just as a Commission document, but as a shared agenda, behind which the Council, the European Parliament and the Member States (existing and new) can all throw their weight.

The new Constitutional Treaty, which will emerge from the Inter-Governmental Conference, will define the relationship between the different EU institutions and between the EU and the Member States. It is essential that this Treaty continues to provide a robust legal basis for the further development of the Internal Market, so that it can go on serving Europe's interests and empowering our citizens and businesses.

[12] The actions are classified in the annex according to three types: type 1: early adoption or completion; type 2: for further examination and discussion; and type 3: for Member States to implement.

Part B: Priorities

1. FACILITATING THE FREE MOVEMENT OF GOODS

a) Assessment

Trading goods across borders within the EU still remains more costly and complex than doing business within a Member State. When selling abroad, companies sometimes have to have their products re-tested or even modified in order to meet local requirements. The intensity of controls and market surveillance varies from Member State to Member State. Substandard products may slip through the net and be bought by consumers who have the right to expect high health and safety standards for all products on the market.

Free movement of goods (and services) in the Internal Market is above all based on confidence. Confidence of businesses that they can sell their products on the basis of a clear and predictable regulatory framework. Confidence of Member States' administrations that the rules are respected in practice throughout the EU and that the competent authorities in other Member States will take appropriate action when this is not the case. And, of course, consumers' confidence in their rights and that the products they buy are safe and respect the environment.

With the EU increasing in size and diversity after enlargement, confidence in the operation of the existing legal framework for the free movement of goods needs to be further strengthened. This can best be done by putting in place a number of disciplines which will make the rules more transparent and more predictable and which will encourage national authorities to have more confidence in each other's methods and assessments. This is not always glamorous work – but it must be done to foster intra-Community trade and harvest the advantages of economies of scale and specialisation.

Technical obstacles continue to frustrate cross-border trade in goods:

- Trade with third countries has been growing faster than trade between Member States in recent years and the convergence of prices between the Member States has more or less ground to a halt.[13]

- 75% of businesses think that removing technical barriers to trade in goods and services should be a top priority for the Union.[14]

- Almost one in five Swedish companies encounter barriers to trade. 85% choose to get round the problem by adapting their products to comply with the rules in the receiving country.[15]

- Technical regulations and conformity assessment are the biggest headache for Spanish businesses – accounting for half of all problems encountered.[16]

- The average time needed to adopt European standards increased from 4.5 years in 1995 to about 8 years in 2001[17]. Only 22% of the 600 standards needed to create a genuine Internal Market for construction products have been adopted more than a decade after the Construction Products Directive entered into force[18].

- Non-application of the mutual recognition principle cut trade inside the EU by up to €150 billion in 2000[19].

[13] 2001 and 2002 Reports on the functioning of Community product and capital markets, COM (2001) 736 of 7.12.2001 and COM (2002) 743 final of 23.12.2002.

[14] Internal Market Scoreboard No. 11, November 2002.

b) Actions

1. **Mutual recognition** is a corner stone of the Internal Market It enables products to circulate freely on the basis of conformity with the national laws in the Member State where the product is first marketed. The principle is that there are no specific procedural rules and no extra paperwork. This is its strength, but at the same time its weakness. When problems occur, there is little or no transparency, there is no commonly agreed approach to evaluating whether levels of protection are equivalent and there is no clear procedure for a company to challenge a negative decision. As a result, many companies decide to abandon certain markets or are forced to modify their products to comply with local requirements. Such responses risk becoming more widespread after enlargement.

The Commission, therefore, takes the view that specific rules are needed to give mutual recognition more structure so as to enhance transparency and to encourage national authorities to act more 'European'. The Commission believes this could best be achieved by means of a new Community Regulation establishing key principles. These could include mandatory notification in cases where mutual recognition is refused, the possibility for companies to demonstrate that the disputed product is indeed lawfully marketed elsewhere in the EU by means of a standard certificate and possibilities for appeal. Before making a proposal, the Commission will consult widely with the Member States, industry and other interested parties on the different options.

2. In more complex or sensitive areas, mutual recognition is not enough and the only way to remove barriers is to harmonise national rules at EU level. While this is sometimes achieved through detailed, technical legislation, in certain sectors, a simplified regulatory alternative is used, known as the **"New Approach."** Developed in 1985, this limits legislation to establishing the mandatory essential requirements that products must meet, leaving manufacturers free to choose to apply either the appropriate European standard or any other technical specifications which meet these essential requirements.

The New Approach has been a successful tool for the development of the Internal Market but some of its features need strengthening, particularly in view of enlargement. This includes improving conformity assessment procedures, strengthening administrative co-operation and market surveillance to ensure that effective action is taken when products do not meet the essential requirements and improving understanding of CE-marking. There may also be a case for expanding the use of the New Approach to sectors not yet covered as a means of improving and simplifying legislation.

These ideas are set out in a Commission Communication on "Enhancing the Implementation of the New Approach Directives", which is being issued in parallel with the Internal Market Strategy. One of the options being considered is the introduction of a common base Directive, including standard articles on horizontal issues common to all New Approach Directives. This

[18] See footnote 14.

[19] 2001 Report on the functioning of Community product and capital markets, COM (2001) 736 of 7.12.2001.

approach would strengthen consistency between New Approach Directives and ensure more effective implementation.

3. **European standards** play a particularly vital role in the implementation of New Approach Directives. Currently, it takes far too long to develop standards. The European standardisation organisations and industry must work together to speed up the process. There is also a need to ensure quality[20] in the production of standards and their uniform transposition into national standards, including in the new Member States. The promotion of European voluntary marks needs to be reinforced, since nationally controlled marks may have a fragmentary effect. The Commission will ensure implementation of these aims, in particular through partnership and performance contracts that it will sign with the European standardisation organisations in 2003. The aim is to link Community financial support for these organisations to clear performance criteria.

4. In order to ensure that economic development is **sustainable**, the EU has established minimum requirements for the quality of air and water and the reduction of waste. Clearly, success in meeting these requirements will depend on our ability to limit the impact of products on the environment – i.e. the impact of both their production and their use. The EU needs to provide industry with a coherent and flexible regulatory framework which does this effectively - and which at the same time is not detrimental to competitiveness and free circulation within the Internal Market. Otherwise Member States will seek to meet EU environmental requirements by adopting their own national technical rules which can create new barriers to trade.

In response to this challenge, the Commission has already adopted proposals to introduce environmental requirements into some items of Internal Market legislation[21]. In addition, it will shortly adopt an innovative proposal for a framework Directive on the Eco-design of products. These Directives will need to be adopted and implemented. They are in line with the principles of Integrated Product Policy[22] for which the Commission will set out the next steps shortly. Standardisation also has a role to play here. A better integration of environmental requirements in technical standards can help to reduce the impact on the environment of products and also reduce the development of national environmental legislation. A Communication on this issue is scheduled for adoption by the end of the year.

5. Consumer confidence in **product safety** relies on effective market surveillance and consistent enforcement across the EU by competent authorities, as well as fulfilment by producers and distributors of their obligations. The safety of consumer products is regulated by sectoral Directives and the General Product Safety Directive (GPSD), which has been recently revised and reinforced. The Commission will seek to ensure compliance with the requirements of this Directive, through the development and revision of European standards, and will report on its application by 2006. In addition, the Commission intends to present a legislative proposal on unfair commercial practices to improve consumer protection and the functioning of the Internal Market (for goods and services).

[20] There is also a need to increase the participation of all interested parties, particularly representatives of SMEs, in the drafting of standards.

[21] See, for example, the Commission proposal for a Directive of the European Parliament and the Council modifying Directive 94/25/EC on the approximation of laws, regulations and administrative provisions of the Member States relating to recreational crafts, COM (2000) 639 final, OJ C 62E, 27.02.2001, p.139.

[22] Green Paper on Integrated Product Policy, COM (2001) 68 final of 7.2.2001.

A more coherent European contract law would also facilitate intra-EU trade and will make it easier for consumers to reap the benefits of the Internal Market. Steps to promote convergence of national contract laws will be pursued through the Action Plan on European Contract Law.[23]

6. In the **automotive sector**, the EU Whole Vehicle Type-Approval system applies to both passenger cars and motor cycles on a mandatory basis. This system has a number of advantages. Once a car or a motor cycle is type-approved in one Member State, it can be registered and put on the market anywhere in the Community without further testing. This reduces costs for industry and prevents the re-emergence of barriers in the Internal Market. The system now needs to be extended to other types of vehicles, particularly trucks, vans and lorries.

[23] COM (2003) 68 final of 12.2.2003.

2. INTEGRATING SERVICES MARKETS

a) Assessment

Considerable differences in regulation from one Member State to the next – and the lack of confidence in each others' regulatory systems - are the main reason why free movement of services has so far been more a legal concept than a practical reality. Because of the complex and intangible nature of many services - and the importance of the know-how and qualifications of the service provider – they are generally subject to more wide-ranging and complex legal rules than goods.

The picture is not entirely bleak. In financial services, action is well underway – with 32 of the 42 measures foreseen in the Financial Services Action Plan (FSAP) already adopted. However, structural changes, new business models and constantly evolving risk patterns pose new challenges for financial regulators and supervisors. Furthermore, new regulatory bottlenecks have been uncovered, e.g. in the area of clearing and settlement, which constitute the arteries of the financial system. Particular attention will also need be devoted to identifying regulatory barriers which are acting as a brake on trade and competition in markets for those retail financial services which are tradable.

Many other services sectors – such as tourism, distribution, construction, engineering and consultancy, certification and testing services or employment agencies - have not been subject to a comprehensive Internal Market policy. There are different ways of providing these services. While some can be provided at a distance thanks to new information and communication technologies, many still require the permanent or temporary presence of the service provider in the Member State where the service is delivered. For some services, such as distribution, establishment in the target market remains the key commercial strategy. However, these different ways of service provision are all hampered by a variety of legal and administrative barriers[24].

These barriers affect all stages of the business process – from the initial establishment of the business and the use of inputs, such as labour and equipment – right through to promotion, distribution, sales and after-sales activities. They result in considerable extra costs for companies doing business between Member States. This leads to a waste of resources, limiting innovation and differentiation of services. Some companies are deterred from trading across borders at all – particularly SMEs – which are prominent in service industries. This limits competition and consumer choice and keeps prices higher than they need to be. And it prevents the full job creation potential of the service industries from being realised.

It is still very difficult to provide services across borders:

- Services account for for just 20% of trade in the Internal Market, which is less than a decade ago.
- There is an enormous growth potential in most of the Accession Countries where services represent between 56% and 70% of the economy[25] and 54% of total employment[26].

[24] See the report from the Commission to the Council and the European Parliament on the State of the Internal Market for Services (COM (2002) 441) presented under the first stage of the Internal Market Strategy for Services (COM (2000) 888).

[25] Data from the Commission's 2002 Regular Reports on the Candidate Countries' progress towards accession (the figure for Cyprus is 77%).

[26] Commission Report on "Employment in Europe 2002 – Recent Trends and Prospects".

- Nearly 90% of all SMEs in the EU are in service industries[27].
- 40% of business service providers say that eliminating barriers to cross-border trade would increase their sales by up to 20%[28].
- There is plenty of anecdotal evidence on the costs of barriers: one software company spent over €6 million p.a. on the administrative costs associated with moving its staff between Member States; a retail bank paid €19,000 in legal fees before it could run a promotional campaign in two Member States[29].
- In financial services, recent estimates show that further integration could add €130 billion to EU GDP over ten years and boost employment by 0.5%.[30]

b) Actions

1. The Council and Parliament should adopt the proposed **Regulation on Sales Promotion**, which will facilitate trans-European promotional campaigns, and the **Directive on the recognition of professional qualifications**. The latter aims to promote mobility of skilled professionals, including for temporary provision of services in the 'host state' on the basis of compliance with 'home state' rules, thus enhancing consumer choice and ensuring competitive pricing of professional services. Member States must then transpose it correctly and on time and ensure that it is properly applied and enforced.

2. The Commission will make a proposal for **a Directive on services in the Internal Market** before the end of 2003. This Directive will establish a clear and balanced legal framework aiming to facilitate the conditions for establishment and cross-border service provision. It will be based on a mix of mutual recognition, administrative co-operation, harmonisation where strictly necessary and encouragement of European codes of conduct/professional rules.

The Commission will also issue a Communication on the competitiveness of business-related services and their contribution to the performance of European enterprises, setting out non-legislative measures designed to complement the Directive. These will include the development of European standards and measures to improve the statistical coverage of services sectors.

3. Subject to the results of a feasibility study, the Commission intends to propose the **extension of the screening mechanism for draft national technical regulations**[31], to cover services, besides information society services (already covered). This is intended to act as a brake on the creation of new Internal Market barriers in services.

4. The Commission will ensure appropriate follow-up to its report on the **safety of services for consumers** which envisages the introduction of a legislative measure designed to monitor and support national policies and measures in this area.

[28] From a survey on business services carried out for the Commission. See the statistical and technical annex to the 2002 Report on the functioning of Community product and capital markets.

[29] See footnote 24.

[30] "Quantification of the macro-economic impact of the integration of EU financial markets", London Economics study for DG Internal Market.

[31] This will require an amendment to Directive 98/34/EC.

5. The Council and Parliament should adopt the remaining FSAP measures, notably the **Prospectus Directive** and the **Investment Services Directive**, and conclude the first reading on the **Transparency Directive** before the end of the current legislature.

6. The Commission will make the final proposals provided for under the FSAP, including a new **Capital Adequacy Directive** (in early 2004).

7. The Commission will also publish a **Communication on clearing and settlement** in the second half of this year setting out the steps needed to achieve a single European payments area and to facilitate cross-border share trading. This Communication will raise the possibility of establishing an EU-level regulatory framework underpinned by Community legislation.

8. The Commission will consult widely on **completing and further developing the FSAP**, with particular focus on creating a single market in retail financial services. The Council and Parliament should adopt the **Consumer Credit Directive** to enable progress towards an effective single credit market.

3. ENSURING HIGH QUALITY NETWORK INDUSTRIES

a) Assessment

The "network industries" are vitally important for our quality of life and the well being of all EU citizens. They are also key inputs for EU industry and therefore have a determining effect on our international competitiveness.

Over the past ten years, there has been a significant degree of market opening in these sectors – driven partly by Community legislation and partly by market and technological developments. This has brought considerable benefits for both business and consumers.

The priority now is to complete the process of market opening by adopting existing proposals and making new ones where necessary. One area where new action may be required is the water sector – which remains fragmented and where there are potential gains to be had from modernisation. However, this will be the subject of further study. European policy on the question of ownership of water and water services will continue to be neutral. Further action is also foreseen to deliver a modern and dynamic postal sector.

All of the "network industries" are subject to specific public service obligations, e.g. relating to the provision of essential services to vulnerable groups in the population and those living in geographically remote areas. It is vital that these obligations continue to be met. The Commission will shortly publish a Green Paper looking at the EU's role in this area, which is intended to launch a wide-ranging debate on the issues involved.

Over the next few years, massive investment will be needed to raise the quality of our infrastructure, particularly in the Accession Countries. Given the tough budgetary constraints on governments, it is unlikely that public money alone will be enough to finance these needs. The private sector will play an increasingly important role in financing infrastructure and in modernising our vital services and ensuring that they are affordable and of the highest possible quality.

However, public-private partnerships raise certain legal issues. These issues must be clarified so as to create a predictable legal framework within which such partnerships can thrive. The Commission will seek to do this in two ways. First, it will clarify the impact of EU competition/state aids policy on services of general economic interest. Secondly, it will clarify how procurement rules apply to situations in which public-private partnerships are bidding for the provision of these services.

Market opening has benefited both consumers and business:

- Combined with technological developments, market opening has brought down prices for national telephone calls by 50% since 1998, and those for international calls by 40%[32].

- Prices of promotional airfares fell by 41% between 1992 and 2000[33]. The number of routes linking Member States has risen by 46% since 1992 – giving passengers more choice.

[32] Eighth Report on the Implementation of the Telecommunications Regulatory Package, European Commission, SEC (2002) 1329.

[33] Updating and development of economic and fares data regarding the European Air Travel Industry, 2000 Annual Report. Commissioned by DG Transport and Energy.

- Domestic consumers are paying 15% less for their electricity in liberalised markets than in closed markets. And they are paying 25% less for their gas in the UK where markets are 100% open.[34]
- Water is an important sector in the economy, with an estimated annual turnover of €80 billion, which is larger than the natural gas sector. But annual water charges vary from €350 in Berlin to €50 in Rome (with no charge at all in Ireland).[35]
- Infrastructure investment needs for the Accession Countries are estimated at €100 billion for transport alone.[36]

b) Actions

1. The Council and Parliament should rapidly adopt the **"second railway package"**, the proposal on **controlled competition for public transport,** the package designed to create a **Single European Sky** and the proposal on **access to port services**. The Council should give a mandate to the Commission to negotiate an **open skies agreement with the US**. The Commission will rapidly bring forward proposals for **passenger transport market opening** in order to complete the Internal Market in the railway sector.

2. The Council should rapidly adopt and effectively implement the **"energy package"** to open gas and electricity markets completely for non-household customers by 2004 and for household customers by 2007.

3. While European policy on the question of ownership of water and water services will remain neutral, the Commission services will undertake a review of the legal and administrative situation in the **water and waste-water sector**. This will include an analysis of the competition aspects, in full respect of Treaty guarantees for services of general economic interest and environmental provisions. All options will be considered, including possible legislative measures.

4. Member States must ensure full and timely transposition of the **postal services** Directive which will open up substantial sections of the market to competition in 2003 and 2006. The Commission will complete, in the course of 2006, a study assessing, for each Member State, the impact on universal service of full accomplishment of the Internal Market for postal services. Based on the results of this study, the Commission may make further proposals.

5. The Commission will continue its efforts to clarify the **application of the state aid rules to compensation for the costs of providing services of general economic interest**, in the light of forthcoming Court decisions.

6. The Commission will issue a Green Paper in the course of this year with a view to launching a debate on how best to ensure that **public-private partnerships** for major projects can be undertaken in conditions of effective competition and full legal clarity under procurement rules. If necessary, it will propose further (legislative) measures to facilitate such partnerships.

4. REDUCING THE IMPACT OF TAX OBSTACLES

a) Assessment

As the Internal Market matures, more and more companies are seeking to organise themselves at a European level. However, operating with up to 15 (and soon 25) different systems of corporate taxation adds a whole layer of complexity to doing business.

Companies face a multitude of difficulties, such as the time taken by tax authorities to agree transfer prices for cross-border transactions between two parts of the same group, limits on cross-border loss relief (which can lead to an enterprise with overall losses having to pay tax!) and the problems of double taxation.

Moreover, the current VAT system revolves around taxation in the country of consumption. The result is that many firms doing business across borders have to pay VAT in a Member State where they have no permanent establishment. This is difficult and costly, since the trader may not be fully acquainted with the language and legislation in that country. It is a major obstacle to the smooth functioning of the Internal Market, particularly for SMEs. The current system is also vulnerable to fraud which requires a strong, co-ordinated response by the Member States and the Commission.

Other aspects of tax policy cause problems to both industry and citizens. Some Member States, for example, impose a higher tax on cross-border dividends than on domestic dividends. This kind of tax discrimination acts as a strong disincentive to the cross-border holding of shares and slows the creation of pan-European equity markets.

Furthermore, because of differences in Registration Tax, car manufacturers have to produce different models (e.g. with different engine horse power) for different national markets. This deprives them of the full benefits of operating within the Internal Market. Moreover, people who move to another Member State sometimes end up paying Registration Tax twice on the same car.

Tax obstacles are a major headache for businesses in the Internal Market:

- UNICE stresses that the existence of 15 different tax administrations represents "a major burden to business and in particular to SMEs. "[37]

- 77 % of businesses say that national tax systems should be more closely aligned.[38]Europe's top companies have called for further harmonisation of tax systems across the EU.[39]

- Compliance costs related to company tax represent anywhere between 2% and 4% of total corporate income tax revenues[40] - i.e. between €4.3 billion and €8.6 billion for the EU as a whole.[41]

[37] UNICE reaction to the Commission Communication and Report on Company Taxation in the Internal Market.

[40] European Commission "Company taxation in the Internal Market", COM (2001) 582 final.

[41] CEPS estimate using Commission figures.

b) Actions

1. On **company tax**, the Commission will take the following steps to remove key obstacles:

- In the short term, it will propose a revision of the **Parent/Subsidiary Directive** which is designed to eliminate double-taxation within the EU and permit dividends to be paid between companies in the same group without deduction of withholding tax. It will also propose a revision of the **Merger Directive** which is designed to assist the re-organisation of companies by providing for the deferral of certain tax charges and avoiding double taxation. The plan is to extend the applicability of both Directives by relaxing some of the conditions they set and allowing more companies to benefit from them.

- In the longer term, it will propose steps to introduce a **common consolidated corporate tax base** at EU level. This could be achieved without harmonising corporate tax rates and would go a long way towards solving the problems faced by companies by reducing the compliance costs which arise from dealing with fifteen separate tax systems, providing cross-border tax relief and simplifying the existing tax complexities associated with transfer pricing.

2. On **VAT**, the Commission will issue a Communication setting out further steps to modernise and simplify the existing system. These could include the introduction of a single place of compliance for all businesses trading in Member States where they have no establishment. Such an initiative would decrease the administrative cost of VAT for companies and make it easier to do business across borders. It would benefit SMEs in particular.

3. On **vehicle taxation**, the Commission recommends that Registration Tax should be phased out over a transitional period of five to ten years. Member States should compensate by switching over to increased annual road taxes and fuel taxes. The latter would benefit the environment as well as the Internal Market. The Commission will present legislative proposals to remove the obstacles to the free movement of cars in the Internal Market.

4. On **dividends**, the Commission will publish a Communication on the effect of the case law of the European Court of Justice on the various types of dividend taxation systems and take action to ensure non-discriminatory treatment, if necessary by launching infringement procedures.

5. EXPANDING PROCUREMENT OPPORTUNITIES

a) Assessment

The European Union's public procurement market is not yet sufficiently open and competitive. Many public purchasers, particularly at local government level, are unaware of the full extent of the rules. Because of the multiplicity of rules and procedures at national level, many suppliers are reluctant to sell to the government, particularly in another Member State. With few exceptions, procurement still relies entirely on extensive paperwork, ignoring the significant benefits of electronic procurement.

All this translates into limited cross-border participation in contract award procedures, inefficiencies in public procurement markets, lost business opportunities and a reduced likelihood that the taxpayer will achieve value for money. The costs of inefficient procurement are staggering. Public procurement is simply too important to the European economy to allow this situation to continue. With government budgets under severe pressure, more efficient procurement is an obvious way of achieving more with less.

The adoption and effective implementation of the legislative package is essential for modernising Europe's public procurement systems. Without it, neither a Europe-wide "electronic" procurement market can be achieved, nor will we have a legal framework which is suited for complex contracts, such as those for Trans-European networks. But there is more to be done. As with other key areas in the Internal Market, the Member States will have to play a much bigger role in ensuring that rules, which they themselves have agreed, are effectively applied. They should also simplify their national rules, and standardise procedures as much as possible across procurement entities to make it easier for companies to participate in calls for tender. Steps should also be taken to ensure that public-private partnerships for major projects can be undertaken in conditions of effective competition and transparency under procurement rules.[42]

The Commission takes the view that Member States should appoint a national authority which would be responsible for the surveillance of contracting entities' compliance with procurement law. Some Member States have already done so. These authorities should have the possibility in the general interest to bring possible infringements before the courts, seeking the imposition of effective remedies against non-compliant contracting authorities. Stronger remedies would need to be complemented by more intensive administrative co-operation between Member States (based on the recently created European Procurement Network).

Part of achieving better compliance is to raise the professional standards of procurement officials. Those responsible for spending major sums of public money should be fully conversant with existing rules on competitive tendering. Member States should, therefore, ensure that their own procurement officials have access to training with a view to acquiring and developing the professional expertise which the importance of their job demands.

[42] See also section B.3.

Governments and taxpayers are not getting value for money:

- Procurement represents 16% of EU GDP in – i.e. €1.429 billion.[43]A five percent cost reduction as a result of more competitive and efficient public procurement markets would therefore save over €70 billion – i.e. more than four times the education budget for Denmark.[44]
- Only about 16% (in value) of public procurement was published on an EU-wide scale in 2001.[45]
- Cross-border procurement (including indirect procurement through affiliates in foreign countries) rose from 6%[46] in 1987 to 10%[47] in 1998 but has stagnated since then. This is considerably less than in the private sector where cross-border purchasing stands at about 20%.
- Electronic procurement in the EU beyond the posting of notices is negligible.

b) Actions

1. The Council and Parliament should adopt the **legislative procurement package**, which consolidates and modernises the current regime, and which creates the conditions for electronic procurement to take off. Member States must implement this legislative package into national law correctly and on time. This will provide an excellent opportunity for Member States to streamline and simplify their own legislation and standardise procedures.

2. The Commission intends to suggest that Member States confer onto an existing **national surveillance authority (**or onto another national body) the power to bring cases before a national review body or court, seeking effective remedies. Such bodies would have to be independent from contracting authorities and would have to ensure that major cases of non-compliance are effectively sanctioned. This could be achieved in the context of the revision of the Procurement Remedies Directives which is planned for 2004.

3. The recently established **Public Procurement Network** should be extended to include all Member States, EEA and Accession Countries. It should be adequately resourced by the Member States so that it can become the vehicle for resolving cross-border problems (in conjunction with the SOLVIT network), sharing best practices and improving SMEs' access to public procurement. It should also encourage Member States to develop training and ‘certification’ of required competencies, including knowledge of EU law, to improve professionalism.

4. Member States should ensure that all their operational **e-procurement** systems are in full compliance with the requirements of the legislative package by the time it enters into force (probably during the second half of 2005). They should aim at conducting a significant part of their procurement transactions (in value) on an electronic basis by the end of 2006. Generalised e-procurement should be achieved before 2010. The Commission will, next year, present an Action Plan (which will include both legislative and non-legislative measures) for a co-ordinated approach across the EU.

[43] 2002 Report on the functioning of Community product and capital markets, COM (2002) 743 final of 23.12.2002 (2001 figure).

[47] This figure is taken from an independent study carried out for the Commission. See OJ C 330 of 21.11.2000.

5. There is considerable scope for achieving greater efficiency in **European defence procurement**. This will in turn lead to a more competitive European defence equipment industry[48]. The European Court of Justice has produced some important rulings on the scope of Article 296 of the Treaty which covers exceptions for essential security interests in Member States. The Commission will publish an interpretative Communication by the end of 2003 on the implications of these rulings, inter alia for procurement. It also intends to present a Green Paper in 2004 to looking at any further initiatives in European defence procurement.

[48] See the Commission Communication on "European defence – industrial and market issues: towards an EU defence equipment policy", COM (2003) 113 final of 11.3.2003.

6. IMPROVING CONDITIONS FOR BUSINESS

a) Assessment

Action aimed at integrating markets by removing technical and fiscal obstacles to trade and cutting red tape is critical to improving the business environment, but will have its full effect only if we put in place the framework conditions which support creative, dynamic businesses. Small enterprises, in particular, are very sensitive to changes in the business environment. That is why the Feira European Council of June 2000 endorsed the European Charter for Small Enterprises.

The policy measures required to foster entrepreneurship and innovation are mainly within the direct control of Member States[49]. It is up to them to take the necessary action in these areas, drawing fully on exchanges of experience and best practice elsewhere in the European Union. This can be done by benchmarking using the Best Procedure projects[50] co-ordinated by the Commission and by making use of the information collected in the course of the reporting on the implementation of the Charter for Small Enterprises[51].

Beyond this, however, there are a number of areas where Internal Market policies are directly relevant to boosting entrepreneurship and innovation within what is an increasingly knowledge based economy. Europe is a rich source of creativity. But more action is needed to create the appropriate framework conditions in which that creativity can be transformed into investment and competitive economic activity.

Economic operators need to know that their investment in innovative ideas and products will be protected across the EU, including against piracy and counterfeiting[52]. There has already been a significant degree of Community level harmonisation in this area. But coherent enforcement of intellectual property rights across the EU has now become a key issue, particularly in the digital era, as the relevant goods and services can be easily copied and moved from one place to another. Enforcement issues will be even more crucial in an enlarged Internal Market. In addition, it is important to facilitate the cross-border marketing of copyright protected products, such as print products, films and CDs, so that everyone can share in the results of innovation.

Moreover, investors need the guarantee that, when making investment choices, they can rely on company accounts and reports. Firms need to be confident that they can compete on a level playing field (e.g. free from the distortionary effects of state aids), that they will be able to make cross-border strategic alliances and mergers in confidence, and that appropriate legal structures exist to allow all businesses, whatever their size, to operate effectively across the enlarged EU.

[49] See the Green Paper on “Entrepreneurship in Europe” COM (2003) 27 of 21.1.2003 and the Communication on “Innovation Policy: updating the Union’s approach in the context of the Lisbon Strategy”, COM (2003) 112 final of 11.3.2003.

[50] The Best Procedure was launched in the framework of the Multi-annual programme for enterprise and entrepreneurship (Council Decision 2000/819/EC of 20 December 2000). It provides a framework to support Member States’ efforts to identify and exchange best practices in areas of particular importance to enterprises.

[51] “Report on the implementation of the European Charter for Small Enterprises”, COM (2003) 21 final/2 of 13.2.2003.

[52] Efforts to enforce intellecutal property rights could be strengthened by the involvement of Commission services, especially the European Anti-Fraud Office (OLAF).

The EU must help to create an environment in which businesses can thrive:

- More than 17,000 legitimate jobs are lost annually through piracy and counterfeiting in the EU. [53]
- According to industry sources, 37% of software being used in the EU is pirated which represents revenue losses of €2.9 billion.[54] The music industry shows a 7.5% average overall downturn in sales in the EU in 2001.[55] 22% of sales of shoes and clothing are in pirated and counterfeit goods.[56]
- Currently, patent protection covering just 8 European countries costs around five times as much as in the US or Japan. The political agreement on the Community Patent will halve these costs and provide protection in 25 Member States – still more expensive than the US or Japan but very much better than the current situation.[57]
- The contribution made by copyright protected goods and services to EU GDP is significant (above 5%) and growing.[58]
- The overall volume of state aid for the EU as a whole was €86 billion in 2001 – or 0.99% of EU GDP.[59]
- 39% of mergers and acquisitions are now cross-border – up from 26% ten years ago. Over 40% of large companies have entered into co-operation agreements with companies in other Member States.[60]

b) Actions

1. The Council should rapidly finalise the Regulation providing for a legally secure and affordable **Community Patent.** Two other steps are also necessary to make the Community Patent operational: the 1973 Munich Convention must be revised so as to allow the European Patent Office to issue Community Patents; and a specialised Community Patent Court must be created.

2. The Council and the Parliament should rapidly adopt the Directive to strengthen the **enforcement of intellectual property rights** (vital in the fight against counterfeiting and piracy), and the Directive on the **patentability of computer-implemented inventions**.

3. The Commission will submit a **Communication on the Management of Copyright and Related Rights**. This Communication will identify measures to create a more favourable environment for the cross-border marketing and licensing of these rights.

4. Member States are urged to continue their efforts to further reduce the total amount of **state aid** while re-directing aid towards horizontal objectives of Community interest, such as environmental protection and research and development. Another priority is the final adoption

[58] The economic importance of copyright and related rights protection in the EU will be assessed and further specified in a study commissioned by the European Commission. The results of the study will be available in Autumn 2003.

[59] European Commission, DG Competition.

[60] See footnote 14.

of the proposed reform of the mergers regime[61]. In addition, the Commission will propose a new block exemption Regulation relating to technology transfer agreements between companies.

5. A recently adopted Regulation requires all EU-listed companies to prepare their consolidated accounts in accordance with **International Accounting Standards** (IAS) from 2005. This will bring transparency and greater comparability between the consolidated financial statements of EU listed companies, hence better capital allocation and possibly a reduction in the cost of capital. IAS are established by the International Accounting Standards Board, an independent international accounting standard-setting organisation. In order to ensure appropriate political oversight, the Regulation stipulates that IAS to be applied in the EU will also have to be endorsed into Community law. Existing IAS will be endorsed during 2003, provided that, for some of them, the appropriate modifications are made.

In addition, it is important to consider the impact of the Regulation on SMEs. Since these are mainly non-listed companies, they are not obliged to switch to IAS. However, it may be in their interest to do so, in order to facilitate their access to capital markets. This will require certain steps on the part of Member States.

The Commission will soon issue a Communication setting out priorities for 2003 and beyond aimed at improving the quality of **statutory audit** in the EU. These will include: the modernisation and strengthening of the 8th Company Law Directive (which deals with access to and regulation of the audit profession); the creation of a European co-ordination mechanism for public oversight of the audit profession (which will aim to ensure proper oversight of the audit profession at national level and appropriate co-ordination at EU level); and the adoption of International Standards on Auditing in the EU from 2005.

6. The Commission will shortly adopt an action plan on company law and corporate governance in the EU setting out actions for the short term (2003-2005), the medium term (2006-2008) and the long term (2009 onwards). Shorter term actions will include proposals for a 10th Company Law Directive on **cross-border mergers** and a 14th Company Law Directive on **cross-border transfers of seat**. The **Take-over Bids Directive** should also be adopted without delay. These Directives will make it easier for companies to organise themselves more efficiently within the Internal Market.

7. The Commission intends to propose a Regulation on a **European Private Company Statute for SMEs** subject to the results of a feasibility study. This will allow SMEs to organise themselves more efficiently at European level (i.e. it will give them opportunities similar to those which the European Company Statute gives to bigger companies as from 2004).

[61] Proposal for a Council Regulation on the control of concentrations between undertakings, COM (2002) 711 final.

7. MEETING THE DEMOGRAPHIC CHALLENGE

a) Assessment

The ageing of the population will present major challenges for pension systems. The primary responsibility for meeting these challenges lies with the Member States. They will have to take some fundamental political decisions on the reform of public pensions.

However, the Internal Market can help by generating extra growth which should contribute to an improvement in public finances. It can also help to generate extra jobs, which is vital if the Union is to raise its employment rate (including by encouraging greater labour market participation by people over 55) and maintain a sustainable dependency ratio and the financial sustainability of pension systems.

There are also a number of very specific Internal Market measures which can play a useful role as regards occupational (or private) pensions which, in most Member States, will become more important in the future. The establishment of a prudential framework allowing pension funds to operate efficiently in the Internal Market while securing a high level of protection for pensions and the abolition of any sort of discriminatory tax treatment of cross-border occupational pension provision are important issues which need to be tackled urgently.

Over and above the pension problem, the ageing of the population will also have an impact on health services.[62] Member States are responsible for managing their health systems and so it falls primarily to them to meet this challenge. However, the Internal Market impacts on national health policies in a number of ways, particularly as regards cross-border provision of and access to treatments[63]. The only limitation is that this should not unduly impair Member States' ability to ensure sufficient access to high quality hospital treatment on their territory, to control expenditure and maintain high public standards. A well managed application of Internal Market rules to the health care sector has the potential to help both patients and providers by allowing the most efficient possible use of resources across the EU. What is needed now is a shared vision for health systems at a European level so that this potential can be fully exploited.

Ageing means fewer people of working age and more people above pensionable age::

- The number of people over 65 is expected to rise from 61 million in 2000 to 103 million by 2050 and those over 80 from 14 million to 38 million.[64]
- The ratio of people of working age to people above retirement ages (65+) will decline from 4 to 1 to less than 2 to 1 by 2050.[65]
- Only about half of Europeans aged 55-59 are still in employment and less than a quarter of people aged 60-64.[66]

[62] See the Commission's Communication on "Supporting national strategies for the future of health care and care for the elderly", COM (2001) 723 final of 5.12.2001.

[63] See European Court of Justice Decisions in Kohll (C-158/96), Decker (C-120/95), Smits and Peerbooms (C-157/99) and Vanbraekel (C-368/98).

[64] Commission Report to the Spring European Council “Choosing to grow: knowledge, innovation and jobs in a cohesive society”, COM (2003) 5.

[65] "Budgetary challenges posed by ageing populations: the impact on public spending on pensions, health and long-term care for the elderly and possible indicators of the long-term sustainability of public finances", Economic Policy Committee/ECFIN/665/01-EN final, 2001.

[66] European Commission, Eurostat, Labour Force Survey 2001.

- If unfunded pension liabilities were budgetised, in some Member States this would represent a debt of over 200% of GDP.

- Spending on public pension schemes will increase by between 3% and 5% of GDP in most countries over the coming decades.[67]

b) Actions

1. Member States should implement fully and on time the **Pension Funds Directive** which will increase both the security and the affordability of occupational pensions. It will also allow multi-national companies to run single EU-wide pension funds, thus facilitating intra-firm mobility across borders.

2. The Commission will launch the second stage consultation of the Social Partners on measures to ensure that people who change employment between Member States (including those who change jobs between different firms) do not suffer undue losses of occupational pension entitlements. Depending on the final outcome of this consultation, the Commission would examine the desirability of proposing a **Directive on portability of occupational pensions**..

3. The Commission will continue its determined action to tackle **tax discrimination** against pension funds established in other Member States: this is essential if we are to create a genuine Internal Market for occupational pensions.

4. In the area of **health services**, the Commission will work closely with Member States – particularly in the High Level Reflection Group on Patient Mobility – to develop a shared vision of the ways in which the Internal Market can support national health systems in full compliance with the relevant jurisprudence of the European Court of Justice. The consultation process, launched in July 2002, will be completed and the results presented to Member States as a basis for further discussion.

[67] See footnote 64.

8. SIMPLIFYING THE REGULATORY ENVIRONMENT

a) Assessment

A high quality regulatory environment is essential for competitiveness. That is why the Lisbon European Council put better and simpler regulation at the top of the Union's political agenda. To translate this political commitment into action, the Commission has presented a Better Regulation Action Plan[68] and a Simplification Rolling Programme[69] that address both the preparatory phases of new legislation and the improvement of the existing Community 'acquis'. The recent Brussels European Council once again emphasised the importance of improving the regulatory framework.

However, presenting an Action Plan is not enough – it must be made to work in practice. The Commission is beginning to impose new disciplines on itself (particularly in the area of ex-ante impact assessment and simplification of the EU's existing legal acts). It is now up to the Council and Parliament to do likewise, particularly when they introduce major changes to Commission proposals during the negotiations. Better regulation and simplification at EU level will always need to be accompanied by commensurate activity at Member State level, in particular during the sensitive phases of transposing Community legislation into national administrative provisions.

The quality of rules depends not only on making sure that the impacts of a measure have been checked before it is proposed and that it is well drafted, clear and proportionate to its objectives. Within the Internal Market, it also depends on choosing the right legislative technique or instrument – i.e. the one which will most effectively eliminate barriers to cross-border trade while serving public interests, such as health and safety and sustainable development, and respecting national diversity as far as possible.

This involves complex issues, such as the role of mutual recognition as opposed to harmonisation, and where harmonisation is necessary, the use of Regulations or Directives and the appropriate level of harmonisation. It is also necessary to establish the right balance between regulation by the public authorities and the co-regulation or self-regulation by the private sector through the elaboration of European standards and codes of conduct.

The Commission believes that this question of legislative technique or legislative architecture is an important part of the debate on better regulation and one which has not yet been fully explored. It will therefore enter into a wide-ranging consultation during 2003, taking into account developments in the Convention on the Future of Europe and ongoing discussions on a future Inter-Institutional Agreement on Better Regulation, with a view to making clear its views on these complex issues during the course of 2004.

Finally, the European Parliament has suggested[70] the introduction of an Internal Market "compatibility test" to be applied to all legislation adopted at national level. The Commission believes this to be an interesting proposal. Member States often adopt and implement rules as they see fit without considering the implications for the Internal Market. A "compatibility test" could be a very useful self-imposed discipline.

[68] COM (2002) 278 final of 5.6.2002.

[69] COM (2003) 71 final of 11.2.2003.

[70] Harbour Report, A5-0026/2003.

Business needs better rules – at national and EU level:

- Poor quality regulation costs European business at least €50 billion per year[71]. The total cost of regulation to society is in the region of 4 to 6% of GDP per year, or between €360 and €540 billion.[72]

- Member States are responsible for between 50% and 90% of rule-making[73]. A Swedish study estimated Brussels to be responsible for only about 10% of the regulatory burden[74]. A recent study in the UK estimated that about 60% of rules are made at national level[75].

- No fewer than 6,000 draft national technical regulations have been notified to the Commission since 1992[76]. While this shows that a screening at EU level is useful, the amount of rules in itself constitutes a serious threat to Europe's competitiveness.

- 87% of companies say that the most important priority is to have ONE set of rules, instead of 15 – soon to be 25.[77]

b) Actions

1. The Commission will launch a wide-ranging reflection and consultation on the **legislative architecture** of the Internal Market and issue its conclusions in 2004 taking into account developments in the Inter-Governmental Conference. The Commission could define certain criteria, which it will take into account, e.g. when deciding whether to pursue mutual recognition, "new" approach or more detailed harmonisation, as well as the conditions under which "home country" control should be applied. It will also address the involvement of the private sector and civil society in co-regulation or self-regulation initiatives, such as the elaboration and implementation of European standards and voluntary codes of conduct.

2. The Commission will work together with the European Parliament, the Council and the Member States to develop the idea of an Internal Market **"compatibility test"**. The purpose of this test would be to offer guidance to legislators at national level as to how best to reconcile the interests of free movement in a border-free Europe with other legitimate public policy objectives. If such a test were applied at an early stage – and at all levels of government – the risk of fragmentation could be considerably reduced. Together with existing preventive mechanisms, such as the notification of technical rules and regulations, such self-imposed discipline could prove a powerful tool to ensure that lawmakers take wider European interests into account when considering new measures.

3. The Council is invited to establish a horizontal working group on **"better regulation"** with whom the Commission can interact on a regular basis. This group could work on the implementation of the Better Regulation Action Plan, including on the implementation of the parts for which Member States are responsible. The Commission will also open a web site

[76] Under the provisions of Directive 98/34/EC.

[77] See footnote 14.

where interested parties can bring to its attention examples of particularly complex rules or rules which may conflict with the Internal Market “compatibility test”.

4. The Commission will develop, in close co-operation with Member States, appropriate **indicators** to measure progress towards a higher-quality regulatory framework and lower administrative burdens, starting with the Internal Market. Monitoring of results is essential to keep the better regulation process on track and show to Europe’s businesses and citizens that their governments are serious about this.

9. ENFORCING THE RULES

a) Assessment

When Internal Market Directives are not implemented on time or not applied correctly in practice, EU citizens and businesses can be effectively deprived of their Internal Market rights. Many rights flow directly from the Treaty: if its provisions are ignored, this can also lead to failure and frustration. This self-inflicted damage causes wholly unnecessary harm to the European economy, and undermines the confidence citizens have in the European Union.

Ultimately, effective application and enforcement can only be achieved if Member States are prepared to play a much more active role in the day-to-day management of the Internal Market. It is up to them to ensure that the rules which they themselves have adopted are made to work in practice.

When things do go wrong, citizens and businesses currently have a choice between lodging a complaint with the Commission or going before a national Court. This is not entirely satisfactory. Litigation at national level can be slow and expensive and is therefore not always a viable option. Complaints lodged with the Commission can result in infringement procedures against the Member State concerned but these take a long time to resolve and do not offer the individual complainant the opportunity to seek damages. Moreover, the Commission cannot possibly intervene in each and every individual case of misapplication, particularly in an enlarged Union. Action is needed now to avoid a drift towards a situation where breaches of Community law go unchallenged and confidence in the operation of the Internal Market is undermined.

There are a number of possible solutions to these problems. Many are set out in the Commission's recent Communication on "better monitoring of Community law."[78] Possible ways forward could include a speeding up of the Commission's handling of infringement procedures and greater use of initiatives such as "package meetings"[79] to resolve more cases without the need for further legal action.

Beyond this, the Commission believes that it is important to develop alternative means of redress other than national litigation or infringement procedures. It will, of course, continue to pursue infringement procedures where this is the most effective way to achieve a solution or where important legal precedents are likely to be established. But for the majority of cases, alternative means of problems solving may be more effective and proportionate.

The use of complementary measures to infringement procedures is now beginning to take off. The SOLVIT initiative,[80] for example, is an attempt – through administrative co-operation between Member States - to make it easier to obtain redress in cases where the Internal Market rules are misapplied in practice. Another possible solution – which could even be integrated with SOLVIT – might be the designation of some kind of a mechanism in each of the Member States which would help to ensure the correct application of Internal Market legislation and relevant Treaty articles.

[78] COM (2002) 725 final of 11.12.2002.

[79] These meetings involve experts from Member States and the Commission coming together in order to discuss a "package" of cases being examined by the Commission for violation of Community law. Their purpose is to solve cases without the need for further legal action.

[80] COM (2001) 702 of 27.11.2001, Commission Recommendation of 7.12.2001 OJ L331/79 15.12.2001, http://europa.eu.int/solvit/

Such mechanisms could provide citizens and businesses with a means of redress located in their home Member State. This would be a tangible step towards bringing the enlarged European Union closer to the citizen. They could deal with problems which, although technically breaches of Community law, are really administrative or technical in nature, rather than legal. This would allow the Commission to concentrate on the most serious cases with the most far-reaching implications. Clearly, this suggestion raises a number of important questions to which the Commission would have to find satisfactory answers before taking any initiative.

Better enforcement is equally important as far as consumer interests are concerned. Each Member State has developed an enforcement system adapted to its own national situation. These systems are, however, not always sufficiently adapted to the challenges of cross-border shopping within the Internal Market. Consumers need to be confident that governments have the ability to deal effectively with cross-border fraud or other fly-by-night operations, if they are not to be reluctant to buy from suppliers in another Member State.

Late transposition and ineffective enforcement remains a serious problem:

- The average transposition deficit stands at 2.4%. In other words, Member States are late in notifying over 550 national legislative measures transposing EU Directives[81].
- The number of open infringement cases has gone up from 700 in 1992 to nearly 1600 today[82]. This indicates that large numbers of Directives are not being correctly implemented and properly applied at national level.
- Two thirds of infringement cases which go to the Court of Justice take longer than four years to resolve.[83]
- Assuming that the new Member States behave in the same way as the existing ones, the number of infringement cases will rise by more than 40% by 2007, unless there is a change of policy.
- Only about half of companies say that they can easily get help from their national authorities when they run into an Internal Market problem[84].

b) Actions

1. Member States should commit themselves to setting and respecting more ambitious **transposition targets** at each Spring European Council. This has already happened over the past few years but it should now be put on a permanent footing[85]. It is vital to maintain the political pressure on transposition in order to avoid fragmentation of the Internal Market in a Union of 25 countries.

2. The Commission will issue a **Recommendation setting out a number of "best practices"** which should be applied consistently throughout the Union to ensure better and faster transposition, e.g. the development of transposition "timetables" and the need to discuss the transposition performance regularly with national and regional parliaments. It will also intensify its work with Member States during the transposition phase **("preventive dialogue").** This dialogue will focus particularly on measures of greatest economic importance and those which, because of their nature, may be more difficult to transpose.

[81] Internal Market Scoreboard No. 12, May 2003.

[82] See footnote 1.

[83] Internal Market Scoreboard No. 8, May 2001.

[84] Internal Market business survey, Flash Eurobarometre 106, September 2001.

[85] This year's Spring European Council reaffirmed the existing target of a 1.5% deficit overall and a zero deficit for Directives more than two years past their transposition date.

3. The Commission believes that there may be a case for introducing a **legal instrument** to make certain implementation aspects mandatory. These could include the obligation to notify measures electronically and the requirement to provide the Commission with “concordance” tables clarifying where provisions have been implemented in national law. Without these tables, checking that the transposition measures adopted in 25 Member States fully conform to the requirements of the particular Directive will become a real paper chase. This instrument could also provide a legal underpinning for SOLVIT.

4. The Commission invites Member States and the Parliament to define a **standard transposition period** (2 years), from which departures should only be possible when they can be justified by the volume or complexity of the measure to be transposed. Similarly, the Commission wishes to hear views about inserting **standard sanctions clauses** into Directives as well as **standard clauses** to put **administrative co-operation** on a stronger footing.

5. Member States are invited to maximise their efforts to “clean up” their infringements, so that as many as possible of the outstanding cases can be resolved. The Commission believes that many of the currently active cases can be easily resolved if the will to do so is there. The aim should be for each Member State to **reduce the number of Internal Market infringements by at least 50% by 2006**. The Commission will also promote better follow-up to Court judgements, particularly by Member States who are not directly targeted by the case at hand.

6. The Commission will undertake a **study** examining the different options for improving the enforcement of Internal Market law. This would look, *inter alia*, at the desirability and feasibility of designating enforcement mechanisms in the Member States.

7. The Commission will set up a special section on the home page of the EUROPA web site describing the various **procedures available to citizens and businesses seeking to defend their rights** under Community legislation. Essentially, it will describe the most effective ways of obtaining relief, which will most often involve alternative ways of settling problems, such as through the SOLVIT network. The aim is to solve problems more quickly and limit resort to infringement procedures to the most serious breaches of Community law. In all cases, estimations of the time and costs involved will be provided.

8. To ensure more **uniform enforcement of consumer protection** legislation throughout the Union, the Commission will propose a Regulation (at around the same time as the Internal Market Strategy) which will establish a network of public enforcement authorities throughout the European Union. In contrast to "Internal Market Authorities", which would monitor the behaviour and decisions of national and local administrations, the focus in consumer protection would be on behaviour in the private sector.

10. PROVIDING MORE AND BETTER INFORMATION

a) Assessment

For the Internal Market to deliver its full potential, it is not enough to put a legal framework in place and to enforce the rules. Citizens and businesses also need to know about their Internal Market rights and opportunities and some will need practical information on how to exercise these rights in practice. This is in addition to the general need to explain Internal Market policies to the public and stakeholders as part of building the public and political support needed to take the Internal Market forward.

Information policy is thus not just an optional extra or an opportunity to generate publicity for the EU's activities. It is an integral part of the efforts to create a fully functioning Internal Market.

There is still a great deal to do. General awareness of Internal Market rights remains low. Those who run into problems when trying to exercise their rights often do not know where to find a solution. Service providers face particular problems, since services are subject to a wider range of more complex rules and authorisation regimes than exporters of goods. And citizens need to be informed about their rights as consumers, particularly as consumers of services. The information deficit in the Accession Countries is even greater than in the existing Member States.

If we are to close this gap, we need a step change in the scale of the information effort. In the first place, the Member States and the Accession Countries must fully assume their responsibility for informing their citizens and invest the necessary resources.

EU citizens and businesses still do not know about their Internal Market rights:

- A recent Commission survey revealed that less than half of EU citizens consider themselves to be well informed about the Internal Market. When asked, for example, 49% thought that they needed a work permit when working abroad and only 29% were aware that they were entitled to vote in local and EP elections when living in another Member State.[86]
- Less than half of the businesses questioned said that they felt well informed about their company's rights in the Internal Market. The figure fell to 41% for small and medium-sized companies.
- Nearly 20% of businesses who are not currently exporting said that they might do so if more and better information were available.
- A 2002 survey showed that less than 10% of companies in Slovenia feel fully informed about the obligations and benefits of the Internal Market[87].

b) Actions

1. Member States should develop **national plans** to raise general awareness of Internal Market opportunities among their own citizens and businesses. Progress will be monitored in the Internal Market Scoreboard and by the Internal Market Advisory Committee (IMAC) meeting at Director General level.

[86] See footnote 14.

[87] Electronic survey carried out by Eurochambres and the Slovenian Business and Research Association.

2. The needs of business and consumers in the **new Member States** for information on the EU and its Internal Market will require special attention and the development of an overall Communication Strategy in those Member States. The Commission will take account of these needs in the 2005 review of its Communication Strategy, following the conclusion of the current PHARE-funded strategy for the Accession Countries at the end of 2004. It should build on existing and planned initiatives and make effective use of the media and of appropriate relay organisations, particularly those which have already played a role in the lead up to accession

3. Commission initiatives, such as the **Dialogue with Citizens and Business** and the **Citizens Signpost Service**, will be progressively extended to the new Member States. The Commission will improve the Dialogue web site so that citizens and businesses have better access to practical and useable information. In addition, Member States should take more responsibility for the quality of the information which is made available through the Dialogue.

4. The Commission will establish a top class **information portal** bringing together existing initiatives, including the Dialogue with Citizens and Business[88], the Citizens Signpost Service[89], SOLVIT[90], European Consumer Centres[91], Fin-net[92] and EEJ-Net[93], and giving citizens and business access to a wide range of practical information and advice on Internal Market rights and opportunities[94]. Citizens and businesses can also contact Europe Direct – a service with a single number across Europe (00800 67891011) which provides answers to questions on all aspects of the EU and can direct people to the site/information source most suited to their needs. Clearly, both the portal and the Europe Direct number must be widely promoted.

5. Within the ongoing initiative to make the EUROPA web site clearer and more accessible, the more specialised audience (journalists etc) will be catered for by a new **Internal Market portal** bringing together information about policy and legislative developments relating to the Internal Market, irrespective of the Commission department responsible.

6. The **Euroguichet network** needs to be extended so that there is at least one European Consumer Centre in each Member State. The main task of these centres is to provide information to consumers on their rights in the Internal Market and to assist and advise them on dispute resolution mechanisms and legal aid when a problem arises.

[94] Advice on ways of solving the problems they have encountered will be made available via the special section on the home page of the EUROPA web site referred to in section B9.

Part C: Getting the Best out of the Enlarged Internal Market

a) Assessment

The Accession Countries have taken important strides forward in recent years. However, incorporating the Community *acquis* and progressively building up their institutions to apply and enforce Internal Market rules is no small task. Naturally, there is much work left to do and efforts to support these countries should continue up to accession and beyond.

Existing Member States will also have to adapt to the new situation after enlargement. Above all, they must ensure that all of their competent authorities are well informed and ready to accord full Internal Market rights to the new Member States.

There will inevitably be some teething problems in the initial post-accession period. In particular, more work is needed in those areas which are covered by Treaty provisions alone[95] – i.e. those areas where there is no EU secondary legislation. More generally, there are bound to be problems with compliance and enforcement[96]. Market surveillance authorities, in particular, need to be further strengthened. It is important to solve these problems at an early stage so that the integrity of the Internal Market is maintained and the need to invoke the Internal Market safeguard clause[97] can be avoided.

In the end, success in an Internal Market of 25 countries will depend on mutual trust and confidence. The key is administrative co-operation and understanding between officials in competent authorities leading to ways of finding practical solutions to problems. This can only develop over time – there is no magic solution. But there are a number of actions, which taken together, can produce positive results.

b) Actions

1. Support for **institution-building activities** will continue over the period 2004-2006 through the Transition Facilitiy[98]. This will provide appropriate resources for further building up the capacity of the new Member States to enforce Internal Market legislation. The Commission will step up the monitoring process and produce a comprehensive monitoring report six months before accession.

2. The Commission will make it possible for Accession Countries formally to **notify their implementing measures before accession**. These will then of course not have to be re-notified after accession. This will make for a more orderly process of notification and checking of conformity with Community law. The Commission will also establish pre-notification agreements with regard to draft national technical regulations [99]

[95] Treaty articles 28-30 (goods), 39 (workers), 43 (establishment), 49 (services) and 56 (capital and payments).

[96] See also section B9.

[97] The safeguard clause can be used by the Commission until 1 May 2007 if it establishes that a new Member State, by not meeting its negotiation commitments, has caused a serious breach of the functioning of the Internal Market. In that case, the Commission can take appropriate measures. The clause can also be invoked in cases where there is an imminent risk of such a breach.

[98] See COM (2002) 700 final of 9.10.2002.

[99] These are notified in accordance with Directive 98/34/EC.

3. In order to eliminate barriers to free movement of goods and services, the Accession Countries are urged quickly to complete the **screening of their legislation** in the light of Articles 28, 43 and 49 of the Treaty and to repeal any national, regional or local rules and regulations which discriminate against citizens or companies from other Member States.

4. The process of negotiating, concluding and implementing **Protocols to the Europe Agreements on Conformity Assessment and Acceptance of Industrial Products** (PECAs) will continue insofar as they can operate for a reasonable period before the date of accession (2007 in the case of Bulgaria and Romania). PECAs are a particular form of agreement covering the reciprocal recognition of conformity assessment of industrial products based on the adoption by the Accession Countries of Community legislation on such products and the creation of the appropriate implementing infrastructure. They are useful instruments for integrating these countries into the Internal Market.

5. Accession Countries and Member States administrations will be requested to demonstrate that they have taken steps to **inform competent authorities and enforcement officials of the implications of enlargement**, so that full rights are conferred on citizens and business consistent with Membership, subject to any transitional arrangements.

6. Many of the existing Member States are prepared to offer **short-term traineeships** to Internal Market officials from the Accession Countries. The Commission will set up a database to facilitate this type of exchange. Multi-country co-operation (including joint training, resource sharing, common problem solving and benchmarking) could also be envisaged.

Part D: Building the Internal Market in an International Context

a) Assessment

Following enlargement, a major challenge for the EU is to start developing closer relationships with our “new neighbours” – Russia, Ukraine, Moldova, Belarus and the Southern Mediterranean countries. In exchange for better access to our markets, these countries will be asked first to align progressively their regulations as closely as possible with ours. This has a number of benefits: it will make trading between the EU and these countries significantly easier, thus benefiting both sides. It will also provide the "new neighbours" with a “ready to use” regulatory framework, suited to the needs of a market economy.

In today’s highly globalised economy, the impact of legislation/regulation adopted thousands of miles away is increasingly felt in the EU. We have already seen evidence of this in policy areas ranging from financial reporting to electronic commerce and the protection of personal data. The result is that our regulators have to be much more systematic about talking to their counterparts in our major trading partners so that problems can be avoided as far as possible.

In some cases, discussions between regulators can best take place in global fora, such as the World Trade Organisation (WTO), the OECD, the World Intellectual Property Organisation (WIPO), the Basle Committee for banking capital standards or the International Accounting Standards Board.[100] In the automotive sector, the EU is a contracting party to two international agreements concluded under the auspices of the United Nations Economic Commission for Europe (UN/ECE). Global regulatory convergence is particularly important in this sector where commercial relations are becoming increasingly international.

In other cases, bilateral dialogues may be more appropriate. For example, last year the Commission services developed a set of overall Guidelines for Regulatory Co-operation and Transparency with services of the US Government for product regulations. There are also sector-specific bilateral dialogues, such as those with US financial regulators and supervisors in the context of the EU-US financial markets dialogue or the EU-Japan Regulatory Reform Dialogue. The aim of these dialogues is not just to defuse existing problems. They should also help to make future conflicts less likely. Exchanging information and both sides providing each other with an opportunity to comment on rules before they are adopted are essential to ensure that dialogues are productive.

The globalised economy also presents major challenges for customs services. They are being asked to maintain the impermeability of the EU’s external frontier while the volume of international trade is increasing all the time. Following enlargement, much of the burden will fall on the new Member States. Action is needed to ensure that measures to protect European citizens, the consumer and the environment from dangerous or unsafe products from third countries continue to be applied equally effectively at all points along the EU's external frontier. A well-managed external frontier is essential for confidence within the Internal Market.

[100] See section B6.

b) Actions

1. To implement the **“new neighbours"** concept, the aim is to conclude new agreements supplementing, where necessary, the Partnership and Co-operation Agreements and Association agreements which the EU already has with these countries. These new agreements can only be concluded once they have aligned their rules with ours and shown themselves to be capable of enforcing the rules effectively.

2. The Commission will continue to promote and defend the EU's regulatory approach within international bodies, such as the WTO and WIPO. In the automotive sector, **convergence between EU legislation and UN/ECE Regulations** will be encouraged as far as possible.

3. The Commission will strengthen ongoing regulatory dialogues, notably the **EU-US financial markets dialogue**. It will also assess whether it would be in the EU’s interest to initiate new dialogues in other policy areas or with other countries and report about this to Council and Parliament.

4. The Commission will seek to **improve controls at the external frontier** via a common risk management approach. It also proposes creating teams of customs experts in the Member States to provide rapid specialised support at the external frontier. These issues will be covered in a Commission Communication on “the role of customs at the external frontier” which will be launched soon. A second Communication on a "simple and paperless environment for customs and trade” will look at ways of laying down the basis for a computerised exchange of information needed for customs purposes.

Part E: Monitoring

Systematic monitoring and evaluation will be crucial to the success of the Internal Market Strategy. There is little point in setting out policy priorities and leaving the rest to chance. It is vital to check that the proposed actions are actually being implemented and that they are producing the desired effects.

The Strategy will therefore be monitored on three levels. The **first task** will be to make sure that the proposed measures have been adopted on time. This will allow pressure to be exerted on decision makers whenever delays occur. The **second task** will be to ensure that the measures are being properly enforced. Once again, remedial action can be taken if problems are detected. **Finally**, the impact of the measures on the ground must be measured, i.e. their effect on markets, businesses and other economic operators.

Monitoring the impacts on the ground is particularly challenging. It requires the development of a comprehensive set of indicators which in turn depends of the availability of the relevant statistics for all Member States. It is important to start developing these indicators as soon as possible, even though monitoring itself can only be carried out once a particular action has been fully implemented and has had time to produce its effects. Fortunately, we are not starting from zero. The Commission has already developed indicators to measure the effectiveness of its policies in specific sectors, such as telecommunications and energy. In procurement, two panels have been set up - one made up of business representatives, the other of public authorities - as a means of monitoring levels of cross-border tendering and its impact on prices. The Commission has also developed the Internal Market Index - a composite indicator tracking the ‘real world’ benefits of the Internal Market in general[101].

Thought must also be given to the form in which indicators are presented and the vehicles used to do it. The Commission currently produces a number of monitoring instruments, including the Implementation Report on the Internal Market Strategy, the report on the functioning of product and capital markets (Cardiff Report), the Competitiveness Report and the different Commission Scoreboards. The relationship between these different instruments now needs to be considered. There is undoubtedly scope for a degree of rationalisation.

[101] The index score has been published in the November Internal Market Scoreboard since 2001.

Conclusion

This Internal Market Strategy represents a comprehensive package of actions designed to improve the performance of the Internal Market in an enlarged Union.

Some of these actions are already well advanced as proposals make their way through the legislative process. Others will need to be further examined and developed over the coming months before the Commission can make proposals. A number of actions are for the Member States themselves to implement.

In light of the stage of preparation of the different actions, Council (in the form of a Resolution prepared by the Competitiveness Council) and Parliament are requested to:

- Endorse the general orientation set out in the Internal Market Strategy;

- Commit themselves to adopting existing (or forthcoming) proposals within the suggested deadlines[102];

- Support the Commission's intention to explore the different options for tackling particular obstacles with a view to making proposals at a later stage[103];

- Call on the Member States to play their full part in improving the operation of the Internal Market in areas under their own control[104].

[102] These actions are classified as type 1 in the annex.

[103] These actions are classified as type 2 in the annex.

[104] These actions are classified as type 3 in the annex .

Type 1: early adoption or completion
Type 2: for further examination and discussion
Type 3: for Member States to implement

ANNEX

1. FACILITATING THE FREE MOVEMENT OF GOODS

ACTION	TYPE	DESCRIPTION	TIMING
1	2	The Commission to make a proposal for a Regulation on mutual recognition to facilitate its correct application. This will take account of the results of a wide consultation with Member States, industry and consumer organisations on possible options. Council Decision 3052/95, which requires Member States to inform the Commission of any cases where mutual recognition has been refused, and which is not achieving its objectives, will either need to be amended or incorporated into the Regulation.	12/2004
1	1	The Commission to adopt a Communication on the correct implementation of the mutual recognition principle. Its aim is to clarify, in anticipation of the Regulation, the current rights and obligations of economic operators and national administrations when products are to be marketed in a Member State where its legislation imposes different technical rules.	06/2003
2	2	The Commission may propose a Common Base Directive, taking into account the discussions and possible Council conclusions on the Communication on the New Approach. Such a Directive could cover a number of horizontal issues common to all New Approach Directives, including measures needed to support administrative co-operation and 'standard' articles that would provide for a more homogeneous implementation of these Directives.	12/2004
3	1	The Commission to sign partnership and performance contracts with European standardisation organisations to speed up the production of standards, particularly in fields where standardisation has proceeded at a too slow pace, and improve their quality. One major standardisation body (CEN) has already committed itself to reducing the average time needed to prepare standards from eight to three years.	12/2003

3	1	The Commission to undertake a comprehensive study on voluntary marking at national and European level. In the light of the results, the Commission to consider ways of enhancing their positive effects and reducing the risk of market fragmentation and confusion on the part of consumers.	06/2004
4	1	The Commission to issue a Communication setting out the next steps for the application of Integrated Product Policy (IPP). IPP focuses on the different phases of products' life-cycles with a view to improving their overall environmental performance. Doing this at Community level should reduce the pressure to adopt national measures, which because of their divergence may lead to the erection of new barriers to the free movement of goods.	06/2003
4	1	The Council and European Parliament to adopt the framework Directive on the integration of environmental aspects into product design. This initiative is based on New Approach principles, i.e. the basic elements and design parameters with respect to the environmental aspects are specified in the framework directive, while specific product eco-design requirements will be established through Commission implementing measures supported by voluntary standards. While this is good for the environment, it should also considerably facilitate trade in these products within the Internal Market.	06/2004
4	1	The Commission to issue a Communication on the integration of environmental aspects into the standardisation process, inviting the standardisation organisations, national authorities and stakeholders to take greater account of environmental considerations at all stages of the standardisation process at both national and European levels.	12/2003
5	1	The Commission to give mandates to European standardisation bodies for the development of new standards or the revision of existing ones to ensure compliance with the requirements of the General Product Safety Directive. The references of the relevant standards will also be published in the Official Journal. The Commission to monitor implementation of the Directive over the period of the Strategy and prepare a report on its application, including an assessment of market surveillance and enforcement in the Member States, by 2006.	06/2004

5	1	The Commission to propose a Directive on unfair business to consumer commercial practices. This will be a framework Directive harmonising national rules governing unfair business-to-consumer commercial practices. It will be based on mutual recognition in order to allow a fully functioning Internal Market, while delivering a high level of consumer protection in order to promote consumer confidence.	06/2003
6	1	The Commission to propose a recasting of the framework Directive on motor vehicles and their trailers (Directive 70/156/EEC). One of the main aims will be to extend EC whole vehicle type approval to vans (optional for new types within 12 months of the entry into force of the new Directive, compulsory for new types from 1 January 2007 and compulsory for existing types from 1 January 2009) and trucks and lorries (optional for new types within 12 months of the entry into force of the new Directive, compulsory for new types from 1 January 2008 and compulsory for existing types from 1 January 2010).	09/2003

2. INTEGRATING SERVICES MARKETS

ACTION	TYPE	DESCRIPTION	TIMING
1	1	The Council and European Parliament to adopt the draft Regulation on Sales Promotion in the Internal Market which will allow SMEs, in particular, to use sales promotions to draw attention to their products in new markets. Large firms will be able to offer a single EU-wide promotion instead of 15 (or 25) different campaigns. Consumers will benefit from increased competition and transparency of information about sales promotions offered.	12/2003
1	1	The Council and European Parliament to adopt the draft Directive on the recognition of professional qualifications. The proposed Directive seeks to clarify and simplify the rules in order to facilitate the free movement of qualified people between Member States, particularly in view of an enlarged Europe.	03/2004
2	1	The Commission to make a proposal for a Directive on Services in the Internal Market. The proposal will seek to remove barriers and reduce costs for companies arising from red tape while maintaining high levels of consumer protection. This would benefit all services which, as soon as they cross a Member State border, are affected by multiple application of different legal regimes and a duplication of administrative requirements. The Commission will also issue a Communication on the competitiveness of business-related services setting out non-legislative measures designed to complement the Directive. These will include the development of European standards and measures to improve the statistical coverage of service sectors (this is very important since these statistics are currently almost entirely lacking and, without them, it very difficult to analyse what is actually going on in service industries).	12/2003
3	1	The Commission, subject to the results of a feasibility study, to propose an extension of Directive 98/34/EC, which concerns notification by Member States of national technical rules and regulations, to services (besides information society services). The results of the feasibility study will be published by the end of the year.	12/2004

4	2	In light of the Council and European Parliament's response to the Commission's report on the safety of services for consumers, the Commission to decide whether to make a proposal for a legislative framework aimed at monitoring and supporting national policies and measures in this area. This could, for example, cover the systematic collection of data on accidents, injuries and risks (currently available data is inadequate), procedures for the exchange of information on national policy and regulatory developments and procedures for the establishment of European standards where necessary.	12/2004
5	1	The Council and European Parliament to adopt the Prospectuses Directive which should make it easier for companies to raise money on an EU-wide basis while at the same time providing adequate provision for investors.	09/2003
5	1	The Council and European Parliament to adopt the Investment Service Directive. The proposed Directive will replace the existing one which has been in place since 1993 and is being proposed against the background of major structural changes in EU financial markets over the past five years. The proposal will offer investment firms an effective "single passport" which would allow them to operate across the EU while at the same time providing investors with a high level of protection when using the services of investment firms.	06/2004
5	1	The Council and European Parliament to conclude 1st reading on the Transparency Directive. This Directive has been proposed in order to increase the quantity of information (e.g. on shareholding and changes of shareholding) investors have about publicly quoted companies. Apart from safeguarding investors' interests, the proposal should help to further integrate Europe's securities markets and increase the availability of funds for investment.	06/2004

6	1	The Commission to propose a new Capital Adequacy Directive. This Directive will provide a more modern and flexible capital requirements framework for banks and investment firms. The overall aims are to maximise the effectiveness of capital requirement rules, ensure continuing financial stability, maintain confidence in financial investment and protect consumers. The new regime is also designed to ensure that capital requirements for lending to small and medium-sized enterprises are appropriate and proportionate.	03/2004
7	1	The Commission to publish a Communication on clearing and settlement. This Communication will provide a firm indication of the Commission's views as regards the need for and content of legislative actions to facilitate inter-connected and efficient cross-border clearing and settlement as a basis for discussion with authorities and market participants.	09/2003
8	1	The Commission to consult widely on completing and further developing the FSAP, with a particular focus on creating a single market in retail financial services.	12/2003
8	1	The Council and Parliament should adopt the Consumer Credit Directive to enable progress towards an effective single credit market.	03/2004

3. ENSURING HIGH QUALITY NETWORK INDUSTRIES

ACTION	TYPE	DESCRIPTION	TIMING
