A cet égard, il serait opportun de sécuriser la définition communautaire de la concession, afin d'éviter les problèmes d'interprétation soulevés par la Communication interprétative de la Commission sur les concessions en droit communautaire, qui sont source d'insécurité juridique et peuvent limiter l'attractivité[4] et le financement des projets. Au-delà du critère du mode de rémunération (paiement par le consommateur ou par l'autorité publique), il serait économiquement plus pertinent d'adopter une définition des concessions qui prenne en compte à la fois les critères du risque et de l'objet du PPP. Ainsi, par exemple, une concession pourrait être définie comme le contrat par lequel une collectivité locale confie à une entreprise la gestion d'un service d'intérêt général, et dont la rémunération comporte un risque significatif lié aux résultats de l'exploitation.

Aussi, un contrat de construction et d'exploitation (BOT[5]) d'une usine de traitement d'eau, où l'opérateur supporte un risque significatif lié aux évolutions du volume d'eau vendue, serait-il logiquement qualifié de concession au sens communautaire. Il en serait de même pour un contrat de construction et d'exploitation d'usine d'incinération, dans le cas où les recettes de l'opérateur dépendent de façon significative de ventes à un prix non garanti sur le marché de production d'électricité.

Ces cas sont en situation d'insécurité juridique, puisque, par exemple, ils relèvent en droit français de la procédure de délégation de service public (proche de la notion de « concession de services » européenne) alors qu'ils sont soumis aux directives marchés publics en droit communautaire.

2. Le principe de publicité préalable et de mise en concurrence sur l'attribution du contrat

Lorsqu'un organisme public décide de faire intervenir un tiers dans le cadre d'un PPP, que ce soit sous forme contractuelle ou institutionnelle, il est essentiel de respecter les principes de publicité préalable et de mise en concurrence sur le contrat.

La législation communautaire en vigueur concernant les obligations de publicité préalable n'est pas suffisante et est parfois source d'insécurité juridique : par exemple, dans le domaine des concessions, l'obligation explicite de publicité ne concerne que les concessions de travaux dans les secteurs dits classiques, et aucun modèle d'avis communautaire n'est adapté au cas de la concession de service. Les contrats de concessions de service et de travaux étant généralement mixtes, un principe d'obligation de publicité commun à tous les PPP, et notamment aux concessions, permettrait d'éviter toute incertitude d'application.

Le principe de mise en concurrence sur le service implique notamment, lors de la mise en place d'un PPP institutionnel (c'est à dire une société dans laquelle l'entreprise privée détient des parts du capital et participe à la gestion du service en tant qu'opérateur) que la mise en concurrence porte sur l'attribution du contrat. Au moyen d'objectifs de performance, elle permet en effet d'améliorer le service aux consommateurs.

3. La définition du terme « tiers »

Lorsqu'un organisme public confie une mission de service public à un tiers, le principe de mise en concurrence s'applique. La définition juridique du terme « tiers » est donc essentielle car elle délimite les cas d'exonération aux règles de mise en concurrence. La dérogation au principe de concurrence doit être strictement limitée aux deux conditions cumulatives suivantes :

- l'entité qui se voit octroyer le contrat réalise l'intégralité de son chiffre d'affaires avec l'organisme adjudicateur,
- l'entité qui se voit octroyer le contrat ne dispose pas d'autonomie décisionnelle et est soumise aux mêmes procédures de contrôle que celles qui s'appliquent aux propres services de l'organisme adjudicateur.

[4] C'est notamment le cas dans les nouveaux Etats membres, dont l'expérience en matière de concession est parfois assez récente et nécessite un encadrement juridique.

[5] Voir infra. les définitions fournies en réponse à la question1.

4. L'égalité d'accès aux subventions publiques

Les actuelles inégalités d'accès aux subventions publiques constatées constituent une des principales discriminations dont souffrent les opérateurs privés (cf. exemples dans la réponse à la question 12).

REPONSES AUX QUESTIONS POSEES PAR LA COMMISSION DANS LE LIVRE VERT.

1) Quels types de montages de PPP purement contractuels connaissez-vous ? Ces montages font-ils l'objet d'un encadrement spécifique (législatif ou autre) dans votre pays ?

La terminologie liée aux PPP est confuse. Le terme « PPP » lui-même, recouvre différentes réalités selon le pays ou le contexte dans lequel il est employé.

Les métiers de Suez consistent principalement à gérer des services publics sous une forme contractuelle ou institutionnelle avec des autorités publiques. Au sein de l'Union européenne, dans le secteur de l'eau et de l'assainissement, environ un tiers des habitants sont desservis par un opérateur privé via une forme de PPP et, pour ces mêmes métiers, environ 6% des européens sont desservis par une société du groupe Suez.

En fonction de la volonté de l'organisme adjudicateur, Suez intervient sous différentes formes de PPP comme les marchés de gérance ou O&M[6], les régies intéressées, les contrats de délégation de service public (affermages, concessions), les BOT ou bien encore les PFI britanniques, qui regroupent des contrats très variés. Selon le type de PPP choisi, le degré de participation de l'opérateur dans le financement des investissements ainsi que la nature de la relation entre l'opérateur et le consommateur final varient.
Il est fréquent que pour mieux s'adapter aux besoins de l'organisme adjudicateur, le PPP choisi soit hybride entre deux des modèles cités ci-dessus.

Les définitions précises d'un O&M, d'un contrat de délégation de service public, et d'un contrat « d'infrastructures », principales formes contractuelles mises en œuvre par les sociétés de Suez sont les suivantes :

- **Opération et Maintenance (O&M)**

- L'opérateur privé prend en charge le fonctionnement opérationnel du service, sur un secteur géographique précis, et avec un niveau de responsabilité déterminé. A ce titre, l'opérateur privé peut se voir conférer une autorité sur le personnel sous statut public, en charge du service et assure la gestion quotidienne et la maintenance des installations.
- L'autorité publique rétribue l'opérateur privé pour les prestations effectuées. Cette rétribution peut être modulée en fonction de critères de performance identifiés et mesurés.

- **Construction et gestion d'infrastructures, type Build Operate and Transfer (BOT)**

- L'opérateur privé se voit confier la responsabilité de la conception, du financement, de la construction (ou de la réhabilitation) et de la gestion, sur une durée déterminée, d'un équipement majeur. En contrepartie, il est rémunéré par l'autorité publique, en lui facturant le service rendu pour ce nouvel équipement.
- Ce type de contrat est particulièrement bien adapté[7] lorsque les projets de développement de la collectivité portent seulement sur la réalisation d'une infrastructure bien déterminée, par exemple : usine de traitement d'eau, usine d'incinération.

[6] O&M = Operation and Maintenance

[7] Comme rappelé dans l'introduction, il arrive que les catégories de PPP ne soient pas semblables dans les droits nationaux et le droit communautaire. Par exemple, certains schémas de BOT sont classés dans les délégations des service public dans le droit français.

- **Délégation de Service Public (DSP)**

- L'opérateur privé se voit confier par l'autorité publique la responsabilité opérationnelle de la gestion du service pendant une durée déterminée. L'opérateur, qui se rémunère en principe directement auprès des consommateurs, finance tout ou une partie du renouvellement (affermage) et des infrastructures nouvelles (concession). Dans la pratique peu de contrats répondent à une stricte distinction entre affermage et concession[8].
- Dans tous les cas la collectivité publique prend les décisions essentielles, notamment en ce qui concerne les tarifs et les objectifs à atteindre, et conserve un contrôle étroit sur les conditions d'exécution du service public.

Lorsque le PPP contractuel est qualifié de marché public, les règles nationales, qui comprennent au moins la transposition des directives marchés publics, s'appliquent. C'est le cas par exemple pour les contrats d'O&M.

Dans le cas de montages PPP qui ne relèvent pas des directives marchés publics (par exemple les concessions ou les affermages), trois pays de l'Union européenne ont, à notre connaissance, mis en place un encadrement législatif :

- la loi Sapin en France (1993) : cette loi, avec ses décrets d'application, impose la procédure de mise en concurrence des contrats de délégation d'un service public après publicité. Cette procédure n'est pas différenciée entre les contrats d'affermage, de concessions et autres montages complexes.
- la législation espagnole : le décret royal 2/2000 qui encadre les contrats administratifs, complété par la loi 13/2003 qui s'applique aux concessions de travaux publics, donnent les principes relatifs à la passation des contrats, et garantissent la concurrence. De plus, les services locaux comme l'eau et l'assainissement, font l'objet d'une réglementation locale spécifique, qui détaille les procédures applicables pour l'attribution de contrats.
- la législation italienne (loi Merloni de 1994, loi des finances de 2002 et paquet législatif sur les services publics locaux de 2003) : suite à la modernisation du secteur de l'eau initiée par la loi Galli de 1994, sur chacun des 91 territoires recouvrant le pays, un opérateur doit[9] être sélectionné : soit l'appel d'offres porte sur le contrat, soit il porte sur le choix du partenaire privé qui rentre dans le capital de la société exploitante. Des cas d'exonérations sont prévus, notamment pour les cas dits de « in-house » ainsi que pour les sociétés cotées avant le 10 octobre.2003.

Comme il est souligné en introduction du présent document, il serait souhaitable de préciser et d'améliorer la définition communautaire de la concession en retenant (au-delà du critère du mode de rémunération) à la fois les critères du risque et de l'objet du PPP. Ainsi, une concession pourrait être définie comme le contrat par lequel une collectivité locale confie à une entreprise la gestion d'un service d'intérêt général, et dont la rémunération comporte un risque significatif lié aux résultats de l'exploitation.

[8] En effet, il est fréquent qu'un contrat d'affermage prévoit des travaux à la charge du délégataire et réciproquement, il est exceptionnel qu'une concession mette tous les travaux à la charge du concessionnaire.

[9] Quelques cas d'exonération sont prévus, où plusieurs opérateurs pourront co-exister sur le même territoire.

2) De l'avis de la Commission, la transposition en droit national de la procédure de dialogue compétitif permettra aux parties concernées de disposer d'une procédure particulièrement adaptée à la passation des contrats qualifiés de marchés publics lors de la mise en place d'un PPP de type purement contractuel, tout en préservant les droits fondamentaux des opérateurs économiques. Partagez-vous ce point de vue ? Si non, pourquoi ?

Suez accueille favorablement la mise en place de la procédure de dialogue compétitif dans le cadre des marchés publics. En effet, même si sa mise en œuvre peut s'avérer complexe, cette procédure devrait permettre de promouvoir l'innovation technologique au sein de l'Union.
Il conviendra cependant de veiller à ce que la mise en œuvre de cette procédure respecte la propriété intellectuelle des concurrents. En effet, celle ci est menacée si l'organisme adjudicateur remet en concurrence l'ensemble des candidats sur la solution qu'il aura jugée bonne suite à la mise en commun des idées des différents soumissionnaires. Aussi, devrait-il être envisagé qu'à la suite de la première étape - qui consiste à la sélection par l'organisme adjudicataire d'un nombre restreint de concurrents sur la base de pré-projets – l'organisme adjudicateur poursuive avec les concurrents un dialogue parallèle, sur la base des solutions de chacun des candidats retenus, sans faire pression sur un candidat pour qu'il accepte que sa solution soit divulguée aux autres candidats.

En tout état de cause, la procédure de dialogue compétitif n'a de sens que dans les cas pour lesquels l'organisme adjudicateur n'est pas en mesure de définir a priori les choix technologiques liés à la prestation à réaliser.
Cette procédure, limitée à juste titre à certains marchés publics, présente une certaine flexibilité adaptée à des marchés complexes et au degré d'indétermination technique forte, mais elle ne propose pas la souplesse nécessaire aux négociations des contrats de concessions de services (cf. réponse à la question 7). En d'autres termes, la procédure de dialogue compétitif a pour but de définir le projet technique avant appel d'offres, alors que la phase de négociation dans le cadre de l'attribution d'un contrat de concession a pour but de définir le contrat qui liera les parties pendant une durée longue. En effet, la procédure de dialogue compétitif est inopérante pour définir avec précision la répartition des risques et des responsabilités entre les parties. Pas plus ne l'est-elle pour arrêter la répartition des responsabilités financières des parties. Aussi, cette procédure ne peut-elle remplacer la nécessaire phase de négociation entre les parties à un PPP.
Pour prendre un exemple concret, la procédure de dialogue compétitif pourrait être utilisée pour la réalisation d'une unité de traitement des boues de station d'épuration par exemple, car l'essentiel du projet dépend d'un choix technologique. Elle n'est en revanche pas pertinente le cas d'une délégation globale de la gestion du service d'assainissement.

3) En ce qui concerne ces contrats, existe-t-il selon vous des points autres que ceux relatifs au choix de la procédure d'adjudication, susceptibles de poser problème au regard du droit communautaire des marchés publics ? Si oui, lesquels et pour quelles raisons ?

Bien qu'elle ne relève pas directement du droit communautaire, une certaine dérive liée aux marchés dits « à reconduction », utilisés en France, notamment dans le domaine de la collecte des déchets est constatée.
Dans ces contrats, lorsque la collectivité locale décide de ne pas actionner la reconduction, le prestataire doit arrêter les prestations. En revanche, si au contraire, la collectivité locale décide de reconduire le contrat, le prestataire qui ne le souhaiterait plus n'a aucun droit de refus. Une telle situation n'est pas satisfaisante dans la mesure où elle a pour effet de rendre très malaisée la cotation des marchés par les candidats lors de la remise initiale des offres, tout en les forçant à intégrer ce risque dans leur prix. Une telle dérive ne répond pas à l'objectif de rationalisation des deniers publics.
Il serait donc tout à fait souhaitable de pallier les dérives de ce type de marchés, notamment en permettant au prestataire de refuser leur reconduction.

4) Avez-vous déjà organisé, participé, ou souhaité participer, à une procédure d'attribution d'une concession au sein de l'Union? Quelle expérience en avez-vous ?

Suez, avec ses différentes filiales, répond en moyenne à plus de 500 appels d'offres par an dans l'UE, essentiellement en France et en Espagne, pour des concessions de service (au sens communautaire).

Cette expérience a permis de constater que :

- les règles et pratiques des différents Etats Membres sont très hétérogènes ;
- il arrive que l'attention des collectivités locales soit parfois focalisée sur les aspects financiers ou tarifaires au détriment du niveau de qualité de service proposé. Ce fut par exemple le cas lors de l'appel d'offres pour le choix du gestionnaire des services d'eau et d'assainissement de Prague en 2001, où le choix de l'adjudicataire fut effectué sur le seul critère financier (prix d'achat des actions de la société titulaire du contrat) ;
- pour qu'une procédure d'attribution de concession soit réussie et qu'elle conduise à un PPP adapté, jouissant d'une sécurité juridique et d'une solidité économique suffisantes, il est nécessaire de passer par une étape de négociation significative entre l'autorité publique et l'opérateur (cf. réponse question 7) ;
- les règles de passation de contrats de concession, comme la loi Sapin[10] en France, donnent parfois lieu à des excès au contentieux. En effet, la complexité des procédures permet un grand nombre de recours purement formels, sans que l'infraction invoquée porte grief à celui qui la met en avant. Pour assurer une plus grande sécurité juridique, les directives recours devraient limiter la recevabilité des recours aux seuls moyens faisant grief au requérant.

5) Estimez vous que le cadre juridique communautaire actuel est suffisamment précis pour assurer la participation concrète et effective de sociétés ou groupements non-nationaux aux procédures de passation de concessions? Une concurrence réelle est-elle, selon vous, habituellement assurée dans ce cadre ?

En pratique et malgré le manque d'homogénéité des règles nationales quand elles existent, la publicité réalisée dans le cadre de passation de concessions suffit à signaler le lancement de la procédure aux opérateurs potentiellement intéressés. Dans certains pays, comme la France, la législation nationale en vigueur impose des règles de publicité précises.

En France, Lyonnaise des Eaux, filiale de Suez Environnement, est à l'origine de l'arrêt du Conseil d'Etat « Communauté de communes du Piémont de Barr ». Comme demandé, le Conseil d'Etat a considéré qu'une collectivité ne pouvait pas confier à un syndicat départemental la gestion d'une station d'épuration sans procéder à une publicité préalable. Malgré cette jurisprudence, il existe encore des cas en France où une collectivité locale attribue un contrat de concession de services d'eau à une régie voisine sans mise en concurrence.
D'une façon générale, afin d'échapper à la jurisprudence « Piémont de Barr », il arrive que les syndicats départementaux dans le domaine de l'eau et de l'assainissement incitent les communes à transférer leurs compétences afin de ne pas avoir à se soumettre à une procédure de mise en concurrence.

Ainsi, l'adoption d'une directive sur les PPP, qui préciserait les quatre points détaillés dans la première partie de ce document (cf. p. 3 et 4) et rappelés à la question suivante, permettrait de sécuriser la législation communautaire grâce à une clarification dans le droit positif de l'obligation de publicité préalable pour tous les PPP et de la définition de la notion de « tiers ».

[10] La loi Sapin comporte 8 étapes principales, qui peuvent chacune donner lieu à de nombreux recours.

6) Pensez-vous qu'une initiative législative communautaire, visant à encadrer la procédure de passation de concessions, est souhaitable ?

La question d'une éventuelle initiative législative communautaire dans le domaine des PPP se décline en trois points :

- quels PPP seraient concernés ?
- quel serait le contenu de l'outil législatif ?
- quel outil législatif serait utilisé ?

Suez estime qu'une initiative législative commune à tous les PPP, et non pas limitée aux seuls contrats de concessions, est souhaitable. Cet outil législatif, qui serait vraisemblablement une directive, devrait comporter les principes et éléments suivants :

1. la définition des PPP,
2. le principe de publicité préalable et de mise en concurrence sur l'attribution du contrat,
3. la définition du terme « tiers », qui limite les cas dérogatoires au principe de mise en concurrence,
4. l'égalité d'accès aux subventions publiques.

Chacun des ces points est développé dans la première partie du présent document (cf. p. 3 et 4).

Si un tel outil juridique devait être adopté, il devrait :

- respecter les caractéristiques des contrats de concession et ne pas condamner leur viabilité économique. Par exemple (cf. réponse à la question 7), les contrats de concession ne devraient pas être soumis aux règles d'attribution des marchés publics ;
- préserver l'équilibre économique des contrats en cours, sans les remettre en cause avant leur terme, afin de respecter les engagements pris par les parties ainsi que l'intérêt des usagers.

7) De manière plus générale, si vous estimez qu'il est nécessaire que la Commission propose une nouvelle action législative, existerait-il à votre avis des raisons objectives de viser dans cet acte tous les PPP de type contractuel, qu'ils soient qualifiés de marchés publics ou de concessions, pour les soumettre à des régimes de passation identiques ?

Si un outil législatif visant à encadrer les procédures de passation de concessions devait être adopté, il ne devrait en aucun cas être semblable à la réglementation européenne en vigueur pour les marchés publics.

Les concessions se caractérisent notamment par une prise de risques par le concessionnaire en matière d'investissements et de risques commerciaux sur une durée longue. De plus, le concessionnaire, en contact direct avec les consommateurs, assume une mission d'intérêt général, qu'il doit réaliser en respectant les règles et les objectifs fixés par la collectivité tout en bénéficiant d'une certaine autonomie.

Ainsi, la mise au point d'un contrat de concession nécessite une phase de négociation plus longue et plus complexe que dans le cas d'un marché public afin d'ajuster la répartition des risques, le contenu des missions et le financement de l'opération. L'appréciation par la collectivité publique de la relation de confiance qui peut s'instaurer avec l'opérateur est encore plus essentielle qu'en matière de marchés publics.

De plus, et contrairement aux marchés publics, il doit être possible de réviser périodiquement les contrats de concession, qui sont à juste titre d'une durée relativement longue, en fonction d'événements extérieurs ou d'ajustement des besoins de l'organisme adjudicateur (cf. question 14).

8) Selon votre expérience, l'accès des opérateurs non-nationaux aux formules de PPP d'initiative privé est-il assuré? En particulier, lorsqu'il existe une invitation des pouvoirs adjudicateurs à présenter une initiative, cette invitation fait-elle généralement l'objet d'une publicité adéquate permettant l'information de tous les opérateurs intéressés ? Une procédure de sélection véritablement concurrentielle est-elle organisée pour assurer la mise en œuvre du projet retenu ?

9) Quelle serait selon vous la meilleure formule pour assurer le développement des PPP d'initiative privée dans l'Union européenne tout en assurant le respect des principes de transparence, de non discrimination et d'égalité de traitement ?

Suez ne dispose pas de la pratique de projets d'initiative privée.

10) Quelle expérience avez-vous de la phase postérieure à la sélection du partenaire privé dans les opérations de PPP contractuels ?

L'expérience montre que la vie d'un contrat est toujours affectée par un certain nombre de changements ou bouleversements exogènes. Il est alors nécessaire pour les deux parties de convenir des modifications à apporter au contrat d'origine, dans le respect de certains principes (par exemple de l'équilibre économique initialement défini). Dans le cas de concessions, la durée du contrat (cf. question 14) implique des clauses de rendez-vous réguliers (par exemple quinquennaux) entre l'organisme adjudicataire et le titulaire du contrat.

11) Avez-vous connaissance de cas dans lesquels les conditions d'exécution – y compris les clauses d'adaptation dans le temps - ont pu avoir une incidence discriminatoire ou ont pu constituer une entrave injustifiée à la libre prestation de services ou à la liberté d'établissement ? Si oui, pouvez-vous décrire le type de problèmes rencontrés ?

Suez n'a pas connaissance de telles discriminations ou entraves.

12) Avez-vous connaissance de pratiques ou de mécanismes d'évaluation d'offres ayant des incidences discriminatoires ?

La plupart des discriminations dont souffrent les opérateurs privés sont moins liées aux mécanismes d'évaluation des offres qu'aux désavantages structurels qui pénalisent les offres du secteur privé.

Dans le domaine fiscal par exemple, les régies d'assainissement allemandes sont exemptées de TVA alors que les opérateurs privés se voient imposer une facturation avec une TVA de 16%. En France, la plupart des régies d'eau, d'assainissement et de gestion des déchets ne sont pas assujetties à l'impôt sur les sociétés ou à la taxe professionnelle ni à certaines redevances d'occupation du domaine public et ont des charges moindres pour les cotisations des retraites de leurs employés que les opérateurs privés. De plus, les régies de gestion des déchets sont exemptées de TVA.

Il est par ailleurs essentiel de veiller, au moyen du contrôle communautaire des aides d'Etat, à ce que l'octroi de subventions soit non discriminatoire entre les opérateurs, quel que soit leur statut.
En France, par exemple, il est pratiquement impossible de bénéficier d'aides des départements et des régions pour des travaux financés par les délégataires et non par des régies[11].
De plus, même lorsque le financement des infrastructures est à la charge de la collectivité publique, des discriminations sont parfois constatées en fonction du mode de gestion du service : le Conseil d'Etat français a

[11] En effet, la loi réserve le bénéfice de certaines subventions aux régies et les concessionnaires ne peuvent pas y prétendre.

validé en décembre 2003 la décision du Conseil Général des Landes d'accorder aux communes en régie un taux de subvention supérieur à celui accordé aux communes ayant délégué leurs services d'eau potable et d'assainissement.
Ces mesures discriminatoires sont un frein évident au développement des PPP. Aussi Suez promeut un outil législatif reposant sur quatre principes dont celui de l'égalité d'accès aux subventions publiques (cf. introduction p.4).

13) Partagez-vous le constat de la Commission selon lequel certains montages financiers, en particulier les montages de type "step-in" peuvent poser problème en termes de transparence et d'égalité de traitement ? Connaissez vous d'autres "clauses types" dont la mise en œuvre est susceptible de poser des problèmes similaires ?

Du fait même qu'un candidat est évalué sur ses compétences et sa capacité financière à assumer une opération, une substitution, après attribution du projet à un candidat, pourrait à priori être considérée comme contraire aux règles de concurrence.

Toutefois, la réalité est autre. Tant la personne publique que les opérateurs souhaitent, dans la mesure du possible, procéder à des opérations déconsolidantes. Or, dans une telle situation, seul un établissement financier peut admettre dans ses comptes une opération à caractère consolidant, ce qui paraît devoir, dans ces conditions, justifier la présence d'établissements financiers « aux côtés » du gestionnaire du service d'intérêt général.
Les clauses de step-in sont ainsi devenues nécessaires à la mise en œuvre de beaucoup de PPP et permettent d'obtenir des financements à meilleur coût.

Il est par ailleurs important de rappeler que les clauses de step-in ont un caractère essentiellement dissuasif : à notre connaissance aucune clause de ce type n'a été activée dans le domaine de l'eau et des déchets à ce jour.

Pour répondre aux inquiétudes légitimes de la Commission, Suez considère souhaitable qu'un changement significatif au niveau de l'opérateur (comme l'activation d'une clause de step-in) dans le cadre d'un contrat soit soumis à l'autorisation de la collectivité locale, laquelle ne peut faire valoir, pour s'y opposer, que des motifs mettant en cause la gestion du service ou les garanties présentées par l'opérateur.
Ce raisonnement doit également s'appliquer en cas de changement majeur dans l'actionnariat de l'opérateur. En effet, s'il est souhaitable qu'une autorité publique puisse s'opposer à une modification du capital de l'opérateur, les motifs du refus, comme l'a souligné le Conseil d'Etat en France, ne doivent pas être discrétionnaires.

14) Estimez-vous qu'il serait nécessaire de clarifier au niveau communautaire certains aspects relevant du cadre contractuel des PPP ? Si oui, sur quel(s) aspect(s) devrait porter cette clarification ?

Forte de son expérience séculaire des PPP, Suez tient à souligner les deux points suivants, relatifs à la durée des contrats et à leurs éventuels avenants.

La durée des contrats.

La mesure qui consisterait à limiter la durée des concessions de services ou de ne prendre comme seul critère la durée d'amortissement des investissements, est souvent considérée comme une mesure simple et efficace visant à dynamiser la concurrence. Cette question mérite un examen plus approfondi.

En effet, la détermination de la durée des contrats ne saurait s'appuyer uniquement sur des conditions d'amortissement et de rentabilité raisonnable. Par exemple, des contrats trop courts dans le secteur de l'eau ou de l'assainissement menaceraient l'optimisation du couple entretien/renouvellement des infrastructures. Une conséquence serait l'augmentation des coûts d'exploitation et un probable sous-investissement[12].

De plus, et indépendamment des investissements effectués, l'achèvement des objectifs de performance sur lesquels l'opérateur s'est engagé dans le contrat suppose une durée suffisamment longue. C'est par exemple le cas lorsqu'un contrat de concession prévoit des objectifs de réduction des pertes en eau. Dans certains nouveaux Etats membres, la seule réalisation d'un diagnostic précis de la situation des réseaux (dans le secteur de l'eau et de l'assainissement les réseaux sont en effet enterrés) nécessite une analyse de plusieurs années. De plus, la réalisation des objectifs de performance nécessite la formation du personnel, laquelle n'est efficace que dans la durée.

En outre, une courte durée des contrats nécessiterait de fréquentes mises en concurrence sur le service (dont l'objet réduit limiterait les possibilités d'innovation) dont le coût élevé pénaliserait les consommateurs. La concurrence ne serait ainsi pas stimulée. Au contraire, l'opérateur sortant disposerait dans ce cas d'un avantage significatif. En France, le Conseil de la Concurrence a confirmé ce raisonnement, en considérant, dans un avis rendu en 2001, que pour créer les conditions d'une saine concurrence, les contrats devaient avoir une durée suffisamment longue pour être attractifs.

Pour finir, l'expérience montre que la vie d'un contrat est souvent affectée par un certain nombre de changements ou de bouleversements exogènes. La durée est nécessaire pour que l'opérateur puisse anticiper et s'adapter à ces situations puis introduire, pour y faire face, les innovations techniques et de gestion pertinentes pour continuer à assurer la bonne qualité du service.

Les avenants éventuels aux contrats.

Comme souligné en réponse à la question 7, l'une des caractéristiques des contrats de concession est de pouvoir être adaptés dans le temps, sans toutefois remettre en cause l'égalité des candidats lors de l'appel d'offres. Une limitation excessive des possibilités d'avenants conduirait à limiter l'intérêt, pour une collectivité, de conclure un contrat de gestion de service si celui-ci devait être remis en cause ou résilié suite à chaque changement dans l'environnement du contrat. En obligeant à la résiliation des contrats avant terme, l'absence de possibilités d'avenants entraînerait également le risque de coûts supplémentaires pour les collectivités ainsi que pour les consommateurs.

15) Dans le contexte des opérations de PPP, avez-vous connaissance de problèmes particuliers rencontrés en matière de sous-traitance ? Lesquels ?
16) Le phénomène des PPP de type contractuel, impliquant le transfert d'un ensemble de tâches à un unique partenaire privé, justifie-t-il selon vous que des règles plus détaillées et/ou d'un champ d'application plus large soient mise en place en ce qui concerne le phénomène de sous-traitance ?
17) De manière plus générale, estimez-vous qu'une initiative complémentaire devrait être prise au niveau communautaire en vue de clarifier, ou d'aménager, les règles relatives à la sous-traitance ?

En application des directives marchés publics, les règles applicables en matière de sous-traitance sont différentes pour un concessionnaire selon que les dispositions de la directive « secteurs spéciaux » lui sont ou non applicables. Or de grandes incertitudes subsistent sur la notion de droits exclusifs et spéciaux que ne lève pas la nouvelle directive 2004-17. En effet, l'interprétation à donner à la nouvelle définition de ces droits par cette directive est délicate s'agissant d'entreprises dont tous les contrats n'ont pas été attribués selon une même procédure (cas des activités eau et assainissement en France). Par ailleurs, les règles applicables au secteur de l'assainissement sont confuses : la notion d'activité liée à l'eau potable est imprécise. Il ne peut être satisfaisant de prétendre assujettir ou non à une procédure formalisée les achats d'un concessionnaire dans le domaine de l'assainissement selon l'étendue des compétences de la collectivité publique, organisatrice du service[13].
En conséquence, une clarification des textes sur ces différents points serait bienvenue afin de lever ces incertitudes, sources d'insécurité juridique et donc frein au développement des partenariats concernés.

[12] Cas rencontrés par exemple dans des contrats de traitement des eaux usées en Espagne

[13] Critère défini par la Communication interprétative sur les concessions pour déterminer si un contrat de concession de travaux est soumis à publicité communautaire.

18) Quelle expérience avez-vous de la mise en place d'opérations de PPP de type institutionnalisé ? En particulier, votre expérience vous conduit-elle à penser que le droit communautaire des marchés publics et des concessions est respecté dans le cas de montages de PPP institutionnalisé? Si non, pourquoi ?

Pour une plus grande exhaustivité, et compte tenu des régimes législatifs différents dans les métiers de l'énergie et de l'environnement, Suez a jugé pertinent d'apporter une réponse d'une part en ce qui concerne les métiers de l'énergie et, d'autre part, en ce qui concerne l'environnement.

Dans le domaine de l'énergie

En Belgique, depuis la fin des années 1950, environ 80 % de la distribution publique d'électricité et 90 % de la distribution publique de gaz sont assurées par des PPP de type institutionnalisé. Ces montages font l'objet d'un encadrement législatif spécifique dans les trois régions du pays, en dehors du droit des marchés publics.

Cet encadrement législatif soumet les contrats de PPP de type institutionnalisé à une tutelle administrative :

- les décisions des communes, préalables à la constitution d'un PPP et, ultérieurement , celles relatives à son fonctionnement ou à sa liquidation, sont soit susceptibles de suspension et d'annulation, soit soumises à l'approbation de l'autorité de tutelle ;
- les actes des organes de gestion et de contrôle des PPP sont également soumis à une tutelle administrative générale (suspension ou annulation) ou spéciale (approbation) ainsi qu'à des règles de publicité ;
- les communes disposent toujours de la majorité des voix et des mandats, de façon à assurer la maîtrise des pouvoirs publics. L'associé privé se voit reconnaître un droit de veto limité à la protection de ses intérêts financiers d'actionnaire ;
- les travaux qui ne sont pas exécutés par du personnel de la structure, de même que les fournitures et les services donnent lieu à l'application de la législation des marchés publics.

L'ouverture du marché de l'énergie va de pair avec la création d'autorités de régulation auxquelles les PPP sont soumis :

- une autorité fédérale de régulation (la CREG) est chargée essentiellement d'approuver les tarifs d'accès aux réseaux d'électricité et de gaz ;
- trois autorités régionales de régulation sont chargées d'approuver les plans de développement, de vérifier l'exécution des obligations de service public applicables aux gestionnaires de réseau de distribution.

Les éléments qui précèdent, la durée des PPP institutionnels (de 18 à 30 ans maximum, selon les régions) ainsi que leurs spécificités, expliquent qu'ait été créée une législation spécifique aux PPP.

Dans le domaine de l'environnement

Un certain nombre de contrats ou de marchés sont attribués sans mise en concurrence à des établissements publics ou à des sociétés d'économie mixte, ce qui parait contraire aux principes dégagés par la jurisprudence en matière de phénomènes dits de « in-house ». Par exemple, l'attribution de marchés à la société Aquafin (société en charge de l'assainissement dans la région des Flandres en Belgique, dont l'actionnariat est composé à 80% par une holding détenue par la région des Flandres et à 20% par une société privée) s'est faite sans mise en concurrence.

Il paraît ainsi nécessaire de créer un droit positif clair sur ce thème. Ainsi qu'il est souligné en introduction de ce document, lorsqu'un organisme public confie une mission de service public à un tiers, le principe de mise en concurrence s'applique. La définition du terme « tiers » est donc essentielle car elle délimite les cas d'exonération aux règles de mise en concurrence. La dérogation au principe de concurrence doit être *strictement* limitée aux deux conditions cumulatives suivantes :

- l'entité qui se voit octroyer le contrat réalise l'intégralité de son chiffre d'affaires avec l'organisme adjudicateur,
- l'entité qui se voit octroyer le contrat ne dispose pas d'autonomie décisionnelle et est soumise aux mêmes procédures de contrôle que celles qui s'appliquent aux propres services de l'organisme adjudicateur.

Par ailleurs, la mise en place de PPP institutionnalisés présente dans certains pays une insécurité juridique qui nuit à l'attractivité des projets et à leur financement. C'est le cas par exemple dans le secteur de l'eau en Italie.
En effet, la modernisation de ce secteur s'appuie sur la mise en place de PPP institutionnels, dont la compatibilité avec les principes du traité est incertaine : souvent, une société à capitaux publics se voit attribuer un contrat de concession sans mise en concurrence et ensuite la vente d'une partie du capital de cette société fait l'objet d'un appel d'offres.
De plus, la multiplication des textes réglementaires sur la procédure de passation et l'absence d'une véritable coordination entre eux, crée une incertitude chez les opérateurs notamment quant à la durée des concessions. Cette imprécision du cadre juridique peut être démontrée d'une part, par l'insertion, dans les contrats signés entre opérateurs et organismes adjudicateurs, de clauses spécifiques relatives à la résiliation anticipée due à une éventuelle réduction de la durée de la concession (méthode de valorisation des actions et modalités de participation de l'actionnaire privé dans un nouvel appel d'offres) et, d'autre part, par la déclaration récente d'une autorité publique locale (l'AATO de Torinese) sur l'inexistence de règles juridiques claires sur le sujet.

19) Estimez-vous qu'une initiative devrait être prise au niveau communautaire en vue de clarifier ou de préciser les obligations des organismes adjudicateurs quant aux conditions dans lesquelles doivent être mis en concurrence les opérateurs potentiellement intéressés par un projet de type institutionnalisé? Si oui, sur quels points particuliers et sous quelle forme? Si non, pourquoi ?

Les PPP institutionnels ne sont pas directement visés par la Communication interprétative de la Commission sur les concessions en droit communautaire publiée en 2000. Or la mise en place de PPP institutionnels, dont le développement s'accélère en Europe, est parfois fragilisée par un manque de sécurité juridique.

Plutôt qu'une initiative en vue de clarifier les modalités de mise en concurrence dans le cadre de PPP institutionnels, il semble souhaitable en revanche que la Commission réaffirme et précise, dans une directive sur l'ensemble des PPP, un certain nombre de principes communs à tous les PPP, contractuels ou institutionnels.

L'affirmation du principe de publicité préalable et de mise en concurrence sur le contrat permettrait notamment de renforcer la sécurité juridique des montages de PPP institutionnels. En effet, si le principe de mise en concurrence dans le cadre de la mise en place d'un PPP contractuel semble généralement acquis et appliqué, il est essentiel qu'il soit également respecté dans le cadre de la mise en place d'un PPP institutionnel.
De façon concrète, lorsque l'achat de parts de la société exploitante, à capitaux jusqu'alors publics, accorde un pouvoir de gestion à l'investisseur privé, alors la mise en concurrence sur l'ouverture du capital d'une société titulaire d'un contrat, ne peut valablement se substituer à la mise en concurrence sur l'attribution du contrat. Dans ce cas, c'est donc l'attribution du contrat, qui peut être assorti de la vente de parts, qui doit faire l'objet de la mise en concurrence.
En revanche, l'entrée au capital d'investisseurs privés, sans droit particuliers liés à la gestion du service, ne doit pas être soumise à une obligation d'appel d'offres (exemple : cas d'une mise en bourse d'une partie du capital).
La mise en place du PPP institutionnel de Murcie, en Espagne, est un exemple de mise en concurrence dans le but d'améliorer le service : le prix d'achat correspondant à la part de capital de la société à capitaux publics en vente, était fixé en fonction des éléments du bilan de la société et la sélection de l'entreprise privée (attribution du contrat) portait sur l'offre technique et les engagements de qualité du service.

Par ailleurs, l'élaboration d'un droit positif pour les phénomènes dits de « in-house » (cf. troisième principe énoncé dans le propos introductif) permettra de clarifier le fait qu'une société d'économie mixte ne peut en aucun cas se voir attribuer un marché ou un contrat sans mise en concurrence.

D'autre part, une telle initiative législative, prise au niveau communautaire, devrait également tenir compte de la nécessité de préserver l'équilibre économique des contrats en cours, sans les remettre en cause avant leur terme, afin de respecter les engagements pris par les parties ainsi que l'intérêt des usagers. Elle devra également tenir compte de l'existence d'une réglementation européenne sectorielle dans le domaine de l'énergie.

20) Quelles sont les mesures ou pratiques que vous estimez constitutives d'entraves à la mise en place des PPP au sein de l'Union européenne ?

Les pratiques discriminatoires évoquées dans la réponse à la question 12 constituent des entraves à la mise en place des PPP au sein de l'Union européenne. Le projet de loi néerlandais qui vise notamment à interdire la mise en place de contrats de concession dans le domaine de l'eau, constitue potentiellement une entrave à la mise en place de PPP aux Pays-Bas ainsi qu'au principe de la libre prestation de services prévu par le traité.

Par ailleurs, la politique communautaire en matière d'utilisation de fonds communautaires n'est pas clairement en faveur du développement des PPP. Ce manque de clarté freine le développement de tels projets, notamment dans les nouveaux Etats Membres. Pour Suez, les objectifs affirmés par les Chefs d'Etat et de gouvernement à Lisbonne en mars 2000, ainsi que l'adoption d'une initiative européenne pour la croissance au Conseil européen de Bruxelles en octobre 2003, devraient conduire la Commission à adopter une attitude claire et positive sur les possibilités de réaliser des PPP et d'obtenir conjointement des fonds communautaires afin d'éviter de priver d'effets de levier importants et de gains d'efficacité reconnus pour conduire des projets d'infrastructures et assurer une gestion efficace et pérenne des projets réalisés.

A titre d'exemple, le mode de consultation sur financements européens concernant la construction d'infrastructures ne prévoit aujourd'hui pas de fonds européens pour financer des projets de PPP sous forme de BOT ou d'un DBO[14]. Le mode de consultation actuel est limité aux contrats de travaux sans opération et maintenance et sans investissement de la part des opérateurs privés. Si les PPP en BOT ou en DBO peuvent intégrer un financement communautaire portant sur le contrat de travaux, il n'existe toutefois pas de financement européen pour la globalité du PPP ; ce qui explique le faible nombre de PPP en DBO ou en BOT bénéficiant de fonds européens. Cette situation est préjudiciable au développement de l'investissement dans le domaine des infrastructures dans les nouveaux Etats membres.

En outre, ce mode de consultation pour les travaux sous fonds européens présente certaines lacunes. Il est en effet effectué aujourd'hui :

- sans vérification préalable de la conformité administrative et technique des offres au cahier des charges puisque leur ouverture est faite en un seul temps ;
- sur la base d'un prix d'opération et maintenance qui n'est que théorique et qui n'engage pas les candidats, ce qui biaise ainsi les offres de certains candidats sans que ceux-ci soient contractuellement tenus de respecter les coûts d'opération et maintenance annoncés ;
- sans pré-sélection ou examen préalable des références techniques et financières des candidats ;
- sur la base d'une conception (design) excessivement préétablie des projets et ainsi sans possibilité pour les opérateurs de travaux, possédant un savoir-faire technique spécialisé, de proposer des solutions techniques optimisées en tirant, par exemple, profit de récents développements technologiques.

Pour favoriser le développement des PPP dans l'UE dans un contexte de concurrence efficace, il serait ainsi souhaitable d'organiser des modes de consultation qui permettent de pallier ces lacunes.

Aussi, Suez suggère l'élaboration d'un guide et de procédures pratiques à destination des Etats membres, des autorités locales et des acteurs concernés afin de les aider à développer des montages de PPP qui puissent permettre de mobiliser les fonds communautaires, dans le respect des principes du traité. A cet égard, les documents publiés par la Commission « Guidelines for successful PPPs » (publié en 2003) et, plus récemment, le « PPP Resource book » (juin 2004) ne répondent pas à ces besoins.

Une réflexion, menée par la Commission avec les acteurs concernés, pourrait être lancée à cette fin (cf. infra question 22).

[14] « Design-build, operate » : PPP où l'autorité confie à l'opérateur privé la conception, la construction et l'exploitation, pour une période déterminée, d'une nouvelle installation. Celle-ci demeure propriété de l'autorité publique. Le risque lié à la conception et à la gestion est supporté par l'opérateur privé, qui est rétribué par l'autorité publique. L'opérateur privé s'engage sur un coût global de construction et d'exploitation. Le financement de l'investissement est supporté par l'autorité publique.

21) Connaissez-vous d'autres formes de PPP développées dans les pays en dehors de l'Union ? Connaissez-vous des exemples de « bonnes pratiques » développées dans ce cadre, dont l'Union pourrait s'inspirer ? Si oui, lesquelles ?

Suez n'a pas connaissance d'autres formes de PPP développées hors de l'Union.

22) De façon plus générale, et compte tenu des besoins importants d'investissements nécessaires dans certains Etats membres, afin de poursuivre un développement économique et social durable, estimez-vous utile une réflexion collective sur ces questions qui se poursuivrait à des intervalles réguliers entre les acteurs concernés, et qui permettrait un échange des meilleures pratiques ? Est-ce que vous considérez que la Commission devrait animer un tel réseau ?

Suez considère qu'une réflexion sur ces questions, qui se poursuivrait à intervalles réguliers entre les acteurs concernés par les PPP serait très utile, compte tenu, d'une part de la nécessité d'assurer le développement des PPP au sein de l'UE élargie dans un contexte de concurrence efficace et de clarté juridique et, d'autre part, compte tenu des besoins en investissements nécessaires dans certains pays de l'Union.

Une telle réflexion devrait porter sur les principaux thèmes soulevés par le Livre vert ainsi que sur les aides d'Etat. Elle devrait également aborder les questions liées aux financements des PPP au moyen de fonds communautaires afin de favoriser les effets de leviers nécessaires au développement de projets d'infrastructures et à la gestion durable et pérenne des ouvrages réalisés.

Pour Suez, la Commission européenne devrait animer un tel réseau. Celui-ci devrait, notamment, impliquer les opérateurs dotés d'une expérience concrète des PPP au sein de l'Union européenne ainsi que des représentants des autorités des Etats membres, en particulier des autorités locales. Des contacts bilatéraux sur ces sujets devraient également être organisés par la Commission sur ces questions. Suez se tient naturellement à la disposition de la Commission pour évoquer ces sujets et partager son expérience des partenariats public-privé en Europe.

European Commission
Directorate General for Internal Market
Consultation "Green Paper on PPPs and the Community law on public contracts and concessions”
C 100 2/005
B-1049

Dear Sirs

Comments by Kocian Solc Balastik on the Commission´s Green Paper on Public-Private Partnerships and Community Law on Public Contracts and Concessions

1. Introduction

1.1. Kocian Solc Balastik (“**KSB**”) is the largest Czech law firm, with offices in Prague, Brussels and Karlovy Vary. KSB has very broad experience in advising on public procurement law issues governed by national legislation before the accession of the Czech Republic to the EU, as well as national and European legislation after 1 May 2004. KSB has advised on several projects based on project financing principles as well as genuine PPP projects, including the very first large PPP project in the Czech Republic.

1.2. KSB welcomes the opportunity to comment on the Commission’s Green Paper on Public-Private Partnerships and Community Law on Public Contracts and Concessions (the “**Green Paper**”),[1] since it believes that the Green Paper and any follow-up steps based thereupon might pave the way to efficient use of all the advantages inherent to PPP throughout the Community and, in particular, may act as a useful introduction of this type of project in the new Member States, which lack the requisite degree of experience to carry out this type of project, particularly in accordance with Community law.

1.3. KSB believes that its contribution to the discussion initiated by the Green Paper, as set out below, has particular value, as its views originate in a Member State where a successful PPP has yet to be developed, since the Czech Republic has so far experienced failures rather than successes in developing this type of cooperation between the private and public sector. The aim of this contribution is to comment on the Green Paper from the perspective of that experience, as we feel the process of learning from failures is the most efficient course of action. In addition, KSB’s intention is to firmly place its comments within the existing national legal framework, and briefly assess its functionality in connection with implementation of PPP.

2. General Remarks on PPP implementation in the Czech Republic

2.1. The outcome of applying PPP principles in the Czech Republic is very open-ended. A few small projects have succeeded,[2] but larger projects (assuming these have got past the blueprint stage) have faced many problems and have simply died.

2.2. In general, the following matters have significantly contributed to failure:

(a) An inadequate legal framework;

(b) Despite lack of previous adequate experience, attempts to start with huge, complex projects rather than small, easy ones;

(c) Lack of familiarity with typical PPP features and usual timeframes;

(d) Unrealistic expectations (in financial terms and also as regards timing);

(e) Political pressure (upcoming elections).

2.3. From the Green Paper's point of view, the above legislative aspects are of prime importance. The very first suggestions relating to PPP projects arose at the beginning of the 1990s. At this time, the entire legal system of the Czech Republic was experiencing significant amendment and PPP was not a key topic for legislators. Thereafter, PPP did not attract the attention of legislators for several years. In 2000/2001, the idea of a pilot project, the construction of 90 kilometres of motorway, was strongly promoted and eventually started being put into effect.

2.4. Unfortunately, the legal framework was a step behind the concept. The outcome was to adapt existing legislation to the project, rather than *vice versa*. In addition to amendment of the Public Procurement Act[3], there have been substantial amendments to the Surface Roads Act[4] whereunder the notion of concession was introduced into Czech law. For your convenience, we have provided for the amended provisions, together with the new provisions on concessions, in a working English translation as an Annex hereto.

2.5. Although the amendments to the Surface Road Act were partly inspired by Community instruments relating to concessions[5], they appear to have been overly tailored to a particular project. This is particularly apparent from the list of mandatory particulars to be included in a

[2] For example, a project in which a private company renovated a hospital heating system, a subsequent task being to maintain and operate the system to ensure adequate heat supplies to satisfy hospital requirements. Also, a project to upgrade Prague's water supply and sewerage system can be regarded a PPP project.

[3] Act. No. 199/1994 Coll., the Public Procurement Act, as amended. This Act is no longer in force, being replaced on 1 May 2004 by Act No. 40/2003 Coll., the Public Procurement Act, intended fully to comply with Community law.

[4] Act No. 13/1997 Coll., the Surface Roads Act, as amended.

[5] In the Government proposal for adoption of the amendment (Chamber of Deputy's Doc. 1226, 3rd Election Period, 2002), reference is made to Directive 93/37/EEC with respect to Article 18b and to the Commission Interpretative Communication on concessions under Community law (No. 2000/C121/02) with respect to Article 18d, paragraphs 1 and 2, and Article 18f, paragraph 2.

concession contract. In consequence, we believe these provisions are too restrictive, preventing them from becoming the general pattern for future projects; the result is to undermine the importance of these provisions as a pilot act of law, the intention of which was to introduce the concept of the concession into the Czech legal system.

2.6. Other than the ill-fated provisions of the Surface Roads Act, there is currently no other framework or special legislation that could directly govern implementation of PPP in the Czech Republic.

2.7. Although it is possible to implement some projects without the need to amend existing legislation, in general, legislative amendments will be required if the use of PPP is to expand and be properly implemented.[6] Any amendments will need to touch upon the following areas:[7]

(a) Public procurement (the new Public Procurement Act has not yet transposed Directives 2004/17 and 2004/18, in particular, the "competitive dialogue procedure");

(b) Treatment of property by the public sector (currently, certain restrictions apply to acquisition, alienation, charging and lease of such property);

(c) Conclusion of concession contracts (a general framework to allow a lawful and valid grant of "concession" style arrangements common in other countries utilizing PPP projects);

(d) Infrastructure user fees (detailed rules required);

(e) Fiscal discipline (mandatory rules for assumption of obligations by the public sector crucial).

2.8. In addition, it may be helpful to adopt rules to provide for:

(a) Clarification of ownership and security interest rights in a PPP setting;

(b) Delineation of the rights and powers of the State, regional districts and municipalities in the application of PPP projects;

(c) Modification of tax and accounting regulations as necessary to allow the effective financial functioning of entities in a PPP framework;

(d) Creation of administrative conditions conducive to project development (e.g. fast tracking of zoning construction permits, etc.)

[6] *See* Public Private Partnership – Legal Feasibility Study in the Czech Republic, October 2003 (hereinafter the "***Legal Feasibiliy Study***"), p. 1, as published (in Czech) by the Ministry of Finance of the Czech Republic (accessible at http://www.mfcr.cz/download/ppp/Aktuality/PPP-pravo.pdf)

[7] *See* Legal Feasibility Study, p. 1

(e) Establishment of an informed and competent central autonomous PPP body to act as a co-ordinating interface between private investors on the one hand and the many governmental entities on the other hand.

2.9. Bearing in mind the above matters and the importance of PPP for further development of public services, at the beginning of 2004 the Government of the Czech Republic approved the Public Private Partnership Policy (hereinafter the "***PPP Policy***"),[8] wherein the Government outlined basic principles for the further development and promotion of PPP. At the same time, the Ministry of Finance was entrusted with the task of preparing methodology and a system of implementing PPP. The material prepared by the Ministry of Finance is to be tabled for a meeting of the Government by the end of July 2004.

3. Detailed Comments on the Green Paper

3.1. Types of Contractual PPP Set-Ups

Given the historical developments in the second half of the last century, it has long not been the case in the Czech Republic that end users of most public services (such as health care, schools, penitential centres, transport infrastructure) directly pay for the use of these services. Therefore, the "concessive model" is very likely to face difficulties in being promoted in the Czech Republic and, we believe, in some other post-communist countries too.

In the event of an set-up where a link between the private partner and the end user is required, and the end user is requirement to pay a fee or charge to the private partner, such a fee or charge would need to be of a symbolic nature only, and the public partner would have to make up any difference in the actual costs of the service.

As far as KSB is aware, none of the projects so far implemented (including those where an attempt at implement has been made) have sought to impose any form of direct or indirect payments on end users. The truth is that the nature of most projects has not allowed application of the principle of end user payment. The only exception seems to be the D47 motorway project, where a shadow-toll principle was to be used.

In general, contractual PPP set-ups are not subject to any specific supervision in the Czech Republic due to the lack of a sufficient legal framework. The only exceptions are the provisions of the Surface Road Act on concession agreements as referred to above.

3.2. Competitive Dialogue Procedure

KSB is of the view that traditional public procurement procedures are not suitable for PPP projects and therefore welcomes the competitive dialogue procedure as outlined in Directive 2004/18/EC. If properly transposed into national law and then correctly implemented, the competitive dialogue procedure might become a basic public procurement tool for PPP projects.

[8] Government Decision No. 7 of 7 January 2004.

Please note however that the competitive dialogue procedure seems to be more demanding with regard to implementation in terms of proper management and co-ordination, negotiation experience, and other aspects, something that the public partner is not necessarily accustomed to. Also, this procedure can be even more vulnerable to favouring a particular bidder, and the risk of corruption is increased. Hence this procedure will require competent and impartial personnel in charge on the side of the public partner, and such personnel may be difficult to find particularly in countries where PPP experience is low or does not exist at all.

3.3. Award of Concessions

Although KSB has not, as yet, participated in a procedure for the award of a concession outside the Czech Republic, it has gained some experience from the participation by foreign partners in tenders organised in the Czech Republic. On the basis of that experience, mostly of a pre-accession nature, we consider the national legal framework in this area, which has been inspired by Community law, sufficient to ensure genuine competition. In our opinion, effective participation of non-national companies is guaranteed in general and not only as regards procedures for the award of concessions.

With reference to the Community legislative initiative to regulate the procedure for the award of concessions, we take the view that it would be preferable to wait until such time as initial experience of how the competitive dialogue procedure functions becomes apparent, rather than to introduce a new piece of legislation in circumstances where the existing provisions might prove satisfactory.

3.4. Participation of Non-national Operators in PPP and Advertising Practice

In our experience, non-national operators have faced no substantial difficulties in accessing PPP schemes. Given the lack of experience of local operators, in some cases there has been no alternative.

At the outset of PPP development in the Czech Republic, advertising the intention to launch a project was seriously neglected and hence genuine competition was not well ensured. In particular, in the case of some large projects, an operator had already been selected at the time the decision to launch the project was announced. Although the situation has gradually improved since the very first stages, advertising continued to take place at national, rather than Community, level.

3.5. Further Development of Private Initiative PPPs in the EU

Given the complexity of implementing PPP principles on the basis that too many areas of national law are affected and not harmonised at a Community level, it is difficult to identify the best formula to ensure development of PPP within the EU.

KSB believes that the development of PPP should be natural rather than artificial. Given the variety of national frameworks and their differing levels of focus on regulation of PPP, there seems to be no one-fit-all formula available that would pave the way to achieving the unqualified success of private initiative PPPs within the EU.

In our view, the best way to progress in this area would be to create a set of guidance materials for implementing PPP that could eventually lead to gradual harmonization of implementation procedures.[9] Such guidance material would also be flexible enough to be easily tailored to any developments, which in the area of PPP are inevitable. If it proves a success, the guidance material could be followed by a piece of legislation unifying all the rules and giving them binding legal force.

Also, promotion and education activities could be more meaningful than any binding and sacred formula. Public sector officials and administrators would be the best target group for such activities, as it largely depends on such people's level of knowledge and experience as to whether they are able to reap all the benefits offered by the principles of PPP, thereby achieving the aims of the project.

3.6. Post-selection Procedure

In our opinion, a prerequisite for the post-selection procedure to proceed smoothly is efficient and thorough preparation and implementation of the tender procedure, thereby preventing unexpected problems crucial to the project implementation from arising from the outset. In our experience, most detrimental to the post-selection procedure are disputes regarding the scope of the project concerned and the manner of implementation thereof which were not properly resolved before the tender procedure was launched or during, provided that the tender had the character of a competitive dialogue procedure.

This proves that the crucial stage for success of any PPP project is its pre-tender and tender phase, rather than the post-selection phase.

As concerns the "step-in" arrangement, we share the Commission's view that it may present a problem with regard to transparency and equality of treatment to the extent that it involves a replacement of the concession holder in its entirety.[10] On the other hand, however, we consider this arrangement necessary for creditors to be able to protect their interests. In our view, the exercise of step-in rights should be time limited to recovery of the business; the entity exercising the rights concerned together with the public partner should be obliged to select a new operator in accordance with applicable public procurement rules. We believe this objective is achievable through contractual arrangements, while the legislation should be limited to allowing the exercise of step-in rights for a limited period of time, until a new operator is selected.

3.7. Sub-contracting

We fully share the Commission's view as expressed in the Green Paper, i.e. if the special purpose project company is itself in the role of a contracting body, then public procurement rules apply. Otherwise, it is free to sub-contract by whatever means it wishes.

[9] *See e.g.* Guidelines for Infrastructure Development through Build-Operate-Transfer (BOT) Projects, prepared by the United Nations Industrial Development Organisation.

[10] Step-in rights may also consist of lighter forms as a replacement of management, assumption of certain rights or obligations, or acquisition of shares in the project company.

KSB is convinced that one of the principles of PPP lies in the fact that the private sector can provide certain services better and cheaper than the public sector. Consequently, it should be inherent to each project that the private partner will exert its best effort to provide services of the highest quality for minimal costs. In a normal situation, the private partner should therefore be able to use sub-contracting according to its own rules. However, such freedom in sub-contracting is justifiable only in circumstances where any payment the private partner receives from the public partner does not depend on its actual costs.

Regulation of sub-contracting would then be desirable only for those projects where the private partner is rewarded on the basis of actual costs incurred.

3.8. Institutionalised PPPs

Institutionalised PPPs are implemented in the Czech Republic at a municipal level rather than for large projects going beyond municipal borders. Those set-ups are almost exclusively used for projects regarding the construction, operation and maintenance of local water supply and sewerage systems and local gas distribution systems.

In our experience, funding provided by European structural funds and PPPs are not always entirely compatible. It very often happens that finding structural funds excludes application of PPP principles and vice versa.

In this respect, KSB believes that a closer study of mutual co-existence of the above financing instruments would be desirable.

We believe that any collective discussion and mutual exchange of experience will undoubtedly be of great help not only for the Commission, but also for all stakeholders.

4. Conclusion

4.1. Although major PPP principles are well known, their application in practice may significantly differ, for the most part currently depending on national legislation. As the Commission has noted, only a few Member States have developed special legislation making provision for PPP. In some cases, PPP-targeted legislation has been influenced by particular projects carried out in the Member State concerned.

4.2. Since PPP projects might become of prime importance in the near future, as one of several major tools in financing and operating the public infrastructure, KSB believes that a certain level of uniformity needs to be introduced into the piecemeal national frameworks. However, unification of PPP implementation rules needs to occur naturally, rather than artificially. The best solution seems to be to start with guidance material flexible enough to be adjusted to effect gradual developments in a relatively new area of public-private co-operation.

4.3. Without prejudice to the adoption of binding legislative acts regulating particular aspects of PPP implementation, if it is necessary to ensure compliance with the principles of Community law, a framework legislation should not be adopted until a minimum level of unification is reached on a natural basis, e.g. with the help of guidance material prepared by the Commission.

Comments by Kocian Solc Balastik on the Commission´s Green Paper on Public-Private Partnerships and Community Law on Public Contracts and Concessions

Prague, Brussels, 30 July 2004

Bouygues Construction : éléments de réponses au Livre Vert PPP COM(2004)327 fin

Question 1

Quels types de montage de PPP purement contractuels connaissez-vous ? Ces montages font-il l'objet d'un encadrement spécifique (législatif ou autre) dans votre pays ?

Au sein de Bouygues Construction, nous avons une expérience significative des concessions dans plusieurs pays européens ainsi que des PFI anglais. Selon leur forme (concession, crédit bail, bail emphytéotique, convention d'exploitation, PFI,…) ces différentes formes de PPP font l'objet d'un encadrement spécifique plus ou moins élaboré.

Nous considérons que les marchés de type PPP purement contractuels présentent des différences très importantes avec les marchés publics au sens de la directive. Le paragraphe 2 du 1.1 « le phénomène PPP » du livre vert explicite les éléments qui caractérisent normalement les opérations de PPP (ces éléments sont à nos yeux une justification de la différence avec les marchés publics). Le mode de procurement de ces marchés complexes est aussi très différent, mais aucun des textes que nous connaissons ne reconnaît suffisamment cette différence. Le développement des PPP nécessite une participation active des partenaires privés. Les phases de sélection et la phase de préparation des contrats après sélection du partenaire sont longues et coûteuses pour le secteur privé comme pour le secteur public. Le développement des PPP nécessite que les règles existantes ou en préparation assurent au secteur privé (opérateurs –préteurs …) la sécurité indispensable.

Question 2 :

De l'avis de la Commission, la transposition en droit national de la procédure de dialogue compétitif permettra aux parties concernées de disposer d'une procédure particulièrement adaptée à la passation des contrats qualifiés de marchés publics lors de la mise en place d'un PPP de type purement contractuel, tout en préservant les droits fondamentaux des opérateurs économiques. Partagez-vous ce point de vue ? Si non, pourquoi ?

Réponse : La transposition en droit national de la procédure de dialogue compétitif permettra aux parties concernées de disposer d'un outil utile pour la passation des PPP de type purement contractuel.

La procédure présente beaucoup de similarités avec la pratique actuelle des PFI anglais pour lesquels le client public dialogue avec les candidats sur les solutions proposées, réduit graduellement le nombre des participants et finalement entre dans une phase de dialogue exclusif avec un groupement avant la signature du contrat. En ce sens, la procédure de dialogue compétitif codifie la pratique actuelle.

Il est à noter que les projets de PFI anglais sont généralement traités en procédure négociée et que la procédure du dialogue compétitif pourrait être utilisée dans ce cadre. L'article 29 de la directive 2004/18/EC appelle cependant un certain nombre de commentaires.

1. La définition de la procédure de dialogue compétitif est très peu explicite en ce qui concerne la phase qui suit la sélection d'un partenaire et conduit au closing de l'opération.

   Pour que le coût de la phase de compétition soit acceptable par le secteur privé, une partie importante de la préparation finale des contrats est réalisée après la sélection d'un partenaire, par exemple :
   - Le développement de la Conception jusqu'à un stade avancé permettant de sécuriser l'ensemble des intervenants sur les aspects techniques de l'opération (due diligence des banques –agences de rating, …)
   - L'obtention des permis et autorisations
   - La documentation juridique
   - La documentation financière

Notre expérience de ces phases (sur les PFI anglais) nous montre que la préparation de ces éléments nécessite une période longue (de 6 à 12 mois) au cours de laquelle des modifications légères inévitables sont introduites (mais qui ne changent pas matériellement la substance de l'engagement du partenaire privé).

Il nous paraît essentiel que la réglementation reconnaisse ces aspects qui sont aujourd'hui insuffisamment codifiés.

Tout d'abord en précisant l'étendue des négociations possibles avec le partenaire retenu et qui ne devrait pas selon nous être moindre que la liberté laissée dans la procédure négociée.

Ensuite en précisant la définition des « marchés particulièrement complexes « éligibles à la procédure de dialogue compétitif. Notre expérience anglaise nous démontre que les projets de type PFI (projets comprenant le financement, la conception, la construction et l'ensemble des services sur une période longue avec un transfert de risques important vers le partenaire privé) doivent rentrer dans cette catégorie.

2. Il est important de respecter la confidentialité du savoir-faire des candidats qui ne saurait être utilisé au profit des autres concurrents. En la matière il apparaît que l'article 6 de la Clause 29 de la Directive 2004 / 18 / CE ayant trait au dialogue compétitif ne permet pas d'offrir une complète garantie : en effet il apparaît que l'adjudicateur pourrait éventuellement utiliser les résultats intermédiaires du dialogue compétitif pour définir les paramètres de la demande d'offre finale.

3. La procédure doit être la plus courte possible et pour ce faire, les conditions suivantes doivent être remplies:
   - Définition précise du programme dès l'origine de l'appel d'offres. Ce programme doit définir la performance à atteindre et non les moyens pour y parvenir.
   - Limitation du nombre de concurrents au stade de la pré-qualification car pour être efficace, le dialogue compétitif demande une grande disponibilité des équipes du Client public.
   - Limitation du dialogue compétitif lors de la phase finale du dialogue à 2 candidats
   - Cahier des charges définissant le cadre juridique précis et la répartition des risques entre secteur public et privé
   - Critères de sélection clairs et transparence.

4. Les coûts de développement doivent être acceptables par le privé :
   - La proposition initiale ne peut être que préliminaire afin de limiter les coûts à risques engagés par les concurrents (consultants, avocats, banques).
   - Les coûts de développement doivent être reportés à la fin de la procédure au fur et à mesure de la réduction du nombre de candidats
   - La force d'innovation du secteur privé ne doit pas être restreinte :
   - En matière de financement, les candidats doivent rester libres afin de mettre en concurrence les différentes solutions de financement pour proposer la solution optimum
   - Les solutions techniques alternatives doivent pouvoir être formulées
   - La trop grande définition du cahier des charges en amont doit être évitée (Superposition des rôles des entreprises et consultants/bureaux d'ingénierie du client)

5. Les pouvoirs adjudicateurs peuvent prévoir des prix ou des paiements aux participants au dialogue.

Question 3 :

En ce qui concerne ces contrats, existe-t-il selon vous des points autres que ceux relatifs au choix de la procédure d'adjudication, susceptibles de poser problème au regard du droit communautaire des marchés publics ? Si oui, lesquels et pour quelles raisons ?

En complément des éléments développés dans la réponse précédente, il nous paraît utile de mentionner le point suivant :

> Dans la procédure PFI anglaise, il est relativement fréquent que des modifications des membres du Consortium interviennent entre la remise de l'offre et la signature du contrat . La directive ne précise pas clairement dans quelle mesure ces changements peuvent être réalisés et un complément d'information sur ce sujet serait utile.

Question 4 :

Avez-vous déjà organisé, participé, ou souhaité organiser ou participer à une procédure d'attribution de concession au sein de l'Union ? Quelle expérience en avez-vous ?

Nous avons participé à de nombreuses procédures d'attribution de concessions au sein de l'union.

Question 5 :

Estimez-vous que le cadre juridique communautaire actuel est suffisamment précis pour assurer la participation concrète et effective de sociétés ou groupements non-nationaux aux procédures de passation de concessions ? Une concurrence réelle est-elle, selon vous, habituellement assurée dans ce cadre ?

Notre réponse à cette question s'applique aux concessions mais aussi à l'ensemble des PPP.

Le cadre juridique communautaire actuel (Traités, directive 2004/18/CE, communication interprétative sur les concessions) traite essentiellement des conditions de consultation et impose évidemment le respect des traités. Il devrait, en théorie, permettre une libre concurrence entre des entreprises nationales et non nationales. Il nous semble qu'une plus grande efficacité, donc une plus grande liberté d'accès des groupements non-nationaux aux procédures de passation serait obtenue par une plus grande vigilance européenne et des Etats membres pour la mise en œuvre effective des principes des traités dans les pratiques courantes plutôt que par un cadre juridique communautaire renforcé.

Question 6 :

Pensez-vous qu'une initiative législative communautaire, visant à encadrer la procédure de passation de concessions, est souhaitable ? Si oui, estimez-vous que la nouvelle procédure de dialogue compétitif pourrait constituer une procédure de passation adéquate pour la mise en place de PPP contractuels.

Nous ne pensons pas qu'une initiative législative communautaire visant à encadrer la passation des concessions est souhaitable.

Pour les autres types de PPP contractuels,ainsi que nous l'avons mentionné dans notre réponse à la question n°2, la procédure de dialogue compétitif est un outil utile et nécessaire pour la passation des contrats mais insuffisant à certains égards. Dans cette même réponse nous avons développé un certain nombre de remarques et/ou suggestions visant à améliorer l'efficacité de cette procédure. En particulier, la procédure de dialogue compétitif ne couvre de façon satisfaisante la phase postérieure à la sélection d'un partenaire et précédent la signature des accords définitifs et le closing financier des opérations.

Question 7 :

D'une manière plus générale, si vous estimez qu'il est nécessaire que la Commission propose une nouvelle action législative, existerait-il à votre avis des raisons objectives de viser dans cet acte tous les PPP de type contractuel, qu'ils soient qualifiés de marchés publics ou de concessions, pour les soumettre à des régimes de passation identique ?

Nous ne pensons pas qu'il soit souhaitable de proposer une nouvelle action législative qui aurait pour effet de traiter tous les PPP de façon identique. Pour les raisons exposées dans les réponses aux questions précédentes, nous pensons que si la législation devait évoluer vers un régime commun, ce sont les règles applicables aux PPP non qualifiés de concessions qui devraient être assouplies.

Question 8 :

Selon votre expérience, l'accès des opérateurs non-nationaux aux formules de PPP d'initiative privée est-il assuré ? En particulier, lorsqu'il existe une invitation des pouvoirs adjudicateurs à présenter une initiative, cette invitation fait-elle généralement l'objet d'une publicité adéquate permettant l'information de tous les opérateurs intéressés ? Une procédure de sélection véritablement concurrentielle est-elle organisée pour assurer la mise en œuvre du projet retenu ?

Par manque d'information, nous n'avons pas de commentaire particulier sur ce point

Question 9 :

Quelle serait selon vous la meilleure formule pour assurer le développement des PPP d'initiative privée dans l'Union européenne tout en assurant le respect des principes de transparence, de non-discrimination et d'égalité de traitement ?

Si l'on veut promouvoir les PPP d'initiative privée au sein de l'union, il est nécessaire que le secteur privé trouve une motivation à proposer des idées innovatrices. Nous comprenons bien que le respect des traités impose de mettre le projet en concurrence mais l'une des solutions permettant de maintenir la motivation du secteur privé à proposer des PPP d'initiative privée serait l'octroi d'un droit de premier refus à l'initiateur de la proposition.

A défaut de l'acceptation du bénéfice de ce droit par le soumissionnaire une indemnisation pour un montant à définir devrait lui être accordée.

Il est également indispensable que le fonctionnement de la procédure de dévolution garantisse la confidentialité des informations et le maintien de la possession et de l'usage des innovations que proposent les soumissionnaires.

Ainsi que nous l'avons indiqué dans une réponse précédente, il apparaît que l'article 6 de la Clause 29 de la Directive 2004/18/CE ayant trait au dialogue compétitif ne semble pas offrir ce type de garantie : en effet l'adjudicateur pourrait éventuellement utiliser les résultats des premières phases du dialogue compétitif pour redéfinir les paramètres de la demande d'offre finale.

Question 10 :

Quelle expérience avez-vous de la phase postérieure à la sélection du partenaire privé dans les opérations de PPP contractuels ?

Nous avons une expérience significative de la phase postérieure à la sélection du partenaire prive dans les opérations de PPP contractuels dans le domaine des concessions d'une part et sur le marchés des PFI anglais (6 projets signés et un en préparation). Nous insistons à nouveau sur l'importance de cette phase longue de la préparation d'un contrat PPP qui doit être reconnue et codifiée dans la réglementation.

La conduite de ces phases sur les opérations PFI en Angleterre nous semble être un bon exemple de la façon dont elles doivent être conduites et encadrées.

Question 11 :

Avez-vous connaissance de cas dans lesquels les conditions d'exécution – y compris les clauses d'adaptation dans le temps – ont pu avoir une incidence discriminatoire ou ont pu constituer une entrave injustifiée à la libre prestation de services ou à la liberté d'établissement ? Si oui, pouvez-vous décrire le type de problèmes rencontrés ?

Nous n'avons pas connaissance de cas où les conditions d'exécution et de changement dans le temps aient pu avoir une incidence discriminatoire où constituer une entrave.

Il est selon nous inévitable que des variations aient lieu pendant le déroulement d'un contrat dont la durée est de l'ordre de 30 ans. Il y a en effet des risques associés à la durée (changement de la loi par exemple) que ni le secteur bancaire ni les opérateurs privés ne sont prêts à accepter sur une durée aussi longue. La prise en compte de ce besoin d'évolution dans les contrats peut très bien se faire sans remettre en cause les principes d'égalité de traitement et de transparence.

Question 12 :

Avez-vous connaissance de pratiques ou de mécanismes d'évaluation d'offres ayant des incidences discriminatoires ?

L'imposition dans la réglementation européenne et dans celle des états membres d'une plus grande transparence dans la définition et l'application des critères d'attribution devrait diminuer le risque de pratiques discriminatoire dans l'évaluation des offres.

Question 13 :

Partagez-vous le constat de la Commission selon lequel certains montages du type « step-in » peuvent poser problème en termes de transparence et d'égalité de traitement ? Connaissez-vous d'autres « clauses types » dont la mise en œuvre est susceptible de poser des problèmes similaires ?

Nous ne pensons pas que les clauses de type « step-in » peuvent présenter un problème en termes de transparence ou d'égalité de traitement.

Ces dispositions sont nécessaires pour sécuriser le secteur bancaire qui n'a pas de sécurité autre que la régularité des flux financiers en provenance de l'autorité contractante. L'exercice d'un droit de step-in permet aux préteurs d'intervenir en cas de difficulté sérieuse dans la société projet.

Nous considérons que le « step-in » des prêteurs doit être encouragé par l'autorité publique comme un moyen de régler les problèmes beaucoup plus avantageux pour le secteur public qu'une terminaison qui auraient des conséquences très dommageables.

Question 14 :

Estimez-vous qu'il est nécessaire de clarifier au niveau communautaire certains aspects relevant du cadre contractuel des PPP ? Si oui, quel devrait en être le contenu et la forme ?

Nous n'avons pas de commentaires sur ce point.

Question 15 :

Dans le contexte des opérations de PPP, avez-vous connaissance de problèmes particuliers rencontrés en matière de sous-traitance ? Lesquels ?

Non, dans le contexte des opérations de PPP où nous intervenons, nous ne rencontrons pas de problème particulier en matière de sous-traitance.

Question 15 :

Le phénomène des PPP de type contractuel, impliquant le transfert d'un ensemble de tâches à un unique partenaire privé, justifie-t-il selon vous que des règles plus détaillées et/ou d'un champ d'application plus large soient mises en place en ce qui concerne le phénomène de sous-traitance ?

Non, nous ne pensons pas que le phénomène des PPP justifie des règles plus détaillées en matière de sous-traitance. Les opérations de type PPP sont des opérations complexes, qui comprennent le plus souvent la conception et la construction de grands projets. Ces projets sont donc très souvent trop importants pour pouvoir être traités directement par des petites ou moyennes entreprises et le seraient quel que soit le mode de dévolution. Ces entreprises interviennent donc sur ces projets en sous-traitance d'une entreprise générale avec un transfert de risques compatible avec leur taille et leur surface financière. L'introduction des PPP ne devrait donc rien changer dans ce domaine, les entreprises générales sous-traiteront la même proportion de leur activité que par le passé.

Question 17 :

De manière plus générale, estimez-vous qu'une initiative complémentaire devrait être prise au niveau communautaire en vue de clarifier, ou d'aménager, les règles relatives à la sous-traitance?

Non, nous ne pensons pas qu'une initiative complémentaire est nécessaire concernant les règles relatives à la sous-traitance.

Question 18 :

Quelle expérience avez-vous de la mise en place d'opérations de PPP de type institutionnalisé? En particulier, votre expérience vous conduit-elle à penser que le droit communautaire des marchés publics et des concessions est respecté dans le cas de montages de PPP institutionnalisé? Si non, pourquoi?

Le concept même de PPP institutionnalisé couvre des réalités très différentes d'un pays à l'autre. La logique de création d'une société d'économie mixte relève d'une réflexion très différente du PPP. La mise en compétition d'une société d'économie mixte dans le cadre d'un PPP doit répondre aux mêmes conditions générales que pour les autres concurrents. De ce point de vue, des distorsions de concurrence existent aujourd'hui, ainsi que le souligne le Livre vert.

Question 19 :

Estimez-vous qu'une initiative doit être prise au niveau communautaire en vu de clarifier ou de préciser les obligations des organismes adjudicateurs quant aux conditions dans lesquelles doivent être mis en concurrence les opérateurs potentiellement intéressés par un projet de type institutionnalisé? Si oui, sur quels points particuliers et sous quelle forme? Si non, pourquoi?

Une initiative s'impose pour préciser les obligations des organismes adjudicateurs mais il semble que cela doit faire l'objet d'une différenciation avec les PPP.

De façon générale et indépendamment des questions soulevées dans ce document:

19. Quelles sont les mesures ou les pratiques que vous estimez constitutives d'entraves à la mise en place des PPP au sein de l'Union européenne?

Nous n'avons pas de commentaire sur ce point.

21. Connaissez-vous d'autres formes de PPP développées dans les pays en dehors de l'Union? Connaissez-vous des exemples de 'bonnes pratiques' développées dans ce cadre, dont l'Union pourrait s'inspirer? Si oui, lesquelles?

Nous n'avons pas de commentaire sur ce point

22. De façon plus générale, et compte tenu des besoins importants d'investissements nécessaires dans certains Etats membres, afin de poursuivre un développement économique social et durable, estimez-vous utile une réflexion collective sur ces questions qui se poursuivrait à des intervalles réguliers entre les acteurs concernés, et qui permettrait un échange des meilleures pratiques? Est-ce que vous considérez que la Commission devrait animer un tel réseau ?

Il apparaît effectivement très souhaitable qu'une réflexion en commun entre la CE et les professionnels se poursuive à intervalles réguliers sur tous ces sujets. En effet, les difficultés rencontrées ne sont pas seulement liées à l'imperfection des outils juridiques mais également à un déficit de compréhension partagé de ce qu'est un PPP, de son intérêt, de sa place dans des politiques de recherche de développement et de compétitivité

PROPOS LIBRES

Nous avons formulé ci-dessous quatre suggestions qui permettraient selon nous d'aider au développement des PPP dans les pays de la communauté.

Proposition 1 :
Concernant le développement efficace et rapide des PPP, leur variété et leur complexité laissent à penser qu'il sera difficile de développer une initiative législative au niveau Européen qui, de façon pratique, réponde et respecte l'ensemble des besoins, des secteurs et des histoires des différents pays et régions de l'UE. L'approche de l'UE s'avérerait donc potentiellement plus efficace si elle était focalisée sur une clarification des règles et des principes.

Dans ce cadre, il apparaît qu'il est important de promouvoir les éléments principaux qui font le succès des PPP :

- Le PPP se développera d'autant plus rapidement que l'UE encouragera le développement de la maîtrise des compétences fondamentales suivantes :
    - Secteur Public : Gestion de projets ; Capacité de mise en place de comparatifs de type PSC (Public Sector Comparator) et d'évaluation des offres
    - Secteur privé : Conception / Construction ; Maintenance ; Juridique et financier
- Le PPP se développera d'autant plus rapidement que l'UE favorisera la capitalisation des expériences acquises :
    - Les expériences, notamment en Grande-Bretagne, ont mis une longue période pour s'établir, mais elles ont permis de créer des pratiques adaptées et des praticiens expérimentés et reconnus
    - Le développement des PPP en Europe serait d'autant plus rapide qu'il capitaliserait sur les pratiques déjà établies.
- Le PPP se développera d'autant plus rapidement que l'UE favorisera l'homogénéisation de l'approche du partage des risques, permettant ainsi aux acteurs de pouvoir se positionner partout en Europe sans avoir à réétudier l'ensemble des conditions contractuelles. Il est utile de citer pour référence le partage des risques suivant :
    - Secteur privé
        - Conception/construction (délais, spécifications, coûts…)
        - Maintenance /exploitation
        - Risque financier (après closing)
    - Secteur public
        - Obtention des permis / autorisations
        - Force majeure et assimilée
        - Qualité / état du sol
        - Assurances
        - Changement de loi/règlement/fiscalité
        - Risque de taux (jusqu'au closing)

Proposition 2 :

L'établissement d'une 'Task Force Européenne' à haut niveau pourrait permettre de clarifier les pratiques du PPP et de soutenir les intervenants publics et privés du secteur

Les expériences passées du PPP montrent qu'il est indispensable que le secteur public connaisse parfaitement le fonctionnement des PPP afin qu'il assume au mieux ses rôles de coordination et de client.

Pour parvenir à ce résultat, et comme cela a été montré notamment en Grande-Bretagne, la mise en place d'une 'task-force' peut constituer un outil extrêmement efficace de développement harmonieux du PPP en intervenant en tant que point de référence et conseiller.

Une telle **task force** pourrait répondre aux besoins des acteurs en assumant, par exemple, les rôles suivants :

- **Soutien aux états et aux administrations locales**
  - Épauler les autorités pour l'établissement des cadres juridiques pour les PPP
  - Faciliter l'identification des projets qui constituent de 'bons candidats' pour des PPP
  - Travailler avec les autorités sur l'ensemble des phases des projets, de l'appel d'offre à la réalisation
- **Centre d'expertise et de référence**
  - Identifier les compétences requises au niveau local pour mener à bien les projets
  - Proposer des formations sur les PPP (à destination des états mais aussi des intervenants du secteur public)
  - Permettre le transfert des leçons d'expérience d'un pays et / ou d'un secteur à l'autre
  - Suivre l'évolution des PPP et mener les enquêtes et recherches nécessaires à leur bonne compréhension
- **Force de proposition en matière de politiques publiques**
  - Contribuer à l'établissement et au suivi de programmes et de projets PPP pan-européens
  - Formuler des solutions permettant d'allier PPP et fonds BEI et / ou UE
  - Développer des solutions financières novatrices
  - Constituer une source d'enseignements et de retour sur expérience pour l'UE
- **Interlocuteur privilégié**
  - Répondre et interagir avec les autorités nationales et locales
  - Travailler avec les industriels, les intervenants exploitants et financiers du secteur

Cette task-force serait d'autant plus pertinente qu'elle :

- **Rassemblerait l'ensemble des efforts existants** (comme la Task Force de la commission avec la National Statistics Institute a paru le faire en rassemblant la BEC, la BEI, l'UE etc.)
- **Serait guidée dans ses réflexions par des représentants du secteur public mais aussi par des intervenants clefs du secteur privé** tels que des constructeurs, exploitants, préteurs et investisseurs
- Interviendrait **en tant que conseil aux plus hauts niveaux décisionnels européens**

Proposition 3 :

La mise en place rapide des suggestions formulées dans le document de l'UE portant sur 'l'initiative de croissance' permettrait de répondre à nombre de défis du secteur.

L'initiative de croissance a identifié un programme de construction d'infrastructures de transport prioritaire en Europe, le 'Quickstart Program'. Celui-ci s'inscrit notamment dans le plus vaste réseau européen de transport (TEN) et tous deux nécessitent des moyens financiers considérables.

L'initiative de croissance identifie l'outil des PPP comme une piste prometteuse pour répondre au défi du financement des 'Quickstart' et du 'TEN'. En conséquence, elle propose un certain nombre de mesures pour faciliter la mise en place du PPP parmi lesquelles les suggestions suivantes paraissent particulièrement appropriés :

- **Mise en place d'une garantie de risques commerciaux par l'UE ou la BEI**
  - Beaucoup de projets souffrent du fait que les acteurs ne soient pas à même de porter l'intégralité du risque commercial. Ceci est par exemple vrai pour le risque trafic post-construction qui est difficilement assumé par les marchés financiers.
  - La proposition de l'initiative de croissance paraît particulièrement attractive notamment si elle :
    - Permet une prise de risque significative
    - Est économiquement intéressante
    - Est applicable à un maximum de secteurs et de type de projets
    - Se matérialise rapidement

- **Etablissement d'un fonds de titrisation des dettes commerciales par l'UE / BEI**
  - Les capacités de prêts par des banques commerciales sont limitées par leur bilan et ne permettront à priori pas de répondre à l'ensemble des besoins du secteur des transports et des PPP.
  - Ce sujet pourrait être néanmoins traité si la liquidité des moyens de refinancement est améliorée, et, en la matière, la proposition de l'initiative de croissance qui propose d'établir un fonds de titrisation des dettes dédiées aux projets européens, paraît constituer une piste de réflexion appropriée.

- **Fonds d’Investissements Européens**
    - Les PPP nécessitent des prises de participations sous forme de capital et de quasi capital.
    - Il n’existe cependant qu’un nombre limité de participants qui puissent offrir ce type de financement au stade du développement et de la construction.
    - Les industriels ont alors souvent à prendre ces apports à leur charge et, leur capacité étant limitée par leur bilan et les règles comptables, ce système atteint rapidement ses limites.
    - Un fonds d’investissement ‘capital risque’ de taille significative et pouvant intervenir sur de nombreux projets pourrait alors constituer un des éléments de réponse sur ce sujet.

Proposition 4 :

La modification de procédures BEI permettrait de mieux répondre aux besoins

La BEI dispose des ressources, des compétences et du mandat nécessaire pour répondre aux défis que posent les transports européens et leur financement.

Il apparaît cependant que l’action de la BEI est parfois gênée par des processus propres qui pourraient bénéficier d’être améliorés.

On peut citer en exemple :

- **State aid clearance** : celle-ci pourrait être une formalité remplie après le closing financier, mais elle apparaît souvent avant celui-ci. Ceci conduit à des retards et à des confusions en particulier car le closing n’ayant pas eu lieu, le projet n’est matériellement pas sujet à une clearance.
- **Flexibilté** : la BEI ne semble disposer que de peu de marge de manœuvre pour s’adapter aux projets et aux besoins et contrainte auxquels ils doivent répondre.
- **Couverture** : la BEI requiert des niveaux de couverture de l’ordre de 115% de ces prêts. Ceci paraît un niveau très élevé qui ne peut pas être toujours fourni par le reste des participants au projet (investisseurs et préteurs).

Direction Générale
Le Directeur Délégué
Pierre DAURES

Paris, le 27 juillet 2004

Nos Réf.: 251 – HTH/cg

Commission Européenne
Monsieur Alexander Schaub
Direction Générale Marché Intérieur
Rue de la loi, 200
1049 BRUXELLES
Belgique

Objet : Réponse au Livre Vert PPP

Monsieur le Directeur général,

Permettez moi tout d'abord de vous féliciter et de vous remercier d'avoir pris l'initiative d'ouvrir une large consultation sur le partenariat public - privé (PPP). En effet, comme l'a souligné la Commission dans sa communication sur l'initiative de croissance, les PPP sont un outil essentiel de l'équipement rapide de l'Europe élargie dans les 20 ans qui viennent.

Pour que ce type de contrat soit l'outil efficace et utile que tout le monde attend, il faut, à nos yeux, améliorer un certain nombre des dispositions actuellement proposées. C'est le sens des réponses élaborées par nos différents métiers en fonction de leur secteur d'activité et qui sont transmises directement à vos services dans le cadre de cette consultation.

Permettez moi de souligner ici quelques aspects communs à toutes les branches de notre groupe et qui me paraissent, de ce fait, extrêmement importants :

a) Les directives « Marchés publics » proposent une définition très large des marchés publics qui peut s'appliquer à différentes formes de PPP. Toutefois, à nos yeux le concept de PPP est spécifique et ne se réduit pas à celui de l'acquisition d'un bien ou d'un service tel que peut le couvrir un « marché public ». En tout cas, les mesures contenues dans les directives n'apportent pas, pour le partenaire privé, une sécurité juridique suffisante et elles sont même parfois franchement inadaptées.

b) Le dialogue compétitif, ne peut suffire. Une phase négociée restera toujours nécessaire pour finaliser un contrat de partenariat. En effet, ce n'est que durant cette phase que pourront être harmonisés le « design » définitif de l'ouvrage ou du service et son closing financier. Or cette négociation ne peut être conduite avec plusieurs candidats à la fois. Bien entendu cette négociation doit intervenir après une phase de compétition. Elle ne peut être considérée comme une libre négociation avec un fournisseur sur la seule base de la crédibilité de celui-ci.

c) Des principes simples de répartition des risques entre les deux partenaires (public et privé) devraient être posés au niveau européen afin de limiter la propension de chacun à abuser de ses pouvoirs propres ou de ne pas supporter les conséquences de ses décisions externes. Par exemple, il est anormal que, par une mesure fiscale ou tarifaire (de sa compétence) un Etat rompe sans compensation, l'équilibre économique d'un contrat conclut sur 30 ans.

En résumé, il nous apparaît judicieux que la Commission travaille à un encadrement juridique des PPP en tant que mode spécifique de collaboration entre les deux secteurs pour la fourniture de services publics et non en adaptation des textes relatifs aux marchés publics.

Comme suggéré dans le Livre Vert, cela pourrait passer par une réflexion collective pilotée par la Commission et la conduisant, dans un premier temps, à émettre une recommandation.

Cette recommandation consoliderait la jurisprudence de la Cour de justice, proposerait une définition large des PPP, et fixerait les principes de la consultation des offreurs, de la gestion des contrats et de la répartition des risques.

Par la suite, une culture commune du PPP ayant été mise en place, un projet de Directive cadre pourrait être proposé. Le Délégué général du Groupe, Henri Thomé, est à votre disposition pour poursuivre l'échange avec vos services et se faire accompagner des responsables des métiers du Groupe Bouygues.

Espérant avoir répondu à votre attente, je vous prie de bien vouloir agréer, Monsieur le Directeur Général, l'expression de ma considération distinguée.

Pierre DAURES

Observations et Suggestions à la

COMMISSION des COMMUNAUTES EUROPEENNES

Après la publication du LIVRE VERT

sur les Partenariats Public-Privé et le Droit Communautaire des Marchés Publics et des Concessions

Préambule

Dans son LIVRE VERT publié le 30 Avril 2004, la Commission a invité les parties intéressées par les questions abordées « ...à lui transmettre leurs observations sur les questions posées dans le présent Livre Vert ».

C'est le cas de la Revue des Concessions et des Délégations de Service Public dont le site Internet www.concession-bot.com – et les autres sites qui lui sont associés – participe à l’étude des questions posées par le Partenariat Public-Privé non seulement en Europe (où elle dispose de nombreux correspondants qui l’informent des projets dans les différents Etats, y compris en Russie) mais encore dans le reste du Monde puisque ces questions intéressent les Etats préoccupés de la bonne fin de leurs projets d’intérêt général.

La Revue est dans ces circonstances à l’écoute des expériences étrangères dans le domaine des concessions (bot en droit anglo-saxon) tout particulièrement, mais aussi lorsqu’un projet ne peut finalement se réaliser que par le biais d’un marché public et non d’une concession.

L’expérience de la Revue est d’ailleurs maintenant de plus de 100 ans dans le droit des concessions, même si l’essentiel de cette longue durée a concerné les applications de la concession dans l’économie française et dans les pays qui lui étaient liés.

L’examen des multiples projets nationaux dont elle a actuellement connaissance conduit bien souvent à s’interroger sur la définition des termes utilisés. On constate alors une confusion dans l’emploi des concepts. Il y a même un abus de langage.

Ainsi on constate depuis quelques années une mode intellectuelle qui vise à qualifier de Partenariat Public-Privé tout contrat dès l’instant où il réunit une personne publique et une personne privée sans se préoccuper de savoir quel droit s’applique : est-ce le droit des marchés publics (avec les Directives ou la jurisprudence communautaires qui en sont le corollaire), est ce le droit des concessions (avec la jurisprudence qui lui est propre, ainsi les principes rappelés par la Communication interprétative de la Commission de 2000) ?

En réalité on s’aperçoit que lorsqu’on a utilisé l’appellation « Partenariat Public-Privé », on n’est pas plus avancé sur la connaissance du régime juridique du contrat en cause. Il faut ensuite rechercher dans le contenu du contrat si, pour le service public en cause, la gestion est directe ou indirecte (gestion déléguée).

Le Partenariat doit-il être un conglomérat de contrats de toute nature (sorte de fourre-tout qui ne servira pas à grand chose) ou doit-il correspondre à une forme contractuelle spécifique, comme le veulent les opérateurs qui cherchent une troisième voie ?

Lorsque le projet de Livre Vert utilise la formule « les différentes formes de PPP », il évite l'écueil principal qui est de savoir si dans un cas donné on est en présence d'une gestion directe (qui justifiera le recours à un marché public) ou si on est en présence d'une gestion déléguée (auquel cas il n'y aura pas de marché public sauf si l'exploitant est une personne adjudicatrice). Il n'y a pas plusieurs types de gestion d'une activité de service public. Il n'y en a que deux (direct ou indirect) et si les formules peuvent varier, c'est seulement à l'intérieur de chacun des deux grands modes de gestion.

Une clarification des concepts est donc non seulement nécessaire mais encore impérative puisqu'elle influence les décisions des Etats membres quant à la réalisation de leurs infrastructures publiques ou la gestion de leurs services publics.

La remarque du Livre Vert selon laquelle « le recours aux PPP ne saurait toutefois être présenté comme une solution miracle pour le secteur public faisant face à des contraintes budgétaires » est donc particulièrement bien venue.

C'est dire tout l'intérêt du projet de Livre Vert, à l'égard duquel les observations suivantes sont présentées mais uniquement pour ce qui touche au Chapitre I du Livre Vert, c'est-à-dire « Le PPP purement contractuel et le Droit communautaire des marchés publics et des concessions », domaine tout particulier de notre expérience.

Dans ces conditions nos observations et suggestions se décomposeront en trois parties :

1ère partie : les observations et remarques proprement dites sur les développements du Livre Vert concernant les concessions, marchés publics et partenariats public-privé. Ces observations entrent dans le cadre de la première branche de la distinction annoncée au point 2O du projet, c'est-à-dire les PPP de type purement contractuel ;

2ème partie : Les réponses aux 15 questions qui intéressent spécifiquement le domaine d'activité qui nous est tout particulièrement connu ;

3ème partie : Nos suggestions à l'égard de questions importantes qui ne sont pas abordées dans le projet de Livre Vert.

Ière Partie : **Observations et Remarques**

Celles-ci suivront l'ordre des développements du Livre Vert.

a) « Le phénomène « partenariat public-privé »

- Si le partenariat public-privé doit être défini en droit communautaire comme une forme de coopération, il ne pourra d'ores et déjà pas recouvrir le droit des concessions. En effet la concession n'est pas une forme de coopération, mais la délégation à un tiers (public ou privé) d'une prérogative de puissance public, à savoir la gestion d'un service public pour le compte de la personne publique qui en a la responsabilité à la fois en droit et au niveau politique (puisque les élus rendent compte devant les citoyens de la gestion des services publics).

Il n'y a pas de coopération (terme utilisé aux points 1 et 2) mais l'existence de rapports d'autorité et de sanction de la personne publique envers celui à qui elle a confié le soin de gérer le service en ses lieu et place, et à certaines conditions. C'est pour cette raison que le passage du point 7 aux termes duquel « Les autorités publiques ont également recours à des structures de partenariat avec le secteur privé pour assurer la gestion de services public, notamment au niveau local … » est sujet à discussion dans la mesure où la distribution d'eau ou d'énergie, comme la gestion des déchets, sont des domaines d'élection traditionnels de la concession au vrai sens du terme.

La doctrine des Avocats généraux de la Cour de Justice évite d'ailleurs soigneusement l'utilisation du concept de coopération, qui n'est pas compatible avec le régime même de la concession.

- Si le financement d'une opération est assuré par le secteur privé, comment celui-ci se remboursera-t-il de ses investissements ? C'est ici que se pose la vraie question du financement. Si le remboursement provient en dernière analyse de la personne publique, n'est-ce pas un marché déguisé ? (l'exemple des redevances payées par la personne publique à la place des usagers, comme dans l'exemple des péages virtuels, sera analysé ci-dessous). Si le remboursement provient essentiellement de l'usager, ce sera une concession. De même si les risques financiers sont transférés sur le secteur privé, cela impliquera qu'il ne s'agit pas d'un marché mais d'une concession, surtout si cette formule contractuelle est recherchée en raison des contraintes budgétaires de la personne publique cocontractante.

C'est dire qu'on ne peut s'arrêter à la seule indication que « le mode de financement » est assuré par le secteur privé. Il est nécessaire d'aller plus loin dans l'analyse de la charge définitive du financement.

- De même encore la participation de l'opérateur privé à la conception du projet ne peut être retenue comme un signe distinctif original du partenariat public-privé. En effet en France, avant comme après la loi Sapin (qui est visée dans le Livre Vert), il est souvent demandé aux candidats à la concession de concevoir et présenter un programme en faveur du service, un projet de modernisation d'un service d'intérêt général, la collectivité n'ayant pas les services avertis des dernières techniques innovantes. La tâche de conception s'ajoute aux tâches de financement, de réalisation et d'exploitation d'un équipement public ou d'un service nécessitant de nombreux équipements. Il en va de même avec les marchés publics puisque nombre de pays connaissent la formule du marché dit de « conception réalisation).

C'est dire que la notion de PPP donnée au point 21 du projet de Livre Vert ne peut assurer une originalité du PPP par rapport à la concession ou aux différents types de marchés publics déjà connus.

On doit donc rechercher quel est l'avantage supplémentaire que peut constituer l'appellation « partenariat public-privé par rapport au marché public ou à la concession.

Le Livre Vert vise le partenariat public-privé comme d'une dénomination générale (ainsi p. 11 il est parlé de « …contrats qualifiés de marchés publics lors de la mise en place d'un PPP de type purement contractuel). Or on ne peut en rester à une dénomination générale sans contenu autonome par rapport aux marchés publics ou aux concessions, car ce serait nier l'intérêt que les opérateurs cherchent à donner à cette qualification.

Il est donc nécessaire de définir le partenariat public-privé comme une notion autonome, à défaut elle n'aurait guère d'intérêt juridique puisque le droit communautaire ne peut permettre à cette appellation de jouer le rôle de contrat dérogatoire aux deux systèmes connus que sont les marchés publics et les concessions.

Le but des présentes observations n'est donc pas de revenir sur les grandes libertés communautaires qui encadrent la procédure de passation de tout contrat relevant de la Commande Publique et qui sont rappelées par la Commission au point 8 du Livre Vert, mais de faire observer que dans nombre des cas étudiés le PPP se révèle n'être finalement qu'un « faux nez » qui cache l'existence déguisée soit d'un marché public soit d'une concession. On utilise l'expression à la mode pour tenter de se soustraire aux contraintes légales.

Ainsi il est connu que sur certains chantiers publics, ce sont les entreprises privées qui doivent consentir à l'Etat des facilités de trésorerie, sous l'appellation de PPP ! Que sont donc ces partenariats forcés camouflés derrière des marchés publics classiques ?

De telles anomalies ont fait dire à un représentant de la BEI que « les risques politiques et juridiques (incertitude des opérateurs, requalification possible des contrats) sont finalement bien plus importants que les risques techniques et financiers »

Il importe donc de savoir si le PPP peut se distinguer de ces deux régimes bien identifiés depuis longtemps **par un régime juridique autonome**.

- Il faut à ce sujet savoir si le Partenariat Public-Privé doit être considéré comme ayant son champ d'application limité à la réalisation d'infrastructures (comme cela est indiqué au point 4) ou s'il s'étend aux services publics (comme cela est signalé au point 7).

L'exemple du PFI britannique ne peut représenter une modalité distincte de la concession dans la mesure où l'étude des contrats existants en Grande Bretagne montre qu'il s'agit d'une forme de gestion déléguée de service public impliquant la réalisation d'équipements publics avec ensuite l'exploitation de ceux-ci. Le fait que la personne publique paie le prestataire à la place de l'usager – compte tenu des options politiques en vigueur – n'empêche pas que le prestataire prend en charge les dépenses liées à l'exécution du service. La rémunération du prestataire se rapproche de la rémunération par l'usager dans la mesure où elle tient compte de la fréquentation de l'équipement. Il y a un risque de nature concessive.

D'ailleurs le Portugal qui pratique ce système en utilisant le procédé du « péage virtuel » admet sans ambiguïté qu'il ne s'agit que d'une modalité nouvelle du droit des concessions.

b) Le PPP purement contractuel et le droit communautaire des marchés publics et des concessions

- La constatation faite au point 31, selon laquelle très peu de pays membres ont souhaité se doter de législations internes visant à encadrer la phase de passation des concessions, s'explique par le caractère fondamental de la concession qui est *l'intuitus personae*.

Ce caractère s'explique par l'existence de risques financiers sérieux sur toute la durée du contrat, qui est une durée longue (20,30,40 ans), ce qui n'existe pas dans les marchés publics. L'attribution du contrat résidait donc traditionnellement dans un lien de confiance personnelle, qui ne peut se retrouver dans une procédure de type marché public avec des critères objectifs de sélection.

Ceci étant dit, l'intuitus personae ne saurait couvrir l'arbitraire dans le choix du concessionnaire ni l'exclusion de candidats au prétexte de privilégier la préférence nationale.

En France, la loi Sapin – citée par le Livre Vert – a permis de concilier les deux exigences : la confiance personnelle associée à l'intuitus personae et les impératifs de la mise en concurrence de la procédure d'attribution. Il faut toutefois noter que la tendance est d'aller de plus en plus vers une transposition de la procédure de passation des marchés publics dans le secteur des concessions. Il en résulte une grave dégradation des caractères et des qualités du régime de la concession.

- La difficulté à identifier dès l'origine la nature du contrat (marché public ou concession) ne devrait pas exister. En France, le Conseil d'Etat sanctionne les modifications importantes au projet de contrat soumis aux candidats retenus au nom du respect des règles de concurrence. Dans un tel cas, il n'hésite pas à prononcer l'annulation de toute la procédure, ce qui oblige la collectivité publique à tout recommencer depuis le début.

Il en résulte que les collectivités publiques s'abstiennent désormais de toute remise en cause du régime juridique choisi dès le début de la procédure de passation.

- Pour répondre à la préoccupation de la Commission telle qu'elle s'exprime au point 36, il n'y aurait que des avantages à soumettre la procédure de passation des concessions à un régime autonome, différent par conséquent de celui existant pour la passation d'autres PPP contractuels. En effet la dimension des projets en concession est telle qu'elle justifie une procédure spécifique d'attribution, distincte de celle du marché public qui est limité dans le temps et dans les risques financiers.

C'est dire qu'une procédure commune aux marchés publics et aux concession – telle que la menace en est faite au point 36 – offrirait de nombreuses difficultés politiques ou juridiques.

- Au point 37, le projet de Livre vert relate que certains Etats membres permettent au secteur privé de prendre l'initiative d'une opération PPP, en soumettant à la collectivité publique une proposition de projet de construction et de gestion d'infrastructure.

Une telle possibilité existait effectivement en France aussi, avant que la loi Sapin (déjà citée) ne réserve à la seule collectivité le soin de lancer une nouvelle procédure d'attribution. L'initiative d'un opérateur privé pour obtenir un contrat sur la base d'un projet innovant pour le service en cours pourrait même tomber sous le coup du délit de favoritisme, sanctionné pénalement avec comme peine accessoire l'interdiction de soumission à toute nouvelle procédure de passation. C'est ce qui explique la quasi disparition d'une pratique qui existait autrefois pour le bien de la collectivité : en effet elle permettait à la collectivité de vérifier si les propositions d'un candidat mettaient ou non en évidence le caractère obsolète du contrat en cours. Si elle était informée d'une nouvelle technique ou d'une nouvelle forme de gestion, une telle démarche permettait à la collectivité d'abandonner le contrat en cours pour prendre d'autres relations contractuelles plus innovantes.

Il y a une autre raison à cette quasi disparition, qui doit être connue de la Commission.

La publicité organisée autour de la procédure de passation fait courir le risque à l'inventeur, candidat à la concession, de voir son idée ou sa technique diffusée auprès de tous ses concurrents qui auront à se déterminer d'après cette idée ou cette technique. Aussi afin d'éviter ce risque, les entreprises novatrices évitent désormais ce genre de démarche et préfèrent faire connaître discrètement qu'elles possèdent une technique qu'elles ne révéleront qu'une fois le contrat attribué.

D'ailleurs le texte du projet de Livre Vert met en lumière ce risque lorsqu'il est écrit : « …si l'autorité publique souhaite mettre en œuvre un projet présenté, il doit organiser la mise en concurrence de tous les opérateurs économiques potentiellement intéressés par le développement du projet retenu … ».

La leçon de ce qui se déroule actuellement est que s'il n'y a pas de protection de l'inventeur, il n'y aura pas d'initiative privée en faveur de techniques venant du secteur privé.

- Le principe figurant au point 45, relatif à l'évaluation régulière de la performance de l'exploitant est parfaitement judicieuse et pertinente. Il est d'ailleurs de plus en plus couramment imposé dans les contrats de BOT ou dans les contrats de concession dans les autres Etats du monde que ceux de l'Union européenne. Ce principe est d'autant plus adapté au régime de la concession que le concessionnaire a une obligation de résultat : satisfaire en permanence les usagers et rendre un service plus efficace et plus moderne qu'au début du contrat.

- A l'inverse, la pratique rapportée au point 48 du projet de Livre Vert doit être radicalement proscrite.

Il n'est pas envisageable que la collectivité publique et les habitants de celle-ci deviennent les otages d'institutions financières qui se réservent le droit de substituer au gestionnaire en place un nouveau gestionnaire au prétexte que la rentabilité de la concession n'est plus aussi haute qu'ils l'avaient prévu au départ.

Seule la collectivité publique doit décider du maintien ou non de l'exploitant, compte des obligations contractuelles qui sont les siennes. Les relations financières entre l'exploitant et ses banquiers ou préteurs de deniers doivent rester étrangères à la collectivité publique.

- Enfin la sous-traitance (ou sous-concession si on vise la concession) doit certes respecter les principes rappelés au point 51 de droit communautaire, mais aussi le principe de l'intuitus personae qui veut que le concessionnaire principal ne puisse se décharger de sa tâche que si la collectivité accepte la personnalité du sous-traitant et l'objet de la sous-traitance ou si celle-ci a été définie à l'avance dans le projet de contrat soumis à la procédure de mise en concurrence.

2ème Partie : Réponses aux 15 questions

a) Plusieurs types de montages de PPP purement contractuel sont identifiés. Mise à part les exemples d'équipements publics (comme la construction en France de 18 prisons selon la formule du PPP admise par une récente Ordonnance de juin 2004), on peut citer des exemples d'équipements sociaux. Ainsi la gestion et le fonctionnement d'une halte garderie itinérante et d'un relais d'assistance maternelle ont-ils été confiés en France à une association de familles rurales, alors qu'un syndicat de communes assurait le financement de l'équipement. Afin de garantir des coûts réduits un contrat « petite enfance » est en cours de signature avec la Caisse d'Allocations Familiales . Afin de favoriser des modes d'accueil des plus petits en milieu rural, une communauté de communes a financé une halte garderie alors qu'une association de familles rurales s'occupe de la gestion du service en association avec une caisse d'allocations familiales.

Dans ces exemples, il n'existe aucun encadrement législatif ou réglementaire en France, à l'inverse de ce qui existe pour les grands équipements de l'Etat. Il s'agit d'un PPP d'initiative spontanée. Le problème est qu'on ne sait plus qui est le responsable de ce qu'il convient de reconnaître comme l'existence d'une activité de service public.

b) question n°4 : Praticiens habituels de ce secteur, nous avons naturellement organisé au côté de collectivités organisatrices des procédures de passation de contrats de partenariat, ou participé à de très nombreuses procédures d'attribution de concession en France, mais aussi en Italie ou au Portugal.

La nécessité de satisfaire les exigences d'une population au moyen d'équipements publics toujours plus performants et plus modernes, avec l'exigence de permettre leur amortissement pendant la durée de la concession, conduit à une exigence : concevoir un contrat dont l'exécution se projette dans le temps. Il faut alors anticiper les événements, permettre au contrat une souplesse contractuelle à concevoir et à mettre en place, qui n'est pas envisageable dans un marché public dont l'objet est déterminé avec une durée à court ou moyen terme.

Si la préférence locale ou nationale reste une difficulté certaine pour le choix de l'attributaire final, les contrôles de plus en plus importants des instituons financières dans chaque Etat limite les risques de favoritisme.

c) question n°5 : En fonction de plusieurs années d'expérience, on doit admettre que le cadre juridique communautaire actuel est tout à fait insuffisant pour imposer la participation effective de sociétés ou groupements non-nationaux aux procédures de passation. Il n'y a pas de véritable concurrence, même si certains groupes suscitent la création de filiales ad hoc dans un autre Etat membre afin de se donner des chances de réussir une procédure d'attribution.

d) question n°6 : Compte tenu de l'ensemble des observations qui sont portées à la connaissance de la Commission, on doit reconnaître qu'une initiative législative communautaire est amplement nécessaire afin d'imposer une procédure harmonisée de passation des concessions.

On doit rappeler qu'une demande en ce sens a été adressée à la Commission il y a plusieurs années par des Etats membres dont l'Allemagne, la Belgique, la France etc.

Toutefois cette intervention législative ne saurait être l'occasion d'une dénaturation des caractères intrinsèques du régime de la concession, notamment par une assimilation avec les caractères du régime des marchés publics. Cette réserve est importante dans notre réponse à la question n°6.

e) question n° 7 : Pour les raisons données ci-dessus l'intervention législative communautaire ne saurait mêler dans une procédure de passation des régimes contractuels aussi différents que les marchés publics par rapport aux concessions, dont les finalités et les enjeux financiers sont si étrangers les uns des autres.

f) question n°8 : Comme cela a été dit, l'accès des opérateurs non-nationaux aux formules de PPP d'initiative privée n'est pas assuré dans la plupart des Etats européens. L'invitation à présenter une initiative ne fait certainement pas l'objet d'une information de tous les opérateurs intéressés puisque cette invitation a été réservée à l'un d'eux et qu'il est convenu le plus souvent de conserver la plus grande discrétion possible sur les modalités de la rencontre entre la collectivité et l'opérateur novateur.

g) La meilleure formule pour assurer le développement des PPP d'initiative privée, tout en assurant le respect des principes de transparence, de non discrimination et d'égalité de traitement serait d'assurer **la rémunération obligatoire de l'inventeur** par le versement de royalties ou autres formes de compensation à la diffusion de son idée.

h) Notre longue expérience de la phase postérieure à la sélection du partenaire privé se prolonge jusqu'aux événements qui motivent et justifient une rupture prématurée du contrat, en passant par les avenants de rétablissement de l'équilibre financier du contrat , l'étude des adaptations contractuelles possibles compte tenu d'événements soudains extérieurs aux parties.

Depuis toutes ces années que nous suivons les questions abordées dans le projet de Livre Vert , nous pouvons affirmer que nous avons vu presque toutes les hypothèses possibles qui peuvent survenir dans la vie d'un contrat.

C'est la raison pour laquelle nous sommes consulté de la part de toutes sortes d'organismes, de collectivités ou d'opérateurs et que nous avons écrit de nombreuses articles, ouvrages, fascicules, etc.

Notre expérience dans les différents Etats du Monde a d'ailleurs conduit à la rédaction d'une étude comparative de la gestion des services d'intérêt général dans plus de 13O pays dans le monde. Cette étude a fait l'objet d'un livre intitulé « **la gestion déléguée dans le monde : concession ou bot ?** »

i) question n° 12 : Les exemples de pratiques ou de mécanismes d'évaluation des offres ayant des incidences discriminatoires existent dans presque tous les pays, dès lors que certaines collectivités territoriales décident d'orienter la procédure de passation pour favoriser soit un candidat soit un type d'activité favorable aux thèses économiques ou politiques des élus.

j) Nous avons indiqué dans la première partie combien étaient inacceptables les clauses de « step-in ». Nous renvoyons aux développements qui y sont consacrés.

D’autres clauses posent des problèmes similaires comme celles qui imposent à la collectivité la société issue d’opérations boursières, dont elle ne connaît pas à l’avance le profil, le sérieux technique, la surface financière, etc. Du côté des collectivités, il en va de même pour les clauses qui imposent au concessionnaire de subir certaines événements politiques ou économiques sans pouvoir demander la moindre compensation.

k) question n° 15 : du rappel du respect de l’intuitus personae ci-dessus découle l’existence de problèmes liés au non respect de ce principe, qui ont été énoncés ci-dessus à la fin de la 1ère partie.

l) question n° 16 : On doit rappeler qu’en droit des concessions, la sous-traitance (ou sous concession) est une exception à l’obligation d’exécution personnelle qui pèse sur le concessionnaire lui-même. Elle doit donc être encadrée afin d’éviter des conflits avec la collectivité publique qui verrait son concessionnaire se décharger d’une partie plus ou moins grande de ses obligations sur des sous-traitants que la collectivité ne connaissait pas lors de la procédure d’attribution de la concession.

C’est dire que s’il doit y avoir de nouvelles règles en ce domaine, elles devront préserver le droit de la collectivité d’exiger que tout projet de sous-traitance lui soit soumis a priori afin qu’elle puisse en prendre connaissance et décider s’il y a lieu ou non de s’y opposer.

3ème Partie : Suggestions sur certains aspects non traités

- L’un des aspects non traités concerne la place de l’usager dans la mise en œuvre de la concession.

Or il est essentiel que les usagers puissent contrôler l’exécution du service public par le concessionnaire, notamment au regard de ses obligations contractuelles figurant dans le contrat signé avec la collectivité organisatrice.

Le droit de contrôle de l’usager permet de surveiller le respect du droit de la concurrence, d’écarter les clauses empreintes d’un favoritisme redouté, de contrôler que le concessionnaire met en œuvre les moyens nécessaires à la modernisation du service ainsi qu'à la recherche de la performance qui lui a été assignée par la collectivité publique.

En un mot, le contrôle de l'usager permet d'éviter qu'existe un champ clos entre la collectivité organisatrice et l'exploitant. Il y a trop de concessions d'envergure où la connaissance des documents contractuels est refusée aux citoyens, pour des raisons qui ne sont pas indiquées. Le secret n'a pas lieu d'être dans la commande publique.

L'usager doit donc avoir la possibilité de consulter les documents contractuels pour vérifier qu'ils sont bien respectés. C'est dire que les principes édictés au point 44 au sujet des documents de consultation doivent pouvoir bénéficier aux usagers, et non plus seulement aux différents candidats.

Le futur Livre Vert gagnerait donc à préserver cette avancée démocratique qui existe normalement en droit des concessions.

- Dans sa Communication Interprétative sur les concessions de 2000, la Commission avait indiqué ne pas devoir faire état des partenariats public-privé dans la définition du régime communautaire des concessions. Or le Livre Vert semble revenir sur cet acquis juridique en associant PPP et concession.

Il conviendrait donc de savoir dans quelles conditions le PPP peut ou non être défini séparément de la concession, ou du marché public.

Dans le même ordre d'idée, la définition de la concession donnée au point 9 est celui de la Directive travaux, mais en aucun cas celle beaucoup plus exacte de la Communication Interprétative de 2000. En 2004, on ne plus résumer la concession à cette définition partielle et réductrice de la Directive travaux.

De même il semble difficile d'affirmer que « …les concessions de service, échappent à tout encadrement de droit dérivé.. » (point 11) ou que « ..Peu de dispositions de droit dérivé coordonnent les procédures de passation de contrats qualifiés de concessions en droit communautaire. » (point 28) alors que la Communication Interprétative de 2000 avait pris soin d'établir une liste des principes à respecter lorsqu'on voulait se réclamer du droit des concessions, et que la doctrine des Avocats généraux près la Cour de Justice, voire la jurisprudence de la Cour elle-même, ont tracé les conditions indispensables pour une qualification communautaire de la concession.

Il n'y a pas de néant juridique en ce domaine. Le PPP n'arrive pas sur un terrain vierge !

Si un travail de clarification doit être accompli, c'est bien pour aboutir à une définition homogène de la concession, qu'elle concerne l'exécution d'une mission de service public ou la réalisation de travaux publics.

Plus encore, il serait intellectuellement plus exact d'abandonner la formule utilisée tout au long du projet de Livre Vert « droit des marchés publics et des concessions ». On sait désormais que le droit des marchés publics n'est pas adapté à la spécificité des concessions et que ses principes ne sont pas transposables aux concessions, à l'exception des principes régissant le respect des règles de concurrence lors de la procédure de passation. C'est d'ailleurs ce qu'avait intelligemment souligné la Commission dans la Communication Interprétative de 2000.

Une formule plus adaptée serait « droit des marchés publics ou celui des concessions ».

ELEMENTS DE REPONSE AU LIVRE VERT DE LA COMMISSION EUROPEENNE SUR LES PARTENARIATS PUBLICS/PRIVES ET LE DROIT COMMUNAUTAIRE DES MARCHES PUBLICS ET DES CONCESSIONS

Objet : Cette note a pour objet de répondre aux questions posées dans le livre vert de la Commission Européenne sur les PPP et le droit communautaire des marchés publics et des concessions du 30 avril 2004.

1 - LES MONTAGES DE PPP CONTRACTUELS EN FRANCE

Les PPP, en tant que tels, ont été introduits en France par l'Ordonnance n° 2004-559 du 17 juin 2004.

Cette Ordonnance permet effectivement, tant à l'Etat et ses Etablissements publics qu'aux Collectivités territoriales, leurs Etablissements publics, et également les Etablissements publics de santé, de recourir au financement privé pour la mise en place de projets globaux comportant la conception, la réalisation, le financement, la rénovation et l'exploitation d'un ouvrage public.

Toutefois, il existait en France, préalablement à cette Ordonnance, des formes de PPP. En effet, notamment, le recours au bail emphytéotique administratif a permis à certaines Collectivités, puis aux Etablissements publics de santé (Ordonnance n° 2003-850 du 19 septembre 2003) de recourir à un partenariat avec une entreprise privée confiant ainsi à celle-ci la conception, la construction et la maintenance de biens sur un terrain mis à disposition par la personne publique, ainsi qu'un financement privé par recours à un système de crédit-bail.

Le PPP étant un mode de pré-financement ou de financement privé d'équipements collectifs, la France a une longue expérience de montages contractuels permettant le déploiement de tels mécanismes :

…/…

- concession de travaux et/ou de service public (englobée, depuis 1993, dans la catégorie générique des conventions de délégation de service public, où l'on retrouve également l'affermage ou encore la régie intéressée),

- marchés d'entreprise de travaux publics (marchés de construction – maintenance ou de construction – exploitation permettant un étalement de prix à payer par la collectivité tout au long du contrat de tels marchés étant aujourd'hui très encadrés),

- mais aussi des procédés tirés de la pratique du droit privé, soit consacrés par certains textes (bail emphytéotique administratif, crédit-bail lié à la protection de l'énergie, …) soit permis, dans certains cas, par la jurisprudence (VEFA…).

Le problème est que le droit français des constructions publiques (loi sur la maîtrise d'ouvrage publique du 11 juillet 1985, Code des marchés publics,…) et de la domanialité publique (inaliénabilité) limite fortement le recours à des modalités de construction et de financement « exotiques ».

Les nouvelles formes de PPP en France (loi du 29 août 2002 pour les bâtiments de police et de gendarmerie et du 9 septembre 2002 pour les établissements pénitentiaires, ordonnances du 19 septembre 2003 pour les établissements publics de santé et du 17 juin 2004 sur les partenariats publics privés) comportent à la fois la continuité de l'existant (exemple : bail emphytéotique administratif) et une rupture de l'existant, en ce sens qu'ils assouplissent les règles des contrats publics et du domaine public.

En tout état de cause, l'ensemble des partenariats publics privés, pris dans un sens large, sont strictement encadrés par des lois ou règlements.

2 - LA PROCEDURE DE DIALOGUE COMPETITIF EST-ELLE ADAPTEE EN MATIERE DE PPP ? PRESERVE-T-ELLE LES DROITS FONDAMENTAUX DES OPERATEURS ECONOMIQUES ?

Il nous semble que la procédure de dialogue compétitif est tout à fait adaptée à la mise en place de partenariats publics privés dès lors qu'il est difficile pour une personne publique de prédéfinir en totalité ses besoins – mais aussi, et surtout, les solutions techniques et financières permettant d'y parvenir - au regard d'un projet global.

Toutefois, cette approche ne doit pas avoir pour effet d'aboutir à une incompétence de la personne publique au regard des projets qui lui seront proposés. En effet, la personne publique doit conserver en interne l'ensemble des compétences qui lui permettent de mener à bien un projet, et notamment au niveau du choix du projet et de sa mise en œuvre.

Enfin, il doit être rappelé que les partenariats publics privés ne relèvent pas, en France, de la législation applicable en matière de marchés publics. Au contraire, les PPP sont hors Code des marchés publics, et ce, même s'ils en reprennent certaines dispositions.

Quant à la question de savoir si les PPP préservent les droits fondamentaux des opérateurs économiques, on est à même de se demander si les PPP ne dénaturent pas la « commande publique ».

En effet, d'une part, le pré-financement privé suppose un endettement à long terme de la personne publique, laquelle n'a pas de vision à plus de quelques années sur son budget ; et d'autre part, la globalisation du projet implique que les titulaires seront soit des Sociétés déjà importantes, soit des mandataires de groupements solidaires.

Ce dernier point risque de nuire aux PME dès lors que celles-ci ne seront plus sollicitées en direct et n'interviendront qu'en tant que sous-traitants du titulaire, lequel risque de leur imposer des conditions contractuelles très strictes au nom de la commande publique.

C'est ce qu'a souhaité éviter le Conseil Constitutionnel français dans sa décision du 23 juin 2003, laquelle ne semble pas avoir été suivie par l'ordonnance du 17 juin 2004.

Au demeurant, il nous apparaît tout aussi essentiel de privilégier les droits fondamentaux de l'ensemble des opérateurs que de mettre en place des partenariats publics privés.

3 - LES PPP SONT-ILS SUSCEPTIBLES DE POSER DES DIFFICULTES AU REGARD DU DROIT COMMUNAUTAIRE DES MARCHES PUBLICS ?

Un encadrement des PPP au niveau communautaire est nécessaire afin que ceux-ci ne puissent être considérés comme conclus dans le cadre d'un détournement de procédure applicable en matière de marchés publics.

4 - LA PARTICIPATION DE NOTRE CABINET A UNE PROCEDURE D'ATTRIBUTION DE CONCESSION AU SEIN DE L'UNION EUROPEENNE

En France, nous assistons certaines collectivités publiques pour la passation de leurs concessions (eau, déchets, transferts, gestion d'équipements sportifs ou de loisirs…) :

La procédure étant très bien encadrée par la réglementation interne, les règles de mise en concurrence et de traitement égalitaire sont toujours bien respectées.

Trois observations sur ce plan :

- Dans certains secteurs, la concurrence est faible (peu de candidats potentiels). Les textes ne peuvent bien évidemment pas résoudre un tel état de fait,

- Dans d'autres cas, des systèmes d'entente illégale se développent. Là encore, les textes ne peuvent rien (il faut les détecter et les sanctionner),

- Enfin, quelles que soient les règles existantes, la collectivité choisira toujours son entreprise de manière « intuitu personae » (entreprise en qui elle a confiance).

En effet, à titre d'exemple, nous avons pu travailler, en matière de déchets, sur un marché entre deux pays de l'Union Européenne, pour lequel la personne publique avait préalablement orienté son choix vers un titulaire prédéterminé ; les règles de mise en concurrence n'ayant, en l'espèce, qu'encadré un tel choix.

5 - LE CADRE JURIDIQUE COMMUNAUTAIRE ACTUEL EST-IL SUFFISAMENT PRECIS POUR ASSURER LA PARTICIPATION CONCRETE ET EFFECTIVE DE SOCIETES OU GROUPEMENTS NON NATIONAUX AUX PROCEDURES DE PASSATION DE CONCESSION ? EXISTE-T-IL UNE CONCURRENCE REELLE DANS CE CADRE ?

En liaison avec ce qui a été indiqué ci-dessus, la concurrence effective ne dépend pas uniquement des textes, mais aussi et surtout de la pratique des acteurs publics et privés, de l'état réel de la concurrence entre opérateurs, de la volonté politique d'assurer une telle concurrence mais aussi de contrôler et sanctionner les irrégularités…

Cela étant, un cadre reste nécessaire. Aujourd'hui, et bien que le traité de Rome et ses principes (liberté d'établissement…) servent de fondement juridique, les concessions, notamment de service public, sont insuffisamment encadrées. Il faut un minimum, comme la loi SAPIN du 29 janvier 1993 en droit français.

6 - UNE INITIATIVE LEGISLATIVE COMMUNAUTAIRE VISANT A ENCADRER LA PROCEDURE DE PASSATION DE CONCESSION EST-ELLE SOUHAITABLE ?

Oui, en liaison avec ce qui vient d'être exposé, la procédure de passation de concession devrait être encadrée.

En fait, il faudrait une initiative permettant de mettre en place un régime général des contrats publics en Europe (marchés, concessions, PPP) avec, tout en maintenant les spécificités, des procédures de passation unifiées.

En effet, l'existence actuelle de différentes procédures ne favorise pas la passation de contrats publics entre les différents pays des Etats membres, notamment en termes de cohérence et de sécurité juridique (cf ci-dessus).

7 - SI UNE NOUVELLE ACTION LEGISLATIVE S'AVERAIT NECESSAIRE, DEVRA-T-ELLE VISER TOUS LES PPP DE TYPE CONTRACTUEL (QU'IL S'AGISSE DE MARCHES PUBLICS OU DE CONCESSION) POUR LES SOUMETTRE A DES REGIMES DE PASSATION IDENTIQUES ?

Oui, car cela serait plus cohérent et plus sécurisant pour les acheteurs et les collectivités publiques. Mais il est important de ne pas trop encadrer afin de leur laisser une marge de manœuvre en toute responsabilité (conformément à l'esprit du Code des marchés publics français de janvier 2004).

8 - L'ACCES DES OPERATEURS NON NATIONAUX AUX FORMULES DE PPP EST-IL ASSURE PAR UNE PUBLICITE ADEQUATE ET UNE PROCEDURE DE SELECTION VERITABLEMENT CONCURRENTIELLE ?

Jusqu'à présent, cela dépend des PPP :

- concessions et autres délégations : loi SAPIN du 29 janvier 1993 (bien encadré)

- marchés publics, METP : Code des marchés publics (même chose)

- crédit-bail, VEFA, bail emphytéotique administratif (pas suffisamment encadré – exemple bail emphytéotique du Code Général des Collectivités Territoriales pas soumis à concurrence)

- régime général Ordonnance du 17 juin 2004 instaurant les PPP en France : procédures plus encadrées (dialogue compétitif et/ou appel d'offres restreint)

Et surtout, donc, cette dernière ordonnance permet l'initiative privée (offres spontanées de sociétés vers des personnes publiques), laquelle n'est jamais permise par les autres textes.

Cela étant, le mode de fonctionnement de l'initiative privée est peu détaillé. Dès lors, il conviendrait d'approfondir cette nouveauté, tout en résolvant la question suivante :

Une entreprise ayant proposé un projet finalement retenu par la collectivité, et qui se retrouve attributaire à l'issue de la procédure de concurrence ne va-t-elle pas se faire accuser de favoritisme ?

A nouveau, il n'y a pas de formule textuelle miracle. Cela dépend de la pratique et du comportement des acteurs.

En tout état de cause, la réglementation en matière de PPP est à ce jour insuffisante et imprécise, mais nous sommes dans l'attente de la publication de décret d'application de l'Ordonnance du 17 juin 2004 sur les PPP.

9 - QUELLE POURRAIT ETRE LA MEILLEURE FORMULE POUR ASSURER LE DEVELOPPEMENT DES PPP D'INITIATIVE PRIVEE DANS L'UNION EUROPEENNE, TOUT EN ASSURANT LE RESPECT DES PRINCIPES DE TRANSPARENCE, DE NON DISCRIMINATION ET D'EGALITE DE TRAITEMENT ?

En premier lieu, pour que soit respectés les principes de transparence, de non discrimination et d'égalité de traitement, il est important de mettre en œuvre des règles de publicité et de concurrence très encadrées.

Toutefois, il n'est pas certain que les principes de non discrimination et d'égalité de traitement soient totalement compatibles.

A titre d'exemple, lors d'un appel d'offre européen en matière de fourniture d'électricité, on est amené à se demander si une entreprise de taille moyenne qui sera sollicitée au titre de l'égalité de traitement, ne sera pas ensuite discriminée, en pratique, en raison de sa taille.

Dès lors, il nous apparaît qu'une meilleure définition de leurs besoins, en interne, par les personnes publiques est nécessaire afin de « rentabiliser » le recours au PPP en évitant de formuler des appels d'offres trop larges ou de faire perdre du temps à un candidat lors de la mise en place d'une procédure de dialogue compétitif très poussée.

10 - NOTRE EXPERIENCE DANS LE CADRE DE LA PHASE POSTERIEURE A LA SELECTION DU PARTENAIRE PRIVE DANS LES PPP CONTRACTUELS

C'est, entre autres, la problématique des avenants qui est visée.

En France, les avenants (en matière de marchés publics, de par les textes ; et de conventions de délégation, de par la jurisprudence surtout) sont encadrés (pas de bouleversement de l'économie ni de changement de l'objet du contrat) même s'il reste des marges de manœuvre importantes pour les personnes publiques (pas de pourcentage d'augmentation du montant du contrat au-delà duquel l'avenant est nécessairement illégal).

Faut-il en faire de même pour tous les contrats publics, y compris les PPP ? Sans doute, dans le cadre d'une réglementation unifiée déjà évoquée.

En tout cas, il est clair qu'un avenant illégal est discriminatoire et favorise l'entreprise titulaire du contrat (ce qui peut d'ailleurs être sanctionné par le délit de favoritisme, en droit pénal français).

Concernant les PPP, le plus difficile sera de trouver un équilibre entre l'interdiction des avenants illégaux et la nécessaire adaptation des contrats dans le temps, s'agissant en l'espèce de contrats de longue -ou très longue- durée (exemple bail emphytéotique hospitalier) et des nécessités liées au service public.

11 - NOTRE EXPERIENCE AU REGARD DES CONDITIONS D'EXECUTION ET DE LEURS EVENTUELLES INCIDENCES DISCRIMINATOIRES OU ENTRAVES A LA LIBRE PRESTATION DE SERVICES OU LIBERTE D'ETABLISSEMENT

Nous n'avons pas d'expérience en la matière dès lors qu'en cas de modifications des conditions d'exécution, il est toujours procédé par avenant (voir question 10).

12 - EXISTE-T-IL DES PRATIQUES OU DES MECANISMES D'EVALUATION D'OFFRES AYANT DES INCIDENCES DISCRIMINATOIRES ?

Il existe toujours en pratique des mécanismes d'évaluation discriminatoires, et ce, alors même que les textes l'interdisent.

Il appartient à la jurisprudence d'établir au cas par cas les conditions dans lesquelles la discrimination, qu'elle soit positive ou négative, peut être retenue et ce, en application des textes en vigueur.

13 - CERTAINS MONTAGES DU TYPE « STEP-IN » PEUVENT-ILS POSER DES PROBLEMES EN TERME DE TRANSPARENCE ET D'EGALITE DE TRAITEMENT ? EXISTE-T-IL D'AUTRES CLAUSES TYPES DONT LA MISE EN ŒUVRE EST SUSCEPTIBLE DE POSER DES PROBLEMES SIMILAIRES ?

14 - EST-IL NECESSAIRE DE CLARIFIER AU NIVEAU COMMUNAUTAIRE CERTAINS ASPECTS RELEVANT DU CADRE CONTRACTUEL DES PPP ?

Au regard, de ce qui vient d'être exposé ci-dessus, il nous apparaît nécessaire de clarifier les aspects contractuels des PPP, tout en laissant un minimum de liberté contractuelle aux acteurs concernés.

15 - EXISTE-T-IL UN PROBLEME PARTICULIER DANS LE CADRE DES PPP EN MATIERE DE SOUS-TRAITANCE ?

Il existe un éternel problème de sous-traitance dans les METP et, globalement, dans les PPP.

Mais, il est difficile d'imposer le recours à la sous-traitance (ce serait contraire à la liberté d'accès à la commande publique), sachant de plus que la sous-traitance relève de contrats de droit privé.

Une des solutions serait d'inciter le recours à la sous-traitance (exemple : cela pourrait être un des critères de choix des entreprises – cf Ordonnance du 17 juin 2004) tout en protégeant les sous-traitants (mais problème de cohérence avec le paiement forfaitaire et échelonné des PPP ? Sinon, mise en œuvre d'un système de caution bancaire ?).

16 – 17 - LE MONTAGE DU PPP DE TYPE CONTRACTUEL NECESSITE-T-IL DES REGLES PLUS DETAILLEES EN MATIERE DE SOUS-TRAITANCE ?

Il faudrait une réglementation communautaire reprenant les règles du Code des marchés publics français et celles de la loi sur la sous-traitance du 31 décembre 1975 dans le but de remplir les deux objectifs ci-dessus : incitation et protection.

18 – 19 – LES PPP INSTITUTIONNALISÉS ET LE DROIT COMMUNAUTAIRE

La forme institutionnalisée de PPP (ou qui s'apparente à cela), en France, est la Société d'Economie Mixte.

Depuis dix ans, elle est très encadrée par les textes (loi SAPIN du 29 décembre 1993) et par la jurisprudence (pas de favoritisme des Sociétés d'Economie Mixte par rapport aux autres candidats dans les marchés publics et concessions).

Il y a d'autres formes institutionnalisées de PPP, comme les Groupements d'Intérêt Public ou les Groupements d'Intérêt Economique.

Sur ce point, et concernant ces organismes, il faudrait que les textes communautaires réaffirment que, dès lors que ces structures sont majoritairement composées de personnes publiques, elles doivent respecter, pour la passation de leurs contrats, le droit de la concurrence applicable aux contrats publics.

Il ne faut pas que ces structures soient un moyen de coopération public-privé dérogeant aux règles des contrats publics, et ce, le cas échéant, à celles des PPP.

20 - QUELLES SONT LES MESURES OU LES PRATIQUES CONSTITUTIVES D'ENTRAVES A LA MISE EN PLACE DES PPP AU SEIN DE L'UNION EUROPEENNE ?

Il y a, localement, comme dans tous les contrats publics, des pratiques allant à l'encontre du développement des PPP et quelquefois des textes qui l'interdisent.

Une réflexion comparative, animée par la commission, est indispensable à ce niveau. Il faut savoir ce qui se passe ailleurs (et même hors Europe) et profiter des expériences des autres.

D'autant que, selon nous, le développement des PPP est inévitable et ce pour les raisons suivantes :

(i) Conception juridique

La contractualisation de l'action publique, ainsi que de la mise en place de services publics et/ou d'équipements collectifs met en avant un équilibre liberté-responsabilité : le pouvoir adjudicateur est libre de son choix mais doit pouvoir l'assumer ; quant à l'attributaire, celui-ci sera responsabilisé par l'existence du contrat.

(ii) Conception financière

Les PPP font peser tout ou partie du risque financier, et donc économique, sur l'attributaire.

En effet, celui-ci pré-finance un projet, ce qui le contraint à mettre en œuvre des solutions optimales non seulement au regard des aspects techniques mais également concernant les aspects financiers.

Il y a là encore une responsabilisation du titulaire qui dispose d'une certaine liberté dans la réalisation du projet dès lors qu'il en est le maître d'ouvrage.

(iii) Conception technique

Ainsi que cela a été indiqué ci-dessus, les PPP permettent aux pouvoirs adjudicateurs de se procurer le savoir faire d'entreprises spécialisées dont ils ne pourraient bénéficier autrement.

En outre, le PPP permet aux personnes publiques de disposer de garanties techniques plus importantes au regard également de la durée de ces contrats publics, dans lesquels est généralement introduite une obligation de maintenance.

(iv) Conception politique

La mise en place des PPP comprend également un volet politique en ce que ces derniers favorisent un rapprochement entre les différents acteurs de la commande publique tout en les responsabilisant en fonction de leurs compétences.

En effet, il s'agit davantage d'une coopération entre les acteurs publics-privés, dans l'intérêt général, que d'une simple « commande ».

L'Etat devient davantage un régulateur qu'un opérateur.

Il est probable que la notion d'obligation de conseil très fréquente en droit privé des contrats s'applique progressivement aux PPP.

Cette conception politique est d'ailleurs également très marquée dans le livre vert sur les PPP de la Commission Européenne du 30 avril 2004.

C'est pour toutes ces raisons que la mise en place des PPP est devenue inéluctable.

En outre, les PPP ont pour vocation de garantir une meilleure exécution du service public, et ce, pour la satisfaction de l'ensemble des usagers.

21 - LES AUTRES FORMES DE PPP DEVELOPPEES DANS LES PAYS EN DEHORS DE L'UNION

De nombreux articles ont été publiés sur ce sujet, et nous ne prétendons pas les reprendre ici.

22 - SUR LA NECESSITE D'UNE REFLEXION COLLECTIVE SUR LES PPP, EN VUE D'UN ECHANGE DE MEILLEURES PRATIQUES

Il nous semble tout à fait opportun de poursuivre une réflexion collective en matière de PPP, et ce, pour les raisons suivantes :

(i) Tout d'abord parce que cela fait appel à une notion importante : la coopération entre les acteurs publics-privés dans le cadre d'une mission d'intérêt général ; ce qui suppose une diminution de la prédominance de l'initiative publique, notamment au regard du fait que la maîtrise d'ouvrage est transférée à la personne privée.

(ii) La réflexion collective devra également mener à analyser l'ensemble des questions rencontrées dans la pratique, notamment concernant le respect des principes de transparence, de non discrimination et d'égalité.

(iii) Enfin, une réflexion collective permettra de profiter des avantages et des inconvénients des différentes pratiques en fonction des différentes cultures de la commande publique dans chaque pays et ce, afin d'aboutir à une certaine uniformisation des pratiques.

Avocat à la Cour

Question 1

Quels types de montages de PPP purement contractuel connaissez-vous? Ces montages font-ils l'objet d'un encadrement spécifique (législatif ou autre) dans votre pays ?

La Commission Européenne regroupe dans le Livre Vert PPP des montages très différents les uns des autres sur les plans juridiques, économiques, techniques ou temporels. Il en résulte des caractéristiques difficilement comparables, aussi bien pour la répartition des responsabilités entre les parties, le volume des investissements, les charges et recettes d'exploitation, que pour la durée des contrats en jeu. Pour ne prendre qu'un exemple, les marchés publics et les concessions présentent peu de caractères communs. A cet égard, la distinction entre partenariats contractuels et partenariats institutionnels est intéressante en théorie mais elle ne rend pas compte de cette grande diversité des liens contractuels entre collectivités publiques et entreprises, qui correspond à des logiques différentes.

A titre d'illustration, le droit français en matière de coopération public-privé offre un large éventail d'outils juridiques éprouvés permettant de répondre aux besoins d'efficacité et de sécurité juridique dans le respect des principes rappelés par la Commission européenne, à savoir transparence, non discrimination, égalité d'accès…

1. Les différents types de montages juridiques offerts par la réglementation française.

Le réglementation française présente actuellement deux modes classiques de partenariat public-privé : le marché public et la délégation de service public.

Le marché public permet à la personne morale de droit public de contractualiser avec un prestataire privé pour répondre à des besoins ponctuels au bénéfice des services publics qu'elle gère: la personne morale de droit public, en fonction de seuils financiers, lance un appel d'offres afin de choisir le prestataire le plus à même de lui fournir un bien, un service ou des travaux de qualité et au meilleur coût.
Le choix du prestataire privé s'effectue dans le respect d'une réglementation précise (le nouveau code des marchés publics paru début 2004, consécutif aux directives marchés publics 2004/17et 18 du 31/03/2004) visant à promouvoir la mise en concurrence. Une fois le prestataire choisi, en fonction de la prestation et du mode de marché, « l'adjudicateur public » paie un prix en échange du bien ou du service, pour une durée déterminée et généralement courte (1 à 4 ans le plus souvent).
Au sein de toutes les procédures de passation décrites dans le code, il faut distinguer la procédure dite de ***dialogue compétitif*** qui permet aux différents candidats sollicités de participer, au moyen d'auditions, à l'élaboration du projet de la collectivité sur la base duquel ils devront par la suite présenter leur offre.

La délégation de service public permet à une personne morale de droit public de contractualiser avec un délégataire public ou privé pour confier à ce dernier la gestion d'un service public sur le moyen ou long terme dans le respect des principes de transparence et non discrimination. La principale distinction avec le marché public est que le délégataire exploite le service public à ses risques et périls en se rémunérant sur les résultats de l'exploitation. Cette définition légale de la délégation de service public a été consacrée par la loi n°2001-1168 du 11 décembre 2001.
Les trois principales catégories de conventions susceptibles d'être qualifiées de délégations de service public sont les suivantes : la régie intéressée, l'affermage et la concession.

La régie intéressée s'appuie sur le concours extérieur d'un professionnel privé contractuellement chargé de faire fonctionner un service public. Ce professionnel est rémunéré par la collectivité au moyen d'une rétribution qui comprend une redevance fixe et un pourcentage sur les résultats de l'exploitation.

L'affermage consiste, pour la collectivité, à remettre à la personne privée (le fermier), les équipements nécessaires à l'exploitation du service public qui lui est confié. Le fermier doit assurer l'exploitation du service (maintenance des ouvrages et éventuellement modernisation ou extension). La rémunération du fermier repose sur les redevances payées par les usagers. Le fermier reste tenu de verser à la collectivité une contribution destinée à couvrir l'amortissement des frais initiaux engagés par la collectivité lors de la mise en place des équipements.

La concession est un mode de gestion déléguée par lequel la collectivité charge son cocontractant de réaliser les travaux de premier établissement et d'exploiter à ses frais le service pendant une durée déterminée en prélevant le plus souvent directement auprès des usagers du service des redevances qui lui restent acquises. La rémunération du concessionnaire est donc assurée par les usagers et la gestion du service s'effectue aux risques et périls du concessionnaire. La convention de concession, accompagnée d'un cahier des charges précis des droits et obligations du concessionnaire, doit tenir compte pour la détermination de sa durée de la nature des prestations demandées au délégataire et ne doit pas dépasser la durée d'amortissement des installations. La durée des concessions est normalement la durée la plus longue de tous les modes de coopération public-privé.

Ces trois catégories de convention constituent les principaux modes de coopération et de partenariat entre la sphère publique et la sphère privée.

Conscient de la baisse sensible des investissements publics sur ces vingt dernières années, le gouvernement français est à l'origine de nouvelles lois visant à promouvoir le **Partenariat Public Privé**[1]**.** Cette formule vise à pallier l'insuffisance des ressources publiques pour la réalisation d'infrastructures dédiées à des secteurs non marchands, telles que routes, écoles, prisons, etc. n'appelant pas de contribution directe de la part des destinataires. Trois lois ont déjà été adoptées, les lois du 29 août 2002, du 9 septembre 2002 et du 2 juillet 2003. Ces nouveaux contrats PPP constituent une catégorie distincte, à la fois des marchés publics et des délégations de service public.

Les PPP font l'objet d'une ordonnance qui prévoit qu'un même contrat pourra être attribué à une seule et même personne pour la construction et l'exploitation des ouvrages, le projet pouvant être initié par le secteur privé. Il ne peut être utilisé que dans un contexte bien précis, sur une longue durée et suppose le paiement régulier d'une somme par la personne morale de droit public au titulaire du contrat qui assure le financement complet de l'opération. Les modalités de passation de ce partenariat sont celles du dialogue compétitif énoncées dans le nouveau Code des Marchés Publics.

2. Les procédures de passation organisées par la réglementation visent à garantir la sécurité juridique des différents partenariats.

Chaque mode de coopération public-privé pour la gestion des services publics décrit ci-dessus est inscrit dans un dispositif législatif et réglementaire qui encadre sa passation et comprend un mécanisme d'attribution respectueux des principes de libre accès et de transparence.

Les ***marchés publics*** font l'objet d'une réglementation spécifique décrite dans le nouveau Code des marchés publics publié début 2004. Ce Code prévoit notamment des mécanismes d'attribution et de contrôle très précis en conformité avec les dernières prescriptions de la Commission dans ce domaine (directives marchés publics).

La ***délégation de service public*** (DSP) comprend également des règles d'attribution strictes énoncées par la loi Sapin du 29/01/1993 avec notamment : l'appel à candidature, l'examen contradictoire des offres par une commission spécialisée et le choix du délégataire approuvé par l'assemblée délibérante dans l'hypothèse d'un marché local ou par la commission spécialisée des marchés dans l'hypothèse d'un marché de l'Etat. En outre la collectivité délégante ou concédante contrôle le bon fonctionnement du service, notamment au vu des comptes-rendus techniques et financiers annuels.

Le ***partenariat public-privé***[2]***,*** récemment mis en place, obéit à des mécanismes d'attribution et de transparence qui ne se distinguent pas des autres modalités de gestion de service public puisqu'il s'inspire directement du dialogue compétitif du Code des Marchés Publics. En outre un décret devrait instaurer un système de contrôle spécifique à ce mode de gestion.

Par ailleurs, dans le cadre d'un projet de coopération développé par une collectivité locale, rappelons que :

- ❑ le choix du mode de DSP et du candidat fait l'objet d'un contrôle au sein de l'assemblée délibérante,
- ❑ la décision définitive d'attribution est soumise au contrôle de légalité du préfet,
- ❑ les comptes sont susceptibles d'être audités par les chambres régionales des comptes,
- ❑ en toute hypothèse, le juge peut être saisi en cas d'irrégularités constatées.

En ce qui concerne spécifiquement la distribution d'électricité, qui constitue un monopole naturel selon les dispositions des directives européennes, la législation française confie à un opérateur désigné sur un territoire donné la mission de la desserte en électricité. Concrètement, le législateur a désigné EDF et les Entreprises Locales de Distribution comme partenaires des collectivités locales, lesquelles disposent du pouvoir d'organisation et de gestion des services publics dont elles ont la charge. Ce régime juridique se justifie notamment par la péréquation tarifaire appliquée à l'acheminement du courant (transport et distribution) sur tout le territoire national, conforme aux dispositions de la directive 2003/54/CE.

[1] Cette expression est utilisée en France pour des formes de coopérations qui ne recouvrent qu'une partie de celles désignées sous ces mots dans le Livre Vert.

[2] Idem.

Question 2

De l'avis de la Commission, la transposition en droit national de la procédure de dialogue compétitif permettra aux parties concernées de disposer d'une procédure particulièrement adaptée à la passation des contrats qualifiés de marchés publics lors de la mise en place d'un PPP de type purement contractuel, tout en préservant les droits fondamentaux des opérateurs économiques. Partagez-vous ce point de vue? Si non, pourquoi ?

La procédure de dialogue compétitif est d'ores et déjà opérationnelle en droit français, puisqu'elle est décrite notamment à l'article 36 du nouveau code des marchés publics paru au début de l'année 2004, qui a intégralement transposé les principes des directives européennes 2004/17 et 2004/18.

Par ailleurs l'ordonnance portant création des partenariats publics-privés[3] prévoit de s'appuyer sur la procédure de dialogue compétitif afin de choisir le titulaire du contrat de partenariat.

Il est dans l'immédiat difficile de déterminer si la procédure de dialogue compétitif est "particulièrement" adaptée, dans la mesure où elle n'a pas encore fait l'objet d'une pratique suffisante.

En ce qui concerne spécifiquement les concessions de distribution d'électricité, la procédure de dialogue compétitif poserait deux problèmes d'application :

- L'adjudicataire demeurerait dans l'impossibilité de fixer un prix pour des travaux dont le volume ne peut a priori être déterminé pendant la durée de la concession, compte tenu de leur nature (investissements liés à de nouveaux raccordements, augmentation ou maîtrise de la demande) et des aléas (investissements de renouvellement liés en partie à des phénomènes climatiques non prévisibles). Ces travaux ne sont en outre pas toujours limités au périmètre d'une concession, mais visent souvent plusieurs concessions, voire concernent le niveau national.
- La définition des engagements et donc des moyens relève du contrat de concession signé avec les collectivités locales. Le tarif d'acheminement qui rémunère les distributeurs est, de son côté, déterminé par la Commission de Régulation de l'Energie (CRE) pour l'ensemble du territoire national (ce qui n'autorise pas de négociation à l'échelle d'une concession) et avec un horizon de visibilité plus réduit que celui des concessions. Le niveau de qualité requis est enfin encadré par l'Etat, dans les contrats de service public signés avec les opérateurs.

Le dialogue compétitif peut donc difficilement s'instaurer entre les acteurs, sauf à revoir complètement l'édifice des concessions de distribution en France, et à renoncer au principe de péréquation tarifaire.

Le caractère récent des textes en vigueur, aussi bien au plan horizontal (directives 2004/17 et 2004/18) ***qu'au plan sectoriel*** (directive 2003/54/CE) ***plaide pour une période d'observation suffisante avant une éventuelle nouvelle étape législative***. S'agissant du secteur de l'électricité, rappelons que la directive visée ci-dessus prévoit le libre choix du fournisseur d'électricité par l'ensemble des professionnels depuis le 1er juillet 2004 et la liberté de choix de l'ensemble des consommateurs au 1er juillet 2007. Pour mettre en application l'ensemble des changements introduits au plan légal, les opérateurs ont maintenant besoin de stabilité, ce qui implique une certaine pérennité du cadre juridique actuel.

[3] Cette expression est utilisée en France pour des formes de coopérations qui ne recouvrent qu'une partie de celles désignées sous ces mots dans le Livre Vert.

Question 3

En ce qui concerne ces contrats, existe-t-il selon vous des points autres que ceux relatifs au choix de la procédure d'adjudication, susceptibles de poser problème au regard du droit communautaire des marchés publics? Si oui, lesquels et pour quelles raisons ?

EDF n'a pas connaissance de problèmes de ce type.

Question 4

Avez-vous déjà organisé, participé, ou souhaité organiser ou participer à une procédure d'attribution de concession au sein de l'Union? Quelle expérience en avez-vous?

EDF ne possède pas d'expérience de ce type.

Question 5

Estimez vous que le cadre juridique communautaire actuel est suffisamment précis pour assurer la participation concrète et effective de sociétés ou groupements non-nationaux aux procédures de passation de concessions? Une concurrence réelle est-elle, selon vous, habituellement assurée dans ce cadre ?

Les principes fondateurs de transparence et de mise en concurrence contenus dans le Traité s'appliquent à toute activité par laquelle une entité publique confie une prestation économique à un tiers. Cette activité peut consister à offrir des services, des biens ou des travaux sur un marché, même si ces services ou travaux visent à assurer un "service d'intérêt général" tel que défini par un Etat membre.

Par ailleurs les deux nouvelles directives marchés publics 2004/17 et 2004/18 du 31 Mars 04, qui visent à promouvoir la mise en concurrence, soumettent les contrats qualifiés de marché public de travaux ou de services et définis comme étant "prioritaires" à des règles précises en matière de passation de contrats.

En France, juridiquement les collectivités publiques disposent d'un cadre précis et sécurisé en matière de gestion de **délégation de service public dont la concession est un des modes de gestion.** A cet égard, la concession est un outil efficace de coopération entre la sphère publique et la sphère **privée dont le mode de passation est prévu par** la loi du 29/01/1993 dite loi "Sapin", qui organise une mise en concurrence réelle et contrôlée. Ce cadre juridique complète le dispositif communautaire existant.

Enfin, pour ce qui concerne spécifiquement le secteur de l'électricité, rappelons que les modalités d'ouverture à la concurrence ont été définies successivement par deux directives européennes dont la seconde a été adoptée en juin 2003 (directive 2003/54/CE). Ce texte poursuit le processus d'ouverture à la concurrence initié par la première directive "électricité", tout en assurant la protection de l'ensemble des consommateurs, notamment les plus vulnérables.

Question 6

Pensez-vous qu'une initiative législative communautaire, visant à encadrer la procédure de passation de concessions, est souhaitable ?

Compte tenu de la grande diversité de modèles de PPP qui existent dans les pays de l'Union européenne (PPP issus du droit anglo-saxon, délégations de service public de droit français…), il paraît très difficile de soumettre l'ensemble de ces conventions à un régime uniformisé inspiré des règles communautaires relatives aux marchés publics. Dans le respect du principe de subsidiarité, il est par conséquent souhaitable de préserver la liberté des Etats membres pour les modalités d'organisation de leurs services publics ou de création d'infrastructures.

Le cadre législatif et réglementaire actuel ne comporte pas d'insuffisances particulières, et les derniers ajustements qui lui ont été apportés n'ont à ce jour révélé aucune lacune. Ce cadre fournit aux autorités publiques les instruments nécessaires pour agir en pleine transparence et effectuer l'ensemble des contrôles et vérifications utiles.

Dans la période actuelle, **si une initiative communautaire devait être prise, il serait judicieux qu'elle porte sur le renforcement de la sécurité juridique des entreprises dotées de mission d'intérêt général, comme EDF l'a souligné l'an passé dans le cadre du débat sur le Livre vert « services d'intérêt général ».**

Les entreprises de service public pâtissent en effet des incertitudes qui entourent l'application des règles de concurrence, tout particulièrement pour la compensation des charges de service public. Cette insécurité a été reconnue par la Commission elle-même à plusieurs reprises. Le Conseil européen, à son tour, a mis en avant la nécessité de renforcer la sécurité juridique, tout particulièrement au regard des règles relatives aux aides d'Etat. La Cour de justice a apporté des éléments de clarification dans l'arrêt Altmark de juillet 2003. L'adoption du Livre blanc « services d'intérêt général » par la Commission européenne constitue une réponse à cette préoccupation. EDF nourrit donc l'espoir que les initiatives visant à améliorer la sécurité juridique, programmées dans ce Livre blanc, seront mises en œuvre rapidement.

Question 7

De manière plus générale, si vous estimez qu’il est nécessaire que la Commission propose une nouvelle action législative, existerait-il à votre avis des raisons objectives de viser dans cet acte tous les PPP de type contractuel, qu’ils soient qualifiés de marchés publics ou de concessions, pour les soumettre à des régimes de passation identique ?

Il paraît nécessaire de rappeler l’existence, dans les différents pays européens, d’une législation diversifiée adoptée à l’issue d’une pratique qui a cherché très tôt à imaginer des mécanismes d’ajustement permettant de concilier les impératifs de l’intérêt général et les exigences de l’économie de marché et visant à produire des services publics performants aux meilleurs coûts et dans la meilleure transparence. .

Ces différentes conventions ne sont pas examinées dans le Livre Vert qui se borne à évoquer les marchés publics et les concessions.

La volonté de la Commission Européenne d’améliorer le cadre juridique communautaire est louable, mais il faut prendre garde au risque d’engendrer complexité et incertitudes dans la mesure où il existe déjà des modalités diverses de coopération entre le privé et le public, qui ont le mérite de fonctionner et d’avoir fait leurs preuves, notamment le mécanisme de la concession qui existe depuis plus d’un siècle sous sa forme actuelle et qui ne peut pas être entièrement assimilé à un PPP au sens où l’entend la Commission.

La réponse à la question 1 donne un aperçu de la variété des dispositifs en place dans le cadre d'un seul pays et souligne que ***la forte hétérogénéité des opérations entrant sous le vocable PPP rend inopportun un texte à vocation générale.***

Question 8

Selon votre expérience, l'accès des opérateurs non-nationaux aux formules de PPP d'initiative privé est-il assuré? En particulier, lorsqu'il existe une invitation des pouvoirs adjudicateurs à présenter une initiative, cette invitation fait-elle généralement l'objet d'une publicité adéquate permettant l'information de tous les opérateurs intéressés ? Une procédure de sélection véritablement concurrentielle est-elle organisée pour assurer la mise en oeuvre du projet retenu?

EDF ne dispose pas d'éléments d'information spécifiques sur ce point.

Question 9

Quelle serait selon vous la meilleure formule pour assurer le développement des PPP d'initiative privée dans l'Union européenne tout en assurant le respect des principes de transparence, de non discrimination et d'égalité de traitement ?

EDF ne se prononce pas sur cette question.

Question 10

Quelle expérience avez-vous de la phase postérieure à la sélection du partenaire privé dans les opérations de PPP contractuels ?

A la diversité des formes prises par les PPP en France correspond une grande variété de situations dans les phases postérieures à la sélection.

A titre d'exemple, les concessions de distribution de l'électricité sont régies par un cahier des charges. Un compte-rendu sur l'exécution de ses clauses est effectué à intervalle périodique (généralement un an) auprès du pouvoir concédant (commune ou regroupement de communes).

Limitée par le principe de spécialité des établissements publics, EDF n'a pas d'expérience avec les collectivités territoriales dans des secteurs autres que l'électricité. C'est par ailleurs seulement depuis le 1er juillet 2004 qu'elle est susceptible d'être appelée à participer à des appels d'offres pour la fourniture d'électricité aux collectivités locales et autres personnes publiques soumises au Code des marchés publics.

Question 11

Avez-vous connaissance de cas dans lesquels les conditions d'exécution – y compris les clauses d'adaptation dans le temps - ont pu avoir une incidence discriminatoire ou ont pu constituer une entrave injustifiée à la libre prestation de services ou à la liberté d'établissement ? Si oui, pouvez-vous décrire le type de problèmes rencontrés ?

EDF n’a pas connaissance de tels cas.

Question 12

Avez-vous connaissance de pratiques ou de mécanismes d'évaluation d'offres ayant des incidences discriminatoires ?

EDF n’a pas connaissance d’entraves de cette nature.

Question 13

Partagez-vous le constat de la Commission selon lequel certains montages du type "step-in" peuvent poser problème en termes de transparence et d'égalité de traitement ? Connaissez vous d'autres "clauses types" dont la mise en oeuvre est susceptible de poser des problèmes similaires ?

Indépendamment des problème de transparence et d'égalité de traitement, les clauses de "step-in" semblent inadaptées aux opérations prévoyant un tarif unique pour tous les clients d'une zone nationale.

En France, ce cas se présente dans l'électricité, où la loi garantit la péréquation tarifaire pour l'acheminement du courant (transport et distribution) sur tout le territoire national. Ce dispositif est fondé d'une part sur un souci de cohésion sociale, afin de ne pas défavoriser les résidents de zones difficiles à desservir. Il répond d'autre part à l'objectif de faciliter l'accès au marché pour tous les fournisseurs, qui peuvent ainsi déterminer aisément les coûts d'alimentation de tous leurs clients.

Ainsi que l'a rappelé le Livre Vert sur les Services d'Intérêt Général[4], la péréquation tarifaire correspond à l'une des solutions laissées à l'initiative des Etats Membres afin de rendre un service public accessible à tous, à un prix abordable.

[4] COM (2003) 270 du 21 Mai 2003.

Question 14

Estimez-vous qu'il est nécessaire de clarifier au niveau communautaire certains aspects relevant du cadre contractuel des PPP ? Si oui, sur quel(s) aspect(s) devrait porter cette clarification?

L'Union Européenne s'est déjà dotée d'une législation détaillée, aussi bien sur le plan horizontal, comme le rappelle le Livre Vert, que sur le plan sectoriel, tout particulièrement dans la plupart des secteurs propices à des partenariats public – privé. Certains éléments de cette législation communautaire ont été très récemment mis en œuvre, et demeurent parfois en cours de transposition.

On observe par ailleurs une grande diversité de situations entre secteurs, une large variété de contextes nationaux et l'existence dans plusieurs Etats Membres, notamment en France, de législations sectorielles encadrant déjà les multiples formes de coopération entre secteur public et secteur privé. Certaines dispositions législatives ont été modifiées, de manière trop récente pour que l'on puisse déjà en tirer des enseignements.

Ce double constat ne milite pas en faveur d'une nouvelle initiative législative communautaire en la matière.

Question 15

Dans le contexte des opérations de PPP, avez-vous connaissance de problèmes particuliers rencontrés en matière de sous-traitance ? Lesquels?

EDF n’a pas connaissance de problèmes spécifiques en la matière.

Question 16

Le phénomène des PPP de type contractuel, impliquant le transfert d'un ensemble de tâches à un unique partenaire privé, justifie-t-il selon vous que des règles plus détaillées et/ou d'un champ d'application plus large soient mise en place en ce qui concerne le phénomène de sous-traitance?

EDF ne se prononce pas sur ce point.

Question 17

De manière plus générale, estimez-vous qu'une initiative complémentaire devrait être prise au niveau communautaire en vue de clarifier, ou d'aménager, les règles relatives à la sous-traitance?

EDF ne se prononce pas sur ce point.

Question 18

Quelle expérience avez-vous de la mise en place d'opérations de PPP de type institutionnalisé ? En particulier, votre expérience vous conduit-elle à penser que le droit communautaire des marchés publics et des concessions est respecté dans le cas de montages de PPP institutionnalisé? Si non, pourquoi ?

Au sens du présent Livre vert, le PPP de type institutionnalisé (PPPI) est susceptible de revêtir deux formes différentes qui sont d'une part, la création ad hoc d'une structure juridique réunissant des capitaux publics et des capitaux privés et d'autre part la prise de contrôle capitalistique d'une entité publique par une entité privée.

La mise en place des PPPI est juridiquement encadrée par le droit français en raison d'une pratique déjà ancienne consistant à associer capitaux privés et capitaux publics, notamment au travers de structures juridiques intitulées sociétés d'économie mixte.

Que ce soit au niveau national ou au niveau local, la création et le fonctionnement des sociétés d'économie mixte sont juridiquement encadrées en droit français.

Au niveau local, les sociétés d'économie mixte locale (SEML), tant dans leur création que dans les missions qui sont susceptibles de leur être confiées, font l'objet d'un encadrement législatif, du contrôle de légalité du Préfet et en dernier lieu du contrôle du juge. Rappelons également que les SEML sont des sociétés anonymes dont les actionnaires majoritaires sont des collectivités locales.

La France s'est dotée d'un cadre juridique consolidé assurant mise en concurrence et transparence dans les missions et prestations qui sont confiées aux SEML, dans le cadre de leurs relations avec les entités adjudicatrices. En outre, en tant qu'elles sont elles-mêmes entités adjudicatrices, les SEML sont également soumises aux règles de publicité et de mise en concurrence prévues par le droit communautaire et le droit national.

La structure juridique de la SEML a été retenue pour certaines entités assurant la distribution et la fourniture de l'électricité sur le territoire français. ***Les dispositions résumées ci-dessus, qui garantissent l'application du droit communautaire, leur sont applicables.***

Par ailleurs, les prises de participation pouvant conduire jusqu'à la prise de contrôle capitalistique de l'entreprise par des capitaux privés, opérations de privatisation, sont encadrées par les lois dites de privatisation qui font intervenir, pour les opérations les plus importantes, la Commission des participations et des transferts, dont les avis sont publiés. Des audits et vérifications sont menés ensuite à intervalles réguliers par la Cour des Comptes et par l'Agence des Participations de l'Etat.

Question 19

Estimez-vous qu'une initiative doit être prise au niveau communautaire en vue de clarifier ou de préciser les obligations des organismes adjudicateurs quant aux conditions dans lesquelles doivent être mis en concurrence les opérateurs potentiellement intéressés par un projet de type institutionnalisé? Si oui, sur quels points particuliers et sous quelle forme ? Si non, pourquoi?

Ainsi qu'il a été mentionné dans la réponse à la question 18, les projets de type institutionnalisé revêtent des formes juridiques variées au sein d'un même Etat comme la France et cette diversité est bien sûr accrue si l'on passe aux 25 Etats Membres de l'Union. Les dispositions législatives qui les encadrent subissent de constantes améliorations au niveau de chaque Etat, certains des ajustements ayant été introduits en France depuis moins de deux ans.

Une initiative législative communautaire dans ce domaine visant à englober l'ensemble des situations prendrait donc une forme nécessairement complexe. Ne pouvant s'appuyer sur un retour d'expérience solide, compte tenu de la brièveté des mises en œuvre nationales, elle serait susceptible d'approximations et pourrait engendrer un sentiment d'instabilité juridique préjudiciable aux entreprises.

Mieux vaut partager les enseignements à tirer de l’application des dispositions communautaires et nationales en vigueur, comparer les résultats obtenus et analyser les causes des réussites ou des échecs. Ce n’est qu’au terme de cette évaluation, présentée plus en détails dans la réponse à la question n°22, qu’il sera possible de se prononcer sur l’opportunité d’une initiative au niveau communautaire.

Dans l’immédiat, la priorité est de renforcer la sécurité juridique que sont en droit d’attendre les entreprises dotées de missions d’intérêt général (cf. réponse à la question n°6). La levée des incertitudes est particulièrement souhaitable pour le secteur de l'électricité, dont l'activité s’inscrit dans une perspective de long terme (programmation et financement des investissements…), pour laquelle la stabilité du cadre juridique est essentielle, dans l’intérêt des populations et des industries européennes.

Question 20

Quelles sont les mesures ou les pratiques que vous estimez constitutives d'entraves à la mise en place des PPP au sein de l'Union européenne ?

EDF ne se prononce pas sur ce point.

Question 21

Connaissez-vous d'autres formes de PPP développées dans les pays en dehors de l'Union? Connaissez-vous des exemples de 'bonnes pratiques' développées dans ce cadre, dont l'Union pourrait s'inspirer ? Si oui, lesquelles ?

EDF ne se prononce pas sur ce point.

Question 22

De façon plus générale, et compte tenu des besoins importants d'investissements nécessaires dans certains Etats membres, afin de poursuivre un développement économique social et durable, estimez-vous utile une réflexion collective sur ces questions qui se poursuivrait à des intervalles réguliers entre les acteurs concernés, et qui permettrait un échange des meilleures pratiques? Est-ce que vous considérez que la Commission devrait animer un tel réseau ?

L'ensemble des réponses aux questions du Livre Vert figurant ci-dessus soulignent l'extrême diversité des opérations couvertes par le concept de "partenariat public privé", et des législations qui l'encadrent dans l'UE.

Une réflexion collective orientée vers la comparaison des bases juridiques en vigueur dans les Etats Membres et l'analyse des résultats obtenus au regard des objectifs serait particulièrement bienvenue. L'organisation de rencontres périodiques entre les acteurs concernés, dévolues aux échanges de bonnes pratiques, semble tout à fait opportune.

D'une manière plus générale, comme EDF l'a souligné dans sa réponse au Livre vert sur les « services d'intérêt général », l'évaluation régulière des performances des services d'intérêt général est une préoccupation légitime et permet de vérifier l'adéquation entre la législation et les effets de sa mise en œuvre. D'une part, elle fournit des indicateurs indispensables pour la prise de décision politique, notamment l'adaptation des services d'intérêt économique général aux besoins de la population et aux objectifs sociaux et économiques de l'Union. D'autre part, elle permet de s'assurer de la bonne application des textes relatifs à la concurrence et à la compétitivité, en apportant des éléments d'appréciation sur d'éventuelles situations anticoncurrentielles ou des obstacles aux échanges.

Il convient en tout état de cause que les éléments d'évaluation établis par la Commission européenne soient complétés par les apports d'organismes détenant l'expertise nécessaire et indépendants vis-à-vis des instances chargées de l'élaboration ou de la mise en œuvre des textes communautaires.

france telecom

Direction Internationale des Relations Extérieures

Juillet 2004

Réponse du Groupe France Télécom sur la consultation de la Commission européenne sur les Partenariats Public-Privé.

Le Groupe France Télécom souhaite saluer l'initiative de la Commission européenne d'amorcer un débat sur la meilleure façon d'assurer que les Partenariats Public-Privé (PPP) puissent se développer dans un contexte de concurrence efficace et de clarté juridique. En répondant à la consultation ouverte par le Livre vert sur les Partenariats Public-Privé et le droit communautaire des marchés publics et des concessions[1], France Télécom souligne que le secteur des réseaux et services de communications électroniques s'inscrit dans un cadre réglementaire dont la mise en œuvre a donné lieu à des dispositions qui affectent les conditions d'utilisation de financements publics.

Introduction

Le Livre vert sur les Partenariats Public-Privé, en procédant à une consultation horizontale des acteurs impliqués, vise à promouvoir la croissance en Europe en proposant un cadre contractuel novateur définissant au niveau communautaire des bases communes. Cette initiative a le mérite de clarifier certains points. Elle rappelle opportunément le **principe fondamental selon lequel, que l'infrastructure subventionnée appartienne à une autorité publique, à une entité privée apportant un cofinancement, ou à une entité mixte public-privé, les principes généraux comme l'égalité et la transparence doivent s'appliquer**.

France Télécom, par la présente réponse au Livre vert, souhaite appeler particulièrement l'attention de la Commission sur la situation des PPP dans le secteur des communications électroniques.

Données du problème

Les PPP sont un moyen à la disposition des autorités publiques pour la mise en place d'ouvrages ou de services relevant de leurs missions, mais en recourant à la compétence, voire aux ressources financières, d'entreprises privées.

Dès lors que l'Union européenne a fait le choix, il y a une dizaine d'années, de libéraliser entièrement le secteur des communications électroniques et de faire confiance aux forces du marché pour développer ce secteur clé de l'économie, la construction et l'exploitation des réseaux de télécommunications ne sont plus des missions relevant des administrations, qu'elles soient nationales ou locales, sauf éventuellement pour la satisfaction de leurs propres besoins.

[1] COM(2004) 327 du 30.04.2004

On pourrait donc penser, en première analyse, que le secteur des communications électroniques n'est pas concerné par les PPP. Mais ceci n'est pas tout à fait vrai.
Il existe certains cas où l'initiative privée fait défaut et où les Pouvoirs publics peuvent légitimement estimer qu'ils doivent y remédier en prenant eux-mêmes l'initiative de construire et d'exploiter des réseaux ou de soutenir les acteurs privés à travers un financement public . Tel est le cas notamment dans certaines zones rurales ou peu peuplées dans lesquelles aucun opérateur privé ne peut raisonnablement espérer amortir les investissements nécessaires par exemple à la fourniture de services haut débit ou de services de télécommunications mobiles. En pareille circonstance, l'autorité publique concernée peut décider d'agir seule mais elle peut aussi décider de recourir à un PPP.

Cette addition de forces s'inscrit d'ailleurs dans le plan *e*-Europe 2005 qui souligne que l'Europe a besoin, pour se doter d'une infrastructure large bande à grande échelle, de mobiliser des investissements importants du privé et du public. Les Etats membres ont à ce titre affiché au niveau communautaire leur stratégie et plan d'action pour le large bande en veillant généralement à la dévolution particulière de chacun des secteurs dans leur contribution respective à cet effort.

Le Groupe France Télécom[2], comme d'autres opérateurs, a toujours répondu aux sollicitations des autorités publiques désireuses de faire bénéficier leur territoire de nouvelles technologies quand elles ne désiraient pas l'équiper elles-mêmes.

Il souhaite que les PPP conclus dans ce cadre le soient sur des bases claires, et que l'intervention économique des autorités publiques ne crée aucune distorsion de concurrence entre les opérateurs. Ceci suppose :

- que les modalités de choix du partenaire privé assurent une égalité de chances aux différents candidats potentiels ;
- que, notamment dans ses aspects financiers, le contrat conclu entre l'acteur public et son partenaire privé ne confère pas à ce dernier des avantages indus par rapport à ses concurrents (surcompensation des missions d'intérêt général par exemple, s'écartant de la jurisprudence de la CJCE précisée récemment dans l'arrêt Altmark) ; en particulier, toute aide financière devrait être proscrite lorsque le projet vise à fournir des services qu'un ou plusieurs autres opérateurs fournissent déjà sur le même territoire sans financement public.

A ce titre, la Commission a déjà soumis l'attribution de fonds publics pour des projets d'infrastructure de télécommunications **à des contraintes juridiques.** En particulier, un document de travail[3] récent a rappelé le cadre réglementaire d'attribution de fonds communautaires à la construction d'infrastructures de communications électroniques. **Ce cadre juridique est un gage de transparence et de compétitivité accrue**.

[2] Au 30 juin 2004, le Groupe France Télécom sert un total de 119,6 millions de clients dans le monde ; dans les télécommunications fixes, mobiles et accès Internet, il opère principalement dans plusieurs Etats membres de l'UE parmi lesquels les plus significatifs sont la France, le Royaume-Uni, la Pologne, la Belgique, l'Espagne, les Pays-Bas, la Slovaquie, le Danemark, auxquels il convient d'ajouter la Roumanie et la Suisse.

[3] Document de travail des services de la Commission « lignes directrices relatives aux critères et modalités de mise en œuvre des fonds structurels en faveur des communications électroniques ». SEC (2003) 895.

Conclusion : orientations souhaitées pour le débat sur les PPP

A l'occasion du débat sur les PPP, France Télécom voudrait que soient préservés et encouragés certains principes qui jusque là ont permis le développement de la société de l'information.

Les lignes directrices relatives aux critères et modalités de mise en œuvre des fonds structurels en faveur des communications électroniques constituent une garantie suffisante de transparence et de non discrimination. Ces principes devraient s'appliquer de la même manière à tous les types de contrats.

Le recours à un contrat de partenariat **et l'attribution de fonds structurels** pour la construction d'infrastructures de communications électroniques ne devraient se faire **qu'au terme d'une évaluation rigoureuse des besoins à satisfaire et des capacités du marché à y pourvoir**. A l'issue de cette évaluation le contrat de partenariat ne pourra être retenu que si ses avantages apparaissent clairement. **L'évaluation doit notamment mettre en évidence l'intérêt financier du recours au contrat de partenariat mais aussi sa pertinence économique**.

GAZ DE FRANCE
DIRECTION DE L'INFORMATION ET DES AFFAIRES PUBLIQUES

REPONSE AU LIVRE VERT « *SUR LES PARTENARIATS PUBLIC-PRIVE ET LE DROIT COMMUNAUTAIRE DES MARCHES PUBLICS ET DES CONCESSIONS* »

Position de fond du groupe Gaz de France :

***Gaz de France considère qu'il est nécessaire de conserver une nette distinction entre marchés publics et concessions, compte tenu des caractéristiques spécifiques de ces deux catégories de contrats**. En France, la diversité des types de contrat est essentielle et vient de conduire à la création d'une troisième catégorie de contrat, le contrat de partenariat, à côté de la délégation de service public et du marché public.*

Notre réponse au présent Livre Vert s'attache donc à faire la distinction entre ces divers modes de gestion. Elle est de plus articulée avec les réflexions en cours portant sur les règles communes pour le marché intérieur de l'énergie. Elle porte essentiellement sur les questions 1 à 7.

LE PPP PUREMENT CONTRACTUEL

1. Quels types de montages de PPP purement contractuel connaissez-vous ? Ces montages font-ils l'objet d'un encadrement spécifique (législatif ou autre) dans votre pays ?

Trois grandes catégories de contrats en France peuvent correspondre au concept communautaire de PPP. Toutes les formes de PPP au sens communautaire sont couvertes.

- *Les délégations de service public*

Les délégations de service public existent depuis longtemps en France. Ce sont des contrats par lesquels une personne morale de droit public (Etat, collectivité locale) confie la gestion d'un service public dont elle a la responsabilité à un délégataire public ou privé, dont la rémunération est substantiellement liée aux résultats de l'exploitation du service, ce dernier supportant donc les risques d'exploitation. Le délégataire peut être chargé de construire, entretenir et exploiter des ouvrages. Cette délégation du service par la collectivité s'accompagne d'un véritable transfert de la responsabilité de l'exécution d'un service ou d'une fonction.

La loi n° 93-122 du 29 janvier 1993 (dite loi Sapin) a mis en place un encadrement des procédures de passation de ces contrats. Elle exige des mesures de publicité afin de susciter la présentation de plusieurs offres, l'autorité organisatrice conservant la liberté du choix du délégataire.

- *Les marchés publics*

Les marchés publics sont des contrats conclus par des personnes publiques avec des personnes publiques ou privées. Ils ont pour objet la réalisation de travaux, de fourniture ou de services. La contrepartie de cette prestation réside dans un prix et dès lors la rémunération du cocontractant de la personne publique ne dépend pas substantiellement des résultats de l'exploitation du service.

Ces contrats sont soumis, en France, aux procédures de passation et aux règles d'exécution édictées par le Code des marchés publics.

- *Les contrats de partenariat public-privé*

« Les contrats de partenariat sont des contrats administratifs par lesquels la personne publique confie à un tiers, pour une période déterminée en fonction de la durée d'amortissement des investissements ou des modalités de financement retenues, une mission globale relative au financement d'investissements immatériels, d'ouvrages ou d'équipements nécessaires au service public, à la construction ou à la transformation des ouvrages ou équipements, ainsi qu'à leur entretien, leur maintenance, leur exploitation ou leur gestion, et, le cas échéant, à d'autres prestations de services concourant à l'exercice, par la personne publique, de la mission de service public dont elle est chargée. »[1] Ils se caractérisent par un partage des risques. La rémunération du cocontractant ne peut être liée substantiellement aux résultats de l'exploitation du service. Elle dépend d'objectifs de performance et est répartie sur l'ensemble de la durée du contrat.

Il convient en complément, de signaler une procédure administrative, appliquée notamment dans le domaine des infrastructures dont les réseaux d'énergie en Europe : la procédure d'autorisation ou de licence. Cette procédure est juridiquement très différente d'un PPP. Mais certaines activités gazières peuvent être exercées dans certains pays membres sous un régime de PPP et dans d'autres sous un régime d'autorisation, sans que les différences autres que purement juridiques entre ces situations soient toujours significatives.

La phase de sélection du partenaire privé

Partenariat de type purement contractuel : acte attributif qualifié de marché public

2. De l'avis de la Commission, la transposition en droit national de la procédure de dialogue compétitif permettra aux parties concernées de disposer d'une procédure particulièrement adaptée à la passation des contrats qualifiés de marchés publics lors de la mise en place d'un PPP de type purement contractuel, tout en préservant les droits fondamentaux des opérateurs économiques. Partagez-vous ce point de vue ? Si non, pourquoi ?

La procédure de dialogue compétitif, utilisée dans le cadre de la passation des marchés publics, n'est pas adaptée à toutes les formes de PPP contractuels, et notamment pas aux concessions qui ne sont pas des marchés publics.

[1] Ordonnance n° 2004-559 du 17 juin 2004

Tout d'abord, dans une concession, le titulaire du contrat se voit conférer une responsabilité associée à des risques et aléas de gestion importants, impliquant que la liberté d'organisation du service public par l'autorité concédante ne soit pas restreinte par des règles de passation trop contraignantes.

Par ailleurs, le formalisme du dialogue compétitif pourrait, selon nous, constituer un frein à l'innovation :

- *lors de l'élaboration des offres : la mise en commun des idées et propositions des entreprises risque de freiner le développement des idées innovantes, par crainte de les voir exposées à l'ensemble des candidats,*
- *lors de la vie du contrat : une rédaction du cahier des charges ou du contrat final issu du dialogue compétitif, trop précise, notamment sur les moyens à mettre en œuvre, risque d'empêcher toute adaptation par l'exploitant de gestion dans le temps, au fur et à mesure de la vie de l'exploitation, adaptation nécessaire à ce type de contrat complexe conclu sur une longue durée.*

3. En ce qui concerne ces contrats, existe-t-il selon vous des points autres que ceux relatifs au choix de la procédure d'adjudication, susceptibles de poser problème au regard du droit communautaire des marchés publics ? Si oui, lesquels et pour quelles raisons ?

Gaz de France ne connaît pas de points susceptibles de poser problème au regard du droit communautaire des marchés publics.

Partenariat de type purement contractuel : acte attributif qualifié de concession

4. Avez-vous déjà organisé, participé, ou souhaité organiser ou participer à une procédure d'attribution de concession au sein de l'Union ? Quelle expérience en avez-vous ?

Gaz de France a déjà participé en France à des procédures d'attribution de concessions.

Notre expérience française montre notamment l'intérêt d'une procédure établie par la loi[2] *permettant, après présentation de l'offre initiale sur la base d'un dossier de consultation établi par l'autorité publique, une phase de libre discussion entre le candidat et l'autorité publique.*
L'esprit général de la concession est en effet de s'engager sur des obligations de résultats (et non des obligations de moyens).
Or, cette phase de libre négociation favorise la conclusion d'un contrat équilibré pour les deux parties, collectivité et entreprise.

5. Estimez-vous que le cadre juridique communautaire actuel est suffisamment précis pour assurer la participation concrète et effective de sociétés ou groupements non-nationaux aux procédures de passation de concessions ? Une concurrence réelle est-elle, selon vous, habituellement assurée dans ce cadre ?

[2] Loi n°93-122 du 29 janvier 1993 relative à la prévention de la corruption et à la transparence de la vie économique et des procédures publiques, dite « Loi Sapin »

Le cadre communautaire actuel est constitué par les principes, issus du Traité, de transparence, d'égalité de traitement, et de libre prestation de services. Ces principes et l'application pratique qui doit en découler permettent d'assurer une concurrence réelle.

C'est notamment le cas en France dans le secteur gazier. L'application du Traité et sa mise en œuvre sur le plan des délégations de service public permettent d'organiser la mise en concurrence sur les communes qui ne sont pas encore desservies en gaz. C'est donc le mode d'attribution des concessions qui s'applique pour les 27 300 communes où le gaz n'est pas encore présent. Depuis 2003[3]*, plusieurs appels d'offres de distribution de gaz se sont ainsi déroulés et ont abouti, pour certains, à l'attribution de contrats de concessions à d'autres opérateurs que Gaz de France.*

Le cadre juridique communautaire actuel nous semble donc suffisamment précis pour assurer la participation concrète et effective de sociétés ou groupements non-nationaux aux procédures de passation des concessions.

A noter pour les communes déjà desservies par Gaz de France ou par des distributeurs communaux existants en 1946 : la procédure d'attribution du contrat de concession se fait conformément à la loi d'avril 1946 qui leur attribue le monopole de la distribution publique du gaz. Cette loi est conforme aux principes du Traité et à la législation sectorielle applicable au domaine gazier.

Un cadre législatif communautaire supplémentaire ne nous semble donc pas nécessaire.

6. Pensez-vous qu'une initiative législative communautaire, visant à encadrer la procédure de passation de concessions, est souhaitable ?

Gaz de France estime que la législation française applicable aux délégations de service public remplit les exigences communautaires, mises en lumière notamment par la Communication Interprétative du 29 avril 2000 sur les concessions. Une initiative législative communautaire supplémentaire n'est donc pas nécessaire.

Si la Commission européenne faisait toutefois le choix de fixer des grands principes relatifs aux procédures de passation des concessions, une telle initiative devrait en tout état de cause :

- *respecter le principe de subsidiarité et permettre la prise en compte des particularités nationales et sectorielles qui caractérisent certains montages,*
- *exclure certains domaines comme l'énergie qui dispose déjà d'une réglementation communautaire sectorielle qui contribue à améliorer la qualité des services et à renforcer la transparence et la concurrence loyale au bénéfice du contribuable européen.*

Ainsi, la directive gaz n°2003-55 fixe des règles particulières claires pour l'organisation générale du secteur gazier secteur où la gestion des réseaux et autres installations relève de partenariats public-privé :

[3] Loi n°2003-8 du 3 janvier 2003, reprenant et codifiant les principes énoncés par la loi n° 98-546 du 2 juillet 1998, article 50

- *obligations de service public et de protection des consommateurs,*
- *procédures d'autorisation pour la construction ou l'exploitation d'installations,*
- *règles de gestion des infrastructures et de relations entre tous les gestionnaires de réseaux et d'installations (séparation juridique, confidentialité des informations),*
- *transparence de la comptabilité,*
- *règles d'accès aux réseaux et autres installations.*

Dans le prolongement de la remarque contenue dans la réponse à la question 1, nous souhaitons souligner que les particularités du domaine de l'énergie énoncées ci-dessus illustrent que, selon nous, toute nouvelle initiative législative communautaire dans le domaine des concessions ne pourrait se faire sans réfléchir également aux éventuelles retombées sur les procédures d'autorisation.

7. De manière plus générale, si vous estimez qu'il est nécessaire que la Commission propose une nouvelle action législative, existerait-il à votre avis des raisons objectives de viser dans cet acte tous les PPP de type contractuel, qu'ils soient qualifiés de marchés publics ou de concessions, pour les soumettre à des régimes de passation identique ?

Pour les mêmes raisons que celles qui concernent une éventuelle directive concessions (voir réponse à la question 6) ***Gaz de France ne juge pas nécessaire une nouvelle action législative de la Commission dans le domaine des PPP.***

En tout état de cause, ***si la Commission proposait une telle action, il conviendrait d'appliquer aux procédures de passation des PPP contractuels institués par un acte attributif qualifié de concession un régime distinct de celui qui s'applique aux PPP contractuels institués par un acte attributif qualifié de marché public.***

La catégorie des concessions présente une homogénéité telle qu'il serait cohérent de lui appliquer un régime spécifique. *En effet, le mode de passation d'une procédure doit être directement induit par la nature du contrat et des relations contractuelles qu'elle engendre : le fait que le concessionnaire supporte notamment les aléas économiques, contrairement au titulaire d'un marché public, justifie que la procédure de choix dans le cadre d'un contrat de concession soit moins contraignante pour la personne publique, qui doit conserver sa liberté d'organisation du service public.*
Tous les PPP contractuels ne sauraient en aucun cas être soumis aux mêmes règles*.*

Questions spécifiques à la sélection d'un opérateur économique dans le cadre d'un PPP d'initiative privée

8. Selon votre expérience, l'accès des opérateurs non-nationaux aux formules de PPP d'initiative privé est-il assuré ? En particulier, lorsqu'il existe une invitation des pouvoirs adjudicateurs à présenter une initiative, cette invitation fait-elle généralement l'objet d'une publicité adéquate permettant l'information de tous les opérateurs intéressés ? Une procédure de sélection véritablement concurrentielle est-elle organisée pour assurer la mise en oeuvre du projet retenu ?

Gaz de France est peu concerné par les projets d'initiative privée.

9. Quelle serait selon vous la meilleure formule pour assurer le développement des PPP d'initiative privée dans l'Union européenne tout en assurant le respect des principes de transparence, de non discrimination et d'égalité de traitement ?

Gaz de France est peu concerné par les projets d'initiative privée.

La phase postérieure à la sélection du partenaire privé

L'encadrement contractuel du projet

10. Quelle expérience avez-vous de la phase postérieure à la sélection du partenaire privé dans les opérations de PPP contractuels ?

De manière générale, la phase postérieure à la sélection du partenaire se déroule dans de bonnes conditions, en particulier lorsque le cadre réglementaire présente une relative stabilité et une certaine prévisibilité, et que le contrat est suffisamment flexible pour s'adapter aux évolutions du partenariat.

11. Avez-vous connaissance de cas dans lesquels les conditions d'exécution – y compris les clauses d'adaptation dans le temps - ont pu avoir une incidence discriminatoire ou ont pu constituer une entrave injustifiée à la libre prestation de services ou à la liberté d'établissement ? Si oui, pouvez-vous décrire le type de problèmes rencontrés ?

Gaz de France n'a pas connaissance de telles incidences.

12. Avez-vous connaissance de pratiques ou de mécanismes d'évaluation d'offres ayant des incidences discriminatoires ?

Gaz de France n'a pas connaissance de telles pratiques.

13. Partagez-vous le constat de la Commission selon lequel certains montages du type "step-in" peuvent poser problème en termes de transparence et d'égalité de traitement ? Connaissez-vous d'autres "clauses types" dont la mise en oeuvre est susceptible de poser des problèmes similaires ?

Gaz de France n'a pas connaissance de tels problèmes.

> *Cependant, nous souhaitons souligner par réaction aux commentaires du paragraphe 48 et 49 du présent Livre Vert sur les PPP, que certains changements dans l'organisation de l'entreprise attributaire du contrat de partenariat n'impliquent pas qu'un nouveau contrat doive être signé. En effet, un changement de forme juridique et/ou de l'actionnariat de l'entreprise n'a pas pour objet de remettre en cause les conditions d'exécution du contrat (personnel et moyens matériels dédiés au contrat, etc.….).*

14. Estimez-vous qu'il est nécessaire de clarifier au niveau communautaire certains aspects relevant du cadre contractuel des PPP ? Si oui, sur quel(s) aspect(s) devrait porter cette clarification ?

Gaz de France ne juge pas une telle clarification nécessaire (voir éléments de justification à la Question 10)

La sous-traitance de certaines tâches

15. Dans le contexte des opérations de PPP, avez-vous connaissance de problèmes particuliers rencontrés en matière de sous-traitance ? Lesquels?

Gaz de France n'a pas connaissance de problèmes particuliers en matière de sous-traitance.

16. Le phénomène des PPP de type contractuel, impliquant le transfert d'un ensemble de tâches à un unique partenaire privé, justifie-t-il selon vous que des règles plus détaillées et/ou d'un champ d'application plus large soient mises en place en ce qui concerne le phénomène de sous-traitance?

Ne rencontrant aucune difficulté en la matière, Gaz de France considère que l'élaboration de nouvelles règles communautaires ne se justifie pas.

17. De manière plus générale, estimez-vous qu'une initiative complémentaire devrait être prise au niveau communautaire en vue de clarifier, ou d'aménager, les règles relatives à la sous-traitance?

Gaz de France ne juge donc pas nécessaire une initiative communautaire relative à la sous-traitance.

LE PPP PUREMENT INSTITUTIONNALISE

Si, la Commission jugeait souhaitable une nouvelle initiative dans le domaine des PPP, Gaz de France juge nécessaire de distinguer clairement les PPP contractuels et les PPP institutionnalisés, qui ne relèvent pas de la même logique. Ces deux formes distinctes de PPP ne doivent donc pas relever de la même réglementation.

18. Quelle expérience avez-vous de la mise en place d'opérations de PPP de type institutionnalisé ? En particulier, votre expérience vous conduit-elle à penser que le droit communautaire des marchés publics et des concessions est respecté dans le cas de montages de PPP institutionnalisé? Si non, pourquoi ?

L'expérience de Gaz de France dans le domaine des PPP de type institutionnalisé n'est ni suffisamment significative ni suffisamment homogène pour lui permettre de prendre position sur le respect du droit communautaire des marchés publics et des concessions. De l'expérience internationale de Gaz de France, il ressort en tout état de cause que ces PPP institutionnalisés font en général l'objet d'appels d'offres bénéficiant d'une large publicité.

19. Estimez-vous qu'une initiative doit être prise au niveau communautaire en vu de clarifier ou de préciser les obligations des organismes adjudicateurs quant aux conditions dans lesquelles doivent être mis en concurrence les opérateurs potentiellement intéressés par un projet de type institutionnalisé ? Si oui, sur quels points particuliers et sous quelle forme? Si non, pourquoi ?

Gaz de France ne juge pas nécessaire de clarifier ce point, mais tient, dans ce cadre, à souligner l'importance de la liberté des entreprises quant à la répartition de leur actionnariat.

De façon générale et indépendamment des questions soulevées dans ce document:

20. Quelles sont les mesures ou les pratiques que vous estimez constitutives d'entraves à la mise en place des PPP au sein de l'Union européenne ?

Gaz de France n'a pas connaissance de mesures ou pratiques qui pourraient être qualifiées d'entraves à la mise en place des PPP.

21. Connaissez-vous d'autres formes de PPP développées dans les pays en dehors de l'Union ? Connaissez-vous des exemples de 'bonnes pratiques' développées dans ce cadre, dont l'Union pourrait s'inspirer ? Si oui, lesquelles ?

Gaz de France n'a pas d'expérience suffisamment significative d'autres formes de PPP dans les pays en dehors de l'Union.

22. De façon plus générale, et compte tenu des besoins importants d'investissements nécessaires dans certains Etats membres, afin de poursuivre un développement économique social et durable, estimez-vous utile une réflexion collective sur ces questions qui se poursuivrait à des intervalles réguliers entre les acteurs concernés, et qui permettrait un échange des meilleures pratiques ? Est-ce que vous considérez que la Commission devrait animer un tel réseau ?

Gaz de France est prêt à répondre aux nouveaux besoins d'investissement de certains Etats membres pour les accompagner dans leur développement économique social et durable, et tout particulièrement dans le domaine énergétique.

Un échange des meilleures pratiques entre les Etats membres peut, à ce titre, être source de progrès. Si une telle réflexion collective était menée, elle devrait l'être dans le respect de la diversité et du principe de subsidiarité.

26 juillet 2004

Livre vert de la Commission européenne sur les partenariats public-privé et le droit communautaire des marchés publics et des concessions.

CONTRIBUTION DE SUEZ

Le Livre vert publié par la Commission européenne le 30 avril dernier consulte les opérateurs et toutes parties intéressées sur les partenariats public-privé et le droit communautaire des marchés publics et des concessions. Suez salue cette initiative de la Commission. Ainsi que le relève le Livre vert, le terme « partenariat public-privé » n'est en effet pas défini au niveau communautaire. Aussi, Suez appuie la Commission dans son souci d'analyser si le cadre communautaire existant est approprié aux enjeux et aux caractéristiques spécifiques des partenariats public-privé[1].

Suez, entreprise européenne, d'origine franco-belge, partenaire du développement durable, exerce ses activités dans l'énergie, dans les métiers du gaz et de l'électricité (avec notamment les sociétés Electrabel, Distrigaz, Fluxys, Elyo) ainsi que dans l'environnement, dans les métiers de l'eau, de l'assainissement et dans ceux du traitement, du recyclage, du tri et de la valorisation des déchets (avec les sociétés Suez Environnement, Degrémont et Sita). Forte de ses 172 000 collaborateurs, Suez travaille dans plus de 100 pays. Elle a réalisé un chiffre d'affaires de 39,6 milliards d'euros en 2003. 80% de ce chiffre d'affaires est réalisé dans l'Europe des 25, où Suez emploie plus de 130 000 personnes.

Suez dispose d'une forte légitimité à exprimer sa position sur le sujet posé par le Livre vert. Suez possède en effet une expérience séculaire des PPP dont elle pratique les différentes formes depuis 150 ans. Les entreprises du groupe sont, historiquement, nées du développement des PPP. Ces partenariats ont imprégné l'expérience, le savoir-faire et la culture de Suez :

- Suez a été créé pour réaliser le canal de Suez, projet d'aménagement à vocation universelle, dans une logique de PPP puisqu'il s'agissait d'une concession. La Compagnie universelle du Canal de Suez a géré ce canal pendant près d'un siècle,
- la Société Générale de Belgique a été créée en 1822 pour favoriser l'industrie nationale et développer des projets en France et en Chine,
- dans la seconde moitié du XIXème siècle, la société Lyonnaise des Eaux et de l'Eclairage a été créée pour répondre aux besoins de collectivités locales dans les grandes infrastructures de réseaux d'énergie et d'eau. Elle a géré des contrats de concessions de gaz et d'électricité en France jusqu'aux nationalisations de 1945 ; 80% de son chiffre d'affaires était ainsi réalisé dans les domaines de l'électricité et du gaz dans des projets de PPP,
- Sita a été créée en 1919 pour l'enlèvement des déchets à Paris à la demande de la Ville.

[1] cf. point 18 du Livre vert.

Suez soutient également la démarche de la Commission visant à amorcer un débat sur la meilleure façon d'assurer que les PPP « puissent se développer dans un contexte de concurrence efficace et de clarté juridique »[2]. Un tel contexte est nécessaire au développement et à la réalisation de PPP dans l'Union européenne. Les PPP constituent en effet des formules permettant d'engager les investissements d'infrastructures et de services qui sont jugés prioritaires par la puissance publique. Ils facilitent le développement rapide et de bonne qualité des infrastructures et des services d'intérêt général dans les Etats membres. En effet, les PPP conjuguent l'expertise opérationnelle (savoir-faire technique, expérience du terrain, capacité d'innovation, efficacité de gestion, réactivité, adaptabilité, souci du consommateur) et la capacité de financement des entreprises, avec les missions d'organisation, de conception, de régulation et de contrôle que peut assumer la puissance publique, grâce à une claire répartition des rôles.

Les différentes formules de PPP peuvent, en outre, apporter une contribution significative à l'attractivité ainsi qu'à la compétitivité de l'Union européenne. Les besoins en investissements sont considérables : ils concernent à la fois les infrastructures, dont les besoins en investissements de l'UE 15 ont été évalués à 600 milliards d'euros par la Commission[3] pour les grands réseaux de transport et les infrastructures nécessaires à la protection de l'environnement ; les besoins sont également substantiels dans le domaine des services et d'accès aux réseaux. Ceux-ci vont en outre être fortement accrus suite à l'élargissement.
Parallèlement, par sa stabilité politique et économique, et depuis la création de l'euro, l'Union européenne constitue un pôle fortement attractif pour l'épargne mondiale et, de ce fait, une zone d'investissements potentiels importante.

La Commission souligne, à juste titre, que la problématique des PPP se situe en aval du choix économique et organisationnel effectué par une autorité locale ou nationale. En effet, la mise en œuvre d'un PPP constitue une prérogative de l'autorité publique, seule à même de décider du mode d'organisation d'un service ou de gestion d'une infrastructure. Suez souligne qu'il est également essentiel de distinguer les PPP de la notion de privatisation. A la différence des PPP, la privatisation entraîne un transfert définitif de la propriété des actifs alors que les PPP permettent à l'autorité publique d'en demeurer propriétaire et d'assurer ainsi l'orientation stratégique, la régulation et le contrôle du service.

Avant de répondre aux questions posées dans le Livre vert, Suez souhaite appeler l'attention de la Commission sur les principaux éléments suivants.

Afin de garantir le développement des PPP dans un contexte de concurrence efficace et de clarté juridique, il serait souhaitable, dans le respect de la liberté de choix des autorités publiques quant au mode d'organisation des services et dans le respect des principes du traité, que la Commission précise dans une directive, qui serait commune à tous les PPP - contractuels et institutionnels - les principes et éléments suivants :

- la définition des PPP,
- le principe de publicité préalable et de mise en concurrence sur l'attribution du contrat,
- une définition du terme « tiers » qui limite les dérogations au principe de mise en concurrence,
- l'égalité d'accès aux subventions publiques.

[2] cf. point 16 du Livre vert.
[3] cf. Communication de la Commission européenne « une initiative européenne pour la croissance ». Novembre 2003.

1. La définition des PPP

La distinction faite par la Commission entre PPP contractuels et PPP institutionnels est justifiée.

A cet égard, il serait opportun de sécuriser la définition communautaire de la concession, afin d'éviter les problèmes d'interprétation soulevés par la Communication interprétative de la Commission sur les concessions en droit communautaire, qui sont source d'insécurité juridique et peuvent limiter l'attractivité[4] et le financement des projets. Au-delà du critère du mode de rémunération (paiement par le consommateur ou par l'autorité publique), il serait économiquement plus pertinent d'adopter une définition des concessions qui prenne en compte à la fois les critères du risque et de l'objet du PPP. Ainsi, par exemple, une concession pourrait être définie comme le contrat par lequel une collectivité locale confie à une entreprise la gestion d'un service d'intérêt général, et dont la rémunération comporte un risque significatif lié aux résultats de l'exploitation.

Aussi, un contrat de construction et d'exploitation (BOT[5]) d'une usine de traitement d'eau, où l'opérateur supporte un risque significatif lié aux évolutions du volume d'eau vendue, serait-il logiquement qualifié de concession au sens communautaire. Il en serait de même pour un contrat de construction et d'exploitation d'usine d'incinération, dans le cas où les recettes de l'opérateur dépendent de façon significative de ventes à un prix non garanti sur le marché de production d'électricité.

Ces cas sont en situation d'insécurité juridique, puisque, par exemple, ils relèvent en droit français de la procédure de délégation de service public (proche de la notion de « concession de services » européenne) alors qu'ils sont soumis aux directives marchés publics en droit communautaire.

2. Le principe de publicité préalable et de mise en concurrence sur l'attribution du contrat

Lorsqu'un organisme public décide de faire intervenir un tiers dans le cadre d'un PPP, que ce soit sous forme contractuelle ou institutionnelle, il est essentiel de respecter les principes de publicité préalable et de mise en concurrence sur le contrat.

La législation communautaire en vigueur concernant les obligations de publicité préalable n'est pas suffisante et est parfois source d'insécurité juridique : par exemple, dans le domaine des concessions, l'obligation explicite de publicité ne concerne que les concessions de travaux dans les secteurs dits classiques, et aucun modèle d'avis communautaire n'est adapté au cas de la concession de service. Les contrats de concessions de service et de travaux étant généralement mixtes, un principe d'obligation de publicité commun à tous les PPP, et notamment aux concessions, permettrait d'éviter toute incertitude d'application.

Le principe de mise en concurrence sur le service implique notamment, lors de la mise en place d'un PPP institutionnel (c'est à dire une société dans laquelle l'entreprise privée détient des parts du capital et participe à la gestion du service en tant qu'opérateur) que la mise en concurrence porte sur l'attribution du contrat. Au moyen d'objectifs de performance, elle permet en effet d'améliorer le service aux consommateurs.

3. La définition du terme « tiers »

Lorsqu'un organisme public confie une mission de service public à un tiers, le principe de mise en concurrence s'applique. La définition juridique du terme « tiers » est donc essentielle car elle délimite les cas d'exonération aux règles de mise en concurrence. La dérogation au principe de concurrence doit être strictement limitée aux deux conditions cumulatives suivantes :

- l'entité qui se voit octroyer le contrat réalise l'intégralité de son chiffre d'affaires avec l'organisme adjudicateur,
- l'entité qui se voit octroyer le contrat ne dispose pas d'autonomie décisionnelle et est soumise aux mêmes procédures de contrôle que celles qui s'appliquent aux propres services de l'organisme adjudicateur.

[4] C'est notamment le cas dans les nouveaux Etats membres, dont l'expérience en matière de concession est parfois assez récente et nécessite un encadrement juridique.

[5] Voir infra. les définitions fournies en réponse à la question1.

4. L'égalité d'accès aux subventions publiques

Les actuelles inégalités d'accès aux subventions publiques constatées constituent une des principales discriminations dont souffrent les opérateurs privés (cf. exemples dans la réponse à la question 12).

REPONSES AUX QUESTIONS POSEES PAR LA COMMISSION DANS LE LIVRE VERT.

1) Quels types de montages de PPP purement contractuels connaissez-vous ? Ces montages font-ils l'objet d'un encadrement spécifique (législatif ou autre) dans votre pays ?

La terminologie liée aux PPP est confuse. Le terme « PPP » lui-même, recouvre différentes réalités selon le pays ou le contexte dans lequel il est employé.

Les métiers de Suez consistent principalement à gérer des services publics sous une forme contractuelle ou institutionnelle avec des autorités publiques. Au sein de l'Union européenne, dans le secteur de l'eau et de l'assainissement, environ un tiers des habitants sont desservis par un opérateur privé via une forme de PPP et, pour ces mêmes métiers, environ 6% des européens sont desservis par une société du groupe Suez.

En fonction de la volonté de l'organisme adjudicateur, Suez intervient sous différentes formes de PPP comme les marchés de gérance ou O&M[6], les régies intéressées, les contrats de délégation de service public (affermages, concessions), les BOT ou bien encore les PFI britanniques, qui regroupent des contrats très variés. Selon le type de PPP choisi, le degré de participation de l'opérateur dans le financement des investissements ainsi que la nature de la relation entre l'opérateur et le consommateur final varient.
Il est fréquent que pour mieux s'adapter aux besoins de l'organisme adjudicateur, le PPP choisi soit hybride entre deux des modèles cités ci-dessus.

Les définitions précises d'un O&M, d'un contrat de délégation de service public, et d'un contrat « d'infrastructures », principales formes contractuelles mises en œuvre par les sociétés de Suez sont les suivantes :

- **Opération et Maintenance (O&M)**

- L'opérateur privé prend en charge le fonctionnement opérationnel du service, sur un secteur géographique précis, et avec un niveau de responsabilité déterminé. A ce titre, l'opérateur privé peut se voir conférer une autorité sur le personnel sous statut public, en charge du service et assure la gestion quotidienne et la maintenance des installations.
- L'autorité publique rétribue l'opérateur privé pour les prestations effectuées. Cette rétribution peut être modulée en fonction de critères de performance identifiés et mesurés.

- **Construction et gestion d'infrastructures, type Build Operate and Transfer (BOT)**

- L'opérateur privé se voit confier la responsabilité de la conception, du financement, de la construction (ou de la réhabilitation) et de la gestion, sur une durée déterminée, d'un équipement majeur. En contrepartie, il est rémunéré par l'autorité publique, en lui facturant le service rendu pour ce nouvel équipement.
- Ce type de contrat est particulièrement bien adapté[7] lorsque les projets de développement de la collectivité portent seulement sur la réalisation d'une infrastructure bien déterminée, par exemple : usine de traitement d'eau, usine d'incinération.

[6] O&M = Operation and Maintenance

[7] Comme rappelé dans l'introduction, il arrive que les catégories de PPP ne soient pas semblables dans les droits nationaux et le droit communautaire. Par exemple, certains schémas de BOT sont classés dans les délégations des service public dans le droit français.

- **Délégation de Service Public (DSP)**

- L'opérateur privé se voit confier par l'autorité publique la responsabilité opérationnelle de la gestion du service pendant une durée déterminée. L'opérateur, qui se rémunère en principe directement auprès des consommateurs, finance tout ou une partie du renouvellement (affermage) et des infrastructures nouvelles (concession). Dans la pratique peu de contrats répondent à une stricte distinction entre affermage et concession[8].
- Dans tous les cas la collectivité publique prend les décisions essentielles, notamment en ce qui concerne les tarifs et les objectifs à atteindre, et conserve un contrôle étroit sur les conditions d'exécution du service public.

Lorsque le PPP contractuel est qualifié de marché public, les règles nationales, qui comprennent au moins la transposition des directives marchés publics, s'appliquent. C'est le cas par exemple pour les contrats d'O&M.

Dans le cas de montages PPP qui ne relèvent pas des directives marchés publics (par exemple les concessions ou les affermages), trois pays de l'Union européenne ont, à notre connaissance, mis en place un encadrement législatif :

- la loi Sapin en France (1993) : cette loi, avec ses décrets d'application, impose la procédure de mise en concurrence des contrats de délégation d'un service public après publicité. Cette procédure n'est pas différenciée entre les contrats d'affermage, de concessions et autres montages complexes.
- la législation espagnole : le décret royal 2/2000 qui encadre les contrats administratifs, complété par la loi 13/2003 qui s'applique aux concessions de travaux publics, donnent les principes relatifs à la passation des contrats, et garantissent la concurrence. De plus, les services locaux comme l'eau et l'assainissement, font l'objet d'une réglementation locale spécifique, qui détaille les procédures applicables pour l'attribution de contrats.
- la législation italienne (loi Merloni de 1994, loi des finances de 2002 et paquet législatif sur les services publics locaux de 2003) : suite à la modernisation du secteur de l'eau initiée par la loi Galli de 1994, sur chacun des 91 territoires recouvrant le pays, un opérateur doit[9] être sélectionné : soit l'appel d'offres porte sur le contrat, soit il porte sur le choix du partenaire privé qui rentre dans le capital de la société exploitante. Des cas d'exonérations sont prévus, notamment pour les cas dits de « in-house » ainsi que pour les sociétés cotées avant le 10 octobre.2003.

Comme il est souligné en introduction du présent document, il serait souhaitable de préciser et d'améliorer la définition communautaire de la concession en retenant (au-delà du critère du mode de rémunération) à la fois les critères du risque et de l'objet du PPP. Ainsi, une concession pourrait être définie comme le contrat par lequel une collectivité locale confie à une entreprise la gestion d'un service d'intérêt général, et dont la rémunération comporte un risque significatif lié aux résultats de l'exploitation.

[8] En effet, il est fréquent qu'un contrat d'affermage prévoit des travaux à la charge du délégataire et réciproquement, il est exceptionnel qu'une concession mette tous les travaux à la charge du concessionnaire.

[9] Quelques cas d'exonération sont prévus, où plusieurs opérateurs pourront co-exister sur le même territoire.

2) De l'avis de la Commission, la transposition en droit national de la procédure de dialogue compétitif permettra aux parties concernées de disposer d'une procédure particulièrement adaptée à la passation des contrats qualifiés de marchés publics lors de la mise en place d'un PPP de type purement contractuel, tout en préservant les droits fondamentaux des opérateurs économiques. Partagez-vous ce point de vue ? Si non, pourquoi ?

Suez accueille favorablement la mise en place de la procédure de dialogue compétitif dans le cadre des marchés publics. En effet, même si sa mise en œuvre peut s'avérer complexe, cette procédure devrait permettre de promouvoir l'innovation technologique au sein de l'Union.
Il conviendra cependant de veiller à ce que la mise en œuvre de cette procédure respecte la propriété intellectuelle des concurrents. En effet, celle ci est menacée si l'organisme adjudicateur remet en concurrence l'ensemble des candidats sur la solution qu'il aura jugée bonne suite à la mise en commun des idées des différents soumissionnaires. Aussi, devrait-il être envisagé qu'à la suite de la première étape - qui consiste à la sélection par l'organisme adjudicataire d'un nombre restreint de concurrents sur la base de pré-projets – l'organisme adjudicateur poursuive avec les concurrents un dialogue parallèle, sur la base des solutions de chacun des candidats retenus, sans faire pression sur un candidat pour qu'il accepte que sa solution soit divulguée aux autres candidats.

En tout état de cause, la procédure de dialogue compétitif n'a de sens que dans les cas pour lesquels l'organisme adjudicateur n'est pas en mesure de définir a priori les choix technologiques liés à la prestation à réaliser.
Cette procédure, limitée à juste titre à certains marchés publics, présente une certaine flexibilité adaptée à des marchés complexes et au degré d'indétermination technique forte, mais elle ne propose pas la souplesse nécessaire aux négociations des contrats de concessions de services (cf. réponse à la question 7). En d'autres termes, la procédure de dialogue compétitif a pour but de définir le projet technique avant appel d'offres, alors que la phase de négociation dans le cadre de l'attribution d'un contrat de concession a pour but de définir le contrat qui liera les parties pendant une durée longue. En effet, la procédure de dialogue compétitif est inopérante pour définir avec précision la répartition des risques et des responsabilités entre les parties. Pas plus ne l'est-elle pour arrêter la répartition des responsabilités financières des parties. Aussi, cette procédure ne peut-elle remplacer la nécessaire phase de négociation entre les parties à un PPP.
Pour prendre un exemple concret, la procédure de dialogue compétitif pourrait être utilisée pour la réalisation d'une unité de traitement des boues de station d'épuration par exemple, car l'essentiel du projet dépend d'un choix technologique. Elle n'est en revanche pas pertinente le cas d'une délégation globale de la gestion du service d'assainissement.

3) En ce qui concerne ces contrats, existe-t-il selon vous des points autres que ceux relatifs au choix de la procédure d'adjudication, susceptibles de poser problème au regard du droit communautaire des marchés publics ? Si oui, lesquels et pour quelles raisons ?

Bien qu'elle ne relève pas directement du droit communautaire, une certaine dérive liée aux marchés dits « à reconduction », utilisés en France, notamment dans le domaine de la collecte des déchets est constatée.
Dans ces contrats, lorsque la collectivité locale décide de ne pas actionner la reconduction, le prestataire doit arrêter les prestations. En revanche, si au contraire, la collectivité locale décide de reconduire le contrat, le prestataire qui ne le souhaiterait plus n'a aucun droit de refus. Une telle situation n'est pas satisfaisante dans la mesure où elle a pour effet de rendre très malaisée la cotation des marchés par les candidats lors de la remise initiale des offres, tout en les forçant à intégrer ce risque dans leur prix. Une telle dérive ne répond pas à l'objectif de rationalisation des deniers publics.
Il serait donc tout à fait souhaitable de pallier les dérives de ce type de marchés, notamment en permettant au prestataire de refuser leur reconduction.

4) Avez-vous déjà organisé, participé, ou souhaité participer, à une procédure d'attribution d'une concession au sein de l'Union? Quelle expérience en avez-vous ?

Suez, avec ses différentes filiales, répond en moyenne à plus de 500 appels d'offres par an dans l'UE, essentiellement en France et en Espagne, pour des concessions de service (au sens communautaire).

Cette expérience a permis de constater que :

- les règles et pratiques des différents Etats Membres sont très hétérogènes ;
- il arrive que l'attention des collectivités locales soit parfois focalisée sur les aspects financiers ou tarifaires au détriment du niveau de qualité de service proposé. Ce fut par exemple le cas lors de l'appel d'offres pour le choix du gestionnaire des services d'eau et d'assainissement de Prague en 2001, où le choix de l'adjudicataire fut effectué sur le seul critère financier (prix d'achat des actions de la société titulaire du contrat) ;
- pour qu'une procédure d'attribution de concession soit réussie et qu'elle conduise à un PPP adapté, jouissant d'une sécurité juridique et d'une solidité économique suffisantes, il est nécessaire de passer par une étape de négociation significative entre l'autorité publique et l'opérateur (cf. réponse question 7) ;
- les règles de passation de contrats de concession, comme la loi Sapin[10] en France, donnent parfois lieu à des excès au contentieux. En effet, la complexité des procédures permet un grand nombre de recours purement formels, sans que l'infraction invoquée porte grief à celui qui la met en avant. Pour assurer une plus grande sécurité juridique, les directives recours devraient limiter la recevabilité des recours aux seuls moyens faisant grief au requérant.

5) Estimez vous que le cadre juridique communautaire actuel est suffisamment précis pour assurer la participation concrète et effective de sociétés ou groupements non-nationaux aux procédures de passation de concessions? Une concurrence réelle est-elle, selon vous, habituellement assurée dans ce cadre ?

En pratique et malgré le manque d'homogénéité des règles nationales quand elles existent, la publicité réalisée dans le cadre de passation de concessions suffit à signaler le lancement de la procédure aux opérateurs potentiellement intéressés. Dans certains pays, comme la France, la législation nationale en vigueur impose des règles de publicité précises.

En France, Lyonnaise des Eaux, filiale de Suez Environnement, est à l'origine de l'arrêt du Conseil d'Etat « Communauté de communes du Piémont de Barr ». Comme demandé, le Conseil d'Etat a considéré qu'une collectivité ne pouvait pas confier à un syndicat départemental la gestion d'une station d'épuration sans procéder à une publicité préalable. Malgré cette jurisprudence, il existe encore des cas en France où une collectivité locale attribue un contrat de concession de services d'eau à une régie voisine sans mise en concurrence.
D'une façon générale, afin d'échapper à la jurisprudence « Piémont de Barr », il arrive que les syndicats départementaux dans le domaine de l'eau et de l'assainissement incitent les communes à transférer leurs compétences afin de ne pas avoir à se soumettre à une procédure de mise en concurrence.

Ainsi, l'adoption d'une directive sur les PPP, qui préciserait les quatre points détaillés dans la première partie de ce document (cf. p. 3 et 4) et rappelés à la question suivante, permettrait de sécuriser la législation communautaire grâce à une clarification dans le droit positif de l'obligation de publicité préalable pour tous les PPP et de la définition de la notion de « tiers ».

[10] La loi Sapin comporte 8 étapes principales, qui peuvent chacune donner lieu à de nombreux recours.

6) Pensez-vous qu'une initiative législative communautaire, visant à encadrer la procédure de passation de concessions, est souhaitable ?

La question d'une éventuelle initiative législative communautaire dans le domaine des PPP se décline en trois points :

- quels PPP seraient concernés ?
- quel serait le contenu de l'outil législatif ?
- quel outil législatif serait utilisé ?

Suez estime qu'une initiative législative commune à tous les PPP, et non pas limitée aux seuls contrats de concessions, est souhaitable. Cet outil législatif, qui serait vraisemblablement une directive, devrait comporter les principes et éléments suivants :

1. la définition des PPP,
2. le principe de publicité préalable et de mise en concurrence sur l'attribution du contrat,
3. la définition du terme « tiers », qui limite les cas dérogatoires au principe de mise en concurrence,
4. l'égalité d'accès aux subventions publiques.

Chacun des ces points est développé dans la première partie du présent document (cf. p. 3 et 4).

Si un tel outil juridique devait être adopté, il devrait :

- respecter les caractéristiques des contrats de concession et ne pas condamner leur viabilité économique. Par exemple (cf. réponse à la question 7), les contrats de concession ne devraient pas être soumis aux règles d'attribution des marchés publics ;
- préserver l'équilibre économique des contrats en cours, sans les remettre en cause avant leur terme, afin de respecter les engagements pris par les parties ainsi que l'intérêt des usagers.

7) De manière plus générale, si vous estimez qu'il est nécessaire que la Commission propose une nouvelle action législative, existerait-il à votre avis des raisons objectives de viser dans cet acte tous les PPP de type contractuel, qu'ils soient qualifiés de marchés publics ou de concessions, pour les soumettre à des régimes de passation identiques ?

Si un outil législatif visant à encadrer les procédures de passation de concessions devait être adopté, il ne devrait en aucun cas être semblable à la réglementation européenne en vigueur pour les marchés publics.

Les concessions se caractérisent notamment par une prise de risques par le concessionnaire en matière d'investissements et de risques commerciaux sur une durée longue. De plus, le concessionnaire, en contact direct avec les consommateurs, assume une mission d'intérêt général, qu'il doit réaliser en respectant les règles et les objectifs fixés par la collectivité tout en bénéficiant d'une certaine autonomie.

Ainsi, la mise au point d'un contrat de concession nécessite une phase de négociation plus longue et plus complexe que dans le cas d'un marché public afin d'ajuster la répartition des risques, le contenu des missions et le financement de l'opération. L'appréciation par la collectivité publique de la relation de confiance qui peut s'instaurer avec l'opérateur est encore plus essentielle qu'en matière de marchés publics.

De plus, et contrairement aux marchés publics, il doit être possible de réviser périodiquement les contrats de concession, qui sont à juste titre d'une durée relativement longue, en fonction d'événements extérieurs ou d'ajustement des besoins de l'organisme adjudicateur (cf. question 14).

8) Selon votre expérience, l'accès des opérateurs non-nationaux aux formules de PPP d'initiative privé est-il assuré? En particulier, lorsqu'il existe une invitation des pouvoirs adjudicateurs à présenter une initiative, cette invitation fait-elle généralement l'objet d'une publicité adéquate permettant l'information de tous les opérateurs intéressés ? Une procédure de sélection véritablement concurrentielle est-elle organisée pour assurer la mise en œuvre du projet retenu ?

9) Quelle serait selon vous la meilleure formule pour assurer le développement des PPP d'initiative privée dans l'Union européenne tout en assurant le respect des principes de transparence, de non discrimination et d'égalité de traitement ?

Suez ne dispose pas de la pratique de projets d'initiative privée.

10) Quelle expérience avez-vous de la phase postérieure à la sélection du partenaire privé dans les opérations de PPP contractuels ?

L'expérience montre que la vie d'un contrat est toujours affectée par un certain nombre de changements ou bouleversements exogènes. Il est alors nécessaire pour les deux parties de convenir des modifications à apporter au contrat d'origine, dans le respect de certains principes (par exemple de l'équilibre économique initialement défini). Dans le cas de concessions, la durée du contrat (cf. question 14) implique des clauses de rendez-vous réguliers (par exemple quinquennaux) entre l'organisme adjudicataire et le titulaire du contrat.

11) Avez-vous connaissance de cas dans lesquels les conditions d'exécution – y compris les clauses d'adaptation dans le temps - ont pu avoir une incidence discriminatoire ou ont pu constituer une entrave injustifiée à la libre prestation de services ou à la liberté d'établissement ? Si oui, pouvez-vous décrire le type de problèmes rencontrés ?

Suez n'a pas connaissance de telles discriminations ou entraves.

12) Avez-vous connaissance de pratiques ou de mécanismes d'évaluation d'offres ayant des incidences discriminatoires ?

La plupart des discriminations dont souffrent les opérateurs privés sont moins liées aux mécanismes d'évaluation des offres qu'aux désavantages structurels qui pénalisent les offres du secteur privé.

Dans le domaine fiscal par exemple, les régies d'assainissement allemandes sont exemptées de TVA alors que les opérateurs privés se voient imposer une facturation avec une TVA de 16%. En France, la plupart des régies d'eau, d'assainissement et de gestion des déchets ne sont pas assujetties à l'impôt sur les sociétés ou à la taxe professionnelle ni à certaines redevances d'occupation du domaine public et ont des charges moindres pour les cotisations des retraites de leurs employés que les opérateurs privés. De plus, les régies de gestion des déchets sont exemptées de TVA.

Il est par ailleurs essentiel de veiller, au moyen du contrôle communautaire des aides d'Etat, à ce que l'octroi de subventions soit non discriminatoire entre les opérateurs, quel que soit leur statut.
En France, par exemple, il est pratiquement impossible de bénéficier d'aides des départements et des régions pour des travaux financés par les délégataires et non par des régies[11].
De plus, même lorsque le financement des infrastructures est à la charge de la collectivité publique, des discriminations sont parfois constatées en fonction du mode de gestion du service : le Conseil d'Etat français a

[11] En effet, la loi réserve le bénéfice de certaines subventions aux régies et les concessionnaires ne peuvent pas y prétendre.

validé en décembre 2003 la décision du Conseil Général des Landes d'accorder aux communes en régie un taux de subvention supérieur à celui accordé aux communes ayant délégué leurs services d'eau potable et d'assainissement.
Ces mesures discriminatoires sont un frein évident au développement des PPP. Aussi Suez promeut un outil législatif reposant sur quatre principes dont celui de l'égalité d'accès aux subventions publiques (cf. introduction p.4).

13) Partagez-vous le constat de la Commission selon lequel certains montages financiers, en particulier les montages de type "step-in" peuvent poser problème en termes de transparence et d'égalité de traitement ? Connaissez vous d'autres "clauses types" dont la mise en œuvre est susceptible de poser des problèmes similaires ?

Du fait même qu'un candidat est évalué sur ses compétences et sa capacité financière à assumer une opération, une substitution, après attribution du projet à un candidat, pourrait à priori être considérée comme contraire aux règles de concurrence.

Toutefois, la réalité est autre. Tant la personne publique que les opérateurs souhaitent, dans la mesure du possible, procéder à des opérations déconsolidantes. Or, dans une telle situation, seul un établissement financier peut admettre dans ses comptes une opération à caractère consolidant, ce qui paraît devoir, dans ces conditions, justifier la présence d'établissements financiers « aux côtés » du gestionnaire du service d'intérêt général.
Les clauses de step-in sont ainsi devenues nécessaires à la mise en œuvre de beaucoup de PPP et permettent d'obtenir des financements à meilleur coût.

Il est par ailleurs important de rappeler que les clauses de step-in ont un caractère essentiellement dissuasif : à notre connaissance aucune clause de ce type n'a été activée dans le domaine de l'eau et des déchets à ce jour.

Pour répondre aux inquiétudes légitimes de la Commission, Suez considère souhaitable qu'un changement significatif au niveau de l'opérateur (comme l'activation d'une clause de step-in) dans le cadre d'un contrat soit soumis à l'autorisation de la collectivité locale, laquelle ne peut faire valoir, pour s'y opposer, que des motifs mettant en cause la gestion du service ou les garanties présentées par l'opérateur.
Ce raisonnement doit également s'appliquer en cas de changement majeur dans l'actionnariat de l'opérateur. En effet, s'il est souhaitable qu'une autorité publique puisse s'opposer à une modification du capital de l'opérateur, les motifs du refus, comme l'a souligné le Conseil d'Etat en France, ne doivent pas être discrétionnaires.

14) Estimez-vous qu'il serait nécessaire de clarifier au niveau communautaire certains aspects relevant du cadre contractuel des PPP ? Si oui, sur quel(s) aspect(s) devrait porter cette clarification ?

Forte de son expérience séculaire des PPP, Suez tient à souligner les deux points suivants, relatifs à la durée des contrats et à leurs éventuels avenants.

La durée des contrats.

La mesure qui consisterait à limiter la durée des concessions de services ou de ne prendre comme seul critère la durée d'amortissement des investissements, est souvent considérée comme une mesure simple et efficace visant à dynamiser la concurrence. Cette question mérite un examen plus approfondi.

En effet, la détermination de la durée des contrats ne saurait s'appuyer uniquement sur des conditions d'amortissement et de rentabilité raisonnable. Par exemple, des contrats trop courts dans le secteur de l'eau ou de l'assainissement menaceraient l'optimisation du couple entretien/renouvellement des infrastructures. Une conséquence serait l'augmentation des coûts d'exploitation et un probable sous-investissement[12].

De plus, et indépendamment des investissements effectués, l'achèvement des objectifs de performance sur lesquels l'opérateur s'est engagé dans le contrat suppose une durée suffisamment longue. C'est par exemple le cas lorsqu'un contrat de concession prévoit des objectifs de réduction des pertes en eau. Dans certains nouveaux Etats membres, la seule réalisation d'un diagnostic précis de la situation des réseaux (dans le secteur de l'eau et de l'assainissement les réseaux sont en effet enterrés) nécessite une analyse de plusieurs années. De plus, la réalisation des objectifs de performance nécessite la formation du personnel, laquelle n'est efficace que dans la durée.

En outre, une courte durée des contrats nécessiterait de fréquentes mises en concurrence sur le service (dont l'objet réduit limiterait les possibilités d'innovation) dont le coût élevé pénaliserait les consommateurs. La concurrence ne serait ainsi pas stimulée. Au contraire, l'opérateur sortant disposerait dans ce cas d'un avantage significatif. En France, le Conseil de la Concurrence a confirmé ce raisonnement, en considérant, dans un avis rendu en 2001, que pour créer les conditions d'une saine concurrence, les contrats devaient avoir une durée suffisamment longue pour être attractifs.

Pour finir, l'expérience montre que la vie d'un contrat est souvent affectée par un certain nombre de changements ou de bouleversements exogènes. La durée est nécessaire pour que l'opérateur puisse anticiper et s'adapter à ces situations puis introduire, pour y faire face, les innovations techniques et de gestion pertinentes pour continuer à assurer la bonne qualité du service.

Les avenants éventuels aux contrats.
Comme souligné en réponse à la question 7, l'une des caractéristiques des contrats de concession est de pouvoir être adaptés dans le temps, sans toutefois remettre en cause l'égalité des candidats lors de l'appel d'offres. Une limitation excessive des possibilités d'avenants conduirait à limiter l'intérêt, pour une collectivité, de conclure un contrat de gestion de service si celui-ci devait être remis en cause ou résilié suite à chaque changement dans l'environnement du contrat. En obligeant à la résiliation des contrats avant terme, l'absence de possibilités d'avenants entraînerait également le risque de coûts supplémentaires pour les collectivités ainsi que pour les consommateurs.

15) Dans le contexte des opérations de PPP, avez-vous connaissance de problèmes particuliers rencontrés en matière de sous-traitance ? Lesquels ?
16) Le phénomène des PPP de type contractuel, impliquant le transfert d'un ensemble de tâches à un unique partenaire privé, justifie-t-il selon vous que des règles plus détaillées et/ou d'un champ d'application plus large soient mise en place en ce qui concerne le phénomène de sous-traitance ?
17) De manière plus générale, estimez-vous qu'une initiative complémentaire devrait être prise au niveau communautaire en vue de clarifier, ou d'aménager, les règles relatives à la sous-traitance ?

En application des directives marchés publics, les règles applicables en matière de sous-traitance sont différentes pour un concessionnaire selon que les dispositions de la directive « secteurs spéciaux » lui sont ou non applicables. Or de grandes incertitudes subsistent sur la notion de droits exclusifs et spéciaux que ne lève pas la nouvelle directive 2004-17. En effet, l'interprétation à donner à la nouvelle définition de ces droits par cette directive est délicate s'agissant d'entreprises dont tous les contrats n'ont pas été attribués selon une même procédure (cas des activités eau et assainissement en France). Par ailleurs, les règles applicables au secteur de l'assainissement sont confuses : la notion d'activité liée à l'eau potable est imprécise. Il ne peut être satisfaisant de prétendre assujettir ou non à une procédure formalisée les achats d'un concessionnaire dans le domaine de l'assainissement selon l'étendue des compétences de la collectivité publique, organisatrice du service[13].
En conséquence, une clarification des textes sur ces différents points serait bienvenue afin de lever ces incertitudes, sources d'insécurité juridique et donc frein au développement des partenariats concernés.

[12] Cas rencontrés par exemple dans des contrats de traitement des eaux usées en Espagne

[13] Critère défini par la Communication interprétative sur les concessions pour déterminer si un contrat de concession de travaux est soumis à publicité communautaire.

18) Quelle expérience avez-vous de la mise en place d'opérations de PPP de type institutionnalisé ? En particulier, votre expérience vous conduit-elle à penser que le droit communautaire des marchés publics et des concessions est respecté dans le cas de montages de PPP institutionnalisé? Si non, pourquoi ?

Pour une plus grande exhaustivité, et compte tenu des régimes législatifs différents dans les métiers de l'énergie et de l'environnement, Suez a jugé pertinent d'apporter une réponse d'une part en ce qui concerne les métiers de l'énergie et, d'autre part, en ce qui concerne l'environnement.

Dans le domaine de l'énergie

En Belgique, depuis la fin des années 1950, environ 80 % de la distribution publique d'électricité et 90 % de la distribution publique de gaz sont assurées par des PPP de type institutionnalisé. Ces montages font l'objet d'un encadrement législatif spécifique dans les trois régions du pays, en dehors du droit des marchés publics.

Cet encadrement législatif soumet les contrats de PPP de type institutionnalisé à une tutelle administrative :

- les décisions des communes, préalables à la constitution d'un PPP et, ultérieurement , celles relatives à son fonctionnement ou à sa liquidation, sont soit susceptibles de suspension et d'annulation, soit soumises à l'approbation de l'autorité de tutelle ;
- les actes des organes de gestion et de contrôle des PPP sont également soumis à une tutelle administrative générale (suspension ou annulation) ou spéciale (approbation) ainsi qu'à des règles de publicité ;
- les communes disposent toujours de la majorité des voix et des mandats, de façon à assurer la maîtrise des pouvoirs publics. L'associé privé se voit reconnaître un droit de veto limité à la protection de ses intérêts financiers d'actionnaire ;
- les travaux qui ne sont pas exécutés par du personnel de la structure, de même que les fournitures et les services donnent lieu à l'application de la législation des marchés publics.

L'ouverture du marché de l'énergie va de pair avec la création d'autorités de régulation auxquelles les PPP sont soumis :

- une autorité fédérale de régulation (la CREG) est chargée essentiellement d'approuver les tarifs d'accès aux réseaux d'électricité et de gaz ;
- trois autorités régionales de régulation sont chargées d'approuver les plans de développement, de vérifier l'exécution des obligations de service public applicables aux gestionnaires de réseau de distribution.

Les éléments qui précèdent, la durée des PPP institutionnels (de 18 à 30 ans maximum, selon les régions) ainsi que leurs spécificités, expliquent qu'ait été créée une législation spécifique aux PPP.

Dans le domaine de l'environnement

Un certain nombre de contrats ou de marchés sont attribués sans mise en concurrence à des établissements publics ou à des sociétés d'économie mixte, ce qui parait contraire aux principes dégagés par la jurisprudence en matière de phénomènes dits de « in-house ». Par exemple, l'attribution de marchés à la société Aquafin (société en charge de l'assainissement dans la région des Flandres en Belgique, dont l'actionnariat est composé à 80% par une holding détenue par la région des Flandres et à 20% par une société privée) s'est faite sans mise en concurrence.

Il paraît ainsi nécessaire de créer un droit positif clair sur ce thème. Ainsi qu'il est souligné en introduction de ce document, lorsqu'un organisme public confie une mission de service public à un tiers, le principe de mise en concurrence s'applique. La définition du terme « tiers » est donc essentielle car elle délimite les cas d'exonération aux règles de mise en concurrence. La dérogation au principe de concurrence doit être *strictement* limitée aux deux conditions cumulatives suivantes :

- l'entité qui se voit octroyer le contrat réalise l'intégralité de son chiffre d'affaires avec l'organisme adjudicateur,
- l'entité qui se voit octroyer le contrat ne dispose pas d'autonomie décisionnelle et est soumise aux mêmes procédures de contrôle que celles qui s'appliquent aux propres services de l'organisme adjudicateur.

Par ailleurs, la mise en place de PPP institutionnalisés présente dans certains pays une insécurité juridique qui nuit à l'attractivité des projets et à leur financement. C'est le cas par exemple dans le secteur de l'eau en Italie.
En effet, la modernisation de ce secteur s'appuie sur la mise en place de PPP institutionnels, dont la compatibilité avec les principes du traité est incertaine : souvent, une société à capitaux publics se voit attribuer un contrat de concession sans mise en concurrence et ensuite la vente d'une partie du capital de cette société fait l'objet d'un appel d'offres.
De plus, la multiplication des textes réglementaires sur la procédure de passation et l'absence d'une véritable coordination entre eux, crée une incertitude chez les opérateurs notamment quant à la durée des concessions. Cette imprécision du cadre juridique peut être démontrée d'une part, par l'insertion, dans les contrats signés entre opérateurs et organismes adjudicateurs, de clauses spécifiques relatives à la résiliation anticipée due à une éventuelle réduction de la durée de la concession (méthode de valorisation des actions et modalités de participation de l'actionnaire privé dans un nouvel appel d'offres) et, d'autre part, par la déclaration récente d'une autorité publique locale (l'AATO de Torinese) sur l'inexistence de règles juridiques claires sur le sujet.

19) Estimez-vous qu'une initiative devrait être prise au niveau communautaire en vue de clarifier ou de préciser les obligations des organismes adjudicateurs quant aux conditions dans lesquelles doivent être mis en concurrence les opérateurs potentiellement intéressés par un projet de type institutionnalisé? Si oui, sur quels points particuliers et sous quelle forme? Si non, pourquoi ?

Les PPP institutionnels ne sont pas directement visés par la Communication interprétative de la Commission sur les concessions en droit communautaire publiée en 2000. Or la mise en place de PPP institutionnels, dont le développement s'accélère en Europe, est parfois fragilisée par un manque de sécurité juridique.

Plutôt qu'une initiative en vue de clarifier les modalités de mise en concurrence dans le cadre de PPP institutionnels, il semble souhaitable en revanche que la Commission réaffirme et précise, dans une directive sur l'ensemble des PPP, un certain nombre de principes communs à tous les PPP, contractuels ou institutionnels.

L'affirmation du principe de publicité préalable et de mise en concurrence sur le contrat permettrait notamment de renforcer la sécurité juridique des montages de PPP institutionnels. En effet, si le principe de mise en concurrence dans le cadre de la mise en place d'un PPP contractuel semble généralement acquis et appliqué, il est essentiel qu'il soit également respecté dans le cadre de la mise en place d'un PPP institutionnel.
De façon concrète, lorsque l'achat de parts de la société exploitante, à capitaux jusqu'alors publics, accorde un pouvoir de gestion à l'investisseur privé, alors la mise en concurrence sur l'ouverture du capital d'une société titulaire d'un contrat, ne peut valablement se substituer à la mise en concurrence sur l'attribution du contrat. Dans ce cas, c'est donc l'attribution du contrat, qui peut être assorti de la vente de parts, qui doit faire l'objet de la mise en concurrence.
En revanche, l'entrée au capital d'investisseurs privés, sans droit particuliers liés à la gestion du service, ne doit pas être soumise à une obligation d'appel d'offres (exemple : cas d'une mise en bourse d'une partie du capital).
La mise en place du PPP institutionnel de Murcie, en Espagne, est un exemple de mise en concurrence dans le but d'améliorer le service : le prix d'achat correspondant à la part de capital de la société à capitaux publics en vente, était fixé en fonction des éléments du bilan de la société et la sélection de l'entreprise privée (attribution du contrat) portait sur l'offre technique et les engagements de qualité du service.

Par ailleurs, l'élaboration d'un droit positif pour les phénomènes dits de « in-house » (cf. troisième principe énoncé dans le propos introductif) permettra de clarifier le fait qu'une société d'économie mixte ne peut en aucun cas se voir attribuer un marché ou un contrat sans mise en concurrence.

D'autre part, une telle initiative législative, prise au niveau communautaire, devrait également tenir compte de la nécessité de préserver l'équilibre économique des contrats en cours, sans les remettre en cause avant leur terme, afin de respecter les engagements pris par les parties ainsi que l'intérêt des usagers. Elle devra également tenir compte de l'existence d'une réglementation européenne sectorielle dans le domaine de l'énergie.

20) Quelles sont les mesures ou pratiques que vous estimez constitutives d'entraves à la mise en place des PPP au sein de l'Union européenne ?

Les pratiques discriminatoires évoquées dans la réponse à la question 12 constituent des entraves à la mise en place des PPP au sein de l'Union européenne. Le projet de loi néerlandais qui vise notamment à interdire la mise en place de contrats de concession dans le domaine de l'eau, constitue potentiellement une entrave à la mise en place de PPP aux Pays-Bas ainsi qu'au principe de la libre prestation de services prévu par le traité.

Par ailleurs, la politique communautaire en matière d'utilisation de fonds communautaires n'est pas clairement en faveur du développement des PPP. Ce manque de clarté freine le développement de tels projets, notamment dans les nouveaux Etats Membres. Pour Suez, les objectifs affirmés par les Chefs d'Etat et de gouvernement à Lisbonne en mars 2000, ainsi que l'adoption d'une initiative européenne pour la croissance au Conseil européen de Bruxelles en octobre 2003, devraient conduire la Commission à adopter une attitude claire et positive sur les possibilités de réaliser des PPP et d'obtenir conjointement des fonds communautaires afin d'éviter de priver d'effets de levier importants et de gains d'efficacité reconnus pour conduire des projets d'infrastructures et assurer une gestion efficace et pérenne des projets réalisés.

A titre d'exemple, le mode de consultation sur financements européens concernant la construction d'infrastructures ne prévoit aujourd'hui pas de fonds européens pour financer des projets de PPP sous forme de BOT ou d'un DBO[14]. Le mode de consultation actuel est limité aux contrats de travaux sans opération et maintenance et sans investissement de la part des opérateurs privés. Si les PPP en BOT ou en DBO peuvent intégrer un financement communautaire portant sur le contrat de travaux, il n'existe toutefois pas de financement européen pour la globalité du PPP ; ce qui explique le faible nombre de PPP en DBO ou en BOT bénéficiant de fonds européens. Cette situation est préjudiciable au développement de l'investissement dans le domaine des infrastructures dans les nouveaux Etats membres.

En outre, ce mode de consultation pour les travaux sous fonds européens présente certaines lacunes. Il est en effet effectué aujourd'hui :

- sans vérification préalable de la conformité administrative et technique des offres au cahier des charges puisque leur ouverture est faite en un seul temps ;
- sur la base d'un prix d'opération et maintenance qui n'est que théorique et qui n'engage pas les candidats, ce qui biaise ainsi les offres de certains candidats sans que ceux-ci soient contractuellement tenus de respecter les coûts d'opération et maintenance annoncés ;
- sans pré-sélection ou examen préalable des références techniques et financières des candidats ;
- sur la base d'une conception (design) excessivement préétablie des projets et ainsi sans possibilité pour les opérateurs de travaux, possédant un savoir-faire technique spécialisé, de proposer des solutions techniques optimisées en tirant, par exemple, profit de récents développements technologiques.

Pour favoriser le développement des PPP dans l'UE dans un contexte de concurrence efficace, il serait ainsi souhaitable d'organiser des modes de consultation qui permettent de pallier ces lacunes.

Aussi, Suez suggère l'élaboration d'un guide et de procédures pratiques à destination des Etats membres, des autorités locales et des acteurs concernés afin de les aider à développer des montages de PPP qui puissent permettre de mobiliser les fonds communautaires, dans le respect des principes du traité. A cet égard, les documents publiés par la Commission « Guidelines for successful PPPs » (publié en 2003) et, plus récemment, le « PPP Resource book » (juin 2004) ne répondent pas à ces besoins.

Une réflexion, menée par la Commission avec les acteurs concernés, pourrait être lancée à cette fin (cf. infra question 22).

[14] « Design-build, operate » : PPP où l'autorité confie à l'opérateur privé la conception, la construction et l'exploitation, pour une période déterminée, d'une nouvelle installation. Celle-ci demeure propriété de l'autorité publique. Le risque lié à la conception et à la gestion est supporté par l'opérateur privé, qui est rétribué par l'autorité publique. L'opérateur privé s'engage sur un coût global de construction et d'exploitation. Le financement de l'investissement est supporté par l'autorité publique.

21) Connaissez-vous d'autres formes de PPP développées dans les pays en dehors de l'Union ? Connaissez-vous des exemples de « bonnes pratiques » développées dans ce cadre, dont l'Union pourrait s'inspirer ? Si oui, lesquelles ?

Suez n'a pas connaissance d'autres formes de PPP développées hors de l'Union.

22) De façon plus générale, et compte tenu des besoins importants d'investissements nécessaires dans certains Etats membres, afin de poursuivre un développement économique et social durable, estimez-vous utile une réflexion collective sur ces questions qui se poursuivrait à des intervalles réguliers entre les acteurs concernés, et qui permettrait un échange des meilleures pratiques ? Est-ce que vous considérez que la Commission devrait animer un tel réseau ?

Suez considère qu'une réflexion sur ces questions, qui se poursuivrait à intervalles réguliers entre les acteurs concernés par les PPP serait très utile, compte tenu, d'une part de la nécessité d'assurer le développement des PPP au sein de l'UE élargie dans un contexte de concurrence efficace et de clarté juridique et, d'autre part, compte tenu des besoins en investissements nécessaires dans certains pays de l'Union.

Une telle réflexion devrait porter sur les principaux thèmes soulevés par le Livre vert ainsi que sur les aides d'Etat. Elle devrait également aborder les questions liées aux financements des PPP au moyen de fonds communautaires afin de favoriser les effets de leviers nécessaires au développement de projets d'infrastructures et à la gestion durable et pérenne des ouvrages réalisés.

Pour Suez, la Commission européenne devrait animer un tel réseau. Celui-ci devrait, notamment, impliquer les opérateurs dotés d'une expérience concrète des PPP au sein de l'Union européenne ainsi que des représentants des autorités des Etats membres, en particulier des autorités locales. Des contacts bilatéraux sur ces sujets devraient également être organisés par la Commission sur ces questions. Suez se tient naturellement à la disposition de la Commission pour évoquer ces sujets et partager son expérience des partenariats public-privé en Europe.

Réponses aux questions
du
LIVRE VERT

sur les Partenariats Publics-Privés
et
le droit communautaire des marchés publics et des concessions

Réf : com(2004) 327 final

1. Quels types de montages de PPP purement contractuel connaissez-vous? Ces montages font-ils l'objet d'un encadrement spécifique (législatif ou autre) dans votre pays ?

Je connais les très grosses concessions ferroviaires, en particulier le Taiwan High Speed Train. J'apporte une contribution de monteur d'affaires qui sollicite toutes le compétences pour présenter un projet qui inspire confiance. Je conçois mon rôle comme celui d'un chef d'orchestre qui met à sa juste valeur toutes les compétences indispensables pour pérenniser la crédibilité des engagements.

Un contrat ou un plan de financement offre une ligne d'actions. Mais, aussi bons soient-ils, ils ne transformeront jamais un mauvais montage en un projet réussi. Certaines petites équipes peuvent réussir sous la direction d'un de ses experts. Mais donner trop de pouvoir aux constructeur, financier ou juriste dans un projet ferroviaire hypothèque la pérennité pour des raisons telles que :

- des visions à des termes trop courts,
- Incapacité de réagir aux aléas de la vie des affaires lorsque ces réactions relèvent de compétences sous-représentées,
- Les tempêtes emportent trop souvent les barrières seulement juridiques.

Deux précautions doivent être garanties :

- l'équilibre des respects des compétences en fonction de leur capacité de construire et d'entretenir la confiance dans le projet,
- des montages financier ou juridique respectant les exigences du marché du transport et le métier de celui qui sait l'exploiter.

Il en résulte que chacun doit s'engager dans son domaine de compétence. En particulier, la puissance publique doit laisser les concurrents s'engager sur leurs propres prévisions de trafic dont elle ne peut faire qu’un critère d’appréciation de l’offre par rapport à l’idée qu’elle s’en fait bien entendu.

La grille d’évaluation des offres doit être en partie partagée. C’est le cadre transparent du dialogue compétitif. Elle comprend trois parties :

a- Une partie confidentielle aussi réduite que possible,

b- Un deuxième partie publique (voir question 21),

c- Une troisième partie consacrée aux risques, elle-même découpée en deux parties :
   - Une liste de risques par rapport auxquels la puissance publique demande au concurrents de se positionner
   - Une liste complémentaire à créer par chaque concurrent en fonction des spécificités de son approche.

2. De l'avis de la Commission, la transposition en droit national de la procédure de dialogue compétitif permettra aux parties concernées de disposer d'une procédure particulièrement adaptée à la passation des contrats qualifiés de marchés publics lors de la mise en place d'un PPP de type purement contractuel, tout en préservant les droits fondamentaux des opérateurs économiques. Partagez-vous ce point de vue? Si non, pourquoi ?

A travers le monde, on s’aperçoit que tous les projets un peu novateurs font l’objet de plusieurs appels d’offres. Chaque relance prend en compte les enseignements des appels précédents. Formalisée ou pas, c’est la seule façon pour une autorité d’adapter sa demande aux offres qu’elles découvrent. Le marché du transport ferroviaire est plus grand que ne peut appréhender une autorité normale. L’innovation est véhiculée par les concurrents. Appel d’offres après appel d’offres, pour les projets complexes, la seule façon équitable et efficace de mettre en œuvre l’état de l’art du moment est ce dialogue compétitif. (voir question 21)

C’est aussi la meilleure façon d’organiser la transparence indispensable. En effet :

a. Plus la complexité est grande, moins la transparence aura d’impact sur l’acuité de la compétition. En effet, le savoir-faire dépasse largement les informations qui auront été mises sur la place publique.

b. Dans une telle complexité encore, la transparence est la vraie protection des décideurs publics. (voir question 21)

c. Le niveau de transparence est très variable d’un pays à l’autre.

3. En ce qui concerne ces contrats, existe-t-il selon vous des points autres que ceux relatifs au choix de la procédure d'adjudication, susceptibles de poser problème au regard du droit communautaire des marchés publics? Si oui, lesquels et pour quelles raisons ?

Sur 451 PFI en Angleterre, on trouve 239 écoles nouvelles ou rénovées et seulement 23 projets de transport. Les projets de transport se caractérisent par leur faible nombre et leur taille importante. Cela a plusieurs conséquences :

a- L'innovation ne se situe pas à l'échelle d'un pays, mais sur la totalité du marché mondial. (voir question 21)

b- Par voie de conséquence, les décideurs publiques locaux ont du mal à suivre les progrès des candidats.

c- Le ferroviaire, en Europe, est à un tournant qui verra les métiers et la distribution du pouvoir complètement modifiés.

d- Des partenariats de toutes sortes se substitueront progressivement à la traditionnelle puissance publique dans ces activités de transport.

Pour ces 4 raisons, le dialogue compétitif doit être organisé. Le partage des grilles de sélection en deviendra un outil très utile. Et le nouveau droit des marchés devra permettre des regroupements d'offres dans des conditions équitables et tirant profit de travail accompli, sans avoir à repartir de zéro.

4. Avez-vous déjà organisé, participé, ou souhaité organiser ou participer à une procédure d'attribution de concession au sein de l'Union? Quelle expérience en avez-vous?

Non. Mais à Taiwan, j'ai participé à la procédure d'attribution et de mise en place de la concession de train à grande vitesse.

5. Estimez vous que le cadre juridique communautaire actuel est suffisamment précis pour assurer la participation concrète et effective de sociétés ou groupements non-nationaux aux procédures de passation de concessions? Une concurrence réelle est-elle, selon vous, habituellement assurée dans ce cadre ?

Sans avis sur le cadre communautaire. Mais la pratique de l'international montre que la concurrence n'est réelle que si les concurrents ont intégré le contexte local. L'institution du dialogue compétitif permettra une meilleure mise en concurrence.

6. Pensez-vous qu'une initiative législative communautaire, visant à encadrer la procédure de passation de concessions, est souhaitable?

Le marché ferroviaire de chaque nation est trop faible pour pouvoir disposer rapidement d'un retour d'expérience significatif. Si l'Europe pouvait faire quelque chose dans cette perspective, ce serait intéressant.
Quant à encadrer la procédure de passation de concessions, si on s'adresse aux experts d'un domaine, leur souci de perfection pourrait aller jusqu'à rendre les PPP impraticables, en particulier dans le ferroviaire, si on ne prend pas en considération les retours d'expériences spécifiques de ferroviaire. Il ne faut pas écrire dans le marbre trop tôt, ni de façon trop générale. Ces précautions seront d'autant plus facile à respecter que l'expérience internationale montre qu'un candidat concessionnaire est capable de beaucoup de flexibilité tout en gagnant quand même sa vie.

7. De manière plus générale, si vous estimez qu'il est nécessaire que la Commission propose une nouvelle action législative, existerait-il à votre avis des raisons objectives de viser dans cet acte tous les PPP de type contractuel, qu'ils soient qualifiés de marchés publics ou de concessions, pour les soumettre à des régimes de passation identique ?

Les soumettre à un régime juridique homogène pour avoir des expérience comparables permettrait de constituer cette base de retour d'expérience plus rapidement. Mais si les projets d'école ou de prisons sont suffisamment nombreux pour commencer à tirer des leçons exploitables, les projets de transport public sont moins nombreux et généralement plus gros et plus spécifiques. Cela milite en faveur de l'organisation, au niveau de l'Europe, d'un retour d'expérience ferroviaire pour voir si quelques progrès ne pourraient pas en sortir un peu plus rapidement.

8. Selon votre expérience, l'accès des opérateurs non-nationaux aux formules de PPP d'initiative privé est-il assuré? En particulier, lorsqu'il existe une invitation des pouvoirs adjudicateurs à présenter une initiative, cette invitation fait-elle généralement l'objet d'une publicité adéquate permettant l'information de tous les opérateurs intéressés ? Une procédure de sélection véritablement concurrentielle est-elle organisée pour assurer la mise en oeuvre du projet retenu?

Vue la spécificité des projets ferroviaires de **construction et d'exploitation**, il peut paraître hasardeux de présenter une offre étrangère aussi grosse, même si les exploitants de transport réussissent des délégations de services publics hors de leurs frontières nationales.

9. Quelle serait selon vous la meilleure formule pour assurer le développement des PPP d'initiative privée dans l'Union européenne tout en assurant le respect des principes de transparence, de non discrimination et d'égalité de traitement ?

Monteur de projet, je me limiterai à la structure d'un projet ferroviaire de construction et d'exploitation. Optimiser l'utilisation de ressources financières et garantir les recettes d'exploitation est la seule façon de bâtir une confiance pérenne. Par exemple :

- Si les constructeurs mènent le jeu pendant la construction, ils ne doivent pas construire ce qu'ils veulent. L'exploitant doit être présent dès les premiers jours avec un pouvoir respecté parce que les 20 premiers pour cent des décisions prises engagent 80 % du coût de possession.
- Que le constructeur actionnaire se passe un commande à lui-même n'a de sens que si il a vraiment l'intention d'assurer l'exploitation. Mais trop souvent, abusant du manque d'expérience de l'organisme adjudicateur, il se passe une commande confortable et se prépare une sortie dès la fin de la construction.

Voilà parmi d'autres, deux mécanismes destructeurs de la confiance des investisseurs privés. Utilisant les cadres élaborés par les législateurs et juristes, **les monteurs d'affaires** trouveront des voies et moyens pour prévenir ces faiblesses.

10. Quelle expérience avez-vous de la phase postérieure à la sélection du partenaire privé dans les opérations de PPP contractuels ?

A Taiwan, pendant 6 ans j'ai mené les actions préparatoires du Taiwan TGV groupe comme salarié d'ALSTOM. Puis pendant 3 ans et demi, j'étais auprès du gouvernement Taiwanais depuis le dépouillement des offres auquel j'ai participé, jusqu'au choix du système SHINKANSEN.

11. Avez-vous connaissance de cas dans lesquels les conditions d'exécution – y compris les clauses d'adaptation dans le temps - ont pu avoir une incidence discriminatoire ou ont pu constituer une entrave injustifiée à la libre prestation de services ou à la liberté d'établissement? Si oui, pouvez-vous décrire le type de problèmes rencontrés ?

Non. Ce ne sont pas les clauses qui ont eu une incidence discriminatoire à Taiwan. C'est la pratique des affaires. Les garanties financières de l'Etat sont venues très tard. Et, de façon surprennante, la crédibilité financière de l'offre n'était pas un critère de choix (100 % de financement privé pour un projet de 15 milliards € !).

12. Avez-vous connaissance de pratiques ou de mécanismes d'évaluation d'offres ayant des incidences discriminatoires?

Oui : Tout comité d'évaluation qui n'analyserait une offre qu'en fonction des pratiques traditionnelles dans son pays, ne pourrait que rejeter les offres adaptées au renouveau actuel du ferroviaire. C'est un biais d'autant plus fréquent du ferroviaire que l'analyse de l'expérience étrangère est souvent obscurcie par le sentiment d'un risque lié aux spécificités nationales et un refus consécutif de considérer tout retour d'expérience qui ne soit pas nationale.

13. Partagez-vous le constat de la Commission selon lequel certains montages du type "step-in" peuvent poser problème en termes de transparence et d'égalité de traitement ? Connaissez vous d'autres "clauses types" dont la mise en oeuvre est susceptible de poser des problèmes similaires?

Pour un service public, le conflit d'intérêt qui consiste à voir un actionnaire se passer commande à lui-même est d'autant moins admissible si dans le même temps il n'a pas l'intention d'aller au bout de l'engagement d'exploiter ce qu'il aura construit. Si le constructeur actionnaire se retire de l'exploitation, une garantie de bonne fin devrait mettre à sa charge le coût des modifications que fera son successeur quelques soient les présomptions de tords de l'organisme adjudicateur.

14. Estimez-vous qu'il est nécessaire de clarifier au niveau communautaire certains aspects relevant du cadre contractuel des PPP ? Si oui, sur quel(s) aspect(s) devrait porter cette clarification?

Voir ci-dessus :

1. La disponibilité et l'équilibre des pouvoirs des compétences indispensables,
2. Si l'actionnaire constructeur se passe une commande à lui même, il abandonne le droit de se retirer avant la fin du contrat quelques soient les tords de l'organisme adjudicateur (caution de bonne fin de la question 13).
3. Publication de grilles de sélection telles que définies (voir question 1).

15. Dans le contexte des opérations de PPP, avez-vous connaissance de problèmes particuliers rencontrés en matière de sous-traitance ? Lesquels?

Un actionnaire constructeur qui se passe une commande confortable à lui-même. Il va jusqu'à prendre en charge des travaux que des PME pourraient réussir mieux que lui et moins cher. C'est préjudiciable au tissus industriel du pays. Et, dans une certaine mesure, c'est un abus de bien social par rapport aux autres actionnaires de la concession. Enfin, c'est faire prendre un risque à la communauté par rapport à la pérennité de la société concessionnaire.

16. Le phénomène des PPP de type contractuel, impliquant le transfert d'un ensemble de tâches à un unique partenaire privé, justifie-t-il selon vous que des règles plus détaillées et/ou d'un champ d'application plus large soient mise en place en ce qui concerne le phénomène de sous-traitance?

Oui : Une concession reste un service public dont la pérennité dépend du montant des amortissements. L'actionnaire devrait justifier des préférences qu'il s'attribue à lui-même.

17. De manière plus générale, estimez-vous qu'une initiative complémentaire devrait être prise au niveau communautaire en vue de clarifier, ou d'aménager, les règles relatives à la sous-traitance?

Non : C'est spécifique du tissus industriel de chaque pays.

18. Quelle expérience avez-vous de la mise en place d'opérations de PPP de type institutionnalisé ? En particulier, votre expérience vous conduit-elle à penser que le droit communautaire des marchés publics et des concessions est respecté dans le cas de montages de PPP institutionnalisé? Si non, pourquoi ?

Aucune

19. Estimez-vous qu'une initiative doit être prise au niveau communautaire en vu de clarifier ou de préciser les obligations des organismes adjudicateurs quant aux conditions dans lesquelles doivent être mis en concurrence les opérateurs potentiellement intéressés par un projet de type institutionnalisé? Si oui, sur quels points particuliers et sous quelle forme? Si non, pourquoi?

Sans avis

De façon générale et indépendamment des questions soulevées dans ce document:

20. Quelles sont les mesures ou les pratiques que vous estimez constitutives d'entraves à la mise en place des PPP au sein de l'Union européenne?

Sans avis

21. Connaissez-vous d'autres formes de PPP développées dans les pays en dehors de l'Union? Connaissez-vous des exemples de 'bonnes pratiques' développées dans ce cadre, dont l'Union pourrait s'inspirer? Si oui, lesquelles?

Voir les 3 questions/ réponses 1-b), 2 , 3-a)

22. De façon plus générale, et compte tenu des besoins importants d'investissements
nécessaires dans certains Etats membres, afin de poursuivre un développement économique social et durable, estimez-vous utile une réflexion collective sur ces questions qui se poursuivrait à des intervalles réguliers entre les acteurs concernés, et qui permettrait un échange des meilleures pratiques? Est-ce que vous considérez que la Commission devrait animer un tel réseau ?

Comme je l'ai dit plus haut : OUI !
Le marché ferroviaire est trop petit. Il faut avoir rapidement un retour d'expérience significatif. Pour ce faire, il faut le faire au niveau de l'Europe. Chacun saura faire la part des spécificités nationales. Peut-être cela sera-t-il plus facile que pour l'accidentologie ferroviaire?

July 30th 2004

REPLY BY THE VEOLIA ENVIRONNEMENT GROUP TO THE GREEN PAPER PRESENTED BY THE COMMISSION ON PUBLIC-PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

As Europe's leading private operator of public services (Services of General Economic Interest SGEI) in the domain of the environment, in the domains of potable water treatment and distribution and wastewater collection and treatment, waste collection and treatment, energy services including collective heating and public passenger transportation, and being active in all of the 25 European countries, with the exception of Malta, our Group has studied the Commission's Green Paper on Public-Private Partnerships (PPP) with great interest. With regard to this subject, which is at the very core of our activity as a public services provider on behalf of public authorities, our involvement in these domains has led us to develop strong convictions and a keen awareness of the improvements that could be implemented in the general interest, in each of the Member States. We will express these convictions in an overview presentation, prior to detailing them by way of our replies to the set questions..

OVERVIEW PRESENTATION

Overview introducing and summarising the main points of VE's reply to the Commission's Green Paper on PPP's.

---

1) As the leading private operator of public services in the domain of the environment in Europe and being active in all of the 25 European countries, with the exception of Malta, our Group has studied the Commission's Green Paper on Public-Private Partnerships (PPP) with great interest. We feel that the significance of the initiative undertaken by the Commission should be emphasised, just as the quality of thought underpinning the entire document.

Veolia Environnement's experience is based on 150 years of partnership with public authorities, in a multitude of frameworks, but all having the common element of delegation by a responsible body ("Autorité Organisatrice")[1] to a private operator of the overall provision of a complex service, and its associated responsibilities in the domains of potable water treatment and distribution and wastewater collection and treatment, waste collection and treatment, energy services including urban heating and public passenger transportation.

It appears to us that the Commission's approach has been inspired by the desire to develop these partnerships in Europe and the increasing diversity of their forms, as well as the need to provide them with a realistic legal base, understood by citizens and users and adapted to their specific characteristics and their diverse nature.

We feel that the method adopted by the Green Paper, by building on the basic principles of the Treaty of Rome and by seeking to adapt them to the complex subject of PPPs, without dogmatism or hasty categorisation of the latter, is quite appropriate for the current situation prevailing throughout the Union..

In particular, we feel that this method is such as to avoid two future pitfalls regarding the Commission's initiative. The first pitfall would be the maintenance of a *status quo* that would allow a vagueness regarding the guiding principles of PPPs to persist and that would be prejudicial to the clarity of public decision-making, fair competition and information to the end user. The second would be in the form of too rigid or inadequate legislation which would misjudge the specific nature of these partnerships, their specific characteristic of the requirement for continuous adaptation, the very extensive diversity of the economic activities covered and the pragmatism that must prevail in their creation by way of calls for competition, as well as their implementation and their execution by the parties.

This latter risk would be particularly evident in the event of attempts being made to extend the rules governing public contracts to cover the delegated management PPPs. Abundant and convergent experience exists within member States, where forms of PPP have been developed, to demonstrate clearly that they obey a different logic. The Commission itself has asked this question quite clearly in the context of the Green Paper and we shall be covering it in greater depth.

Before replying to each of the questions on which the Commission has kindly requested the Group's opinion, we wish to shed light on a few fundamental points of our understanding of the initiative undertaken and its challenges.

2) While the Green Paper is seeking the conditions for fair examination of partnership propositions from private enterprises, it leaves open the question of unfair or non-existent

[1] "Autorité Organisatrice" is translated by *responsible body* and sometimes *organising authority*. It transfers to the operator the responsibility of running the service. The responsible body is qualified (skills, rights…) to define the service policy, the characteristics of the rendered service (scope, quality, end-user, tariff…), operating conditions (in-house or outsourcing). It also sets the results to be achieved, calls for competitions and supervises the service.

examination of the comparative merits of solutions having recourse to such a partnership as well as solutions only having recourse to the public sector to fulfil identical missions.

In our mind, in order to guarantee the best possible quality for public services in Europe for the long term, it is necessary to guarantee genuine, fair and transparent examination of those services which could be provided by private enterprises having genuine and acknowledged experience in this sector.

When these services are entrusted directly to public entities, it would also be desirable to ensure that their quality is controlled and that the reality of their performances is measured under conditions comparable to those governing the exercise of identical missions by private enterprises, and that information to end users is provided with regard to the actual performance of these services compared with other services of the same type.

Finally, it appears to us that the current state of European law, as interpreted by jurisprudence, does not offer sufficient encouragement for transparent calls for competition when a public authority entrusts a management assignment to a body that is itself public and connected to it in one way or another.

Even if it fails to meet completely and immediately these aims which, in certain member States, clash with political constraints, in any event adapted legislation should ensure fair competition between public and private organisations when they aim to provide the same service.

There are many ways of distorting this competition and we will provide examples in reply to the questions raised by the Commission. However, it should be noted that in our company's domain of activity, and particularly in terms of water, wastewater treatment and public transportation, currently the main difficulties encountered do not arise from the way in which private enterprises are put in competition by a public authority having so decided, but from a large number of instances where the service is entrusted to a public body distinct from the responsible body without any genuine call for competition being conducted and sometimes even without a proper contract or obligations of measurable results.

If, for the future, this aspect were to be neglected, there would be a risk – as we are already witnessing in certain member States – that the conditions of the partnership with the private sector become increasingly codified and more and more regulated, both with regard to the legal instrument entrusting the service to the operator and with regard to the proper execution by the latter; whilst the execution of identical services by public operators would remain broadly free of these rules and this control and free of the requirements of results that must be a characteristic of the public-private partnership.

3) In fact, we feel that one of the fundamental characteristics of these partnerships, and the source of their merits for the European public service end user, must reside in obligations of measurable and controllable results, and in the economic incentives they comprise, and which constitute one of the basic differences – but not the only difference – existing between these partnerships and certain simple service provision contracts.

It appears to us that the Green Paper takes less account of this point than of others and we would like to stress its importance for several reasons.

From the moment when a certain length of time is required to ensure complete optimisation of a service, obligations of results – that may cover all aspects of the service concerned – make it possible to combine effective and transparent control by the public authority whilst allowing the operator the autonomy of management required to achieve the improvements in terms of quality and productivity that are expected from its involvement. These obligations can serve as the objective basis for regular reviews of the partnership's situation as well as the operator's performance. This aspect is the logical corollary of awarding long-term contracts. For certain activities, the contract duration has to be a long period of time in order to enable the operator to optimise the service effectively.

On this latter point, we feel that it is vital to take into account the specific characteristics of certain services likely to be entrusted via a PPP to an operator, in order to have a proper appreciation of the timescale required in certain cases for achieving service optimisation for the end user.

In this regard, even within Veolia Environnement's own activities, the situation is very varied. The clearest case of optimal long contract periods is that of water and wastewater services, and this has already been the subject of constructive dialogue with certain Commission departments. It is covered in depth in a contribution appended to the present reply.

For reasons analysed in this contribution, we feel that the optimal duration for a major water and wastewater services management contract should not be less than fifteen years if the aims are for the operator to achieve productivity gains over the entire scope of the managed service, to guarantee high service quality and to implement an appropriate policy concerning the renewal and the management of the assets entrusted to it. Naturally, the duration is longer when it encompasses, in the concession framework, the amortisation term of the assets operated, or when a volume of investments spread over the duration of the contract in the context of the management of a complex service, requires a noticeably longer timescale. However, our reflection has been more generally focused on service management contracts not involving major modernisation investments, and not falling into this special category.

Nevertheless, we think that a contract period of seven or eight years, for example, would limit the optimisation of the service to a very small portion of achievable productivity gains, and therefore would considerably reduce the benefits of partnership for the consumer. We also believe that it would give rise to unavoidable pernicious effects in the long-term management of the service's environmental performance, and to major hidden costs for the public authority and the taxpayer. Finally, it would distort competition by giving the operator in place a decisive advantage during possible contract renewal procedures. In our contribution, we believe that we have addressed and clearly established all these points. We look forward to discussing them in greater depth with the Commission at a future date. The result is that, compared with a fifteen-year contract which is well managed on both sides, a succession of three five-year PPP contracts deprives the public authority and the end user of the bulk of the benefits and of the operator's know-how, and imposes major additional costs on the latter.

From this point of view, we believe it is necessary to take into account the diversity of the aims of the activities concerned by PPPs, and to avoid freezing aspects in a manner than would misjudge the economic, human and industrial specificities of certain services. Such an error of appreciation would certainly rebound against the enterprises concerned as well as, eventually, against the end users themselves as they would be robbed of the planned possibility of benefiting from the private operators' know-how due to the inappropriate nature of the partnership conditions.

4) The corollary of the sometimes long contract period required for an efficient partnership with a private operator must be found, it has been said, not only in the transparency and the legibility of the contract's objectives but also in the periodic review of the contract in the relation to the achievement of these objectives. The formative character of the obligation for results is expressed here by the objective basis it creates for this periodic review, often on a five-year basis. This review serves several purposes. The main purposes must be:

- Enabling the control and sanction, both positive and negative, of the operator's performances by the public authority, in accordance with rules laid down in the original contract.

- Enabling the organising public authority to request the operator to integrate certain service adaptation objectives linked to new operating conditions.

- Organising the review of both parties' good faith, in accordance with principles fixed in the original contract, and of the contract's economic balance in the light of any new events having occurred since the tender procedure.

We cannot stress too heavily the importance of these various points, as they are the cornerstones for a major share of the benefits of PPPs for the end user. In this respect, it should not be considered that a long-term contract is in any way a blanket approval given to the operator. In fact, the original competitive bidding procedure can and must provide objective rules throughout the life of the contract that will provide maximum efficiency for the end user, necessary adaptation to changing circumstances and competitive transparency.

5) From this concrete and pragmatic approach to the issues, we can see that tenders relating to complex public-private partnerships can in no way be assimilated with those governing the award of public contracts or more straightforward service provision contracts.

Complex PPP contracts entrust the management of a public service to an operator. They comprise a set of incentives, sanctions and rules not to be found in public contract tenders and that provide for the partnership to adapt to changes in the end user's needs and to changes in the contract's economic context.

The Interpretative Communication on concessions of 24 February 2000 has helpfully sought to confirm the relevance and the limits of adapting certain rules applicable to contracts to public service concessions. Nevertheless, the Commission itself revealed in point 5 of this Communication, that many complex PPPs do not correspond to the specific characteristics of the concession and thus could not be included in the scope of the initiative.

In the same spirit, the Commission quite rightly reveals in the Green Paper, that certain "institutional" PPPs, i.e. composed of mutual financial participations from the public sector and the private sector within a joint entity, also comprise a delegated managementy from the public partner to the private partner which is assigned with a special mission, and that, in this case, the substance of the partnership is comparable to that of a "contractual "PPP. The result of the development of these set-ups, specially adapted to the legal traditions and the organisation of local authorities in certain member States, is that in order to grasp the issue of PPPs properly and to promote competition around the core element, i.e. the operator mission entrusted to the private partner, the European Union must equip itself with a body of rules that are clearly distinct from those governing public contracts.

6) In this regard, particular attention should be paid to adapting the notion of competitive dialogue to the domain of PPPs. Whilst no contradiction whatsoever exists between these two notions, it is imperative that the actual form of the calls for competition retains the specific characteristics of complex PPPs and encourages a realistic review by the organising public authority of all the benefits in both economic and qualitative terms that it may derive from the service.

In our mind, three essential points should be taken into consideration.

a) A large portion of this benefit is linked directly to the originality of private operators' propositions. These propositions, which are often the combined fruit of specific experience and certain technological advantages, have required major upstream investments in research and innovation on the part of these operators. The development of such innovation, intended to meet the local authority's particular set of problems in terms of water and wastewater, waste management or energy services or public transport organisation, represents a major direct cost. It is unrealistic to think that the companies involved would share the fruit of such investments upstream of the tender *per se*. Such a system would directly penalise the most innovative and the most demanding companies in their sector and would discourage, *de facto*, any investment in innovation and any conceptualisation activity for the benefit of the responsible body.

While it is both conceivable and desirable that the responsible body, in advance of the call for competition, sounds out prospective operators about the broad outlines of a possible partnership and about the advantages and disadvantages of the various possible solutions, it is necessary to reserve for the bidding procedure itself, with all related guarantees, any original and underpinning propositions that the operators, placed in competition, are capable of providing. Such propositions are not only sources of benefits for the end user but are also indissociable from each operator's know-how.

We also feel that is necessary, in the case of complex PPPs, for the competitors' original propositions, expressed as variants to the overall outline of the tender, to be welcomed and appreciated when they provide for objectively measurable significant savings for the authority. On this point, we consider that the Commission's current doctrine, particularly as it is expressed in the Interpretative Communication on concessions, does not pay sufficient attention to the benefits derived by the end user from "competing ideas"; benefits that can only appear if enterprises are encouraged to propose original solutions in relation to the tender data, rather than being discouraged to do so.

b) Secondly, all our experience tells us that the choice of a public services operator by a responsible body involves, besides considerations of a purely economic nature, an assessment of the other benefits offered to the authority including the quality of the project, the credibility of the proposing enterprise and the quality of the personnel who are destined to take long-term responsibility for a mission that is often critical for both the authority and the end users.

We are well aware that this assessment, sometimes described under the general title of *intuitu personae* (relating to the nature of person or entity) raises certain difficulties with regard to the general principles of competition as they result from the Treaty of Rome. For all that, we do not believe that there exists any incompatibility between the Treaty and such assessments, nor that the ambition of enabling European public service end users to benefit for clear and appropriate selection procedures can be achieved without consideration of these points which are consubstantial with the issue of PPPs, inasmuch as their purpose is to entrust, for the long term, a complex public service to the most capable operator.

In many cases, it is possible to quantify certain qualitative benefits - of particular importance in the domain of the environment – and to apply parameters them in the context of an overall assessment. In all events, it is desirable to leave to the public authority, whilst respecting the confidentiality of each party's bids and in the context of a negotiation integrated in the tender procedure itself, the possibility of proceeding further with its understanding of the specific merits of these bids as well as the real significance of certain propositions.

c) Finally, we must stress in the light of our ongoing experience, that the information supplied in tenders relating to complex PPPs in our activities almost always comprises uncertainties, with major economic consequences, concerning certain data that the operator has to integrate when drawing up its proposition. Naturally, the level of uncertainty varies from case to case. For example, if it is a matter of constructing and operating an entirely new wastewater treatment plant or a new incinerator as part of a concession set-up, the uncertainties are limited to future parameters such as pollution levels or future volumes to be treated. These uncertainties may be taken into account explicitly in the context of the tender (provided that, once again, the operator is not shackled by a reasoning similar to that governing public contracts).

In contrast, when it is a matter of taking over the management of a major municipal water or heating network, pre-existing data (subscriber files, age and location of pipes and connections, actual network returns) are often incomplete. To give substance to the obligations of results on the part of the operator in an equitable manner, it is always necessary to provide, after the tender award *per se*, a transitional period during which more in-depth due diligence than that conducted during the tender procedure may be performed. This review results in factual adjustments to the parties' obligations. Obviously, such adjustments must not call into question the basis of the competitive bidding procedure, but in many cases, such a procedure is necessary.

These three points are particularly crucial and sensitive in our domain as a provider of environmental services where the risk of lowest cost management of certain tasks and the sacrifice of long term considerations to the sole imperative of profitability is ever present, and where it is therefore necessary to call upon operators capable of deploying extensive know-how, including a dimension of risk management and environmental protection. If we are not careful, such deployments of expertise may be put at risk by recourse to competitive bidding procedures that are too rudimentary.

7) Accordingly, whatever the legal form that the next stage of European legislation may take, it appears to us that it should favour the purpose and content of complex PPPs rather than their form and that, whilst respecting their singularities, it should enhance the legal security that they need, whilst taking proper account of incentives for efficiency as well as the contract periods and flexibility required to make them worthwhile for the end user.

This supposes that the norms concentrate on the substance of the mission entrusted to the private operator and, whilst respecting the spirit of the Treaty of Rome, guarantee compliance with a few major principles, in particular those of transparency, competition and equality of treatment. To achieve this, it is necessary both to establish once and for all the autonomy of these contracts in relation to other forms of public contracts, and not to freeze their forms by multiplying specific legislations that are sources of confusion and, over time, of legal insecurity. We shall cover the form that the legislation could take in our replies to the Green Paper's questions 3, 7 and 14.

Such changes will only really advance the efficiency of the services concerned if they are accompanied by a more realistic approach to equality of treatment. This approach must prevail amongst the various modes of service management, and it must not just reserve for PPPs alone the imperatives of transparency, concretely sanctioned obligations of results and incentives for good management and innovation which form part of their characteristics.

Question 1 ***: What types of purely contractual PPP set-ups do you know of ? Are these set-ups subject to specific supervision (legislative or other) in your country?***

It would be regrettable if there were to be a misunderstanding regarding the meaning given to the terms PPP, Contractual PPP or Institutional PPP. At the outset, and in order to avoid any ambiguity, VE states below the meanings used in the present contribution:

- The term PPP covers any form of cooperation between a Public Authority and an enterprise, be it private or public, having as its effect the attribution to it of the right to exercise an activity of general economic interest with the exercise of this activity including, or otherwise, the obligation to carry out and to finance investments.
- The PPP may be of a contractual or institutional nature. However, it must be distinct from public contracts (subject to the directives 2004/17 and 2004/18). This category includes "concessions" as defined by the Community that may be public services or public works[1], but is of a broader nature.

1) Types of set-ups

The varying levels of involvement on the part of the enterprise are translated by different types of contracts with varying content. Moreover, they may be modular in nature. Any typology of these contracts is somewhat artificial as it depends on the distinctive criteria retained and also on a *continuum* existing in practice.

The traditional typology distinguishes between contracts which confer missions relating to carrying out investments and operating a service, and contracts which only relate to service missions:

Operation and maintenance contract (O&M)

A service contract by which the private operator operates the infrastructures placed at its disposal by the public authority and ensures day-to-day maintenance.

The service mission may be limited to that of operating the facility. However, such a contract type may also correspond to the complete management of a major SGEI including transfer of risk to the operator and high performance commitments.
Two examples:

- The public service contract between Veolia Water and the Syndicat des Eaux d'Ile de France – Greater Paris Region Water Board – that enables the 114 communities covered by the water board and its 4 million inhabitants to benefit from a complete, integrated service (water production plant, distribution and wastewater services management, day-to-day maintenance, billing, collections and customer service, asset planning and asset modernisation) is of this type,

[1] Current community legislation contained in the Directive 2004-18 only covers public works concessions

- Operating contracts for the light metro and tramway lines in Stockholm: see appendix 3.

Management lease contract with modernisation investment

In addition to its operating mission, and over and above day-to-day servicing, the private contracting party takes charge of heavy infrastructure maintenance and at least partial charge of their renewal. The public authorities retain ownership of the assets and take the initiative for capital investments. This is the most common form of contract in France for water distribution and urban passenger transportation activities.

Concession

In addition to service operation, the private contracting party takes charge of renewing and extending the investments required for the service. At the end of the concession, the ownership of all the installations reverts to the conceding authority.
Veolia Water is managing major services by way of concessions: Water in Toulouse in France, in Valongo in Portugal; numerous urban heating concessions; power station operation in Nouméa …).

Design Build Operate contract (DBO)

In this contractual context adapted to the completion and operation of specific, and often technical infrastructures (e.g. a wastewater treatment plant or a household waste treatment plant), the private operator is charged with the design and the construction of the planned infrastructure, prior to operating it. At the end of the operating period, the installations revert to the public entity. The contract may be remunerated by the local authority and/or by revenues derived from the production obtained from the installations.

Build Operate Transfer contract (BOT)

As a variant of the DBO, the BOT is used for major international installations construction projects such as the wastewater treatment plant in the Hague awarded to us in 2003. The private operator takes charge of the design, construction and financing of one or several production or treatment plants, prior to obtaining their operation over a long period. At the end of the operating period, the installations revert to the public entity.

Mixed public private entities ("Société d'Economie Mixte")[1] with operator contracts

The private operator's service operation mission is backed by a participation in the capital of the public company. This provides for closer cooperation, in particular for capital-related issues (planning, financing and carrying out investments).

[1] Mixed public private entities are not a management system. They are external entities bound by a contract with the public authorities.

Our partnership in MIDEWA, the potable water distribution and wastewater services operator located in Saxe-Anhalt, won by us in 1999 further to an international tender, is a good example of this type of PPP where Veolia Water exercises a service operation mandate linked to a 25% participation in the public company's capital.
A further example is that of the operating contract for the household waste incineration plant at Bourgoin Jallieu, entrusted by a local authority to a mixed public private entity known as Nitraval, in which Ronaval, an Onyx subsidiary, is a shareholder. The mixed public private entity company has entrusted the plant's operating contract to Ronaval.

Perhaps the typology does not place sufficient emphasis on the reality of PPPs which are concluded primarily and necessarily so that, in the main, the enterprise provides a general interest service on behalf of the public authority.
Either this service activity just relates to the service for which the investment is the support (e.g. operating a wastewater treatment plant or an urban heating power station) and, in this event it will generally be a BOT contract, or it covers the entire operation of a SGEI on behalf of the public authority with, in the main (but not necessarily), the management of the relationship with the final beneficiary of the service, with any possible investments being just an accessory. In this event, it is more likely to be a concession (or a lease if the initial investments are made available to the operator).

2) Legal framework of PPPs

a) In France, Veolia Environnement's country of origin, all authorised forms of contract are currently subject to laws and regulations defining, in particular, the procedures for awarding contracts and for maintaining open and transparent competition.

These contracts may fall into three different legal categories. Each category is subject to a different corpus, particularly with regard to contract award procedures. They are differentiated by the criterion of the nature of the missions entrusted (varying degrees of complexity and/or global missions, in direct relation or otherwise with the end user of the service) and also by the extent of the commitments or risks undertaken and by the method of remuneration (in function or otherwise of the marketing of the service). Therefore, there is a distinction between the delegated public service management contract[1] subject to the Sapin law (29/01/1993), the partnership contract subject to the Ordinance of 17 June 2004 and the public contract as defined by the French public contracts code (that may be applicable to certain PPPs as defined by the European Community). A fourth category can be added. This relates to contracts known as "unnamed" which are drafted around common law contract types (lease, deed of sale, leasing agreement…) and which, in the main, relate to public property occupation contracts, but this residual category will be broadly amalgamated in the new partnership contracts category, specifically intended for this purpose.

[1] A delegated public service management contract ("Contrat de delegation de Service Public") grants the operator with the executive power within the framework of the responsible body's duties. The operator is self-sufficient and is solely responsible of its acts.

Further details with illustrations are provided in appendix 2.

b) In other European States, there is not necessarily any theoretical typology governing PPPs at the national level, but that does not prevent the award of contracts adapted to specific situations at the local level.. The contracts are awarded further to competitive bidding, translating the principles of the Treaty into a precise formalism and incorporating within it the requirements of certain institutional financial backers (World Bank, EBRD, European Commission…). Therefore, and just as in France**,** the real problem does not lie in the mechanisms of competitive bidding but, as we have argued in our overview, in the rarity of contracts due to the privileged positions of public bodies.

Question 2: In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?

The competitive dialogue procedure defined by the Directive 2004/18 which remains focused on tender procedures and for which the use is moreover subordinated to too strict conditions (not all PPPs are complex) cannot be used in its current form for concluding PPPs as it does not take into account the fundamental differences between the domain of public-private partnerships and that of public contracts.

In the first case, the organising public authority transfers global responsibility for an activity to a third party operator, whilst in the second case its assumes this activity itself while calling upon enterprises, as needs be, just for allotted execution tasks.
Therefore, for a PPP, the procedure must be:

- To maintain, during the bid preparation phase, the possibility for each competitor to present original propositions, without running the risk of transfer of the substance of this originality to other less creative competitors.
- During the negotiation phase, to maintain the possibility for the public authority to state its demands in relation to the opportunities presented and to obtain from the candidates:
    - i) The maximum that they can contribute in terms of optimisation and solutions improvements and therefore in terms of global savings. This enrichment would be the result of exchanges and debate on points of view and aspirations compared to realities, within the framework of constructive dialogue by a way of a series of options.
    - ii) Clarification of the specific advantages of their bids.
- To foresee, even after the choice of the best bid, a phase for fine-tuning and resetting those initially envisaged parameters that might not be relevant to the realities observed for the reasons stated in the reply to question 12.

These points have been clearly argued in detail in our overview.

Moreover, due to the nature of the markets on which we intervene, i.e. SGEI, there is cause to be prudent when taking account of just a minimum number of candidates or bids for judging the reality of competition.

On these markets, the actors are either the public authority operating the service itself or a third party to whom it entrusts the execution of this activity (e.g. the water and wastewater services markets). Doctrine (S. Bishop and M. Walker) and jurisprudence qualify them as bidding markets on which competition comes into play when the responsible body launches a call for competition with a view to awarding a contract. Therefore, competition is not exercised on the market but for the ma rket. This specific type of market does not require a large number of competitors to be effectively competitive. On several occasions, the Community competition authorities have been called upon to confirm that, for example, the presence of three competitors is sufficient to guarantee effective competition on a bidding market (as examples, please refer to the Commission's decisions ABB/Daimler Benz N° IV/M.586 of 18 October 1995 and SNECMA/TI n° IV/M.368 of 9 December 1993)

Furthermore, the effectiveness of the competition should not be judged solely in terms of the number of candidates, but in relation to the real nature of such competition. In practice, as soon as the service to be managed is heavy and complex, or the service expected requires a high level of technical expertise, in reality there are few enterprises capable of meeting the expectations or likely to be interested by such calls for competition. This may be a regrettable state of affairs but it should not be misjudged: experience proves that, when there is competition for a contract, it only requires two candidates for this competition to be real.

***Question 3*: In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these? Please elaborate?**

***Question 7*: More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements?**

***Question 14*: Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level. If so, which aspects should be clarified?**

In these questions, the Commission is wondering about the form of the legal instruments which could be used to improve competition and transparency in PPPs.

In essence, the overview introducing our contribution broadly answers the questions raised by the Green Paper, in particular by way of its points 4 to 7. Therefore, we kindly refer you to those points for the basic reply and here we are limiting our comments to one or two points in reply to the commission's more detailed questions concerning the possible form of its intervention.

1) In the first instance, it appears to us that legislation on contractual PPPs grouping together public contracts and contracts delegating the management of a complex service, envisaged as a possible avenue of action in question 7, would be in opposition to the objective that it is advisable to seek. On the contrary, and as we indicate in our overview, in particular in its points 5, 6 and 7, we need to be aware that:

- it is the very substance of the delegated mission which has to be defined, and that it is around this notion that the future of appropriate legislation can and must be defined;
- as it concerns public services management PPPs, the distinction between contractual PPPs and institutional PPPs is often absolute, and thereby secondary. In contrast, for its part, the distinction between contracts and complex services management contractual PPPs seems to us to be fundamental, as we have explained and analysed throughout this entire contribution.

Therefore, grouping together "contractual" PPPs and contracts based on the reasoning that in both cases they are created and governed by a contract would lead to a simplistic vision focused on the form of the contracts rather than on their substance and would certainly lead European law down the wrong track.

2) More generally, we believe, and have stated, that the Commission should strive to unify the rules governing public services management PPPs by taking proper account of the diverse nature and the specific characteristics of these activities. The already embarked-upon multiplication of categories and special texts is leading to a growing problem. In fact, this multiplication is chasing after the increasing diversity of the subject without managing to embrace its complexity and because of this, is running the risk of either overlooking a major part of the subject, or of having contracts fall into the scope of texts which are not adapted to them. In both cases, we run the risk of allowing a feeling of legal insecurity to take root.

Therefore, in our mind, and in line with the spirit of our overview, the aim of European norms must be to combine compliance with the principles of the Treaty of Rome with the fundamental requirements of PPPs in terms of organisation of the award procedure and the implementation of the contract by the parties. On this issue, we refer again to the fundamental points contained in the other sections of this contribution, and in particular in points 3 to 6 of our overview and we again stress the importance of taking care not to "over-legislate" and to leave open points such as the duration of contracts which may correspond to very different industrial logics depending on the profile of the PPP.

Finally, it is probable that the legal basis of the Commission's intervention may differ depending on the aspects of the issue covered by its intervention. Its powers in terms of initial calls for competition seems to us to be derived more directly from the principles of the Treaty of Rome rather than from issues of contract life for example, even if links do exist between these two aspects.

3) From this perspective, and without it being our responsibility to define the legal instruments that might be used, we feel that we are able to suggest the following approach to the Commission.

An overall text – which could doubtless be in the form of a directive - should be limited to the requirement of equitable and transparent competition, respecting the existing fundamental differences, in particular in relation to the competitive dialogue, between PPPs and contracts (c.f. point 6 of our overview and our reply to question 2 of the Green Paper).

Moreover, the Commission could express, in a more flexible manner, by way of recommendations or guidelines for example, a certain number of coherence principles with regard to the architecture of PPPs, their adaptation over time, the importance of stipulating obligations of results, performance targets and clear incentives/sanctions associated with these targets. The Commission should refrain from categorising PPPs in a manner that stifles contractual innovation and, in all events, the duration of contracts should remain open with this in mind, inasmuch as the underpinning industrial logic and the benefits which the end user can expect from it vary from one activity to another (c.f. comments on water and wastewater services in point 3 of our overview and the presentation appended to the present contribution).

These points of reference could:

- enlighten authorities in their quest for appropriate solutions,
- serve as a user doctrine for European subsidies in this domain, in particular Cohesion Fund subsidies,
- enable the Commission, without it exceeding its powers, to prompt more coherence in the way in which the services are inspected, assessed and encouraged to achieve performance targets, irrespective of the chosen management mode –public or private.

Question 4: ***Have you already organised, participated in, or wished to organise or participate in, a procedure for the award of a concession within the Union? What was your experience of this?***

Since the end of the 1980's, VE has participated in numerous competitive bidding procedures throughout Europe. Some examples:

- in water and wastewater services, via its division Veolia Water, VE has been awarded a significant number of PPP contracts. By way of example, we mention Berlin, Görlitz, Döbeln, Gera, Midewa (Germany); Latina, Sicilacque (Italy); Budapest (Hungary); Prague (Czech Republic); The Hague (Netherlands); Brussels (Belgium); Norrtälje (Sweden). In France, we

have obtained several hundred contracts further to open and transparent competitive bidding procedures.
In these cases, there has been a call for competition by way of an international tender. In the main, the tenders have included a dialogue procedure with one (or two) preferred bidders until the time of signing the contract. Despite the existence of appeal possibilities, not one of these awards has been called into question for possible breaches of procedure.

- in passenger transportation, its Connex division regularly participates in competitive bidding procedures for the award of concessions such as, for example, in Germany where it has won the operating contract covering about ten regional railway lines (see appendix 3).
- in waste management services, via its Onyx division, it has participated in PFI tenders. We can mention the household refuse treatment plant for the City of Brighton and the County of East Sussex. This contract is described in appendix 3.

In the light of this experience, VE considers that whilst certain competitive procedures between enterprises could be improved, the real problems are linked to the unequal conditions of competition existing between public or mixed public private entities and enterprises. We develop this issue in greater depth in our reply to question 20 on the barriers to setting up PPPs.

***Question 5*: Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective contribution of non-national companies or groups in the procedures for the award of concessions, In your opinion is genuine competition normally guaranteed in this framework?**

***Question 6*: In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?**

For public works concessions, the Directive 2004/18 states in a very appropriate manner, the rules for advertising tenders and submitting bids. The selection procedure may thereafter be conducted without excessive constraints, thus enabling contracts to be fine-tuned during an iterative discussion process. These rules appear to be sufficient to guarantee compliance with the principles of the Treaty. Their terseness has the immense advantage of encouraging legal security. In fact, unfortunately we observe all too often that pernickety regulations governing procedures paradoxically lead to legal insecurity, with judges cancelling concluded contracts on the basis of insignificant errors.

For other types of PPPs, contractual or otherwise, there are no Community rules detailing the procedure to be implemented to comply with the said principles. Nevertheless, the ECJ has restated their requirements. It is now common knowledge that prior advertising of the tender and an impartial bidding procedure are required. It would be reassuring for all concerned if the precise conditions were known, but there does not appear to be a need for a Community legislative instrument.

In any event, as indicated in our overview, any possible community rules should respect the specificity of PPPs, cover all types of PPPs and, in particular:

- as opposed to public contracts subject to the Directives 2004/17 and 2004/18, regulate their conditions of award by authorising a discussion with the candidates, and then with the chosen candidate up to the final phase of contract drafting, to achieve optimal fine-tuning of the chosen options and the mutual commitments,
- encompass all forms of PPP including institutional PPPs. This implies that the chosen rules are sufficiently flexible so as not to hold back the development of these forms of PPP under conditions in compliance with the principles of the Treaty, as we explain in our reply to question 18.

Question 7: Please refer to our reply grouped with our reply to question 3.

Question 8:* *In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organised to implement the selected project genuinely competitive?

Question 9:* *In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment?

In Europe, our experience shows that, at the stage of invitation to tender by the authority, there is adequate advertising and dissemination of information, allowing for sufficient international competition.

The problem of the private initiative seems more to be related to promoting initiatives on the part of operators, i.e. upstream of the official advertising and competitive tendering phase. We believe that such stimulation has to pass necessarily by a form of recognition in the award contract of the contribution of the initial private initiator (c.f. reply to question 9). Therefore, the private initiative must be stimulated by recognising its contribution whilst still maintaining a situation of constructive competition.

Firstly, it should be noted that, in the context of the private initiative, competition already exists *de facto* as each operator is free to have relevant ideas for the service in question and to propose them to the public authority. It is just a matter of encouraging them not to wait for an official advertisement to arouse this worthwhile reflection on the public service.

Recognition of the contribution provided by the private initiative may take several forms which may be cumulative. We believe that the two latter forms are the most effective:

- remuneration for the work carried out before exposing it to open competition,
- as a corollary, protection of certain elements of the bid (not remunerated therefore by the previous award) when their innovative and exclusive character could justify confidentiality,
- an advantage in terms of bid development time: the adjudicating authority officially opens the competition but with a response time that is going to allow for the innovation contributed by the first bid to be tested.

In practice, these elements could form part of a standard two-stage approach:

- Stage 1: the responsible body accepts access by the potential operator to its sites and to its documents to build up a private initiative, in the form of a preliminary, feasibility or opportunity study …,
- Stage 2: the study report is the subject of an acceptance in principle and the responsible body launches, within an agreed timescale, a consultation or a tender in accordance with applicable law.

This approach should in no way be obligatory, but it could be the subject of a description, or a normalisation, which would serve, by its simple existence, as an encouragement.
Moreover, the rules governing the award of subsidies from Community Cohesion and Structural funds must be prevented from constituting a barrier to setting up PPPs. Please refer to the arguments advanced on this point in appendix 4. On the contrary, the PPP approach should be encouraged to facilitate obtaining private funds as a complement to public funds and to guarantee better overall economic efficiency.

Question 10: In contractual PPPs, what is your experience of the phase which follows the selection of the private partner?

Question 11: Are you aware of cases in which the conditions of execution –including the clause on adjustments over time – may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered?

If, by this question, the Commission means the fine-tuning phase immediately after the selection of the partner, we refer to point 6 c) in the overview and to our reply to question 2 on competitive dialogue.

If however, by this question, the Commission means more generally the overall execution of the contract, then we feel it is worthwhile to present a few of the conclusions drawn by VE from its experience of the life of such contracts.

Firstly, it takes two to ensure the proper execution of a management contract for a service rendered to inhabitants: the public authority and the operator, with each playing its role.

- On the one hand, during the contract award phase, the public authority must define precisely its objectives and its expectations, and during the execution phase, it must carry out controls and decide on possible modifications to the service characteristics.
- On the other hand, the operator must execute the contract and be a force of proposition for improvements.

This joint action is even more necessary as such a partnership must be forged for the long term (as indicated in the overview, point 3). This long term period that is altogether consubstantial with the reality of the PPP. The period must be of sufficient length to allow for the deployment, in an optimal manner, of the enterprise's experience and motivation and then the implementation of the best overall solutions. Moreover, the savings likely to be made from the right solutions can only be achieved over time. In this aspect, the PPP logic differs from that of the public contract which implies that the responsibility for finding the best solutions (including the conditions of their overall implementation) resides with the public authority (and with its consultants) who *ex ante* draft a tender and the specifications with which the enterprise has to comply without any real freedom of action. The PPP logic calls upon the enterprise's capabilities to a far greater extent as a force of proposition, both during the award process and afterwards, as it benefits from autonomy in the means to be implemented and is subject to obligations of results.

This joint management of the contract must allow for it to be adapted, either in relation to changing needs, or in relation to changes in economic reality, and also sometimes quite simply because it appears indispensable to readjust the agreements in relation to the reality of the situation which may have been initially misjudged by both parties. In fact, all too often, the information serving as the basis of tenders relative to complex PPPs is incomplete, even patchy. After a certain operating period, the responsible body and the operator have the mutual responsibility of resetting certain theoretical parameters or quality or performance indicators by comparing them to reality. The readjustment of an agreement concluded on the basis of erroneous data to observed realities cannot be considered as a calling into question of the conditions of the call for competition.

While some abuses have been committed at the time of these indispensable contractual revisions, such practices remain marginal and can in no way justify further rules intended to eliminate them, particularly as other means already exist for sanctioning such practices.

***Question 12**: Are you aware of any practices or mechanisms for evaluating tenders which have a discriminatory effect?*

The significance of this question is capital. The principal discrimination is the one resulting from the comparison on an identical basis, of propositions with profoundly differing underlying features; a question already raised in the overview. Two practical examples provide an illustration of this statement:

- an analysis of bids without taking account of the differences that may exist in the propositions in terms of the quality of the service to be rendered, of performance requirements and of their associated penalties,
- a comparison of bids by misjudging the inevitable distortion of competition between a bid formulated by a private enterprise and one formulated by a public-funded enterprise or even more so by an public entity. Thus, for example, in Germany a private company seeking to manage a wastewater service is automatically 17 % more expensive than its public competitors as it has to pay Value Added Tax, from which the latter are exempt. In France, those taxes and welfare contributions entering into the cost base of a service managed by a public entity are globally lower than those of a service managed by a private enterprise.

Obviously, there is no question of calling into question the principle of neutrality of the legal nature of entities, but the Commission should take concrete initiatives to limit, as far as possible, this phenomenon of distortions which constitutes an obvious barrier to entry, and it should firmly invite public authorities to address this issue.

The scope of application of the modified directive 80/723 relative to financial transparency between member States and public enterprises could be broadened. Concrete measures should be taken to prevent even further public aid, exclusive rights and other advantages allocated to fulfil a mission being used in practice to submit the lowest price on a competitive bid.

But, above all, this issue's indisputable difficulty and the obvious fact that competition conditions cannot be strictly identical according to the legal status of the entities involved, must not serve as a pretext for those entities benefiting from these rights and advantages or special treatment to be dispensed from being placed in competition for the exercise of new activities entrusted by a public authority. This remark is even more crucial as many invoke this difficulty in order to obtain exemptions from competitive tendering procedures for the profit of more or less close entities or connected or complementary activities. VE presents its position on this point in its reply to 20.

***Question 13**: Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment? Do you know of other "standard clauses" which are likely to present similar problems?*

"Step-in" clauses must seek a balance between legitimate guarantees expected by lenders in the context of "project financing" and the rights of the authority which may not ratify the choice of an operator if it deems that it does not possess the technical or financial capabilities to fulfil this mission properly. There is nothing shocking in allowing the bodies which have financed the investments to avoid suffering the sanctions of cancellation, without being able to react and without being able to substitute another body for the failed contract holder in order to continue contract execution. Therefore, VE has no concerns if these rules are respected.

More generally, the hesitations that may be encountered with this type of clause are allied to the issue of contract assignment which is crucial for enterprises in terms of maintaining their economic value. The notion of contract assignment must be admitted. However, as with "step-in" clauses, in the event of assignment of a contract, the public entity must be able to oppose it if the proposed assignee is not capable of executing the entrusted mission. Nonetheless, the legitimate rights of control and veto do not justify an attack on the principle of free assignment of contracts (which often constitute the principal assets of companies) or of participations giving direct or indirect control of a project company.

Question 14: Please refer to our reply grouped with our reply to question 3.

Question 15: In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.

Question 16: In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?

Question 17: In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?

Special rules are provided by the directive 2004/108 for contracts concluded by public works concessionaires. They are proving to be satisfactory, as indicated in our reply to questions 5 and 6.

Moreover, certain sectors, including those concerning VE, i.e. water, passenger transportation and energy, are special sectors covered by the directive 2004/17 which governs the conditions of award of contracts concluded by the holder of a PPP considered as the adjudicating entity. These rules are globally satisfactory, in particular as they do not prevent the intervention of associated enterprises. However, they do require clarification on their scope of application in terms of wastewater services (it is not normal that this activity is, or is not, subject to the directive depending on whether it is, or is not, operated by the same entity as the one operating the potable water service).

On the other hand, it does not appear necessary to extend these rules to other sectors. The important feature is the upstream competitive bidding procedure which is sufficient to guarantee compliance with the rules of the Treaty. Nothing would be more regrettable than legal rules which would misjudge the effects and the economic interest of the combination of a global mission and its partial subcontracting, i.e. a set-up that characterises PPPs. The choice of such a set-up implies that the senior partner who has been chosen against a bid to which it is committed, including at the financial level, retains full liability for its subcontractors and their actions, implying that it has full freedom in their selection. Imposing downstream competition creates ambiguity: the set-up is no longer quite that of a PPP and resembles more that of several public contracts co-ordinated by the public entity. Upstream competition is also distorted, as the candidates, being faced with the unknown quantity of their subcontractors' future competitive bidding procedures, cannot submit their best prices. Certainly, in some cases, public authorities may legitimately[1] wish that one or another part of the task to be fulfilled is subcontracted after a transparently managed bidding procedure, but there is no need to impose the generalisation of such special cases and by doing so undermine contractual freedom.

***Question 18:* What experience do you have of arranging institutionalised PPPs and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases? If not, why not?**

***Question 19:* Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalised project? If so, on what particular points and in what form? If not, why not?**

1) VE's position

The development of the institutional PPP is both an opportunity and a risk: an opportunity as it is by way of opening up the capital of public entities that the management of certain formerly self-produced SGEIs is opened up to competition; a risk also, as to reinforce the position of institutional PPPs without calls for competition can result in permanently closed markets.

In any institutional PPP, the attribution to a third party of the right to execute an economic activity is established, even if this third party is not contractually identified as it only appears as a shareholder within the mixed capital entity.

There are two possibilities:

[1] For example, in the event of the building of a subsidised installation required for the delegated service, and in particular if the decision to build the installation is taken after the PPP agreement: between the solution of entrusting the building to a third party selected after a bidding procedure and that, more in line with the PPP logic, of entrusting the responsibility for its construction to the PPP holder (by way of a contract amendment as required), it can be considered normal to require the PPP holder to subcontract this construction to an enterprise selected in the context of a bidding procedure conducted in complete transparency.

- either the entity displays all the characteristics of an "in-house" entity as defined by the Teckal jurisprudence and therefore the activity remains managed within the administrative sphere and there are obviously no grounds for calls for competition;
- or the entity is not in-house, and this would be the *a priori* case when a third party has a share in the capital: in this case it is a third party and therefore there are grounds for calls for competition.

With regard to the notion of in-house, VE is insistent that only those bodies over which the public entity exercises control truly identical to that exercised over its own services should be considered as being in-house bodies. Moreover, the ongoing nature of this characteristic should be subject to regular control over time.
Furthermore, we would like the Commission to reflect in further depth on what actually constitutes an entity being, or not being, "autonomous at the decision-making level"[1] in relation to a public authority. Notions of identical control criteria and the extent of the activity with the said entity are of interest but they should be examined in greater depth and added to, in order to eliminate the currently observed abuses that allow certain entities to exercise an activity whilst avoiding any calls for competition.

While the alternative is clear, the practical methods of putting it into application are not evident.

Ideally, we should consider that the mixed capital entity is the third party which receives the authorisation to execute the economic activity. Therefore, it is the award of this activity to the entity that should be the subject of a call for competition. But things are not always so straightforward.

More often than not, the entity pre-exists, was in-house when it was awarded the activity, and then it opens up its capital and therefore is no longer in-house. Nevertheless, VE thinks that we should remain pragmatic and above all not attempt to block such changes: it would not be realistic to require that the activity it exercises, and which doubtless constitutes its only asset, should be put up for competition at the time of this opening up of the entity's capital. Therefore, VE requests that it be stated that the entity opening up its capital must be considered as the holder of an explicit or implicit contract, the execution of which may continue, but only for a certain period. Moreover, this period must be declared to the partner entering in the capital, as it represents an asset forming part of the company's worth.

In the absence of an upstream call for competition relating to the activity, focus should be placed on the downstream activity and the role of the partner entering in the capital. Admittedly, no text can provide for a call for competition relating to a participation in the capital of a company. But, in reality, the acquisition of a participation in such a company is not motivated by dividends but by the desire to be able to contribute to the company's activity, in the context of hoped-for support and assistance contracts.

[1] As defined by the Teckal judgment, case C-107/98, paragraph 51

While we cannot be satisfied by the opening up to competition of just a few *ad hoc* downstream services to the detriment of the opening up to competition of the management of a complete SGEI, VE does however request that, as a mininum, it is stated that:

- in the absence of an initial call for competition for the global activity, *ad hoc* missions shall necessarily be subject to calls for competition,
- the public authority shall be bound to advertise when it intends calling upon a private partner to take a participation in an entity previously defined as in-house.

It seems that the principles of the Treaty, reaffirmed by the Télaustria judgment, enable the Commission to promote best practice on this aspect, without it appearing necessary to create a new derivative law.

2) VE's experiences

Veolia Environnement, in its capacity as an operator, does not have any experience of having been approached to be involved in an institutionalised PPP without being able to exercise operational responsibility. Those institutional PPPs in which VE participates, bringing together the public entity and the private company within a mixed public private entity c, also comprise a delegation of operational responsibility to the private partner which, via a contractual PPP, constitutes the substance of the partnership.

Besides, these PPPs are the fruit of tenders where the contractual part of the PPP governing the private party's operational contributions is going to be the deciding factor in the assessment and the selection of the private company. Therefore, in these PPPs we find the same possibility of being able to vary the enterprise's responsibility in contractual PPPs, with however a more important role for the enterprise in terms of investments, given the inclusion of a private company in the capital of the mixed public private entity which, in the majority of cases, is the owner of the assets.

VE presents two of its characteristic experiences of institutionalised PPPs as illustrations of the above statements:

a) MIDEWA, an institutionalised PPP serving the German model of cooperation for the complete management of a service. Example of an institutionalised PPP created for the occasion

MIDEWA is a potable water distribution and wastewater service operation company located in Saxe-Anhalt. It comprises 281 community partners and a private shareholder appointed further to an international call for competition for taking a participation in the capital, linked to an operating contract. In 1999, Veolia Water was awarded this tender.

The company serves 102,000 clients covering 390,000 inhabitants and operates a 3,000 km network. The company has a workforce of 400 and, in 2003, produced revenues of 43 M€. Average annual investment for installations renewal is 8 M€.

Veolia Water controls 25.1% of the capital, is represented on the supervisory board with a right of veto and manages the enterprise. Veolia Water has an incentive to increase productivity by a mechanism of preferential dividends linked to tariff reductions.

At the end of two years, a 9% reduction in tariffs, at a constant euro rate, has been achieved.

b) FCsM Rt, Budapest Wastewater Services Company, or an institutionalised PPP for the complete management of a service. Example of an institutionalised PPP by modification of the shareholder structure in a public entity (partial privatisation)

FCsM Rt is a company with a majority public shareholding. It ensures the operation of the wastewater services for the City of Budapest. In 1997, the City of Budapest assigned, for 25 years, 25% of its 100% holding in the company to a strategic partner, selected by way of an international tender for taking a participation in the capital, linked to an operating contract and a shareholders' agreement regulating the rights of management, control, and the method of shareholders' remuneration. It was won in 1997 by the Veolia Water-Berliner Wasser Betriebe consortium.

The company serves 200,000 clients covering 1,700,000 inhabitants, operates a 3,600 km network and treats 250 Mm^3 of wastewater per annum. The company has a workforce of 1,150 and, in 2003, produced revenues of 80 M€. Average annual investment for installations renewal is 18 M€.

The City of Budapest is responsible for new service investments. Veolia Water/Berliner Wasser Betriebe controls 25.1% of the capital, exercises day-to-day management tasks and receives a preferential dividend as an incentive to increase operational cash flow in relation to a contractually-defined benchmark.

Since 1997, economic performance and service quality have continually increased, while the average bill for users of the FCsM Rt service has not risen by more than the rate of inflation. The partnership operates in compliance with objectives fixed during the partial privatisation.

Generally, its has appeared to us that the award process for the institutionalised PPPs in which VE has participated, and that have had the special feature of calling on our competences as an operator as well as an investor and thereby including both aspects in a contractual PPP (in other words, in the event, the institutionalised PPP was only a method of execution of a contractual PPP), has been conducted in compliance with Community law.

Question 20*: In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?

1) Measures or practices considered as barriers by VE

In reply to this crucial question, we have already provided elements in our overview and in our reply to question 12.

The real barrier to PPPs in Europe are not the conditions, however clumsy and imperfect they may be, of awarding concessions or even those of institutional PPPs that are placed on the market and which are the subject of calls for competition.

The real problem lies with contractual or institutional PPPs that are "camouflaged" under the aegis of self-production, or of being in-house activities, or of being the so-called monopoly of certain public entities to fulfil certain activities.

We see too many public entities deciding to render services of a purely competitive nature to other public entities, with their justification for doing so being based on apparently lower costs (even on their apparent free of charge provision in order to claim that they are not chargeable contracts). These apparent lower costs are explained by their incapacity to take into consideration the totality of the costs attributable to a given service in their price calculations.

What is more, the principle of neutrality of the legal nature of entities is used as a reason for certain public entities to enter into head-to-head competition with private enterprises. And yet nothing is being done in practice to guard against situations where these direct or indirect advantages which have been awarded to a public entity to exercise a given mission, are hijacked and used *de facto* to achieve more competitive prices for a competitive activity.

Admittedly, all the principles already exist for preventing such abuses and there is no need to create a derivative law in the matter: cross-subsidies are forbidden, in their accounts public enterprises are bound to distinguish between assisted and non-assisted activities. But, in practice, it is very difficult to have these principles applied.

VE expects the Commission to provide teaching tools which should contribute to the clarification and the effective equality of treatment of candidates, irrespective of their legal status or of the advantages from which they may benefit[1]. But we also remind the Commission that it is obvious that these difficulties must not serve as a pretext to reduce the scope of application of the obligations of calls for competition.

2) Illustrations

[1] In particular, see the BIPE survey in December 2003 on comparisons between systems and delegations, entitled "Elements for a benchmark for water and wastewater services".

In order to help the Commission with this action, VE is illustrating its statements with actual examples of difficulties encountered.

a) Problems specific to institutional PPPs

In Italy, we can report several restraints on free competition, with direct contract awards without calls for competition. The foremost examples of such practice have been the Tuscan Publiacque public companies in Florence, Acque in Pisa, and Acquedotto del Fiora in Grosseto. These companies have received from the corresponding ATOs[?] (Optimal Territorial Units), the direct award of the service management contract without a prior call for competition, and for a long period (25 or 30 years), on the basis of a Regional Law allowing such an award insofar as that thereafter and within a period of two years, the company would proceed with a call for competition for its partial privatisation.

At the time, the transactions were conducted contrary to provisions decided by the national Parliament – and they have been the subject of an appeal by the Italian Government through the courts – in the context of the 2002 Finance Law (in its article 35) which laid down that provisions of this nature could only last for a transition period of 3 years, beyond which it would be obligatory to proceed with a call for competition for the service concession.

Moreover, the numerous possibilities of extensions to the transition period have caused the Commission to react and to serve notice on the Italian State to correct these provisions. The latest changes (Decree law 269 2003 and the 2004 Finance law) have created the possibility of making "affidamenti" known as "in-house" for long periods insofar as the beneficiary company is subject to control by the public entity shareholder similar to the control on its own services and insofar as the largest portion of its activity takes place on the territory of this same local authority. As such, the Tuscan concession awards were thus ratified by National Law and numerous others have followed (Milan, Turin, Genoa, etc…).

b) More generally, poorly regulated interaction between the public sphere and the competitive market

We have already highlighted the risks of closed markets created by a too lax application of the concept of in-house or the eclipse of the awarding of the right to exercise an economic activity to a third party (and of the implicit contract) by the setting up of a mixed public private entity.

Here, we will highlight abuses observed based on the principle of free organisation of administrations. Obviously, relations between public authorities which do not constitute the provision of economic activities remain outside the scope of application of the principles of the Treaty. Such would be the case if two public authorities A and B decide to render the same service together to inhabitants by grouping themselves within an intermunicipal body C to do so (moreover, irrespective of the nature of the tasks entrusted, if this body is in-house). Such will also be the case if two public authorities A and B decide that, henceforth, the service to the inhabitants of A and B will no longer be rendered by A but by B who takes over sole jurisdiction.

On the other hand, we believe that the provision of economic activities exists between A and B when each party continues to be responsible for the service in question but when the local authorities agree to provide reciprocal, for payment or even free of charge, *ad hoc* services amongst themselves (in fact, on a *quid pro quo* basis). When the assigned "jurisdiction" is very fragmentary, it in no way enables autonomous management of their competences by either one or the other of the public entities: each party requires, and almost on a constant basis, instructions or work from the other in order to do what it has to do. Therefore, there is an exchange of services.

Admittedly, certain legislative provisions in France (e.g. article 113 of the draft law on local responsibilities) appear to seek to authorise exchanges of services without calls for competition between communities forming part of intermunicipal public entities and between intermunicipal utility consortium[1] and their constituent communities. In this event, it would be sufficient for just one of the public entities to set itself up as a service provider and to equip itself with the appropriate means for there to be no longer any possibility for an enterprise to supply the services for any one of the other group members. Furthermore, it is planned that a State-controlled "expert body" may study the setting up of new partnership contracts on behalf of local authorities. Something that raises questions of competition even if the provision of such services should *a priori* remain free of charge.

Question 21: Do you know of other forms of PPPs which have been developed in countries outside the Union? Do you have examples of "good practice" in this framework which could serve as a model for the Union? If so, please elaborate.

In exercising its activity outside Europe, VE has signed numerous PPP type contracts. It does not appear worthwhile to VE to seek other benchmarks elsewhere in the world as there are already many innovations in the European Union which have given rise to a whole body of good practices.

Question 22: More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practices, would be useful? Do you consider that the Commission should establish such a network?

[1] Cooperative arrangements may result from an intermunicipal utility consortium or the setting of a new responsible body acting as a substitute for the latter.

The PPP is a major development tool for the different counties in the Union. It allows access to enterprises' know-how, it is a guarantee that every effort will be made to obtain the best global cost by optimisation of all the elements, investments and operating procedures required to implement a service. Thereafter, it permits access to private capital and therefore the multiplication of the effects of public funds.

We need to work towards erasing the still too frequent mistrust that exists with regard to the intervention of enterprises in the framework of a PPP; mistrust doubtless based on a misunderstanding of its economic mechanisms.

Therefore, VE is absolutely in favour of creating a network and is ready to take an active part in such a venture. But VE is also in favour of benchmarking between the various practices in this domain. In particular, it would be worthwhile to provide tools for assisting with assessments of the real quality and performance levels offered and to place them in context with the costs of the services provided.

Appendix to the reply to 1

FRENCH FORMS OF PPPs

1) Delegated public service management ("Délégation de Service Public")

a) A contract basically characterised by its purpose of delegation of the management of a public service, with the French notion of "public service" referring to the functional global nature of an activity[1] Its system has been defined by the law of 29 January 1993 (Sapin Law) and its definition given by the Law of 11 December 2000: *"A delegated public service management contract ("Contrat de Délégation de Service Public") is a contract by which a public entity entrusts the management of a public service for which it has the responsibility to a public or private operator whose remuneration is substantially linked to the service's operational result and revenuese. The operator may be tasked with constructing works or acquiring goods required for executing the service".*

b) The most common variants (which are not legal categories) are:

- the concession: this is a delegated public service management in which the responsibility for property and plant investments is covered by the concessionaire who derives its primary remuneration from sales revenues (example of concession: urban heating),
- the lease: the public authority retains the contracting authority role and responsibility for investments, with the lessee ensuring maintenance and, generally, installations renewal as well as service operation in return for a type of remuneration similar to that of a concessionaire (example: water distribution service),
- the public service management contract ("Régie Intéressée") : the operator ensures the operation of the service and the maintenance of the works associated with this service. Remuneration is not derived from end users but by way of a bonus linked to service revenues and performance (example: water in Ile-de-France – Greater Paris region)

2) Partnership contracts

- A contractual legal form defined by the Ordinance of 17 June 2004:
    i) *"Partnership contracts are administrative contracts by which a public entity entrusts to a third party, for a period determined in relation to the investment amortization period or to the chosen financing methods, a global mission relative to the financing of intangible investments, works and facilities required for the public service, for the construction or transformation of works or facilities, as well as their servicing, maintenance or their management and, as required, other service provisions involved*

[1] For example, a wastewater service includes the network and treatment functions. The management of a wastewater treatment plant is not the management of a public wastewater service.

in the exercise by the public entity of the public service mission for which it is responsible."

ii) the public entity's contracting partner ensures the contracting authority role for the works to be completed,

iii) the contracting partner may be entrusted, in part or in whole, with the design of the works,

iv) the contracting partner's remuneration is the subject of a payment from the public entity throughout the entire duration of the contract. This remuneration may be linked to performance objectives assigned to the contracting partner.

- Example: household waste treatment plants with substantial revenues from recycling, so as not to be qualified as a PSD.

3) Complex set-ups

- Structure: These set-ups, based on common law contracts (deed of sale, rental contract, leasing agreement) and public property occupation contracts (long administrative lease, temporary authorisation to occupy public property), allow a private partner to be entrusted with carrying out an investment, with its financing and with operating the service for which the works are the support.
- Example: these set-ups are used for services very directly associated with major and often technical installations, insofar as the bulk of the price has to be paid by the local authority as the rules applicable to French public contracts do not allow for contracts associating different functions. Nowadays, the trend is to replace them with partnership contracts.

4) Public contracts

Definition (given by article 1 of the Public Contracts Code): *"Public contracts are contracts concluded against payment with public or private entities by public law legal entities as mentioned in article 2, to meet their needs in terms of works, supplies or services".*

APPENDIX 3

Appendix to questions 1 and 4

EXAMPLES OF PPPs AWARDED TO THE VE GROUP IN EUROPE

1) Operating contracts for light metro and tramway lines in Stockholm

These transportation services are operated by a subsidiary of the VE transportation division, Connex, within the framework of several contracts concluded for a period of ten years.
The contracts were initially concluded with a company entirely owned by the public authority. VE group's entry into the capital was conducted in two stages: firstly up to 60%, then 100%.
The VE group was selected further to a call for competition procedure. VE is not obliged to take charge of new investments which are provided by the responsible body.
The operator's remuneration is provided entirely by public contribution but varies significantly in relation to service quality, punctuality and continuity.

2) Operating contract for a railway network in the Land of Schleswig-Holstein (Germany)

This ten-year contract has been awarded to a Connex subsidiary further to a call for competition procedure. Connex has contributed an initial investment to finance rolling stock.
Contract remuneration is split between 20% from ticket sales and the remaining 80% from public contributions. It varies upwards or downwards in relation to the quality of the service rendered.

3) Household waste treatment contract for the City of Brighton and the County of East Sussex awarded to Southdowns Waste Service Limited (an SPV[1] owned 100% by ONYX Environmental Group Plc, a VE group division)

This contract, derived from the PFI model, has been concluded in compliance with rules laid down by the Office of Government and Commerce and relates to the award of the household waste collection service for the county of East Sussex and for the City of Brighton for a period of 25 years starting on 1st April 2003. Here are its main points.

a) Contract award

The project was the subject of a call for competition in accordance with British and Community rules for awarding public contracts, and after having been advertised. After an "invitation to tender" to which four enterprises replied, and then two stages of "best and final offer" reviews resulting in the designation of a "preferred bidder", the contact was signed between, on the one

[1] Special Purpose Vehicle

hand the City of Brighton and Hove and the County of East Sussex and, on the other hand, Southdowns Waste Service Limited, an *ad hoc* entity (SPV), being a VE subsidiary specially formed for this transaction.

b) Contractual set-up

The contractual provisions have been approved by the Department of the Environment and by the OGC. As indicated above, the contract period is 25 years. The main terms of the contract are as follows:

- The SPV has been formed to design and build a certain number of household waste management and collection installations comprising: the supply of three transfer stations, a compacting centre for vegetal waste, materials recycling installations and a waste-to-energy recovery installation. Furthermore, the structure has also been entrusted with the management of 15 waste recycling centres throughout the County of East Sussex. The subsidiary was responsible for the construction, the maintenance and management of the waste treatment plants in the city and the county in question.
- The enterprise (which is going to subcontract the construction of these installations) is liable for risks associated with design and construction, as well as project scheduling risks for the minor installations (this excludes the waste-to-energy recovery installation). However, the enterprise is not liable for risks associated with property or scheduling, or risks relative to obtaining the necessary authorisations for the waste-to-energy recovery plant. Nevertheless, if, despite several attempts, the appropriate authorisations and the corresponding plots of land were not to be obtained, a procedure is provided for the parties to reach agreement on a revised project. In the absence of an agreement, execution of the contract shall terminate over a three-year rundown period.
- The enterprise has exclusive rights to household waste treatment (apart from 75,000 tonnes which have been awarded to another operator).
- The payment mechanism has been designed to maintain a certain level of revenues for the company, to protect its equity capital and to cover the costs committed.
- The company is liable for recycling and electrical risks.
- The risk on the residual value of the main assets is borne by the County and special rules provide guarantees that all the assets will be properly transferred in a suitable condition to the County at the end of the contract period. Therefore, the entity is not liable for the residual value risk.

4) Contract for the supply of water and wastewater services to the City of Berlin

In 1999, in partnership with RWE, Veolia Water won the international tender for the management, for a 28-year period, of all the water and wastewater services in Berlin. Veolia Water and RWE acquired 49.9% of the entity in which the Land of Berlin retains the majority holding (50.1%). In particular, the management mandate entrusted to the two private partners has force by way of the majority of voting rights they hold within the board of management. Therefore, this is a case where the "institutional" PPP encompasses quite extensive delegation of responsibility, in the framework of a structure managed jointly by the public partner and the private partners. Since this partial privatisation, within the framework of an agreement signed with the trade unions which provides for a fifteen-year period of no redundancies and despite the extent of the major post-reunification investment programmes, significant productivity gains have been achieved that have resulted in prices, which used to rise at a very rapid rate, being held to a rate just in line with inflation (on average, 2.4% per annum since privatisation). In parallel with the partnership, Veolia Water has developed an ambitious research policy in the domain of sustainable development of water resources, in partnership with Berliner Wasser Betriebe and the Berlin universities. In addition to the productivity gains which have reduced the rate of price rises, this operation has already enabled greater effort to be invested in research and more focus to be placed on long-term environmental issues.

5) PFI contract for wastewater treatment plants in the Hague region

The contract signed on 5 December 2003 between Hoogheemraadshap van Delfland, the local public authority in charge of storm water and wastewater management and the project company Delfluent B.V., covers the design, financing, construction and operation, over a 30-year period, of the wastewater treatment plants in the Hague region, serving a population equivalent to about 1.7 million inhabitants. The wastewater treatment system, which will enter into service in 2008, will be one of the most modern in existence, capable of meeting the most stringent European norms in terms of nitrogen and phosphorus elimination.

This represents the first major public-private partnership in a country where, until this contract was awarded, water management was entrusted entirely to public bodies. Based on the PFI model, this contract enables the Delegating Authority to implement about 300 Million euros of investments, financed entirely by the private sector. The consortium led by Veolia Water has been selected for the quality of its technical proposition which anticipates achieving savings of 17% in relation to the forecast project cost as implemented by the Delegating Authority (measured in accordance with the Public Sector Comparator method).

The Project Company is controlled jointly by Veolia Water and Evides, the Rotterdam region potable water distribution board. These two shareholders, each owning 40% of the Company's capital, also have equal shares in the capital of the operating company. The other partners are Rabobank which holds 10% of the capital and which is also participating in financing the project, and two Dutch civil engineering companies, Heijmans and Strukton, each holding 5% of the capital and participating, along with Veolia Water Systems, in the construction phase.

The contractual set-up provides for a clear and strict separation of risks. In particular, technical risks are entirely transferred by the Project Company to two specialised entities, one for the design and execution of the works (representing an amount of 258 Million euros), the other for installations operation, maintenance and renewal for a 30-year period (representing an annual cost of about 20 Million euros). This contractual structure has enabled a limited recourse project financing package to be put in place, in particular comprising a syndicated loan of 298.8 Million euros, of which about half has been granted by the EIB. The particularly favourable conditions of this loan, with a 27.5-year maturity, reflects the Banks' level of confidence in the PPP economic model in the water sector.

6) Contract for the Greater Lyons heating network

Further to a call for competition, the contract for the management of the Greater Lyons heating network has been awarded to Dalkia France. A dedicated entity will ensure network operations.

The contract is for a 25-year period and investments will be implemented by the assignee. Remuneration is by way of revenues from heating network subscribers.

APPENDIX 4

Appendix to question 9

AWARDING OF COMMUNITY FUNDS AND PPPs

Community funds are essential for developing the infrastructures necessary for improving the operation of Services of General Economic Interest.

Nevertheless, the currently observed distribution conditions are not satisfactory. The malfunctions are due to the fact that the rules and procedures implemented place too much focus on investment issues without sufficiently integrating service and operating issues.

Investment decisions are prepared with insufficient account taken of the new works' operation and integration conditions, all too often leading to technical shortcomings (poor needs analysis, poor project sizing, inappropriate design …). Moreover, reinforcing the review of the project's viability and global efficiency would encourage contributions from private funds alongside public funds.

Therefore, we have to find the way of associating with the decision and implementation process, those people best placed to appreciate in a concrete manner the needs, expectations and constraints and, especially the way of associating the incumbent operator in the process, irrespective of the legal status of this entity (empowered public authority directly operating the service or public or private entity bound by contract).

Whilst nobody disputes the practical worth of such an association of operators, the procedures recommended by the Community authorities and by the relevant guidelines have misjudged this question and do not propose mechanisms adapted to the combination of this requirement with that of complying with the rules of transparency and competition which must obviously govern all allocations of European funds.

This situation is aggravated by the fact that certain parties have believed and stated that the requirements of transparency and fair competition, just as the requirements relating to the proper allocation of the funds for their intended purpose, would require private enterprises to be kept out of the process, as they are deemed to be likely to distort the decisions for their own interest, or even to find themselves in conflict of interest situations. It should also be understood that the aid is not awarded to an operator, but *in rem*, to a service and indirectly to the inhabitants who benefit from it via the price reductions made possible and that all the mechanisms, and contractual ones in particular, only exist to ensure that there are effective repercussions from the aid in terms of the price of the service.

In more concrete terms, and beyond what is written in the texts and guidelines governing the award of European funds, we have been able to observe truly regrettable situations where PPP solutions have been discounted *a priori* for the reason that they are suspected of placing the partner in a conflict of interest situation.

We detail below the most frequently encountered regrettable situations. They are even more regrettable as, in practically every case, proven solutions exist which would, with appropriate safeguards, prevent the involvement of an enterprise whose activity was to operate a public service from invalidating or distorting the competition process.

1) Integration of a new facility into an operation delegated to a private enterprise

This integration has been considered as a source of problems if the operations are already managed by a private enterprise, for fear that the latter would gain an unjustified benefit. Up to the point that it has been considered advisable to complete the construction of the facilities likely to be supported by aid prior to envisaging the award of the service operation contract to a private enterprise.

Be that as it may:

- It is possible for a public authority to agree and negotiate the conditions under which the partner takes into account the operation of a new facility and to do so under conditions which allow compliance with the initial financial balance.
- The contract amendment to be concluded, must not only take into account the extra operating costs created by the new equipment but also any possible additional operating revenues, and must stipulate adjustments to the initial financial conditions by taking accurate account of the impact of these variations, in such a way that the end user benefits from the advantages derived from the aid obtained for creating the facility.

2) Conditions of intervention of an operating enterprise operating the service in the framework of a PPP at the procedures definition stage and then at the new aided facility's construction stage.

The general rules of competition require that any candidate for a contract shall be provided with all necessary or simply useful information and that there should not be inequality of information between candidates. This requires the operator of the service for which the facility is intended to produce all relevant information in its possession.

Insofar as the specification is complete, nothing justifies, in fact or in law, that a company "linked" to the enterprise holding a PPP (i.e. within the same group) should be prohibited from submitting a bid in response to a call for competition launched for the design/construction of the new facility:

- In fact: there is no question of distortion of competition and to refuse this participation would lead to prohibiting the public authority from benefiting from the technology developed by the group of the entity selected for the PPP (this would be paradoxical and, in any event, regrettable),

- In law: improper exclusion of such a candidate would constitute a breach of everyone's rights to submit bids and would invalidate the procedure as it is only in the event of a clear and established conflict of interest, without any possible remedy, that a candidate may be *a priori* legally excluded.

However, in the framework of a PPP, the operating enterprise may only legitimately intervene at the stage of the procedure where its contribution is useful, i.e. during the stage of defining the facility and drafting the consultation, then at the time of acceptance of the completed facilities as it is natural for the incumbent operator to express its views on the suitability of the facility for its stated purpose. Obviously, the operating enterprise should not intervene at the candidate selection stage. This rule is even more important when a company close to the operator has submitted its bid for the construction contract.

The proposed guidelines on ISPA funds have been excessive in qualifying as conflict of interest situations, those situations that are at the most sensitive and that simply call for precautions to be taken to ensure compliance with the principles of competition.

Competition law only recognises conflict of interest situations justifying the exclusion of certain candidates if it is not possible to find other solutions for preserving equality of candidates and for avoiding distortions of competition. Exclusion would be quite an exceptional solution as it would be contrary to the principle of free access to all public contracts. Moreover, such solutions do exist and are widely practised. They enable situations of links between participants to be managed in a transparent manner and for unjustified or discriminatory advantages to be avoided.

It is a matter to be treated on a case-by-case basis, and it is accepted that the existence of legal links between the enterprise participating in the design/construction and the one tasked with operations does not justify *per se* any limitations whatsoever on the right to submit a bid.

In reality, true conflict of interest situations are rare and the requirement of avoiding them must not result in depriving public authorities of a global economic analysis of the planned project and/or in depriving the service of access to the technologies proposed by a company being part of a group, for the reason that a company within the same group is the operator of this public service within the framework of a PPP.

In brief:

1) To obtain efficient use of European aid funds intended for constructing facilities, the investment must not be dissociated from the operation, as this association results in:
- proper adaptation of the investment to the needs,
- subsequent service improvements,
- leverage effect for obtaining private capital,

and therefore it can only be enhanced even further by PPP set-ups.

2) This requires building on the competences of those enterprises developing service operator activities, whether they are already operators within the framework of a PPP, or whether they are capable of being such.

3) Be that as it may, the opposite is currently the case. Not due to the fair reason of required compliance with competition rules and the proper allocation of funds in the general interest, but due to reasons arising from ignorance of proven mechanisms designed to guarantee compliance with these principles, enterprises holding PPPs are all too often excluded from the process:

- either from operations, upstream of the facility construction, for fear of conferring an unjustified advantage on the operator,
- or from the facility construction procedure, downstream of an operating contract, for fear of distorting competition.

4) However, in most cases fears of non-compliance with legal rules are unjustified, as proven practices exist which enable cooperation situations between entities having diverging interests to be managed. They should be studied by the Community departments, in consultation with the relevant public entities and with both public and private operating enterprises. Then they could be usefully proposed to all actors concerned.

VEOLIA
Water

Contents

1. Water and wastewater sector characteristics

a. **A Service of General Economic Interest**

b. **A traditional responsibility experiencing development**

c. **An increased Public Health responsibility**

d. **New domains of responsibility**

e. **Insufficiently informed consumers**

2. Desirable forms of calls for competition

a. **An operational geographic area framed by the nature of the activity**

b. **An integrated service over a sufficent timescale**

- ➢ To satisfy the obligations of results
- ➢ To encourage productivity gains
- ➢ To guarante overall responsibility
- ➢ To limit transition costs
- ➢ To avoid competitive distortions

1. Water and wastewater sector characteristics

1. Water and wastewater sector characteristics

a) A Service of General Economic Interest

- **A service meeting a vital need for everyone: private individuals, tertiary activities, industries;**

- **which must,**

  i. guarantee them compliance with stringent public health and environmental standards.

  ii. offer them a high quality of service.

- **and this, without interruption, irrespective of the vagaries to which the service may be subjected (heat waves, flooding, pollution…).**

1. Water and wastewater sector characteristics

b) A traditional responsibility experiencing development:

- functional responsibility for service continuity and adaptability exercised over extensive networks connecting consumers to potable water production and wastewater collection installations.

- increasingly exposed to all sorts of vagaries (climate extremes, pollution, terrorism,..).

1. Water and wastewater sector characteristics

c) An increased Public Health responsibility

- **Questions of quality, continuity, safety are crucial for Public Health.**

- **These questions are becoming more complex and are increasing actors’ responsibilites in the water sector:**

  i. in the short term, the growth in vulnerable populations (including the elderly…), the appearence of new biological risks (Legionnaires disease, guardia, cryptosporidium..) place extra responsibilites on the service.

  ii. for the longer term, risks linked to pesticides, to endocrine disruptors, to antibiotics and to all hard to identify pollutants pose increasingly complex quality problems.

1. Water and wastewater sector characteristics

d) New domains of responsibility:

i. a responsibility for providing proactive and transaprent information and communication vis-à-vis consumers.

ii. an environmental responsibility for controlling the impacts on the environment of all the infrastructures, of their operation and of the residues from this operation (sludge).

Example 1: Integration of our treatment plants into the Côte d’Azur environment in France

Construction of wastewater treatment plants in compliance with European norms and in response the strict environmental, land occupation and noise/odour pollution constraints:

Toulon, Cap Sicié

- **Marseilles: plant constructed under a stadium.**
- **Monaco: plant in the city centre.**
- **Toulon, Cap Sicié: cliff excavated to accomodate plant.**
- **Antibes, plant under a green area, 100m from the beaches.**

1. Water and wastewater sector characteristics

e) Insufficently informed consumers

- about the price of water
  - according to the latest surveys conducted in France, it is estimated that only 20 % of French consumers are aware of the approximate price of 1,000 litres of water.
- about its components
  - very marked ignorance of wastewater treatment, a service that is not very visible to the end user, but that does however currently represent investment costs that are 50 % to 60 % higher than those for potable water.

1. Water and wastewater sector characteristics

In brief

- an unstable raw material.
- destined to become a vital food product.
- dependent on external conditions subject to high variability.
- destined for demanding consumers.

illustrating

- the demanding nature of this profession.
- the responsibility placed on its managers.
- the possibility of exercising real competition on the product, the service and the price.

Conditions of competition must enable water service operators to exercise their responsibilities in full and enable consumers and their representatives to question and assess the quality of the service.

2. Desirable forms of competition

2. Desirable forms of competition

a) An operational geographic area framed by the nature of the activity

- **Taking into account:**

  i. the physical impact of investments ⇨ non duplication of assets.
  ii. high level of Public Health responsibility.
  ⇒ no competition for the final consumer.

  iii. high costs of operating the investment.
  iv. prohibitive costs of transport (long distances).
  ⇒ local monopoly.

⇨ **Competition is exercised "for" a territory and a complete population within which there is an exclusivity of operation.**

2. Desirable forms of competition

- **The size and the geographic perimeter of the operating unit depends on an arbitrage between:**

  i. the largest possible volume of population which will enable to the assigned public investments to be amortized.

  ii. the proximity/density of this operating unit as a limiting factor on water investments and transport costs.

  iii. other non-economic phenomena such as politico-administrative units and the geographic features of the territory (location of the resource,..).

- **Depending on the case, we observe a resulting geographic scale varying fromregion 500 to 10,000 km².**

2. Desirable forms of competition

b) An integrated service over a sufficient timescale

The two basic conditions for the end user to benefit from the optimisation of a water service are:

- the respect of the integrated character of the service.
- a contract timescale of sufficient length for optimisation to be acheived.

2. Desirable forms of competition

➢ **To satisfy the obligations of results:**

- **water contracts increasingly incorporate precise and quantified obligations of results (network outputs, water quality, customer service) each with its own variable timescale.**

- **these obligations of results are the fruit of a collection of interdependent organisational, management and investment decisions.**

2. Desirable forms of competition

➢ To encourage productivity gains:

- **the service manager of a water service renews and operates assets with varying service lives, in an interdependent manner:**

  i. operating equipment: 2 to 8 years.
  ii. meters: 6-12 years; electromechanical machinery: 12-20 years.
  iii. networks: 30 years and more.

- **operating tasks and renewal choices are interdependent (e.g. renewal / maintenance):**

  i. their optimisation is at the heart of the operator's know-how.
  ii. short contracts necessarily give rise to perverse effects of under-investment and extra operating costs.

VEOLIA Water

2. Desirable forms of competition

➢ **The operator's action must integrate three distinct cycles**

- **Short-term cycle for variable costs optimisation (in particular maintenance and purchases).**

3-5 years

- **Medium-term cycle for operational organisation (restructuring, gradual workforce reductions, "insourcing"…).**

6-10 years

- **Long-term cycle for investment scheduling (both renewal and modernisation investments).**

8-15 years

2. Desirable forms of competition

Thus, the operator has focus constantly play on all three timescales to make the best possible decisions while taking account of all aspects of the service.

For example: rationalisation of subcontracting costs falling within the short-term cycle must be coupled with:

- decisions about the organisation of the controls on this subcontracting and, more globally with the insourcing / subcontracting balance which governs changes in the workforce. (medium-term cycle).
- Investment scheduling decisions (long-term cycle), in particular in relation to the maintenance costs / renewal costs arbitrage.

2. Desirable forms of competition

- **To guarantee overall responsibility, long-term and integrated contracts enable**

  - **long-term changes to be integrated:**

    i. anticipation and integration of changes that are often over a ten-year timescale, such as the implementation of a European Directive.

    ii. integration of technical innovation; the contract manager has an incentive to propose and to integrate innovation, for which concrete benefits for the end user could be far into the future.

    iii. forward-looking management of environmental and Public Health risks.

  - **and reactions to emergencies:**

    i. responsibility in the light of vagaries: e.g. flooding (recent examples in Central Europe and, to a lesser extent in France) or droughts (e.g. in 1976 in France).

2. Desirable forms of competition

➢ To limit transition costs

- **The alternative would be the frequent renewal (e.g. every five to seven years) of contracts which could only be based on an obligation of means. The perverse effects of this system are obvious:**

  i. the local authority is obliged to take charge *in abstracto* and *ex ante* of the bulk of the work related to organisation and allocation of ressources. By doing so, it loses the benefits of optimisation whilst increasing many of its own costs.

  ii. the obligation of results disappears and system assessment becomes more difficult.

  iii. the tender renewal programme rate occupies the bulk of the assigning authority 's resources, increases costs and limits the benefits it derives from the delegation of the service.

VEOLIA Water

2. Desirable forms of competition

➢ To avoid competitive distortions.

- **Calls for competition for short-term contracts :**

  i. accentuate the barrier to entry for new competitors who are less inclined to take risks for a short period of activity.

  ii. deprive the local authority of the possibilities of differentiated bids for which a longer contract term would offer broader scope for propositions (on long-term investments,..).

  iii. therefore, favour conservatism and grant a *de facto* "home advantage" to the incumbent operator.

2. Desirable forms of competition

c) An activity perimeter encompassing water and wastewater?

- **Integrated management of the totality of the water cycle presents advantages in terms of costs:**

  i. operating cost savings on common competences (e.g. servicing, maintenance and renewal costs of electromechanical machinery).

  ii. customer management cost savings are guaranteed on the basis of joint meter reading and billing activities.

  iii. overhead cost savings on the structure required for ensuring the link, on a same terriory, between the two services.

2. Desirable forms of competition

- **Inegrated management of the complete water cycle:**

  i. allows for joint action for protecting the natural environment.

  ii. is necessary when the natural environment is the same for both services, i.e. when the potable water distribution service takes water from the environment where the waste treatment service pumps out treated waste.

  iii. even more vital when the resource in question is rare and/or under threat. The following example of Berlin is interesting in this aspect;

  iv. moreover, enables a united environmental approach to be adopted vis-à-vis the populations served.

2. Desirable forms of competition

The example of Berlin

For 70% of its supplies, the city relies on increasingly solicited, shallow groundwater tables. Therefore, in our role as water manager we must:

i. regulate the drawing of potable water so as to maintain the balance of the groundwater tables whilst avoiding any overflowing;
ii. manage re-injections into natural surroundings (in particular by riverbank filtering) in the context of our responsibility for wastewater;
iii. perfect our understanding of the water table replenishment mechansims and the possible recycling within them of new pollutants (endocrine disruptors);
iv. Thus, over a10 year period Veolia Water, in partnership with universities, is investing 50 M€ into research to maintain the city's environmental future.

2. Desirable forms of competition

In brief:

- **Water is a natural monopoly, but contrary to popular belief, the service is improving greatly, due to competition for the market.**

- **Calls for competition on long-term, integrated contracts, if they are properly regulated:**

  - **can produce significant gains in productivity and in the quality of the service.**

  - **satisfy end users' needs and expectations in an overall and integrated manner.**

- **Absence of open competition produces the opposite effects.**

Europäische Kommission
„Konsultation Grünbuch zu öffentlich-privaten Partnerschaften
und den Gemeinschaftlichen Rechtsvorschriften für
Öffentliche Aufträge und Konzessionen“

B-1049 Brüssel

„Konsultation Grünbuch zu öffentlich-privaten Partnerschaften und den gemeinschaftlichen Rechtsvorschriften für öffentliche Aufträge und Konzessionen – C 100 2/005“

Sehr geehrte Damen und Herren,

gern beantworten wir die im Grünbuch gestellten Fragen. Dabei beschränken wir uns auf Teilaspekte, die wir auf Grundlage unserer Erfahrungen beurteilen können.

Wir sind von der Notwendigkeit überzeugt, öffentliche Vorhaben durch ÖPP-Modelle zu organisieren, da diese eine effizientere Verwendung der öffentlichen Mittel – unter Einschluss privaten Kapitals und Engagements – erwarten lassen, um so auch bei der derzeitigen desolaten öffentlichen Haushaltslage Infrastrukturvorhaben in Europa verwirklichen zu können.

Insbesondere gilt dies für die verkehrliche Infrastruktur, deren Bedeutung von der Europäischen Union durch die Definition der Transeuropäischen Netze (TEN) bestätigt worden ist. Der Situation in Deutschland als größtem Transitland im Zentrum Europas kommt im Kontext mit der jüngsten EU-Erweiterung und den stark wachsenden Verkehrsmengen hinsichtlich des Ausbaus der Verkehrsinfrastruktur eine herausragende Bedeutung zu.

Unser Ingenieurunternehmen IMS (www.ims-ing.de) ist seit über 30 Jahren an zahlreichen Infrastrukturgroßprojekten in Norddeutschland planerisch und beratend beteiligt. Die nachfolgenden Ausführungen beziehen sich daher schwerpunktmäßig auf große und komplexe Projekte der verkehrlichen Infrastruktur.

Zu Frage 1: kein Kommentar

Zu Frage 2:
Das Verfahren des wettbewerblichen Dialogs kann die in den Punkten 26 und 27 angestrebten Grundsätze wie:

- Transparenz und Gleichbehandlung
- Objektivität und Integrität

- * Rechtssicherheit
- * Vorgabe technischer Spezifikationen in Form von Leistungs- oder Funktionsanforderungen
- * Innovative Lösungen
- * Verantwortungsvolle Nutzung der Steuergelder

nur dann erfüllen, wenn der Wettbewerb um Bau-, Finanzierungs-, und Betreiberdienstleistungen auf der Grundlage einer präzisen detaillierten technischen Planung und Kostenberechung durchgeführt wird. Die Wettbewerbsunterlagen sowohl für die Bau-, Finanzierungs- und Betreiberdienstleistungen sollten von liefer- und leistungs-unhängigen Adressen erarbeitet werden. Bei Einreichung der Angebote sollten innovative Lösungen zugelassen sein. Sie sollten an dem vom Auftraggeber (Öffentliche Hand) vorgegebenen Lösungskonzept gemessen werden. Eine solche Vorgehensweise stellt sicher, dass:

- * vergleichbare Angebote eingehen,
- * der Wettbewerb durch Beteiligung des Mittelstandes nicht eingeschränkt wird
- * der Leistungsumfang klar beschrieben ist und damit Rechtssicherheit weitestgehend besteht
- * und last not least durch konsequenten Wettbewerb eine größere Wirtschaftlichkeit, d.h. verantwortungsvolle Nutzung der Steuergelder erreicht wird.

Bau-, Finanzierungs- und Betreiberdienstleistungen können durchaus in einem Paket an ein Konsortium vergeben werden, jedoch nur auf Grundlage einer wie o.e. präzisen Leistungsbeschreibung für diese Dienstleistungen.

Zu Frage 3: kein Kommentar

Zu Frage 4:
Die IMS Ingenieurgesellschaft hat bei einem ÖPP-Projekt (Warnowquerung, Rostock) die Konzessionsgeberin beraten. Dabei konnte sie die Phasen

- * Ausschreibung und Vergabe der Konzession,
- * Verhandlungen bis zum Abschluss des Konzessionsvertrags und
- * Durchführung der Phasen Planung, Bauausführung sowie Betriebsaufnahme

begleiten.

Die Konzession wurde ohne einen für alle Bieter gleichermaßen geltenden Vertragsentwurf ausgeschrieben. Die nach Zuschlagserteilung erfolgten Vertragsverhandlungen erbrachten für die Konzessionsgeberin tendenziell nachteiligere Vertragsbedingungen, als wenn diese Verhandlung vor Zuschlagerteilung erfolgt wären.

Die Ausschreibung der Konzession erfolgte auf der Basis eines Ideenwettbewerbs mit Funktionsbeschreibung. Das Fehlen einer detaillierten Leistungsbeschreibung auf der Grundlage eines genehmigten Entwurfs führte dazu, dass die Konzessionsgeberin nicht beurteilen konnte, welches der Angebote nach Qualität und Leistung wirklich das günstigste war. Es fehlte ferner die Sicherheit, ob die angebotene Idee genehmigungsfähig war, bzw. mit welchen Kosten eine Genehmigungsfähigkeit zu erreichen sein würde. Weiterhin fehlten Kenntnisse über die Baurisiken, wodurch diese den Vertragspartnern nicht eindeutig zugeordnet werden konnten. Die Übernahme dieser unbekannten Risiken durch den Konzessionsnehmer verteuerten sein Angebot durch unnötig hohe Risikozuschläge.

Zu Frage 5:
Das Gemeinschaftsrecht ist sicher präzise genug, um eine effektive Teilnahme von Gesellschaften oder Gruppierungen aus anderen Staaten an den Konzessionsvergabeverfahren sicher zu stellen. Praktisch sind allerdings die projekt-/auftraggebernahen Unternehmen (Bieter) gegenüber anderen im Vorteil, weil sie in der Regel wirtschaftlicher anbieten können. Durch Einbindung des Mittelstandes sollte daher auch erreicht werden, dass mehrere projekt-/auftraggebernahe Unternehmen am Wettbewerb beteiligt werden.

Zu Frage 6: kein Kommentar

Zu Frage 7:
Ein neues Gesetzgebungsvorhaben der Kommission sollte, wenn überhaupt, nur allgemeine Grundsätze enthalten, jedoch mit der sehr konkreten Vorgabe, Wettbewerb um Bau-, Finanzierungs- und Betreiberdienstleistungen nur auf der Basis sehr präziser Leistungsbeschreibungen, die von liefer- und leistungsunabhängigen Unternehmen erbracht werden, durchzuführen (siehe auch Antwort auf Frage 2).

Zu Frage 8: kein Kommentar

Zu Frage 9: kein Kommentar

Zu Frage 10:
Die von uns in der Phase im Anschluss an die Auswahl des privaten Partners von ÖPP auf Vertragsbasis gemachten Erfahrungen weisen erhebliche Defizite in der Projektdurchführung auf, die ihre Ursache in einer mangelhaften Beschreibung der vereinbarten Leistungen hatten (Funktionalausschreibung).

Zu Frage 11: kein Kommentar

Zu Frage 12:
Die von uns beobachteten Praktiken oder Mechanismen zur Bewertung von Angeboten zeigen, dass ohne vergleichbare Angebote auf der Grundlage sehr präziser Leistungsbeschreibungen die Vergabe von den nicht erfolgreichen Wettbewerbern als häufig diskriminierend empfunden werden.

Zu Frage 13: kein Kommentar

Zu Frage 14: kein Kommentar

Zu Fragen 15, 16, 17:
Es besteht bei den wenigen bisher in Deutschland durchgeführten oder geplanten ÖPP-Verkehrsinfrastrukturprojekten die Praxis/Absicht, den privaten Auftragnehmer (Konzessionär) auch die Überwachung und damit die Qualitätssicherung des zu errichtenden Bauwerks mit zu übertragen. Da in der Regel zwischen Konzessionär und bauausführendem Unternehmen gesellschaftliche Abhängigkeiten bestehen, sollte grundsätzlich durch entsprechende Regelungen sichergestellt werden, dass alle bauüberwachenden und qualitätssichernden Funktionen von liefer- und leistungsunabhängigen Unternehmen erbracht werden.

Zu Fragen 18 und 19:
Diese Fragen können nur aus der Sicht eines „normalen“ EU-Bürgers beantwortet werden:
Bei der Einrichtung institutionalisierter ÖPP erscheint besonders problematisch, echten Wettbewerb zu realisieren und auch transparent zu machen, weil in der Regel die öffentliche Hand als Auftraggeber auch an der institutionalisierten ÖPP beteiligt ist.

Zu Frage 20:
Diese Frage kann nur für Deutschland beantwortet werden:
Die Einrichtung für ÖPP für große Verkehrsinfrastrukturvorhaben in Deutschland behindern im Wesentlichen:

- Der Widerstand in den fachlich zuständigen Verwaltungen mit dem ordnungspolitisch durchaus richtigen Argument, es findet keine Trennung von Planung und Ausführung statt und somit kann kein präziser Wettbewerb mit der Entgegennahme vergleichbarer Angebote organisiert werden und damit werden wirtschaftliche Lösungen nicht erreicht.

- Die Finanzlage der öffentlichen Hände in Deutschland ist so desolat, dass in Bund und Ländern Planungsbudgets zur detaillierten Vorbereitung von echtem Wettbewerb um Bau-, Finanzierungs- und Betreiberdienstleistungen in nur sehr geringem Maße zur Verfügung gestellt werden. Dieses hat zur Folge, dass in der gesamten Öffentlichkeit (Verwaltungen, Politik und Bürger) bisher nur geringe Akzeptanz für ÖPP-Projekte vorhanden ist, weil bei den bisherigen ÖPP-Modellkonzepten auf eine unabhängige projektvorbereitende und vor dem Wettbewerb laufende Planung verzichtet wird, auch auf die nachweisbare Gefahr hin, dass die Kosten für die Planung nur ein vernachlässigbarer Teil der vermeidbaren Mehrkosten für Bauinvestitionen, Finanzierungskosten und Betreiberkosten sind.

Schlussbemerkung:

1. Die Leistungsfähigkeit der Verkehrsinfrastruktur in Europa, insbesondere im Transitland Deutschland, ist für die globale Wettbewerbsfähigkeit der Europäischen Gemeinschaft von zentraler Bedeutung.

2. ÖPP-Projekte können einen signifikanten Beitrag zum Bau und zur Unterhaltung dieser Verkehrsinfrastur leisten.

3. Eine wirtschaftliche und von öffentlicher Akzeptanz getragene Durchführung von ÖPP-Projekten setzt notwendigerweise voraus, dass die Projektvorbereitung in den Händen liefer- und leistungsunabhängiger Unternehmen liegt und Wettbewerb um Bau-, Finanzierungs- und Betreiberdienstleistungen nach strengen Wettbewerbsregeln organisiert wird.

4. Die konsequente Einhaltung der vorgenannten Grundsätze liegt letztlich auch im Interesse der Bau-, Finanzierungs- und Betreiberdienstleistungserbringer, da nur so eine höhere Akzeptanz und damit eine größere Nachfrage (Marktvolumen) für ÖPP-Vorhaben entsteht.

5. Der Schlüssel für das Ingangbringen von ÖPP-Projekten in erforderlicher Zahl liegt daher allein in der Zurverfügungstellung von relativ geringen Planungsbudgets zur ordnungsgemäßen Vorbereitung komplexer Verkehrsinfrastrukturprojekte nach dem ÖPP-Modell.

Mit freundlichen Grüßen
IMS Ingenieurgesellschaft mbH

Die Privatisierung von Aufgaben der öffentlichen Daseinsvorsorge durch Gründung einer gemischt-wirtschaftlichen Gesellschaft des Handelsrechts (Public-Private-Partnership) und das Vergaberecht.

I. Formen der Gemeindetätigkeit im Bereich Daseinsvorsorge

Körperschaften des öffentlichen Rechts, insbesondere Gemeinden und Gemeindeverbände, haben schon immer Aufgaben der Daseinsvorsorge in Eigenleistung erbracht. Insbesondere trifft dies für die Abfallentsorgung sowie die Reinigung und Unterhaltung städtischer Anlagen zu. Die entsorgungspflichtigen Selbstverwaltungskörper sind jedoch nicht auf Erbringung dieser Leistungen auf eigenes Personal beschränkt, sondern ihnen stehen auch Privatisierungsmöglichkeiten zur Verfügung. Deren Ziele sind vielfältiger Natur und reichen von ordnungspolitischen Erwägungen über Gesichtspunkte der Flexibilitäts- und Effektivitätssteigerung bis zu steuerlichen Aspekten und zum Hauptziel der Kostenersparnis. Soweit hierfür das Kreislaufwirtschafts- und Abfallgesetz vom 07. Okt. 1996 die Rechtsgrundlage bietet, können die Gemeinden mit der Ausführung ihrer Pflichten Dritte als ihre Erfüllungsgehilfen beauftragen (vielfach genannt formelle Privatisierung) oder an sach- und fachkundige sowie zuverlässige Dritte die Pflichten selbst ganz oder teilweise übertragen (vielfach genannt materielle Privatisierung). Darüber hinaus steht es den Körperschaften des öffentlichen Rechts zu, in einer selbstgewählten Gesellschaftsform des Handelsrechts oder Privatrechts mit anderen Körperschaften des öffentlichen Rechts oder mit privaten Entsorgungsfirmen ihren öffentlich-rechtlichen Pflichten nachzukommen (PPP) oder ihren eigenen Entsorgungsdienst im Gewande einer Gesellschaft des Privatrechtes auszugliedern (In-house-Geschäft).

Weder haben sich bislang im öffentlichen Verwaltungswesen verbindliche Privatisierungsmethoden oder –Vorgänge herausgebildet, noch gehören die Bezeichnungen „Public-Private-Partnership“ und „In-house-Geschäft“ zur vergaberechtlichen oder anderweitigen gesetzlichen Terminologie. Die letzten beiden

Begriffe warten immer noch auf eine Inhaltsbestimmung derjenigen, die diese Termini technici benutzen. Der EuGH hat sie bisher nicht verwendet und die EG-Kommission sucht seit Jahren nach einer allgemeingültigen Definition.

Die Darstellungsform der Schaffung einer gemischt-wirtschaftlichen juristischen Person des Privatrechts wurde in der Bundesrepublik bereits vor Veröffentlichung der Europäischen Richtlinien am Ende der 70iger Jahre und vor deren Umsetzung in das bundesdeutsche GWB beschrieben und diese Rechtslage besteht auch heute noch bei öffentlichen Aufträgen unterhalb der Schwellenwerte.

II. Privatisierung und öffentliches Auftragswesen

1. Verdingungsordnungen, PreisVO Nr. 30/53 (altes Recht)

Sedes materiae sind § 2 (1) der Verordnung PR Nr. 30/53 über die Preise bei öffentlichen Aufträgen (Definition „öffentlicher Auftrag") sowie die förmlichen und materiellen Vergabebedingungen der VOL, VOB und VOF. Öffentliche Aufträge im Sinne der Preisverordnung sind Austauschverträge vor allen Dingen in der Form von Kauf-, Miet-, Werk-, Lieferungs- und Dienstleistungsaufträgen als „Bedarfsdeckungsgeschäfte" der öffentlichen Hand. Unstreitig fallen unter derartige Geschäfte nicht Gründungen von Gesellschaften. Weder findet die Preisverordnung Anwendung noch das Vergaberecht. Außerdem kann nach der Preisverordnung nur eine Körperschaft des öffentlichen Rechts ein „öffentlicher Auftraggeber" sein, nicht z.B. eine gemischt-wirtschaftliche Gesellschaft bestehend aus einer Behörde und einem privatrechtlichen Unternehmen. Ist der Vertragspartner eines öffentlichen Auftraggebers aber eine Privatperson, die zur Erfüllung ihres öffentlichen Auftrages einen Unterauftrag abschließen muss und besitzt der öffentliche Auftraggeber ein Interesse daran, den erststufigen Unterauftragnehmer der Preisverordnung zu unterwerfen, besteht die Möglichkeit einer solchen Einbeziehung dieser Unterauftragnehmerleistung in den öffentlichen Auftrag durch das Verfahren nach § 2 (4) VO PR 30/53.

> *vgl. Ebisch-Gottschalk, Kommentar Preise und Preisprüfungen bei öffentlichen Aufträgen, 7. Aufl. 2001 zu § 1 RdNr. 10; zu § 2 RdNrn. 7,11, 42 ff.*

Durch diese mittelbare Einordnung in das öffentliche Auftragsverhältnis wird der erststufige Unterauftragnehmer zur Duldung der Preisprüfung seiner Leistung verpflichtet (§§ 8, 9 VO PR 30/53). Sein Unterauftrag wandelt sich nicht in einen öffentlichen Auftrag um. Verpflichtungen aus dem Vergaberecht werden hierdurch nicht begründet. Das Verfahren nach § 2 (4) VO PR 30/53 gilt nicht für öffentliche Bauaufträge. Denn die Baupreis-Verordnung VO PR 1/72 wurde mit Wirkung vom 16. Juni 1999 aufgehoben, ohne dass Bauleistungen der weitergeltenden VO PR

30/53 zugeordnet wurden. Dieses „alte Recht“ gilt auch heute noch für öffentliche Aufträge im Sinne der Preisverordnung unterhalb der Schwellenwerte.

2. Richtlinien der EU, Verdingungsordnungen, GWB

Gegenstand des Vergaberechts ist der öffentliche Auftrag als Bedarfsdeckungsgeschäft der öffentlichen Hand.

Das in der Entwicklung begriffene Vergabegemeinschaftsrecht in der Europäischen Union ließ nicht erkennen, dass der öffentliche Auftrag seiner Qualifikation nach eine andere Funktion erhalten solle als ein „Bedarfsdeckungsgeschäft der öffentlichen Hand“ gemäß der jahrzehntelang in Deutschland praktizierten Art. Auch die in der Folgezeit veröffentlichten Richtlinien des Rates der Europäischen Gemeinschaften und deren Umsetzung durch das Vergaberechtsänderungsgesetz/GWB 4. Teil 1998 hatte zu dieser Frage keine anderslautende Regelung geschaffen. § 99 (1) GWB erhielt zwar eine etwas präzisere Ausgestaltung als § 2 (1) VO PR 30/53; sein materieller Sinngehalt unterscheidet sich jedoch nicht von dieser preisrechtlichen Bestimmung. In ständiger Rechtsprechung stellt der EuGH einen konkreten und nachweisbaren öffentlichen Auftrag als Voraussetzung der Anwendung des Vergaberechts heraus.

Umso weniger verständlich mussten daher erste Verlautbarungen von Vergabekammern außerhalb ihrer entscheidungsrelevanten Beschlussbegründungen sowie Besprechungen in der juristischen Literatur und einzelne Beurteilungen aus dem Kartellbereich wirken, als die Meinung vertreten wurde, gemischt-wirtschaftliche gesellschaftsrechtliche Kooperationen im gemeindlichen Entsorgungswesen seien europaweit ausschreibungspflichtig.

Angesichts eines europäisch beeinflussten „Vergaberechtsänderungsgesetzes“, welches offenbar als völlig neues Rechtsgebiet empfunden wurde, vergaß man plötzlich, zur Frage der Ausschreibungspflicht als erstes Tatbestandsmerkmal das Vorliegen eines „öffentlichen Auftrages“ zu ermitteln.

Die Vergabekammer Düsseldorf z.B. nimmt in einem Beschluss aus dem Jahre 2001 zu Beginn ihrer Entscheidungsgründe in einem Nachprüfungsverfahren ein diesbezügliches Untersuchungsergebnis vorweg und führt aus, das Rechtsgeschäft zwischen der Gemeinde als Gründungsmitglied und der zu errichtenden gemischt-wirtschaftlichen Entsorgungsgesellschaft sei als öffentlicher Auftrag zu qualifizieren,

> *„... da ansonsten durch die Kombination einer Gesellschaftsgründung und Aufgabenübertragung die ... Leistungsbeschaffung im Wettbewerb beliebig unterlaufen werden könnte ... Eine Regelungslücke, die derartige kombinierte Verträge bewußt dem Vergaberecht entziehen wollte, ist nicht erkennbar ...“*
>
> Land NRW, Beschluss Vergabekammer Düsseldorf – VK 12/2000 – L vom 07. Juli 2000; NZ Bau 2001. 46

Ähnlich ist Jaeger in seinem Beitrag zum Düsseldorfer Beschluss vorgegangen, in dem er dessen Meinung verteidigte. Er meint, bereits die Gesellschaftsgründung sei zwangsläufig dem Vergabeprimat zu unterwerfen, weil mit dieser Maßnahme

> *„... gesellschaftsrechtliche Konstruktionen gewählt werden, die darauf hinauslaufen, die Anwendung des Vergaberechts im Verhältnis zwischen Gemeinde und der gemischten Gesellschaft auszuhebeln“...*Die vergaberechtliche Prüfung müsse auch auf die Kooperationsgründung erstreckt werden *„... wenn die Gesellschafter versuchen, dieses Ergebnis durch eine geschickte Vertragskonstruktion zu vermeiden – und dieses Bestreben wird wohl immer vorhanden sein, weil die Public-Private-Partnership ihren Sinn sonst verfehlt.“*
>
> Aufsatz: Vorsitzender Richter am OLG Wolfgang Jaeger, Düsseldorf *„Public-Private-Partnership und Vergaberecht“* in NZBau 2001, 7 ff.

Wir fragen uns, auf welchem Boden wohl die Meinung der Vergabekammer Düsseldorf sowie die Auffassung von Jaeger gewachsen sein mag, die Gründung einer gemischt-wirtschaftlichen Kooperation müsse dem Wettbewerb unterstellt werden, damit das Vergaberecht nicht „unterlaufen“ bzw. „ausgehebelt“ werden könne und welche Überlegungen es wohl rechtfertigen, die Gründung einer gemischt-wirtschaftlichen Gesellschaft als Privatisierungsmodell und als vergaberechtsfeindlich zu diskreditieren. Ein derartiges Verdikt ist unangebracht. Die Gründung einer Gesellschaft im öffentlich-rechtlichen Bereich ist vergaberechtlich neutral. Dem Vergaberecht unterliegen nur „öffentliche Aufträge“. Versieht die Gründergemeinde die neue gemischt-wirtschaftliche Gesellschaft nach deren Errichtung mit einem öffentlichen Auftrag, bleibt dieser öffentliche Auftrag dem Vergaberecht unterworfen (vgl. unten III. 1.).

Das Vergaberecht ist kein „Regime“

Kaum waren die ersten Nachprüfungsverfahren eingeleitet, las man in Beschlüssen einiger Vergabekammern vom neuen Vergaberecht als einem „Vergaberechtsregime“.

> Land Niedersachsen, Vergabekammer Lüneburg – 203 VgK – 06/1999 vom 10. Aug. 1999; NZBau 2001, 51; Überschrift der Leitsätze: „Vergaberechtsregime bei Kooperationsmodellen und Diskriminierungsverbot“.
>
> Land NRW, Vergabekammer Düsseldorf, Beschluss VK 12/2000 vom 07. Juli 2000; NZBau 2001/46; Überschrift der Leitsätze: „Vergaberechtsregime bei kommunalen Kooperationsmodellen“.
>
> Freistaat Sachsen, Vergabekammer Leipzig - 1/SVK/109-01
> vom 29. Nov. 2001 „Vergaberegime“
> - 1/SVK/074-03
> vom 01. Apr. 2003 „Vergaberechtsregime“.

Die Vergabekammer Düsseldorf hat am ehesten den Begriff „Regime“ interpretiert, indem sie damit eine gesetzgeberisch verfügte Dominanz der vergaberechtlichen Ausschreibungspflicht bei der Bildung einer gemischt-wirtschaftlichen Gesellschaft anlässlich eines gemeindlichen Privatisierungsvorhabens herausstellt. Sie will bei der Inangriffnahme einer solchen Kooperation eine „im Grundsatz vom europäischen Richtliniengeber wie vom nationalen Gesetzgeber gewollte umfassende Leistungsbeschreibung im Wettbewerb“ erkannt haben. Indessen geben weder die gesetzten Normen eine solche notwendige Gewissheit, noch versucht die Vergabekammer einen derartigen angeblichen gesetzgeberischen Willen zu erklären.

Den Begriff „....Regime“ findet man auch im Beschluss eines OLG’s sowie in einem in der juristischen Literatur veröffentlichten Aufsatz.

> Land NRW, Beschwerdesenat OLG Düsseldorf, Verg. 45/01 vom 21. Januar 2002 Bl. 4 („Vergaberechtsregime“)
>
> Jaeger, Aufsatz NZBau 2001, 46 unter III. 1. a. („Vergaberegime“).

Die Bezeichnung „Nachprüfungsregime“ war bereits in den Materialien zum Vergaberechtsänderungsgesetz zu lesen.

> Bundestags-Drucksache 9340 S. 12 zum Entwurf eines Gesetzes zur Änderung der Rechtsgrundlage des VgRÄG.

Sie lässt sich jedoch aus einem in Deutschland historisch begründeten Umstand damit erklären, dass nach dem I. Weltkrieg die Bestimmungen der VOL/A und VOB/A als interne Dienstanweisungen an die Beschaffungsstellen galten und daher die Bieter nicht in der Lage waren, ein klagbares Recht auf Anwendung dieser Bestimmungen zu ihrem Schutz in Anspruch zu nehmen.

> Nr. 3 Vorl.VV gem. § 56 Bundeshaushaltsordnung

Dieser Rechtsschutz wurde endlich den Bietern und Bewerbern durch die §§ 97 (7), 107 – 115 GWB sowie das Beschwerdeverfahren (§§ 116 – 124 GWB) gewährt. Ein Nachprüfungs-„Regime“ entstand jedoch für die antragsberechtigten Personen nicht. Denn der Gesetzgeber hat durch das GWB keinen uneingeschränkten Bieterschutz verwirklicht, sondern nur diejenigen Vorschriften des Vergaberechts subjektiv-rechtlich aufgewertet, die den Schutz des potentiellen Auftragnehmers bezwecken.

> Boesen, Vergaberecht Kommentar zum 4. Teil des GWB, 1. Aufl. 2000, Bundesanzeigerverlag, zu § 97 RdNr. 187 ff-

Im übrigen ist der Ausdruck „Regime“ bereits durch Bezeichnung einer diktatorischen totalitären Gewaltherrschaft belegt, wie z.B. „Naziregime“ oder „Talibanregime“. Für eine Gesetzgebung innerhalb einer freiheitlich-demokratischen Gesellschaftsform und Staatsverfassung sollte die Anlehnung an eine solche Wortbildung ausgeschlossen sein.

Der „öffentliche Auftrag“ des GWB ist nicht im „funktionellen Sinne“ denaturiert worden

Als weiteren Versuch, die Europäischen Richtlinien außerhalb dogmatischer Gesetzmäßigkeiten zu interpretieren, werten wir die Auffassung von Jaeger, für die Zuordnung des Begriffes „öffentlicher Auftrag“ komme es nicht auf die äußere Rechtsform an, sondern auf die „wirtschaftliche Funktion“ des Geschäftes. Der EuGH habe den Begriff des „öffentlichen Auftraggebers“ zur Zweckerreichung der EG-Vergaberichtlinien schon seit langem im funktionellen Sinne angewendet, so dass der Gedanke nicht fern läge, diese Deutung auch auf den Begriff „öffentlicher Auftrag“ anzuwenden. Ein solches funktionelles Verständnis des Auftragsbegriffes müsse mit Blick auf das Gebot der richtlinienkonformen Auslegung der §§ 97 ff GWB, die der Umsetzung der EG-Richtlinien zum Vergaberecht dienen, auch bei der Auslegung der §§ 99 100 GWB beachtet werden.

Jaeger „Public-Private-Partnership und Vergaberecht“; NZBau 2001, 8

Mit dieser Formel versucht Jaeger, bereits die Gründung einer gemischt-wirtschaftlichen Gesellschaft unter das Vergaberecht vorzuverschieben, ein Rechtsakt, der kein „Geschäft“ darstellt, erst Recht kein Bedarfsdeckungsgeschäft der öffentlichen Hand.

vgl. Byok/Jaeger, Kommentar zum Vergaberecht, Verlag Recht und Wirtschaft Heidelberg, 1. Aufl. 2000, § 99 RdNr. 336.

Vor allem aber liegen die beiden Bezeichnungen „funktionaler Auftraggeberbegriff“ und „funktionaler Auftragsbegriff“ rechtssystematisch nicht auf derselben Ebene. Vielmehr weist der EuGH darauf hin, dass sich der Europäische Richtliniengeber vom klassischen „öffentlichen Auftraggeber“ als den Behörden der öffentlichen Verwaltung getrennt und dessen Kreis erweitert habe auf enumerativ im Anhang I der Richtlinie 71/315/EWG aufgelistete „Einrichtungen“ sowie auf „natürliche und juristische Personen des öffentlichen und privaten Rechts“ und auf „Verbände“. Diese Personen „gelten“ nunmehr gem. Art. 1 b) Richtlinie 92/50/EWG als öffentlicher Auftraggeber; der Begriff „öffentlicher Auftraggeber“ sei daher im „funktionellen Sinne zu verstehen“.

> Urteil EuGH i.d. Rechtssache C-360/96 in dem Rechtsstreit Gemeente Arnheim/Gemeente Rheden ./. BFI Holding BV vom 10. Nov. 1988, Leitsatz Nr. 62 (mit Verweisungen).
>
> Boesen, Vergaberecht Kommentar zum 4. Teil des GWB, 1. Aufl., § 98 RdNr. 28 ff.

Der EuGH hat unseres Wissens die Bezeichnung „funktionaler Auftragsbegriff“ bislang nicht verwendet und spricht nicht einmal von einem funktionalen öffentlichen Auftrag, wenn die in Art. 1 b) der Richtlinie 92/50/EWG genannten nichtbehördlichen „Stellen“ einen Auftrag gemäß Art. 1 a) Richtlinie 92/50/EWG abschließen.

Jaeger setzt sich offenbar für einen völlig neuen Auftragsbegriff außerhalb des § 99 GWB ein abweichend vom tatbestandsmäßigen Typ eines Bau-, Liefer- oder Dienstvertrages hin zu einer Maßnahme, die geeignet ist, dem äußeren Zweck eines derartigen Rechtsgeschäftes zu genügen.

Anlässlich des Düsseldorfer Vergaberechtstages 2003 fand Jaeger Gelegenheit, innerhalb eines Vortrages über die Privatisierung von Leistungen der öffentlichen Hand auf dem Gebiet der Daseinsvorsorge ein EuGH-Urteil aus 2001 zu besprechen, in dem er meinte, feststellen zu können, dass der EuGH den Schritt vom „funktionalen Auftraggeber“ zum „funktionalen Auftrag“ vollzogen habe.

Nachdem der EuGH festgestellt habe, dass nach den Richtlinien der Betriff des öffentlichen Auftraggebers im funktionellen Sinne zu verstehen sei, habe der Gerichtshof seines Erachtens in diesem Urteil auch die Entwicklung des Begriffs des öffentlichen Auftrages im funktionellen Sinne vollzogen.

In einem in Italien anhängig gewesenen Rechtsstreit im Zusammenhang mit einem Großbauvorhaben sei es streitig geworden, ob die unmittelbare Erstellung einer Erschließungsanlage hätte ausgeschrieben werden müssen. Die Bauherren und deren Architekten hätten den Standpunkt vertreten, die Errichtung dieser Anlage sei nach italienischem Recht kein Bauvertrag gewesen und der angerufene EuGH hätte eine Vorabentscheidung treffen müssen, ob diesbezüglich ein öffentlicher Bauauftrag im Sinne des Art. 1 a) der Baukoordinierungsrichtlinie 97/52/EG abgeschlossen worden sei. In diesem Zusammenhang laute die maßgebliche Erwägung des Gerichtshofes im Erwägungsgrund Nr. 52, dass der Art. 1 a), der den Begriff des öffentlichen Bauauftrages definiere, so auszulegen sei, dass die praktische Wirksamkeit der Richtlinie gewährleistet sei.

> Düsseldorfer Vergaberechtstag Sept. 2003. Vortrag: „Die vergaberechtliche Beurteilung von Public-Private-Partnership in der Entsorgungsinfrastruktur“ von Wolfgang Jaeger, Vorsitzender Richter am OLG (Kartell- und Vergabesenat) a.D.; Skriptum S. 136, bezogen auf:
>
> Urteil EuGH-Rs C-399/98 „Teatro alla Bicocca” (Mailand) vom 12. Juli 2001, Erwägungsgrund 52; NZ Bau 2001 512, 514.

Randnummer 52 hat in voller Länge folgenden Wortlaut:

> *„52. Da das Vorliegen eines öffentlichen Auftrages eine Voraussetzung für die Anwendung der Richtlinie 93/37/EWG darstellt, ist Art. 1 lit. a) so auszulegen, dass die praktische Wirksamkeit der Richtlinie gewährleistet ist. Wie aus ihren Begründungserwägungen, insbesondere der zweiten und dritten hervorgeht, soll die Richtlinie Beschränkungen der Niederlassungsfreiheit und des freien Dienstleistungsverkehrs auf dem Gebiet der öffentlichen Bauaufträge beseitigen, um diese Märkte einem echten Wettbewerb zu öffnen. Damit ein solcher Wettbewerb entstehen kann, ist es laut der zehnten Begründungserwägung erforderlich, dass*

> *beabsichtigte Auftragsvergaben in der gesamten Gemeinschaft bekannt gemacht werden.“*

Die Richtlinie 93/37/EWG beginnt mit 14 „Erwägungsgründen“. Aus ihnen hat der EuGH in seinem Urteil 3 herausgegriffen. Im 2. Erwägungsgrund erklärt der Rat der Europäischen Gemeinschaften, dass die Verwirklichung der Niederlassungsfreiheit und des freien Dienstleistungsverkehrs auf dem Gebiet der öffentlichen Bauaufträge neben der Aufhebung der Beschränkungen eine Koordinierung der einzelstaatlichen Verfahren zur Vergabe öffentlicher Bauaufträge erfordern. Der 3. Erwägungsgrund fordert bei dieser Koordinierung, dass die in den einzelnen Mitgliedsstaaten geltenden Verfahren und Verwaltungspraktiken soweit wie möglich zu berücksichtigen sind. Der 10. Erwägungsgrund hält für das Entstehen eines echten Wettbewerbes in den Mitgliedsstaaten die Bekanntmachung der beabsichtigten Auftragsvergaben in der gesamten Gemeinschaft für erforderlich, damit die an öffentlichen Bauleistungen interessierten Unternehmen entsprechende Angebote einreichen können.

Wir vermögen weder aus den 14 noch aus den 3 vom EuGH hervorgehobenen Erwägungsgründen der Baurichtlinie die geänderte Deutung eines öffentlichen Auftrages im funktionellen Sinne zu erkennen, außer das Erfordernis, dass ein solcher vom Gesetzgeber fest umrissener öffentlichen Auftrag auch seinen Zweck erreicht und in der Praxis „funktioniert“. Wir beziehen uns dabei auf die RdNr. 55 des Urteils, in dem der EuGH ausführt, dass die in der Baurichtlinie festgelegten Grundsätze über die Tatbestandsmerkmale „öffentlicher Auftraggeber“, „Bauvorhaben“, „Bauwerk“ und „öffentlicher Bauauftrag“ so zu beurteilen sind, „dass die praktische Wirksamkeit der Richtlinie nicht beeinträchtigt wird und zwar insbesondere dann, wenn diese Fälle Besonderheiten aufweisen, die sich aus den auf sie anwendbaren nationalen Rechtsvorschriften ergeben“.

Sollten tatsächlich Zweifel über die rechtstheoretische Lösung des Streitfalles durch den EuGH angebracht sein, werden diese durch den Urteilsaufbau behoben. Denn in den Urteilsgründen untersucht der EuGH besonders sorgfältig die gesetzlich vorgegebenen Tatbestandsmerkmale der Richtlinie „öffentlicher Auftraggeber“ (57 – 75), „entgeltlicher Vertrag“ (76 – 86), „schriftlicher Vertrag“ (87) und „Unternehmereigenschaft“ (88 – 96). Unter dem Abschnitt „Zum Tatbestandsmerkmal eines entgeltlichen Vertrages“ kommt der EuGH in Nr. 85 wieder auf die Ausführungen in der Nr. 52 mit den Worten zurück:

> *„85. Diese Auslegung der nationalen Rechtsvorschriften entspricht dem oben in Rdnr. 52 genannte Zweck der Richtlinie und ist deshalb geeignet, deren praktische Wirksamkeit zu gewährleisten.“*

Mit diesen Worten will der Gerichtshof resümierend feststellen, dass nach allem auch der Zweck der Richtlinie erfüllt sei und schließt bestätigend in Nr. 97

> *„97. Demnach bildet die unmittelbare Erstellung einer Erschließungsanlage unter den im italienischen Städtebaurecht festgelegten Voraussetzungen einen öffentlichen Bauauftrag i.S. von Art. 1 lit. a) Richtlinie 93/37/EWG.“*

Das Urteil des EuGH „Teatro alla Bicocca (Mailand)“ vom 12. Juli 2001 ist daher nicht als Beispiel dafür geeignet, dass der EuGH nunmehr auch den Schritt vom „öffentlichen Auftraggeber im funktionalen Sinn“ zum „öffentlichen Auftrag im funktionalen Sinn“ vollzogen habe.

Geschütztes Rechtsgut der Vergaberichtlinien ist nicht der „Wettbewerb“

Als weiteres Mittel der Interpretation der §§ 97 ff. GWB findet man die Aussage, ebenso wie das Kartellrecht wolle auch das neue Vergaberecht den Wettbewerb als Institution schützen.

> Marx in: Jestaedt, Kemper, Marx, Drieß „Das Recht der Auftragsvergabe“, 1999, S. 7
>
> Dreher in: Immenga/Mestmäcker, GWB, 3. Aufl. 2001 vor § 97 RdNr. 60
>
> Jaeger, Aufsatz NZBau 2001, 6

Das führt bei Marx und Dreher zur Bezeichnung der §§ 97 GWB als „Kartellvergaberecht“. Der „Wettbewerb“ als solcher solle geschütztes Rechtsgut der einschlägigen Europäischen Richtlinien und des GWB sein. Jaeger formuliert es so: „Die Vorschriften der EG über die Vergabe öffentlicher Aufträge beruhen auf dem Grundgedanken des Schutzes des Wettbewerbs. Das Gebot der richtlinienkonformen Auslegung der §§ 97 ff. GWB, die der Umsetzung der EG-Richtlinien zum Vergaberecht dienen, müsse auch bei der Auslegung der §§ 99, 100 GWB beachtet werden.“

Jaeger, a.a.O. zu III. 1. am Ende, S. 8 oben.

Aufgrund welchen Artikels welcher Richtlinie welche Bestimmung des GWB in welcher Weise auszulegen sei, sagt der Autor nicht.

Weder das primäre Gemeinschaftsrecht (vornehmlich EG-Vertrag) noch das sekundäre Gemeinschaftsrecht (Europäische Richtlinien), welches im Anwendungsgebiet des öffentlichen Auftragswesens die Bestimmungen des EG-Vertrages konkretisiert, bezeichnen den „gemeinschaftsweiten Wettbewerb“ als „geschütztes Rechtsgut“ der neuen Normen. Gegenstand und Ziel dieser Gesetzgebung ist vielmehr die Durchsetzung und Gewährleistung der Öffnung der Europäischen Gemeinschaft für das öffentliche Auftragswesen. Soweit hierbei „Wettbewerb“ erscheint, wird er nur als eines der vielfältigen Mittel zur Zielerreichung aufgeführt und als eine der gesetzlichen Verpflichtungen herausgestellt.

Der EG-Vertrag ist die rechtliche Grundordnung der Gemeinschaften. In den Grundfreiheiten des gemeinsamen Marktes, soweit sie Bezüge zum öffentlichen Auftragswesen aufweisen, zählen insbesondere der freie Warenverkehr (Art. 28 ff. EGV), der freie Dienstleistungs- und Personenverkehr (Art. 39 ff., 43 ff., 49 ff., EGV), das allgemeine Diskriminierungsverbot (Art. 12 EGV) und die Wettbewerbsregeln (Art. 81 EGV).

Zum spezifischen sekundären Gemeinschaftsrecht gehören vor allem die Baukoordinierungsrichtlinie 83/37 EWG, die Lieferkoordinierungsrichtlinie 93/36 EWG, die Sektorenkoordinierungsrichtlinie 93/38 EWG, die Dienstleistungskoordinierungsrichtlinie 92/50 EWG und die Rechtsmittelrichtlinie 89/665 EWG.

Ein Blick in diese Richtlinien lässt erkennen, dass in ihnen nur die jeweiligen Zielvorstellungen und Anordnungen des Richtliniengebers herausgearbeitet sind:

Im Vorwort zur Baurichtlinie 93/37 EWG: Die gleichzeitige Verwirklichung der Niederlassungsfreiheit und des freien Dienstleistungsverkehrs, Aufhebung von Beschränkungen, Koordinierung der einzelstaatlichen Bauverfahren und Einführung einer gemeinschaftlichen Normungs- und Standardisierungspolitik.

Im Vorwort zur Lieferungsrichtlinie 93/36: Wie 93/37 und zusätzlich Anordnung verschiedener Maßnahmen der Transparenz und Dokumentation.

Im Vorwort zu den Ziffern 1., 2., 11., 12. und 45. der Sektorenrichtlinien 93/38: Darlegung Europäischer Gemeinschaftsziele, Vollendung des Binnenmarktes, Gewährleistung eines freien Verkehrs von Waren, Personen, Dienstleistungen, Kapital, flexible Geschäftspraxis sowie Verhinderung einer Abschottung bestimmter Märkte.

Im Vorwort und in Art. 3 der Dienstleistungsrichtlinie 92/50: Notwendigkeit der Verwirklichung des Binnenmarktes, Vermeidung von Hemmnissen des freien Dienstleistungsverkehrs, Nichtdiskriminierung von Dienstleistungserbringern, Koordinierung von Dienstleistungsaufträgen, Unterbindung von Praktiken zur Einschränkung des Wettbewerbs.

Im Vorwort und in Art. 1 (2) der Rechtsmittelrichtlinie 89/665: Verstärkung der Transparenz und der Nichtdiskriminierung sowie Schaffung einer wirksamen und raschen Nachprüfung von Vergabeverstößen.

Danach fehlt es an jeder Bestätigung im neuen Vergaberecht selbst, der Europäische Gesetzgeber und Europäische Richtliniengeber habe durch die fraglichen Normen den „Wettbewerb“ als deren Rechtsgut ausgewiesen.

Prof. Dr. Bunte führt zu diesem Thema aus, sicher gehe es auch beim Vergaberecht darum, den rechtlichen Rahmen für „Wettbewerb“ festzulegen und den Wettbewerb durch spezielle Instanzen zu schützen. Allerdings seien die Gemeinsamkeiten im Wettbewerbsgedanken schon so unterschiedlich, dass es verfehlt erscheine, davon zu sprechen, Kartellrecht und Vergaberecht wollten den Wettbewerb als Institution schützen, und die §§ 97 ff. GWB als „Kartellvergaberecht“ zu bezeichnen. Wohl stelle sich aber die Frage der Bedeutung des allgemeinen materiellen Kartellrechts für das Vergaberecht.

> Bunte, Aufsatz: „Der Grundsatz der dezentralen Beschaffung der öffentlichen Hand“, Ziff. I. 2. „§§ 97 ff. GWB als Kartellrecht?“, BB 2001, 2121.

Zusammenfassend gelangen wir zu dem Ergebnis, dass das Vergaberecht weder als ein „Regime“ anzusehen ist, welches ohne Rücksichtnahme auf seine tatbestandsmäßigen Voraussetzungen nicht nur Rechtsgeschäfte sondern auch Rechtshandlungen (Gesellschaftsgründungen) umfasst, dass weiterhin die Gesetzgeber die drei Arten vom Vergaberecht eingeschlossenen Bedarfsdeckungsgeschäfte: Bau-, Liefer-, und Dienstleistungen nicht funktional geradezu nach Beliebigkeit aufgelöst haben und dass schließlich allenfalls der zu öffnende und zu vollendende Europäische Binnenmarkt im Rahmen öffentlicher Aufträge das durch das Vergaberecht geschützte Rechtsgut darstellen könnte, aber nicht „der Wettbewerb“. Die von uns angegriffenen Erwägungen sind daher ungeeignet für die von Jaeger ausgesprochene Empfehlung (Aufsatz NZBau 2001, S. 8), mittels richtlinienkonformer Auslegung der §§ 97 ff. GWB eine gemischt-wirtschaftliche Gesellschaftsgründung mit einer Gemeinde als Partner europaweit auszuschreiben.

Im übrigen würde bei Unterstellung des „Wettbewerbes“ als geschütztes Rechtsgut dieser Wettbewerb bei freier Gesellschaftsgründung nicht umgangen oder verletzt sein. Denn bei einer Planung, der frei gegründeten gemischt-wirtschaftlichen Gesellschaft nach dessen Gründung einen öffentlichen Auftrag zu erteilen, unterliegt dieser öffentliche Auftrag dem Vergaberecht (vgl. unten III. 1.).

Im übrigen halten wir einen Beschluss des Beschwerdesenates OLG Brandenburg für äußerst beachtenswert, der erklärt hat, das Vergaberechtsänderungsgesetz verfolge nicht den Zweck, das Vergaberecht auf Bereiche auszudehnen, die bislang von ihm ausgenommen waren; allein die EG-Richtlinien sollten umgesetzt werden. Eine Erweiterung der vergaberechtlichen Regelungsbereiche könne nur durch den Gesetzgeber, nicht aber durch den Verordnungsgeber erfolgen.

> Land Brandenburg, Beschwerdesenat OLG Brandenburg-Verg. W 3/03 und 5/03 vom 2. September 2003.

Ausgenommen vom Preisrecht für öffentliche Aufträge/Vergaberecht waren – und sind unterhalb der Schwellenwerte – die Gründung einer Gesellschaft des Handelsrechts mit einer Körperschaft des öffentlichen Rechts als Partner, weil eine solche Gesellschaftsgründung kein „Geschäft“ ist, insbesondere kein „Bedarfsdeckungsgeschäft“ darstellt. Wer mittels Unterstellungen, Analogien, Auslegungen oder Deutungen den klaren gesetzgeberischen Willen zu ändern trachtet, befindet sich contra legem. Sobald eine zuständige Behörde mit der neu entstandenen Kooperation ein Rechtsgeschäft im Bereich der Daseinsvorsorge abzuschließen beabsichtigt und ein öffentlicher Auftrag entsteht, greift das Vergaberecht ein. Die Partnerschaftssuche und Gesellschaftsbildung bleibt der freiheitlich geschaffenen Rechtsordnung vorbehalten.

Angeblich ständige Spruchpraxis der Nachprüfungsinstanzen

In der Bundesrepublik Deutschland hat bis heute noch keine Vergabeinstanz eine Entscheidung – geschweige denn eine rechtsbeständige oder rechtskräftige Entscheidung – über die Frage getroffen, ob die Gründung einer Gesellschaft des Privatrechts mit mehreren Körperschaften des öffentlichen Rechts oder mit einer gemischt-wirtschaftlichen Partnerschaft europaweit auszuschreiben ist. Zwar sind in einer Reihe von Vergabekammerbeschlüssen spontane Meinungen geäußert worden, die eine Ausschreibungspflicht favorisiert haben, aber keiner der gefassten Beschlüsse hatte die Rechtsfrage der Ausschreibungspflicht zum Gegenstand des Nachprüfungsverfahrens.

Die Art und Weise, in der sich die betreffenden Vergabekammern gegenseitig zitieren, sowie die Berichterstattung im Schrifttum über diese formal fehlerhaften Titel, sind geeignet, bei dem Leser den Eindruck zu erwecken, es handele sich bei diesem bislang in Wahrheit ungelösten Komplex um eine ständige für die Zukunft zu beachtende Rechtsprechung. Zu diesen Beschlüssen gehören:

Land Niedersachsen, Vergabekammer Lüneburg – 2003–VgK–6/1999 vom 10. August 1999

Land NRW, Vergabekammer Düsseldorf VK 12/2000-L vom 7. Juli 2000; NZBau 2001, 46

Freistaat Sachsen, 1. Vergabekammer Leipzig – 1/SV-K/71-00 vom 14. August 2000

Freistaat Sachsen, 1. Vergabekammer Leipzig – 1/SV-K/73-00 vom 14. August 2000

Land Baden-Württemberg, Vergabekammer Stuttgart – 1 VK 35/00 und – 1 VK 1/01 vom 24 Januar 2001; NZBau 2001, 340

Land Brandenburg, Beschwerdesenat Brandenburg – Verg. 3/001 vom 3. August 2001; NZBau 2001, 645 ff.

Anders verhält es sich bei der Ausgliederung der Aktivitäten der Daseinsvorsorge aus einer öffentlich-rechtlichen Körperschaft durch diese Behörde unter Umwandlung in eine Gesellschaft des Privatrechts bei Fortführung ihrer Kontrolle über die organisatorisch verselbständigte Einheit wie über ihre Dienststelle („In-house-Geschäft“).

> Urteil EuGH, in der Rechtssache C-107/98 Teckal SrL ./. Gemeinde Viano u.a. vom 18. November 1999
>
> BGH Beschluss – XZB 10/01, Divergenzentscheidung, OLG Jena ./. Thüringer Landesverwaltungsamt, Vergabekammer vom 12. Juni 2001.

III. Gründung einer „Public-Private-Partnership“.

Die Richtlinien des Rates der Europäischen Gemeinschaften sowie das Deutsche Vergaberechtsänderungsgesetz/GWB haben sich gesetzestechnisch mit der Gründung von Gesellschaften spezifisch nicht befasst. Es gelten daher die Eingangsparagraphen des GBW, wonach das Vergaberecht auf einen „öffentlichen Auftrag“ anzuwenden ist.

Der Entschluss einer oder mehrerer Körperschaften des öffentlichen Rechts, mit einem oder mehreren privaten Entsorgungsunternehmen eine Kooperation im Mantel einer Handelsfirma zur gemeinsamen Teilnahme am Markt einzugehen, bedingt gleichzeitig eine Entscheidung der Beteiligten, ob der Gegenstand der Gesellschaft in der Annahme und Ausführung von öffentlichen Aufträgen der Gründergemeinde bestehen soll, oder ob die Gesellschaft Aufgaben der Daseinsvorsorge in gemeinschaftlicher, partnerschaftlicher, gleichberechtigter und gleichverpflichteter sowie unabhängiger Eigenleistung ihrer Partner erbringen soll. Der Gegenstand der Gesellschaft ist in der Satzung unverwechselbar zu beschreiben.

Diese Entscheidung zieht nach der Gesellschaftsgründung eine wichtige Folgewirkung nach sich: Im ersteren Falle hat die Gründergemeinde zu diesem Zeitpunkt das Vergaberecht zu beachten und der Gesellschaft öffentliche Aufträge im Wettbewerb anzudienen und die Gesellschaft hat sie anzunehmen und zu erfüllen, im zweiten Falle führt die Gesellschaft die in Gesellschaftsvertrag/Satzung niedergelegten Aufgaben unabhängig und in eigener Regie aus.

Die Bildung einer gemischt-wirtschaftlichen Privatisierungs-Kooperation der hier genannten Art wird „Public-Private-Partnership“ genannt. Am Versuch einer rechtstheoretischen Erfassung und Beschreibung arbeiten sowohl der Rat der Europäischen Gemeinschaften als auch Gremien der Europäischen Mitgliedsstaaten. Übereinstimmung besteht jedenfalls darin, dass das Innenverhältnis der Partner dem Gesellschaftsrecht des betreffenden Mitgliedsstaates unterliegt. Bei mehrseitigem Staatsbezug gilt das Recht am Sitz der Gesellschaft.

1. Die Gründung einer gemischt-wirtschaftlichen Gesellschaft mit der satzungsmäßigen Verpflichtung zur Annahme und Ausführung öffentlicher Aufträge, die die Gründergemeinde jeweils bei deren Anfall an die Gesellschaft erteilt

Die Gründung einer Gesellschaft des Privatrechts unter Beteiligung einer Körperschaft des öffentlichen Rechts mit dem Ziel der Marktteilnahme ist kein „Bedarfsdeckungsgeschäft" der öffentlichen Hand. Gesellschaftsrecht und Vergaberecht gehören zu unterschiedlichen und selbständigen Rechtssystemen. Die freie Auswahl eines Geschäftspartners zur gemeinschaftlichen Berufsausübung im Rahmen einer Gesellschaft des Privatrechts ist grundgesetzlich geschützt (Art. 9 GG). Der freiheitliche demokratische Rechtsstaat kennt keine Zwangseingriffe in Entscheidungen Privater, in welcher Gestalt und Rechtsform sie ihre berufliche oder gewerbliche Betätigung einzurichten haben. Der in die Gesellschaft aufgenommene Partner aus der Privatwirtschaft wird weder vor, noch während der Gesellschaftsgründung, noch durch einen öffentlichen Auftrag nach der Gründung ein „öffentlicher Auftragnehmer", sondern ist zunächst ein Partnerbewerber, alsdann ein Partner in der Gesellschaft und bei Auftragserteilung wird die Gesellschaft Auftragnehmer, nicht die Person des ausgesuchten Gesellschafters.

Die Folgerung Jaegers, durch eine wettbewerbsfreie Gründung einer mit öffentlichen Aufträgen zu versehenden gemischt-wirtschaftlichen Gesellschaft würde „die Anwendung des Vergaberechts im Verhältnis zwischen der Gründergemeinde und der gemischten Gesellschaft ausgehebelt", muss auf einem Missverständnis beruhen. Die erste Phase der Eingehung einer solchen Kooperation, nämlich die Gesellschaftsgründung, bleibt vom Vergaberecht unberührt. Sobald die neue Gesellschaft jedoch ins Leben gerufen ist, muss die Gründergesellschaft öffentliche Aufträge vergeben. Sie besitzt keine auf Vergaberecht oder sonstigen Normen beruhende Präferenz, „ihre Gesellschaft" nach deren Entstehung vergabefrei mit öffentlichen Aufträgen auszustatten. Vielmehr ist sie verpflichtet, nach den Regeln des Vergaberechts den öffentlichen Auftragnehmer zu ermitteln und zwar in der Reihenfolge: öffentliche

Ausschreibung (offenes Verfahren), beschränkte Ausschreibung (nicht offenes Verfahren), freihändige Vergabe (Verhandlungsverfahren). Um einen öffentlichen Auftrag zu erlangen, muss sich die neue Gesellschaft an diesen Veranstaltungen beteiligen. In dieser zweiten Phase des Werdegangs der Kooperation erweist sich die Verurteilung einer Public-Private-Partnership als willkommenes Instrument einer rechtswidrigen Umgehung des Vergaberechts durch Jaeger (II. 2.) als vorschnell und nicht haltbar. Erst zu diesem Zeitpunkt tritt ein öffentlicher Auftrag konkret in Erscheinung. Erst jetzt löst er tatbestandsmäßig Verpflichtungen aus dem Vergaberecht aus.

Durch diesen Nachweis der Aufrechterhaltung des vollen Rechtsschutzes durch das Vergaberecht im Zusammenhang mit einer kooperativen Bindung gemischt-wirtschaftlicher Partner in einer Public-Private-Partnership wird auch den Hilfserwägungen Jaeger's für eine notwendige künstliche Ausweitung des Vergaberechts der Boden entzogen, nämlich der Behauptung einer Funktionalität des Begriffes „öffentlicher Auftrag", der angeblich gebotenen „richtlinienkonformen Auslegung der §§ 97 ff. GWB", der Herausstellung eines „Vergaberechtsregimes" durch die Richtlinien des Rates der Europäischen Gemeinschaft, sowie der Qualifikation des Begriffes „Wettbewerb" als geschütztes Rechtsgut der Europäischen Vergaberechtsnormung sowie des GWB.

2. Die Gründung einer gemischt-wirtschaftlichen Gesellschaft unter Verpflichtung der Partner zu einer satzungsmäßig festgesetzten gemeinschaftlichen, unabhängigen und selbstverantwortlichen Eigenleistung, also bei Entfallen eines öffentlichen Auftrages der Gründergemeinde an die neue Gesellschaft

a) Bis heute hat weder der EuGH noch der BGH noch eine Deutsche Vergabeinstanz eine Entscheidung über die Rechtsfrage getroffen, ob die Gründung einer Gesellschaft des Privatrechts bestehend aus mehreren Körperschaften des öffentlichen Rechts oder die Gründung einer gemischt-wirtschaftlichen Gesellschaft des Privatrechtes bestehend aus einer oder mehreren Körperschaften des öffentlichen Rechts und einer oder mehrerer Firmen des Privatrechts dem Vergaberecht unterliegt und daher von der

Gründergemeinde europaweit auszuschreiben ist, wenn die fragliche Neugründung nicht aufgrund öffentlicher Aufträge der Gründergemeinde sondern in Eigenleistung wie ein Anbieter tätig werden soll.

Vielleicht müssen wir geduldig die oben beschriebene emotionale Welle der bisherigen Besprechungen dieses Themas in Deutschland vorübergehen lassen, bis eine Phase der Besonnenheit einkehren kann.

b) Dreher hat hiermit begonnen. In seinem beachtlichen Aufsatz hat er die hierfür maßgeblichen Modelle der „Privatisierungen“ aufgezeigt und unterschieden zwischen den Rechtsgeschäften „mit öffentlichen Aufträgen“ und „ohne öffentliche Aufträge“. Er bezeichnet sie auch als Rechtsgeschäfte „mit“ oder „ohne Beschaffungsbezug“ bzw. „mit“ oder „ohne eingekapseltem Beschaffungsverhältnis“.

> Dreher Aufsatz „Public-Private-Partnerships und Kartellvergaberecht, – gemischt wirtschaftliche Gesellschaften, In-House-Vergabe, Betriebsmodell und Beleihung Privater“; NZBau 2002, 245 ff.

Soweit er „eingekapselte öffentliche Aufträge“ beschreibt, kommt nicht der Eindruck auf, als solle der gesuchte öffentliche Auftrag hineininterpretiert werden, um zu einer Lösung zugunsten einer europaweiten Ausschreibung zu gelangen.

Als Beispiel für ein „nicht eingekapseltes Beschaffungsverhältnis“ – wie in unserem Fall – begnügte er sich mit dem oben zitierten Beschluss des OLG Brandenburg. Dieses Gericht gelangte aber zu einer Entscheidung zu Ungunsten der Ausschreibungspflicht, weil es das zugrunde liegende Rechtsgeschäft als Dienstleistungskonzession definierte, also nicht als öffentlichen Auftrag.

Unseren hier vorgestellten Fall einer gemischt-wirtschaftlichen Gesellschaftsgründung „ohne Beschaffungsbezug“ aus dem Grund der Eigenleistung durch die neu geschaffene Gesellschaft hätte Dreher hier für gegeben erachten können. Aber an anderer Stelle meint er, unsere Auffassung enthalte „rein formelle Erwägungen“ und es fehle die „Differenzierung zwischen den einzelnen Privatisierungsvorgängen“.

> Dreher a.a.O. Seite 248 zu II b) Fußnote 27 und 28

Das Vergaberecht richtet sich jedoch nicht nach Strukturmodellen eines bislang weder in Lehre und Rechtsprechung entwickelten noch allgemein anerkannten Privatisierungskatalogs, sondern die Vergaberegeln hat der Gesetzgeber festgelegt und definiert, indem er bestimmt hat, dass nur öffentliche Aufträge vom Vergaberecht erfasst sind. Bei einer Eigenleistung fehlt jedoch diese gesetzliche Tatbestandsvoraussetzung. In dem bislang in seiner Art einzig gebliebenen Urteil des EuGH auf dem Gebiet der Einschaltung privater Elemente bei der Daseinsvorsorge der öffentlichen Hand (Teckal-Entscheidung/In-house-Geschäft) hat sich der Oberste Europäische Gerichtshof weder mit den Begriffen „Public-Private-Partnership“ oder „In-house-Geschäft“ befasst, noch hat er sich auf Untersuchungen zulässiger oder unzulässiger, anerkannter oder nicht anerkannter Methoden der Privatisierungsvorgänge eingelassen. Vielmehr hat er schlicht und eindringlich die Notwendigkeit der Feststellung eines „öffentlichen Auftrages“ hervorgehoben als einzige Voraussetzung für die Anwendung der einschlägigen Richtlinien des Rates der Europäischen Gemeinschaften und damit des GWB im Vergaberecht.

> Urteil EuGH in der Rechtssache C-107/98 Teckal SrL ./. Gemeinde Viano vom 18. November 1989; NZBau 2000, 90 ff.

Dagegen hat der BGH anlässlich der Erörterung des Teckal-Urteils in seinem Beschluss in einem Divergenzverfahren die Bezeichnung „sog. In-house-Geschäft“ verwendet aber ebenfalls nicht das Thema „Privatisierung“ angeschnitten.

> BGH-Beschluss-XZB 10/01 – OLG Jena – vom 12. Juni 2001; Vergaberecht 2001, 286 ff.

c) „Privatisierungen“ werden aber von Arnold Boesen in seinem Vergaberechts-Kommentar behandelt, indem er sich unter anderem auch mit Fragen der Anwendung des Vergaberechts auf den Privatisierungsvorgang befasst.

> Boesen, Vergaberecht, Kommentar zum 4. Teil des GWB, 1 Aufl. 2000, Bundesanzeiger Verlag, § 100 RdNrn. 105 ff.

Zuzustimmen ist seiner Eingangsfeststellung, dass grundsätzlich die Umwandlung einer Körperschaft des öffentlichen Rechts oder die Veräußerung öffentlichen Vermögens oder die Gründung einer gemischt-wirtschaftlichen Gesellschaft in private Rechtsform, auch wenn Dritte beteiligt sind, kein Bedarfsdeckungsgeschäft der öffentlichen Hand darstellt und damit das Vergaberecht nicht berührt ist (RdNr. 105). Indessen meint er, dennoch dränge sich bei folgenden Sachverhalten im Einzelfall die Frage nach einer analogen Anwendung des Vergaberechts auf (RdNrn. 106, 107):

- Sofern ein Dritter an einer neu zu gründenden oder bestehenden Gesellschaft beteiligt werden solle, würden sich bei dem Auswahlprozess – ähnlich wie bei der Vergabe öffentlicher Aufträge – Fragen nach der Transparenz des Verfahrens, der Gleichbehandlung der „Kandidaten“ und erfolgreicher Haushaltsführung der öffentlichen Hand stellen.

- Vielfach würde der Vorgang der Drittbeteiligung bei einer Gesamtbetrachtung wie die Erteilung eines Auftrages erscheinen, wenn mit der Gründung zugleich eine Aufgabe übertragen würde, die ebenso gut in Trägerschaft der öffentlichen Hand unter Vergabe von öffentlichen Aufträgen erledigt werden könnte, oder wenn der Dritte durch die Privatisierung eine Rolle erhält, die mit der eines

Auftragnehmers vergleichbar ist, es sei denn, dass der Dritte wirtschaftliche Risiken übernimmt.

- Wenn die Gemeinde für die Aufgabenerfüllung verantwortlich bleibt und sie mit eigenen Mitteln garantiert und die Körperschaft lediglich die tatsächliche Erbringung der Arbeit „einkauft".

Hierzu sei ausgeführt:

Unter Analogie versteht man die Übertragung der für einen bestimmten Tatbestand im Gesetz vorgesehene Regel auf einen anderen rechtsähnlichen Tatbestand.

Die Gebote der Transparenz (§ 97 (1) GWB), der Gleichbehandlung (§ 97 (2) GWB) sowie die Grundsätze der Wirtschaftlichkeit und Sparsamkeit bei der Ausführung des Haushaltsplanes der Behörden (z.B. § 7 Bundeshaushaltsordnung) sind Qualitätsmerkmale für das gesamte behördliche Handeln. Die gesetzliche Regel der Ausschreibungspflicht knüpft das Vergaberecht nicht an diese Merkmale, sondern an den Tatbestand des Vorliegens eines öffentlichen Auftrages. Es fehlt also beim ersten Beispiel der rechtsähnliche Tatbestand für eine Analogie zum Vergaberecht.

Ebenfalls schließen die im zweiten Abschnitt gebildeten theoretischen Beispiele die Möglichkeit einer Analogie aus, weil die genannten Gesellschaftsgründer keinen klaren Sachverhalt formuliert haben. Gemäß der Schilderung des ersten Falles „erscheint" die Drittbeteiligung „wie die Erteilung eines Auftrages" und im zweiten Falle erhält die dritte Person eine „Rolle", die mit der eines Auftragnehmers „vergleichbar" ist. Danach stellt sich nicht die Frage nach einer Analogie, sondern nach einem zweifelsfreien Vertragsinhalt. Ggf. ist eine richterliche Feststellung herbeizuführen, ob die Gemeinden und Privatpersonen einen Vertrag schließen wollten und geschlossen haben, der auf die Erreichung eines gemeinschaftsrechtlichen Zweckes gerichtet ist und die Beteiligten gegenseitig zur Förderung dieses Zweckes verpflichtet sind (Gründung einer Gesellschaft), oder ob sie einen Austausch von Leistungen gegen Entgelt vereinbaren wollten und vereinbart haben (Abschluss eines öffentlichen Auftrages). Der wahre Wille der Vertragschließenden ist erst noch zu erforschen und ggf. eine ergänzende Vertragsauslegung vonnöten (§§ 133, 157 BGB). Ferner gilt die Regel, solange nicht die Parteien sich über alle Punkte eines Vertrages tatsächlich geeinigt haben, ist der Vertrag nicht geschlossen (§ 154 BGB).

Jedenfalls vermag keine Analogie einem ungeklärten Sachverhalt Rechtsklarheit und –Wirksamkeit zu verleihen. Vor allen Dingen verbieten weder die Richtlinien des Rates der Europäischen Gemeinschaften noch das GBW die Privatisierung gemeindlicher Aufgaben durch Gründung einer gemischt-wirtschaftlichen Gesellschaft, wenn die betreffende Leistung „ebenso gut unter Vergabe von öffentlichen Aufträgen erledigt werden könnte“.

Schließlich gestattet auch der Sachverhalt im dritten Abschnitt keine Möglichkeit der Umwandlung in einen öffentlichen Auftrag durch Analogie, weil die geschaffene gesellschaftsrechtliche Kooperation als In-house-Gesellschaft zu deuten wäre unter Einstellung einer von der Gemeinde abhängigen Arbeitskraft. Der öffentliche Auftragnehmer wäre im übrigen keinesfalls die „eingekaufte“ Arbeitskraft, sondern allenfalls die In-house-Gesellschaft.

Erkennend, welch vergeblicher und verfehlter Argumentationsaufwand getrieben wird, die Gründung einer gemischt-wirtschaftlichen Gesellschaft in ein „Vergaberechtsregime“ zu zwingen, wird beim Leser unwillkürlich der Wunsch geweckt, dass doch um die Jahrhundertwende der Mut aufgebracht worden wäre, ein solides, faires, freiheitliches, umfassendes Vergaberecht neu zu schaffen. Stattdessen wurden die in Deutsches Recht umgesetzten

Europäischen Richtlinien dem Kartellgesetz als 4. Teil als Fremdkörper zugeordnet.

d) Es ist das Verdienst von Boesen, auf die beiläufige Erwähnung von „Eigenleistungen“ der öffentlichen Hand in Art. 43 Satz 2 der Dienstleistungs-Koordinierungs-Richtlinie 92/50 EWG hingewiesen zu haben.

Boesen, Kommentar Vergaberecht a.a.O. § 99 RdNr. 9, § 10 RdNr. 86

Nach diesem Artikel soll die Europäische Kommission 3 Jahre nach Einführung dieser Richtlinie die Auswirkungen staatlicher Eigenleistungen auf die Liberalisierung des Auftragswesens untersuchen und erforderlichenfalls Anpassungsvorschläge vorlegen. Es wäre wünschenswert, wenn in diese Erörterungen auch die Eigenleistungen gemischt-wirtschaftlicher Gesellschaften des Privatrechtes im Rahmen der Privatisierungen von Aufgaben der Daseinsvorsorge einbezogen würden und zumindest deren Unabhängigkeit von der vergaberechtlichen Ausschreibungspflicht bestätigt werden würde.

e) Die Gründung einer in Eigenleistung tätigen gemischt-wirtschaftlichen Gesellschaft des Handelsrechts muss den gesetzlichen Regeln des betreffenden Gesellschaftstyps entsprechen und der Gesellschaftsvertrag einer nach bürgerlichem Recht zu schaffenden gemischt-wirtschaftlichen Kooperation muss die gegenseitige Verpflichtung der Gesellschafter zur Errichtung und Förderung eines gemeinsamen Zweckes zum Gegenstand haben, die Gesellschafter müssen gesamthänderisch verbunden und mit gleichen Rechten und Pflichten ausgestattet sein und müssen der gesamtschuldnerischen Haftung unterliegen. Weder die Gesellschaftsgründung noch der Abschluss eines Gesellschaftsvertrages sind vom Vergaberecht betroffen. Die Gründergemeinde erteilt der Handelsgesellschaft bzw. der BGB-Gesellschaft keinen öffentlichen Auftrag; sie werden in unabhängiger Eigenleistung tätig. Dies muss die Satzung bzw. der Gesellschaftsvertrag deutlich zum Ausdruck bringen, etwa wie folgt:

> „*Gegenstand der Gesellschaft ist die eigenverantwortliche und in eigener Zuständigkeit sowie im gesetzlichen Rahmen vorzunehmende turnusmäßige Reinigung der städtischen Grundstücke... sowie die Sammlung, Beförderung und Entsorgung von Hausmüll in der Müllverbrennungsanlage ... Die Gesellschaft zieht die entsprechenden Benutzungsgebühren von den Gemeindemitgliedern ein...“*

Erfahrungen aus der Praxis lassen uns die Empfehlung aussprechen, bereits bei Beginn der Verhandlungen über die Gesellschaftsgründung bzw. den Gesellschaftsvertrag darauf hinzuwirken, dass Gegenteiliges in Verlautbarungen, Berichten in der Presse und in sonstigen für die Öffentlichkeit zugängigen Erklärungen nicht zu lesen ist.

Im Innenverhältnis der Gesellschaft gilt Gesellschaftsrecht.

Object Publication

This is paper presents Bombardier’s comments on specific questions raised in the context of a paper (the “Green Paper”) prepared by the Commission of the European Communities on Public-Private Partnership and Community Law on Public Contract and Concessions. The content of this paper has been revised by Structured Finance and TTS (Contract.)

General comments:

Public-Private Partnerships (“PPPs”) are any type of association that brings the public and the private sector together for their mutual benefit.

Public sector entities can be found at different levels of the government structure (i.e. Central/Federal, State/provincial, Regional and or Municipal). These entities can be ministries, departments or special agencies (already existing or created for specifically advising the “host governments”, structuring, negotiating and/or implementing PPPs type projects.

These projects are characterized by a long development period from identification of a “concept” to a successful commercial/financial closing.

Their successful implementation in any given sector depends on the level of regulation in the “host” country, project complexity and envisaged risks sharing between private and public parties.

The public and private sectors typically partner to achieve two main objectives:
(1) provide for a solution that brings value for money; and
(2) share risks providing a fair risk profile and commensurate yield for private equity.

Public authorities generally assess “value for money” using “public sector comparator”.

Railway projects differ from many other PPPs in a number of ways from projects developed in other industrial sectors, for example

Railway projects compete with exiting modes of transportation such as cars, taxis and buses which benefit from a subsidized infrastructure. The ongoing benefit of rail systems over cars, taxis and buses include inter alia (1) reduced congestion and travel time, (2) reduced pollution, (3) reduced traffic accidents, (4) more efficient use of available public land. Most of these benefits accrue to both the surrounding population and the users of rail systems. It is therefore, unreasonable to expect the users of rail transportation systems to pay for benefits accruing to others through “full” fares.

Those rail transportation projects:

- Tend to be much larger and as such require substantially larger capital investment by private and public parties than most other PPPs. In these circumstances the capital requirements make it difficult for the private sector to solely bear the project risks.
- Can be fragmented in different ways - differentiating between different categories of infrastructure - Civil, Electrical & Mechanical/maintenance, Rolling Stock operations and maintenance, etc. Railway PPP projects can involve all or specific asset categories within an overall system.
- Tend to incorporate assets especially the fixed assets, with long term economic life.
- Increasingly tend to be integrated with other transport systems and consequently have complex third party interface agreements.
- Tend to be economically vulnerable to competition or other forms of discrimination (e.g. fuel taxation levels, restricted tariff levels, requirements to provide discounted tariffs, etc.).
- Tend to present limitations in terms of tariffs (use of shadow fares/operating subsidies)
- Tend to have barriers to system expansion other than with the same technology from the same providers. In many instances it may be technically impractical to consider expansion with an alternative concessionaire or providers of systems.
- Tend to require a significant portion of Public Sector funding for capital expenditure and often require some form of revenue support that is not reliant on volume risk or end user tariffs (e.g. Performance Payment Regimes, Availability Payments, Minimum Revenue Guarantees)

The form of railway PPP projects varies significantly from project to project and there is no “generic” model that applies, which is not necessarily the case in others sectors (e.g. toll roads, power projects, etc.).

An element of the rationale or justification for PPP projects may be influenced by factors that are not easily quantified (e.g. socio economic development, technology transfer, economic multiplier affects, etc.).
EU Treaty legislation for the award of PPP contracts should focus primarily on key principles including - Transparency, Equality of treatment, Proportionality, Mutual Recognition. Any legislation should not attempt to prescribe or limit the basis of the contractual arrangements.

Question 1

What type of purely contractual PPP sets-ups do you know of? Are these sets-ups subject to specific supervision (legislative or other) in your country?

Bombardier Transportation has been involved in several rail projects over the recent years involving some form of private participation. Such list includes:[1]:

Croydon, UK
Star, Malaysia
Las Vegas, USA
LUL, UK
Nottingham, UK

These arrangements included contractual arrangements entered with Special Purpose Corporations (SPCs) as contractors to deliver specific goods and services and shareholders agreement as investors in such SPC or through specialized financing vehicles to support part of the SPC's funding requirements.

Each project had its own terms of reference and evaluation criteria. Some were considered as greenfield projects (design, build, finance, operate and maintain new systems) others fell under the category of brownfield (refurbish, expand, operate and maintain). Some included a certain degree of ridership risks for the project company and its shareholders while others were structured around performance/availability payment and/or a mix of both.

Concessionaire revenues included a combination of; end user charges; Performance Payment Regimes; Availability Payments and Minimum Revenue Guarantees.

[1] Only those projects which have reached Financial Close are listed. Bombardier Transportation is or has been involved in a number of other projects (at various stages) in Canada, US, Mexico, UK, Spain, Portugal, Greece, Turkey, Israel, UAE, South Africa, Korea, Taiwan and Thailand.

Given the high level of patronage risk in passenger-rail projects and the little degree of control the private sector has over risk, Bombardier has been a strong advocate of solutions where the private sector partner is rewarded for performance irrespective of how many passengers use the system.

In most cases, the arrangements were subject to specific supervision (legal framework, PPP law or decree) although in certain instances (e.g. Las Vegas), no such supervision was provided or in fact required.

Question 2

In the Commission's view, in the context of a purely contractual PPP, the transposition of the competing dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economics operators. Do you share this point of you? If not, why not?

Yes we share this point of view. A competitive dialogue is a useful process in the development of PPP projects, but needs to be carefully managed to maintain transparency and equality of treatment.

Question 3

In the case of such contracts, do you considered that there are other points, apart from those concerning the selection of the tendering procedure, which pose a problem in terms of Community law on public contracts ? if so, what are these? Please elaborate.

One point that should be clarified is whether any Community law impedes commitments that may be required from the contracting authorities. For example budget constraint rules that would prevent a public authority to make long-term commitments on performance payments for instance. Another is linked to laws restricting the capacity of authorities to make commitments related to foreign currencies.

Question 4

Have you already organized, participated in, or wished to organize or participate in, a procedure for the award of a concession within the Union? What was your experience of this?

Bombardier has participated in a number of European concession tenders and has been successfully awarded contracts - Croydon Tramway, Nottingham Express, London Underground, etc.
In general, our experience has been very positive. However some projects have not yielded the expected benefits for a number of reasons.

In the UK more recent projects have been ‘influenced’ by PFI Treasury Task Force Guidelines. While these have been helpful in many ways, their lack of flexibility has been a handicap in areas where railway projects differ substantially from project in ‘typical’ sectors. For example, the UK requirement that project revenues exceed operating revenues is often not practical in the rail sector, where the benefits of rail transportation accrue to the overall community and not just to the users. In the rail sector, the benefits of reduced congestion and pollution accrue to the overall community and should be compensated by government through operating subsidies as the users are unlikely to pay for benefits accruing to others.

Other criticism is related to the non-disclosure of affordability constraints at the early stage. If private sector partners are to engage and commit resources to the development of such projects, they need to understand and make their own evaluation of whether or not a project has a possibility of being affordable.

Question 5

Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions? In your opinion is genuine competition normally guaranteed in this framework?

Our understanding of such framework is limited so we are unable to provide meaningful comments.

Question 6

In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concession, desirable?

Yes, provided it is restricted to procedures, maintains flexibility for projects to evolve into different structures (e.g. concession to turnkey procurement or vice versa) and provides flexibility to accommodate fundamental differences between projects in different industry sectors including in terms of public support.

Question 7

More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make subject to identical award arrangements?

The establishment of identical award arrangements for contracts or concessions is not considered ideal as award for conventional contracts and concessions in the rail sector differ substantially in terms of contractual arrangements & obligations and risks profile for public and private parties. Such differences are also amplified if such arrangements cover construction as well as services over extended periods of time. As mentioned earlier there are fundamental differences between rail and other industrial sectors making standardization of award arrangements a difficult task.

Only to the extent it is limited to broad principles of the tendering process. Such legislation should not try to prescribe a set of formula for the award criteria.

Question 8

In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all interested operators? Is the selection procedure organized to implement the selected project genuinely competitive?

In our experience, non-nationals operators are not ***guaranteed*** access even though nothing prevents them access. In terms of advertising, this is not systematic and some interested operators may not be informed. The selection procedure is generally competitive.

As we are not an active “operator” we can only assume that there is little or no discrimination against non-national operators in the railway sector, largely due to the relatively limited number of competitors.

Question 9

In your view, what would be the best formula to ensure the development of private initiatives PPP in the European Union, while guaranteeing compliance with the principle of transparency, non-discrimination and equality treatment?

In the railway sector there have been few private finance initiatives (PFI)/ PPPs and those that have taken place have been largely restricted to certain market specially the UK and for the expansion of existing concessions.

Some form of incentive must remain to encourage private sector initiatives. This does not obviate the need for a transparent process, but under certain conditions necessarily require a relaxation of the principle for equality.

For example: concession length in terms of the period required to repay the investment. This concept is problematic in the railway industry. Economic lives assets vary considerably. One of the problems with the efficient financing of Rolling Stock in the UK has been the mismatch between ROSCO contract periods (franchise terms) and the asset economic lives.

§ 48/9 These clauses seem to imply that 'step in' arrangements may present a problem in terms of transparency and equality of treatment.

These clauses are essential in securing the financing of railway PPP projects and their requirement are often recognized at the tender stage. It would be unhelpful to future PPPs if restrictions were introduced in respect of step in provisions.

As mentioned earlier developing PPP type project represent substantial investment on the part of the private sector. Fair compensation of development costs should be seriously evaluated as standard features of award arrangements.

Question 10

In contractual PPPs, what is your experience of the phase which follows the selection of the private partner?

§ 43 makes the observation that considerable time elapses between the Preferred Bidder selection and Financial Close of a project. In the railway sector this period is often calculated in terms of years.

The granting authority is under pressure to close the transaction quickly and the Preferred Bidder could be tempted to negotiate substantial changes to original proposal used as the basis for the award. But in some instances, changes could be required that cannot be reasonably anticipated and are necessary prerequisites for reaching Financial Close. However, in some instances the changes result from tactical positions adopted by the tenderer to become the Preferred Bidder and have 'discriminatory and equality' implications.

Mechanisms to prevent the award of concessions on the basis of flawed proposals should be encouraged. This might be achieved by awarding costs/damages to a disadvantaged tenderer, or allowing tenderers to challenge certain aspects of competitor's proposals.

Question 11

Are you aware of cases in which conditions of execution – including the clauses on adjustment over time – may have had a discriminatory effect or may represented an unjustified barrier to freedom to provide services or freedom of establishment ? if so, can you describe the type of problems encountered?

No.

Question 12

Are you aware of any practices or mechanism for evaluating tenders which have a discriminatory effect?
Technological transfer, localization/local content requirements. Insistence on Tender & Contract being drafted in non-Official EU language.

Question 13

Do you share the Commission's view that certain step-in type arrangements may present a problem in terms of transparency and equality treatment? Do you know of other standard clauses which are likely to present similar problems?

No, these clauses are essential in securing the financing of railway PPP projects and their requirement are often recognized at the tender stage. It would be unhelpful for future PPPs if restrictions were introduced in respect of step-in provisions.

Question 14

Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level? If so, which aspects should be clarified?

The complex nature of a railway PPPs and participants is that flexibility is required in the structures adopted by Sponsors forming a concession company, application of sub-contracting rules to contract awarded to shareholders of the concessionaire and in the classification of necessary public support as "State Aid".

Clarification, of the supporting role and responsibilities of the governmental bodies (e.g. national government, etc.), senior to the awarding authority, would be helpful. In some instances the responsibility of senior governmental bodies is ambiguous to tenderers.

Question 15

In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.

Not aware.

Question 16

In your opinion does the phenomenon of contractual PPPs involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?

This seems to be a reference for the need to tender sub-contracts to a concession. The nature of a railway PPP is that it would be inappropriate to require mandatory tenders for sub-contract work, particularly when revenues are dependant upon performance criteria being met (guaranteed performance quality may override cost considerations).

The only instance this might be justified in is in the award of a contract to a 'master developer' who is not taking full construction cost/integration risk.

Question 17

In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?

No.

Question 18

What experience do you have of arranging institutionalized PPPs in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases? If not, why not?

No specific comments given no experience in "institutionalized" PPPs.

Question 19

Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalized project? If so on what particular points and in what form? If not, why not?

[No specific comments given lack of experience in “institutionalized” PPPs.

Question 20

In your view which measures or practices act as barriers to the introduction of PPPs within the Europeans Union?

Some countries have policies towards maintaining nationalized industries and the provision of certain services (e.g. utilities) which can be a challenge for the development of PPPs involving foreign operators.

Question 21

Do you know of other forms of PPPs which have been developed in countries outside the Union? Do you have examples of “good practice” in this framework which could serve as a model for the Union? If so, please elaborate.

The procurement model for the Gautrain Rapid Rail Link project in South Africa is an interesting one where the public authority adopted a phased Request for Proposals approach combined with an appropriate bid cost compensation regime. This ensured a consultative and interactive spirit throughout the bidding process (still underway).

Mechanisms to prevent the award of concessions on the basis of flawed proposals should also be encouraged. This might be achieved by awarding costs/damages to a disadvantaged tenderer, or allowing tenderers to challenge certain aspects of their competitor’s proposals.

Question 22

More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful ? Do you consider that the Commission should establish such a network?

Given the evolving nature of PPPs, worldwide, a forum for discussing PPP issues would be useful provided it can attract the active participation of the key private and public sector actors.

We would welcome such forum.

European Commission
Consultation « Green Paper on PPPs and the Community law on public contracts and concessions »
C 100 2/2005
B-1049 Brussels

July 28th, 2004

Dear Sirs:

Ref: Consultation « Green Paper on PPPs and the Community law on public contracts and concessions »

We would like to thank you for having sought comments on your « Green Paper on PPPs and the Community law on public contracts and concessions ».

Dexia Crédit Local is a leading European bank with a proven financial advisory, debt arranging and long-term lending expertise in PPP projects across Europe:

- In France, Dexia Crédit Local has a long tradition of financing concessions in many sectors including energy, transportation, water, waste as well as public contracts (under BEA/AOT[1] schemes) in the health and accommodation sectors.

- In the UK, Dexia Public Finance Bank is one of the top five banks in the PFI market, having been actively involved in a large number of projects (health, education, government buildings, street lighting, waste, transport, etc.).

- In Italy, Dexia Crediop is one of the main players in the PPP market, especially in sectors such as transport and health.

- In Spain, Dexia Sabadell Banco Local has also financed a number of transactions in these sectors.

- In Portugal, Dexia Crédit Local acted as adviser and lender in the transportation SCUT PPP program and is currently involved in the bidding process for the first PPP project in the health sector.

[1] Bail Emphytéotique Administratif / Autorisation d'Occupation Temporaire

- In Holland, Dexia Crédit Local was the only non-Dutch bank to finance, as mandated lead arranger, both the two main PPP projects (the HSL Zuid high speed line and The Hague's waste water project).

- Furthermore, Dexia Crédit Local has financed PPP projects, or is currently involved in the bidding process, in other EU countries in sectors such as transportation (Belgium, Greece, Hungary, Poland), water (Belgium, the Czech Republic, Poland, Slovakia), and education (Germany).

Based on this extensive experience, we have tried to answer the queries of the European Commission in the attached document and hope that our participation in the above mentioned consultation would be useful to the Commission.

Should you need any further information on the attached, please do not hesitate to contact me (Tel: 331 43 92 76 44 , email : patrice.vabre@clf-dexia.com) or Patrick Blanchard, Global Head, Project & Sectorial Finance (Tel: 331 43 92 77 56 , email : patrick.blanchard@clf-dexia.com).

Yours Sincerely,

…………….
Patrice Vabre
Global Head of Structured Finance

GREEN PAPER

OF THE COMMISSION OF THE EUROPEAN COMMUNITIES

ON PUBLIC-PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

PURELY CONTRACTUAL PPPs AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

1. What types of purely contractual PPP set-ups do you know of ? Are these set-ups subject to specific supervision (legislative or other) in your country ?

As one of the main players in the European PPP market, Dexia Credit Local has been involved in several types of purely contractual PPP's in Europe.

In *Italy* for instance, we have been involved in both the "concessive models" and the PFI-type transactions. Both types are regulated by law 109/94 – the so-called "Merloni Law" – as amended several times and largely overhauled in 2002 by Law 166/02. The Merloni Law outlines two main procedures to award concession contracts under a PPP framework:

- Under Article 19, a public authority leads the PPP initiative; technical, economic and financial feasibility studies are conducted and preliminary designs of the project are developed by the awarding authority; a regulated procedure for the bidding process is established and a preferred bidder is selected by public tender;
- Under Article 37bis, by contrast, a developer leads the PPP initiative; feasibility analysis, preliminary design and guidelines for the concession contract are prepared by the developer; there is then a streamlined negotiated bidding process with the main players; once the awarding authority deems the project to be in the public interest, a preferred bidder is then chosen through public tender.

In UK Dexia Public Finance Bank has been involved in several transactions in a large range of sectors such as health, education, transport and environment. In the UK, PFI transactions are under the supervision of public authorities and need to comply with law generally, including specific regulations in defined sectors (e.g., in elderly care projects, the Commission for Social Care Inspection, although not a party to the concession agreement, imposes certain rules, and in particular issues a registration certificate before the care provider may provide services).

In *France*, the "Ordonnance sur les contrats de partenariats"[2] has recently been issued and no projects have been financed under this scheme yet. Dexia Credit Local has therefore been involved almost exclusively in concessive models in many sectors. These models ("Délégations de Service Public" or "DSP") have been regulated since 1993 by the so-called "Loi Sapin"[3]. Dexia has also financed projects in the health and the "gendarmeries"[4] sectors using schemes such as the BEA ("Bail Emphytéotique Administratif") and the AOT ("Autorisation d'Occupation Temporaire") where the revenues are not sourced from end users but from public authorities. Although these schemes have been relatively rare in France compared to concessive models, it is anticipated that, following the recent adoption of legal frameworks in relation to specific sectors[5], these schemes will be more frequently used.

Phase of selection of the private partner

Purely contractual partnership : act of award designated as a "public contract"

2. In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view ? If not, why not ?

Based on our extensive PFI/PPP experience in the UK, Portugal and Holland where the competitive dialogue has been implemented successfully for the benefit of both the public and the private sectors, we believe that the transposition of the competitive dialogue procedure into national law adapted to contractual PPP could constitute, for countries where this procedure does not exist yet, an opportunity to introduce a higher level of flexibility in public procurement procedures, safeguarding the fundamental rights of economic operators as well as competition.

It should be noted, however, that the effectiveness of this new procedure would depend on both the way in which the national law will include the new procedure and the capability of public administrations to disclose their needs and negotiate with the private sector in a fair and efficient way. It is indeed critical that clear and transparent procedures are implemented to avoid uncertainty surrounding the evaluation of the bids by the awarding authority and the risk of discontented parties lodging a recourse against the preferred bidder or the awarding authority before an administrative tribunal.

[2] Ordonnance N°2004-559 dated 17/06/2004, which allows DBFO contracts where revenue is received from a public authority

[3] Loi Sapin, 1993, ruling the « Délégations de Service Public »

[4] Accommodation of police officers under the authority of the Ministry of Defense

[5] Internal Security and Justice : « Loi N°2002-1094 du 29 août 2002 d'orientation et de programmation pour la sécurité interieure (LOPSI) » et « Loi N°2002-1138 du 9 septembre 2002 d'orientation et de programmation pour la justice (LOPJ) ». Health : « Ordonnance N°2003-850 du 4 septembre 2003 portant simplification de l'organisation et du fonctionnement su système de santé ». Defense : « Loi N° 2003-73 du 27 janvier 2003 relative à la programmation militaire pour les années 2003 à 2008 »

In addition, we view the potential bid costs associated with this procedure as an important issue that could be an obstacle to a fair competition if only a small number of players can afford to compete due to these costs. A mechanism of compensation for bidders who made it to the last stage of negotiations but were not selected as preferred bidder could probably help.

3. In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these ? Please elaborate.

We do not see any other specific points.

Phase of selection of the private partner

Purely contractual partnership : act of award designated as a "concession"

4. Have you already organized, participated in, or wished to organize or participate in, a procedure for the award of a concession within the Union. What was your experience of this ?

We have been involved, as financial adviser and debt arranger / underwriter / provider, in the financing of many concessions / PPPs in Europe. On a few occasions, Dexia has joined a bidding consortium as financial investor, e.g. in the UK and Italy. Our experience is diverse, depending both on countries and sectors involved.

5. **Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions ? In your opinion is genuine competition normally guaranteed in this framework ?**

Yes. We believe that the competitive advantage of national companies is not necessarily coming from a deficiency in national legal frameworks but, often, from a better understanding of the needs of the local public sector.

6. In your view, is a Community legislative initiative, designed to regulate procedure for the award of concessions, desirable ?

So far, Dexia Credit Local has been successful in financing concessions in different countries based on local procedures for the award of concessions.

We would regard a Community legislative initiative as positive only if this allows countries where no concession law exists (such as the Czech Republic for instance), or where the legal framework remains complicated and uncertain (such as Italy, see answer

8 for more details), to adopt clear and efficient procedures, while insuring that mature markets having already clear awarding procedures can keep their good practices.

7. More generally, if you consider that the commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions to make them subject to identical award arrangements ?

Where the borderline between concessive models and public contracts is not totally clear (as in France for instance), we believe that a common award procedure would be useful to eliminate the risk of a dispute post contract award on the basis that the bidding procedure was not the right one, i.e. not in accordance with the defined scheme.

It should be noted however that, in mature markets such as the UK, awarding procedures seem to be efficient and well accepted by market players (very few disputes actually result from bidding procedures); such markets should not suffer from the introduction of Europe-wide rules aiming at solving legal uncertainties of other countries.

Specific questions relating to the selection of an economic operator in the framework of a private initiative PPP

8. In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organized to implement the selected project genuinely competitive ?

Through its Italian subsidiary Dexia Crediop, Dexia Credit Local has gained an extensive experience in projects where the contracting authority issues an invitation to present an initiative.

This experience leads us to think that a few further improvements to the legislative framework and to the procedures used could relatively easily unleash the full potential of private sector involvement in the Italian market. In particular, the regulatory framework, despite recent improvements, remains very complex, mainly in relation to the procedures that need to be followed before the adjudication of a project.

1) The first element of complexity is the Italian peculiarity constituted by the "*Promotore*" procedure, which is the appointment of a private consortium to develop the project together with the public sector with a view to defining it sufficiently to launch a tender. In return for such development work, the *Promotore* is awarded a right of first refusal (right to match) for the project, and the right to have its costs repaid in case of award to a competitor. The initial proposal of a private consortium can be either solicited or unsolicited. In case of an unsolicited offer, the main issue is: how can a private consortium formulate a

very detailed proposal (preliminary design, draft project agreement, financial model…) that meets the needs of the public sector without having a detailed ex ante understanding of what they may be.

2) The appointment of the *Promotore* occurs only if the proposal made by the private consortium is deemed to be of "public interest" by the public authority. Unfortunately, an official definition of such concept does not exist, which leaves the appointment at the entire discretion of the public sector and offers little certainty to the private sector. The main issue faced by private consortia bidding for a project at the tender stage, and obviously by their financial advisors, is the lack of clarity on criteria to be used in the valuation of their offer, since they are not defined by law and often only qualitatively outlined in the meager documentation provided by the awarding authority.

Such a complex process and the uncertainties surrounding the valuation of projects make their award a very long and difficult affair and increase substantially the risk of discontented parties lodging a recourse against their competitor or the awarding authority before an administrative tribunal.

This absence of clear rules might lead to additional difficulties and increase the costs of project organisation for non-national companies. This situation could result in a less competitive selection process.

This said, although we believe that the Italian legal framework could be further improved, we regard the adoption of the Merloni Law together with its recent amendments as a very useful initiative which made possible the development of PPP projects in sectors such as health, transportation and renewable energy.

9. In your view, what would be the best formula to ensure the development of private initiative PPP's in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment ?

We regard Community legislative initiatives seeking to establish a common framework in the European Union, standardise rules and provide less complex procedures as a positive element to reduce shortcomings arising from legal uncertainties.

This said, we believe that these initiatives should not jeopardise the continued development of PPPs in mature markets such as the UK by introducing constraints which are not necessary. Community legislative initiatives addressed to solve legal uncertainties in certain countries should not create hurdles for others who have a legal framework which has proved to be efficient and appropriate.

We believe that the creation of national PPP taskforces is very important to give guidance on best practice. We believe that the English Treasury Taskforce has been of great assistance in the development of PPP in the UK and we regard the creation of PPP taskforces in countries such as Holland, Italy, Belgium, the Czech Republic, Hungary and Germany as very positive initiatives. We think that a pan European network of national taskforces would be useful in terms of sharing best practice feedback.

The phase following the selection of the private partner

The contractual framework of the project

10. In contractual PPP's, what is your experience of the phase which follows the selection of the private partner ?

In the UK, the standardization of PFI contracts and the sharing of best practice have shown that the period of negotiation from the selection of the private partner through financial close can be substantially reduced.

11. Are you aware of cases in which the conditions of execution – including the clauses on adjustments over time – may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered ?

We would make a distinction between three kinds of adjustment clauses : benchmarking clauses, variation/change to services clause, and "re-equilibrium" clauses.

- We regard benchmarking clauses as non-discriminatory in general. The only issue we see with this type of mechanism is in relation with niches or new sectors. The requirement to benchmark in order to achieve best value for money is predicated on the existence of a comparator group. It may be difficult to identify comparators in new sectors. Also, market testing can be an issue for projects where operators are not easily interchangeable (e.g. whilst cleaners may be interchangeable in a PFI hospital, care providers are less so).

- Variation/change to the services clauses are necessary to allow the public sector to adapt the contract to public needs, which can change over time. The issue is to ensure that both the allocation of risk and the remuneration of the risk borne by the private sector remain unchanged (as measured by debt cover ratios and shareholders' returns) and that the procedure of change, especially with regards to adjusting payments made by the public sector, is clearly defined at contract signing so that public and private sectors are neither advantaged nor disadvantaged after the change when compared to the initial contract. The difficulty is then to have a detailed procedure to ensure this is achieved while keeping a flexible adjustment mechanism that does not generate high adviser fees and other costs for each change.

- "Re-equilibrium" clauses ("clauses de revoyure" in French concession contracts) can be more problematic and can have discriminatory effects if not properly addressed in the contract. In a shadow toll project for instance, a bidder may win the concession by requesting smaller grants from the government while making more aggressive traffic forecasts. If at a later stage forecasts are not reached, the concessionaire may (if it has negotiated this in the project agreement) request for "re-equilibrium", and as a consequence its bid might become more expensive for the public sector than those of other initial bidders who were more conservative in terms of traffic forecasts. It is therefore very important to have in the contract a clear allocation of risk when selecting the preferred partner.

12. Are you aware of any practices or mechanisms for evaluating tenders that have a discriminatory effect ?

We are not aware of such practices.

13. Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment? Do you know other "standard clauses" which are likely to present similar problems ?

No. In countries where the legal framework provides for "step-in" rights for the benefit of financial institutions (like in the UK, Italy, Holland, Portugal), "Direct Agreements" lay down clear procedures. In particular, any suitable alternate operator has to be approved by the awarding authority. Lenders should have the first call to choose the suitable alternate operator at the time of financial difficulty as they must ensure their debt is repaid. It is to be noted that this applies only in case of termination due to concessionaire's default under the PPP agreement, which is a very extreme situation. Step-in rights can therefore not be considered as a mechanism that could potentially skew fair competition.

14. Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level. If so, which aspects should be clarified ?

Standardization of the contractual framework with some uniform scheme/wording for the main contractual types and clauses, could be, in our opinion, very useful to improve clarity and competition. We believe however that this can only be organized at national level to ensure that PPPs continue to be as a valuable and accurate answer to public needs in each EU country.

Sub-contracting of certain tasks

15. In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting ? Please explain.

No.

16. In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting ?

No, because each bidder will have already submitted their best price based on their assessment of the risks they will take, which are normally passed to the subcontractor who, more often than not, is one of the sponsors.

We believe that there is a danger to be overly prescriptive. Ultimately, the risks are borne by the private partner signing the contract, who must therefore be given sufficient flexibility to change material subcontract terms in particular. It is only when material terms are affected that the awarding authority should be consulted.

17. In general do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules of subcontracting ?

No.

INSTITUTIONALISED PPPs AND THE COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

18. What experience do you have of arranging institutionalised PPPs and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases. If not, why not?

Dexia Credit Local has an extensive experience of arranging institutionalized PPPs, especially in France but also in other countries such as Italy. A potential conflict of interest may exist when the awarding authority is also a stakeholder in the entity jointly held by the public and the private sector parties.

19. Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalized project ? If so, on what particular points and in what form ? If not, why not ?

We do not consider this as a priority.

IN GENERAL

20. In your view which measures or practices act as barriers to the introduction of PPPs within the European Union ?

The main barriers to the development of PPPs we have identified are as follows:

- Absence of strong political will to implement these schemes
- Absence of a national PPP taskforce to give guidance
- Inappropriate legal framework
- Need for significant training of civil servants and private sector players, which have to deal with novel, rather complex schemes both during contract negotiations and during subsequent contract monitoring
- Need for a cultural shift on the part of the public sector to allow the private sector into areas that had hitherto been uniquely their preserve
- Resistance of the trade unions regarding transfers of staff
- Need for managing complex interfaces (e.g. with clinical / educational staff in hospitals / schools)

21. Do you know of the other forms of PPPs which have been developed in countries outside the Union ? Do you have examples of "good practice" in this framework which could serve as a model for the Union ? If so please elaborate.

For instance, Dexia Credit Local has a positive view on waste management PPP projects in Switzerland : the company in charge of the waste treatment is owned by both the municipality and private partners, it is controlled by the municipality but with private status; contracts are under private law.

Australia is another country which has established interesting PPP programs at state levels, which are actually quite similar to the UK PFI model.

22. More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful ? Do you consider that the Commission should establish such a network ?

Yes, we think that exchange of best practice would be useful at a European level. We believe that the Commission is best placed to encourage the national PPP taskforces to set up a pan European network.

NORTON ROSE

RESPONSE TO THE GREEN PAPER ON PUBLIC-PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS PUBLISHED BY THE COMMISSION OF THE EUROPEAN COMMUNITIES ON 30 APRIL 2004 (THE "GREEN PAPER")

This is the response of Norton Rose to the Green Paper.

Norton Rose is a leading international law firm which operates through a network of offices in Europe, the Middle East and Asia. The firm has over 200 partners, over 1000 fee earners and 2000 staff worldwide. Norton Rose focuses research, know-how and expertise on five strategically important areas where the firm and its clients have particular interests: international corporate finance, financial institutions, transportation, energy and infrastructure and technology. More detailed information on Norton Rose is available on the firm's website at: www.nortonrose.com.

In this paper, Norton Rose respond to questions 1, 2, 6, 7, 13, 15, 16, 17 and 20 of the 22 questions posed by the Commission of the European Communities in its Green Paper. These questions have been chosen on the basis of their relevance to our clients and the PPP markets in which they operate.

References in this paper to:

"Directives" means one or both of the New Directive and the Utilities Directive as the context requires;

"New Directive" means Directive 2004/18/EC;

"procurement rules" means the rules relating to the procurement and award of public works contracts, public services contracts and/or public supply contracts contained in the relevant Directive, as the case may be; and

"Utilities Directive" means Directive 2004/17/EC.

1. *What types of purely contractual PPP set-ups do you know of? Are these set-ups subject to specific supervision (legislative or other) in your country?*

   PPP projects procured under the UK Government's Private Finance Initiative ("PFI") are subject to specific supervision. The Treasury published version 3 of "Standardisation of PFI Contracts" in April 2004 ("SoPC"). The aim of SoPC is to provide guidance on the key issues that arise in PFI projects in order to promote the achievement of commercially balanced contracts and enable public sector procurers to meet their requirements and deliver best value for money.

The three main objectives of SoPC are:

1. to promote a common understanding of the main risks which are encountered in a standard PFI project;

2. to allow consistency of approach and pricing across a range of similar projects; and

3. to reduce the time and costs of negotiation by enabling all parties concerned to agree a range of areas that can follow a standard approach without extended negotiations.

The Treasury has policy responsibility for PFI and for SoPC. In addition, many of the sectors which procure projects on the basis of public private partnerships (for example, health, education, criminal justice and social housing) have their own standard form project agreement which is based on SoPC but is tailored to the specific requirements of the sector in question.

In terms of procuring PPP contracts, contracting authorities and contracting entities clearly have to comply with national legislation giving effect to the Directives. In addition in the UK, there are requirements on local authorities and the National Health Service to make and comply with their own standing orders, promoting competition in procurement and various other legislation and case law- governing aspects of local authority procurement.

Norton Rose has advised a range of participants in relation to PPP projects of a purely contractual nature in a number of European jurisdictions and in a variety of different sectors. These include health, education, criminal justice, roads, rail, ports/airports, telecommunications, water, waste, defence, accommodation projects and social housing.

The contractual PPP structures include:

(a) traditional PPP structures, for example, design, build, finance, operate/maintain (DBFO/DBFM) and build, operate, transfer (BOT) in various sectors such as road, rail, health, education and the criminal justice system, where the private sector operates or maintains, as the case may be, the relevant asset for typically a 25-30 year period and is paid a unitary charge for doing so by the public sector party; and

(b) other structures more akin to the “concessive model” referred to in paragraph 22 of the Green Paper in other sectors, for example, social housing projects. In social housing projects in the UK, the private sector party will be obliged to collect rental payments from the tenants and pay a guaranteed rental amount to the public sector party in return for payment by the public sector party of the unitary charge.

Very few of these structures comprise "concessions" within the meaning that is given to this term by the Commission Interpretative Communication on Concessions under Community Law[1] ("Communication on Concessions"). In our experience, the type of concession is less common than the more traditional PPP structures.

PPP structures other than purely contractual ones are becoming increasingly common; for example, joint ventures between the public and private sectors (which often take the form of limited partnerships) for the purpose of the development of land for housing, recreational or industrial purposes in The Netherlands, and long term partnering contracts between the public and private sectors in the health and education sectors in the UK.

2. *In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?*

Major infrastructure projects, such as PPPs, are large, complex projects and it is widely acknowledged that the award procedure for such projects needs to be flexible and needs to facilitate dialogue between the public and private sectors.

However, Norton Rose does not consider that the competitive dialogue procedure is an appropriate award procedure for PPP projects because it is not sufficiently flexible and it does not facilitate dialogue/negotiation after the contract award. Other concerns with the appropriateness of the competitive dialogue procedure for PPP projects are set out in more detail below.

Existing public procurement award procedures

The existing competitive form of the negotiated procedure has generally been regarded as the most suitable procedure for the award of PPP contracts because it is a far more flexible procedure than either the open or the restricted procedures.

One of the fundamental features of public private partnerships is the utilisation of the private sector's expertise and experience in terms of proposing innovative solutions to meet certain requirements and objectives specified by the public sector. The public sector is generally not able to state in advance the technical solution best suited to the project. Specifically, the public sector does not define in precise detail how its requirements and objectives are to be achieved. This is one of the perceived benefits of public private partnerships. The open and restricted

[1] 2000/C 121/02

procedures are not appropriate because they pre-suppose that the public sector can and does specify precisely what its requirements are and how they are to be achieved.

In addition, neither the open nor the restricted procedures permit any form of negotiation with the potential bidders following submission of their tenders on any fundamental aspect of the contract or variations in the contracts. It is usual, in projects of this nature, for negotiations between the public sector party and the preferred bidder to take place after the appointment of the preferred bidder. The reason for this is entirely commercial. Funders to a project will not commit resources or incur the costs of carrying out their due diligence unless and until the bidder that they are supporting has been appointed as preferred bidder. In addition, the negotiation stage allows the parties to draw up full designs, fine-tune technical specifications, carry out due diligence exercises and agree final risk allocations, as well as finalising (often contentious) staff transfer issues at an exclusive stage of the bidding process. This is essential in keeping bid costs to a minimum, which is of fundamental importance for economic operators.

In recent decisions, the European Commission has itself concluded that changes negotiated with a preferred bidder in a negotiated procedure relating to the timing and scope of work to be done, risk allocation, the performance regime and also provisions of the contract relating to funding did not amount to a breach of the procurement rules, because they did not change the scope of the project beyond that advertised in the Official Journal. The Commission recognised that, in complex and innovative infrastructure contracts, negotiations with the preferred bidder are an unavoidable part of the process of finalising a market price for the contracts.

Further advantages of the competitive form of negotiated procedure are:

(a) the public sector party is able to negotiate with different firms on the basis of different proposals and different contract conditions. The restricted and open procedures envisage a single specification and although variant bids may be permitted, this does not offer the same flexibility as the negotiated procedure; and

(b) the public sector party may solicit proposals from a number of firms and later reduce the number for the submission of final offers based on the quality of the original proposals as part of an iterative tendering process which is not possible under the restricted procedure.

The negotiated procedure may only be used by public authorities on certain limited grounds[2] but the nature of PPP projects is such that it is simply not practical to award PPP projects on the basis of the open or restricted procedures. Accordingly, contracting authorities seeking to award a

[2] Two of these grounds are: (i) “in exceptional cases, when the nature of the works, supplies, or services or the risks attaching thereto do not permit prior overall pricing” (Article 30.1(b) of the new Directive); (ii) “in the case of services … the nature of the

PFI/PPP contract will choose a procedure which has sufficient flexibility for it to structure the stages of the process to suit the needs of the project in question. The only flexible form of procedure allowed under the existing procurement rules is the competitive form of the negotiated procedure.

Suitability of the competitive dialogue procedure for the award of PPP contracts

The competitive dialogue procedure has been described as a flexible procedure particularly well adapted to the award of public contracts. We have three main concerns with this procedure:

(a) it is not clear when the competitive dialogue procedure can be used;

(b) the ability to conduct post contract award negotiations is severely limited; and

(c) the grounds for using the competitive dialogue procedure are similar to the limited grounds which justify use of the negotiated procedure and therefore there is little incentive to use the new competitive dialogue procedure.

Each of these concerns is addressed in more detail below:

(a) The competitive dialogue is stated to be available for “particularly complex contracts”. A public contract is considered to be “particularly complex” where the contracting authority (a) is not objectively able to define the technical means (in accordance with the relevant provisions of the New Directive) capable of satisfying their needs or objectives and/or (b) it is not objectively able to specify the legal and/or financial make-up of a project.

However, it is not clear what the definitions are intended to cover. The term “technical means” is not defined, although it appears, from the wording of the New Directive, that it is not limited to difficulties in defining the technology required to achieve the relevant project. Similarly, the term “legal and/or financial make-up” is not defined and is potentially very wide.

Under both limbs of the definition, it is also unclear precisely what the term “not objectively able” means. It suggests that some standard form of reasonableness may be applied to the contracting authority’s inability to define in advance the technical, financial or legal matters in question, although there is no indication whether the actual level of experience or expertise of a particular authority is relevant in this regard. In addition, it is not consistent with the exercise of discretion which the New Directive expressly confers on contracting authorities in deciding whether to use the competitive dialogue procedure. Article 29(1) states that a competitive dialogue is permitted “*where contracting authorities*

services to be provided is such that contract specifications cannot be established with sufficient precision to permit the award of the contract by selection of the best tender according to the rules governing open or restricted procedures” (Article30.1(c) of the *consider that the use of the open or restricted procedure will not allow the award of the contract*".

(b) The main problem with the competitive dialogue procedure is that the ability for the public sector and private sector parties to negotiate post contract award is severely restricted: the only discussion that can take place between the parties is on grounds of "clarification".

It seems that the scope for negotiation following the award of the contract in the competitive dialogue procedure may be little different from that available in the restricted procedure. If this is correct the competitive dialogue procedure is not able to accommodate the funders' requirements in terms of carrying out due diligence post contract award and ignores commercial reality.

If exclusive dialogue is to take place at an earlier stage in the procurement process with at least three bidders discussing detailed technical solutions, bid costs will increase substantially. Higher bid costs are a real concern for economic operators and are likely to result in less competition making public contracts even more difficult to procure. Notwithstanding that the competitive dialogue procedure expressly allows member states to introduce discretionary levels of compensation for unsuccessful bidders, there is no guidance as to how this will be calculated, whether it will be a capped amount and whether awarding authorities will underwrite some of the bid costs. This is the greatest barrier to the introduction of PPPs within the European Union.

(c) There is considerable overlap between the stated grounds justifying use of the competitive dialogue procedure and those justifying use of the negotiated procedure. Two of the limited grounds justifying use of the competitive form of the negotiated procedure referred to above are not dissimilar to the definition of "particularly complex contracts", namely an authority's inability to pre-determine technical means or difficulties in specifying the "financial make-up" of a project.

The award of many PPP contracts is likely to fall within the definition of a "particularly complex contract" and one or more of the grounds justifying use of the negotiated procedure. The distinction between the two procedures is blurred as a result of the uncertainties that currently exist as to when the competitive form of the negotiated procedure may be followed, the lack of clarity in respect of the definition of "particularly complex contracts" and the absence of any relevant case law.

The introduction of the competitive dialogue procedure appears to contradict the Commission's stated aims of clarification, simplification, openness and transparency. Under the New Directive, two parallel procedures now exist that appear to be available in similar circumstances and to involve similar yet distinct processes, and between which the dividing lines are blurred. On the other hand, the competitive dialogue procedure is not available to contracting entities seeking to award PPP contracts under the Utilities Directive and accordingly, they are still free to choose between the open, restricted and negotiated award procedures.

6. *In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?*

We do not consider that a Community legislative initiative to regulate the procedure for the award of concessions is desirable. Concessions are normally associated with major infrastructure projects which are by their nature very complex. We believe that further regulation in this area would mean:

- greater costs for both the public sector parties and the private sector parties; and
- the loss of the flexibility in awarding concessions which is so important for the negotiation and ultimate award of such contracts on a competitive basis.

The Treaty imposes positive obligations in respect of the award of public contracts (including concessions) and so, despite the fact that that concessions are not subject to the full procurement regime, we consider that, provided awarding authorities respect the Treaty principles of equality of treatment, transparency, proportionality and mutual recognition, this should be sufficient to ensure a just and effective framework for the award of concessions.

However, we believe that it would be desirable for the Commission to update its Communication on Concessions in order to clarify further certain existing grey areas. For example, it would be helpful to have more precise guidance on how, short of formally advertising the contract in the Official Journal of the European Union, awarding authorities are able to meet the obligations which arise from the Treaty principles of equality of treatment and transparency.

In addition, we consider that the current interpretation of what comprises a concession should be clarified. The New Directive defines “public works concessions” as contracts of the same type as a public works contract except for the fact that the consideration for the works to be carried out consists either solely in the right to exploit the work or in this right together with payment. Service concessions are similarly defined in the New Directive. Public works and services concessions therefore differ from public works and services contracts by virtue of the fact that the risks inherent in exploitation of the works are transferred to the concessionaire. In the event that there are financial or technical problems relating to the construction or provision of the services, the concessionaire is wholly responsible for any losses.

However, a complete transfer of risk to the private sector is commercially unrealistic and there will be situations where the contracting authority does retain some risks or bears part of the costs but the contract still remains a concession contract. For example, if the contract is of a significant duration, the contracting authority may bear risks arising from changes in legislation during the term of the contract or the contracting authority may bear part of the costs of operating the concession in order to keep prices down. The Communication on Concessions indicates that such contracts also constitute concessions provided that this does not eliminate a significant element of the risk inherent in exploitation.

Accordingly, it is clear that whether a contract can be correctly classified as a concession contract will involve a case by case analysis and a general definition based upon a transfer of "risks inherent in exploitation" can lead to uncertainties as to whether a contract is or is not a concession contract.

7. More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements?

Please refer to our response to question 6 above.

13. *Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment? Do you know of other "standard clauses" which are likely to present similar problems?*

We do not share the Commission's view. Competition for publicly procured contracts takes place at the time when the contract is advertised in the Official Journal of the European Union. All interested parties are aware, when bids are submitted, that any party providing finance for the project in question will require an ability to step-in to the project in certain defined circumstances.

The need for "step-in" arrangements

"Step-in" arrangements are an essential requirement of funders for all limited and/or non-recourse financed projects, including PPP projects. They form an important part of the security package because they allow funders to try and protect their investment by providing a mechanism by which funders can attempt to "save" the project in circumstances where the public sector party would otherwise be entitled to terminate the project agreement. If funders do exercise their step-in rights, this can result in a novation of the project agreement to a new project company which will take over the rights and obligations of the original project company.

If the ability to replace a defaulting project company in this way is restricted and funders are required to retender in accordance with the Directives, they may be unwilling to lend to projects of this nature because the requirement to retender would have an adverse impact on the bankability of the project. In our view this would act as a barrier to the further use of PPPs in the UK and to the introduction of PPPs in other member states.

Even if a funder did agree to lend to a project on this basis, any requirement to retender is likely to make the project unaffordable in the long term because:

(a) the project is likely to suffer delay during the retendering process. It is not clear, under Article 31 of the New Directive whether such a retender may be conducted by using the negotiated procedure without prior notification;

(b) additional costs will be incurred as a result of the retendering process and as a result of any delay to the project; and

(c) the funder will need to re-structure the financing package to take account of such delays and increases in costs.

General structure of "step-in" arrangements

Step-in rights are aimed at ensuring the continuity of a project following a default on the part of the private sector party. The main areas of concern for the Commission in relation to "step-in" arrangements appear to relate to the public sector's ability in certain circumstances to object to the replacement project company and the form of contract that the replacement project company may enter into. In UK PFI deals step-in arrangements are structured so that:

(a) the public sector party may object to the appointment of the substitute project company only on the grounds that it does not have:

(i) the legal capacity, power or authority, or

(ii) the appropriate qualifications, experience, technical competence or available resource (including committed financial resource),

to perform the obligations of the original project company under the original project agreement; and

(b) the original project agreement is novated to the substitute project company i.e. there are no changes to the terms of the original project agreement.

The public sector's party's right to object to the replacement project company is limited to objective grounds contemplated by the Directives as permitted qualification conditions for the selection of the original project company and the original project agreement must continue to be performed in accordance with the original terms and the originally agreed economic position of the parties.

On this basis, we do not consider that step-in arrangements contravene the principles of transparency and equality of treatment and we consider that funders should be permitted to replace the original project company as a result of the exercise of step-in rights without any requirement to retender.

“New” contracts

There may be circumstances where the terms of the original project agreement are re-negotiated in favour of the new project company to the extent that the re-negotiated contract might be considered to be a “new” contract for the purpose of the Directives. We acknowledge that, in these circumstances, a new award procedure may need to be followed.

Subcontracts

If the original project company is in default and the step-in rights are triggered, the funder may exercise the rights it has under the financing documents to replace the relevant subcontractor whose actions have caused the project company to be in default, rather than replace the project company itself. If the award of the original sub-contract was not subject to the public procurement procedures of the Directives, then the selection of a replacement subcontractor should not need to be made in accordance with these procedures. We refer you to our response to questions 15, 16 and 17 for our comments on sub-contracting generally.

15. *In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.*

Problems arise in relation to subcontracting because of uncertainties as to whether, and if so, how the procurement rules apply to the award of subcontracts in respect of different PPP structures, whether the PPP contract is classified as a public contract, a concession or whether the Utilities Directive applies.

The award of subcontracts by a private sector party

In the normal course, the project agreement will have been awarded to a private sector party following a competition which complies with the procurement rules. In these circumstances there should be no additional requirement on the project company to comply with the procurement rules in awarding the subcontracts. In many cases the private sector party will be a consortium that will have bid for the project on the basis that it will be able to award subcontracts for the construction and operation work to its individual members. Any requirement to award such subcontracts through a competition which complies with the procurement rules will restrict this ability and may lead to a reluctance on the part of the firms comprising such consortia to bid for these projects.

In addition, the private sector party is not a contracting authority for the purposes of the Directives and accordingly the award of the subcontracts should not be subject to the procurement rules.

Although it is accepted, in principle, that private sector parties should be free to conclude contracts with third parties, in terms of public works concessions which exceed the relevant threshold, private sector concessionaires are subject to certain obligations when awarding works subcontracts even though they are not contracting authorities. Private sector concessionaires generally have to advertise their intention to award a subcontract and have to follow the general principles of transparency and equality of treatment in their award procedures. This does not apply to subcontracts awarded to persons related to the concessionaire provided that an exhaustive list of such related persons is included in the application for the concession[3].

In addition, in the case of the award of public contracts the awarding authority may ask the tenderer to indicate in his tender any share of the contract he intends to subcontract to third parties and any proposed subcontractors[4] . In the case of public works concessions, contracting authorities may either (a) require the concessionaire to award contracts representing a minimum of 30% of the total value of the work for which the concession contract is to be awarded to third parties or (b) request the candidates for concession contracts to specify in their tenders the percentage, if any, of the total value of the work for which the concession contract is to be awarded which they intend to assign to third parties[5].

If the private sector party is a utility, the Utilities Directive may apply to the award of subcontracts depending on various factors, including whether the private sector party operates on the basis of special or exclusive rights granted by a competent authority of a member state.

Economic operators have previously voiced legitimate concerns in relation to the inability of a chosen consortium to award contracts to its partners and there is now an express exemption from the provisions of the Utilities Directive for works, services and supply contracts awarded to an affiliate in certain circumstances.

Private sector parties should be free to conclude contracts with third parties without being required to comply with the procurement rules and, although this is accepted in principle, there

[3] Article 63(2) of Directive 2004/18/EC

[4] Article 25 of Directive 2004/18/EC and Article 37 of Directive 2004/17/EC

[5] Article 60 of Directive 2004/18/EC

are various derogations to this rule which apply in different circumstances. This has caused undesirable uncertainty and confusion in the award of subcontracts which is not sustainable on a commercial basis.

The award of subcontracts by public sector parties

There may be circumstances where the project company is in fact a public sector party and the project agreement was not tendered in accordance with the procurement rules (because there was no need to do so). In these circumstances, if the value of the works, services or supplies exceeds the relevant threshold, we acknowledge that the project company should be obliged to award the subcontracts in accordance with the procurement rules.

In respect of works concessions, public sector concessionaires are expressly required to comply with the procurement rules in awarding subcontracts to third parties[6].

However, the Utilities Directive expressly provides that it does not apply in certain circumstances where contracts are awarded by contracting entities to affiliated undertakings or to joint ventures of which it forms part if the joint venture meets certain requirements of the Utilities Directive[7].

Institutional PPPs

Institutional PPPs (as such term is defined in the Green Paper) are more complex in that a joint venture is set up between the public sector and the private sector and it is the joint venture company which will award the subcontracts. The award of the subcontracts should not be subject to the procurement rules if the joint venture company is not a contracting authority.

Whether a joint venture company is a contracting authority for the purposes of the New Directive depends primarily on whether it is regarded as a body governed by public law or an association formed by one or more contracting authorities. A body governed by public law means any body:

(a) established for the specific purpose of meeting needs in the general interest, not having an industrial or commercial character, and

(b) having legal personality, and

(c) financed, for the most part, by the State, regional or local authorities, or other bodies governed by public law, or subject to management supervision by those bodies, or having an administrative, managerial or supervisory board, more than half of whose members

[6] Article 62 of Directive 2004/18/EC
[7] Article 23 of Directive 2004/17/EC

are appointed by the State, regional or local authorities or by other bodies governed by public law.

There have been numerous cases in which the European Court of Justice has had to consider the definition of a body governed by public law and it has laid down certain principles regarding the interpretation of this definition. However, there still appear to be areas of uncertainty and these relate mainly to:

(i) the meaning of “management supervision”;

(ii) how the legal framework and factual situation applicable in different member states may affect whether a specific activity meets “needs in the general interest”; and

(iii) what factors are relevant in determining whether an activity has “an industrial or commercial character”.

In terms of an association formed by one or more contracting authorities, in one case[8] the Advocate General indicated in his Opinion that the procurement rules are only applicable to such associations to the extent that the association does not have a distinct legal personality. However, this is also an area where clarity is required.

Even in circumstances where the joint venture company is a contracting authority, the award of the subcontracts should not be subject to the procurement rules where the choice of the private sector partner has been made in accordance with the procurement rules and it is seeking to award subcontracts to affiliated companies. As with the contractual PPP structure, the private sector partner in an institutionalised structure is likely to be a consortium that will have been incentivised to bid for the project on the basis that it will be able to award subcontracts for the construction and operation work to its individual members.

16. *In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?*

No, for the reasons stated in our response to question 15 above.

Public private partnerships have facilitated the development of many projects which might not otherwise have been developed because of the lack of funding and budgetary constraints of many member states. In our view increased regulation of the award of subcontracts would act as a barrier to the introduction of PPPs within the European Union.

17. *In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?*

Our response to question 15 highlights various uncertainties in relation to the award of subcontracts by both public and private sector parties and areas where clarification would be helpful.

In addition, we consider that it would be beneficial to clarify and confirm that the award of subcontracts by private sector parties to their affiliates or to members of the consortium comprising the private sector party are not subject to the procurement rules in any of the cases outlined in the first part of our response to question 15, where the appointment of the private sector party has been made in accordance with the procurement rules or where the appointment of the private sector party has not been made in accordance with the procurement rules because the Directives do not require it to be so made.

20. *In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?*

(1) The limited scope of the negotiated procedure which is not addressed by the introduction of the competitive dialogue (see response to question 2 above);

(2) The imposition of any requirement for PPP projects to be procured only by way of the competitive dialogue procedure;

(3) Lack of a sufficient legislative framework for unsolicited proposals in many member states. It would be preferable for general principles or guidelines for dealing with such proposals to be developed. For example, recommendations 30 - 35 of the UNCITRAL Legislative Guide on Privately Financed Infrastructure Projects sets out a procedure to be followed in respect of unsolicited proposals involving proprietary concepts or technology;

(4) Lack of standardisation of documentation within member states, although this has largely been addressed in respect of PFI projects in the UK (see response to question 1 above);

(5) Use of the national language in project agreements;

(6) Lack of cooperation between public authorities within member states although, again, this has largely been addressed in the UK as a result of the establishment of Partnerships

[8] Case C-360/96, *Gemeente Arnhem v BFI Holding BV* [1998] ECR I-6821

UK, a successor to the Treasury Taskforce, which advises the public sector and helps them to meet the challenges of public private partnerships;

(7) Very high transaction costs, in particular where there is a requirement to have a fully underwritten proposal at BAFO stage;

(8) Deviation from the concept of non-recourse/limited recourse financing (hybrid financing structures) which result in sponsors being required to issue additional guarantees which are “on” balance sheet and which is not sustainable in the long term;

(9) Insufficient knowledge or experience of some public sector parties;

(10) The introduction of a large number of changes during the tender process;

(11) The unavailability of the public sector comparator and public private comparator at a certain stage in the tender process;

(12) The imposition on third party lenders of any requirement to retender the appointment of any step-in entity (see our response to question 13 above);

(13) The introduction of increased regulation in respect of the award of subcontracts; and

(14) Any reduction in the length of the service/operating period in respect of PPP projects.

In addition, long term strategic partnering contracts between the public and private sectors are becoming increasingly common in realising PPP projects in certain sectors in the UK, with the private sector partner being procured to deliver the entire investment programme over a number of years in that particular sector. The primary benefit of such long term arrangements and the prospect of repeat business is that it creates strong incentives for continuous improvement in design, cost and timescales which in turn provides value for money. This is an innovative approach to procuring PPP projects in these sectors: the appointment of the private sector party is/will be made in accordance with the procurement rules and the procedure is designed to encourage competition and respect the Treaty principles of equality of treatment, openness and transparency. Any discussion on the application of Community law to the procurement of PPP projects must therefore take account of the development of specific PPP structures in different member states as well as the relative maturity of the PPP market in these member states - the procurement rules must be sufficiently flexible so as to encourage innovation and the introduction of different PPP structures. A failure to do so is likely to lead to even greater uncertainties in procuring PPP projects which will ultimately act as a barrier to their introduction.

Norton Rose confirms that this response may be posted on the website of the Commission of the European Communities.

Norton Rose

30 July 2004

Point 2

Even PPP competitive dialogue procedures may prove to be inadequate in cases where the participation of a large number of economic operators is made impossible due to the technological or technical complexity of the project. At times, those technological solutions that would best be suited to address innovative high-tech problems do not fully emerge because of the need to protect intellectual property since not every component is covered by some sort of guarantee (copyrights, patents etc.). Despite significant incentives, optimal combinations of different contributions (technical, infotech, financial, organizational, etc.) will seldom surface since some participants will be reluctant to disclose non-protected technical and/or organizational solutions.

Greater cooperation might result from converting incentives and payments payable to proponents of innovative project contributions (as per SS 29(8) of EC Directive 2004/18/04) into scores that would give them an advantage over other competitors in the contract award procedure. Due to balance sheet constraints and the practice of disbursing financings only when significant progress has been made at the design stage, in Italy it is difficult to obtain appreciable funds at the early stages of a project. As a result, this sort of non-pecuniary remuneration might not only be well received but also help disseminate the procedure and a project quality culture of some sort.

Evidently, for this to happen, access to the dialogue procedure should be as wide as possible and the procedures for appraising the value added inherent in project contributions (savings for the public authorities, greater public benefits and/or lower expenses) will have to be transparent and predetermined.

Point 3

Another obstacle to effective competition which is inherent in applicable Community legislation and will be difficult to sidestep is the objective disparity (mostly territorial) of the situations from which economic operators start off. Let us mention just one example: when assisting a municipality draft a public PFI proposal for a convention centre (under SS 19(2) of Italian law 109/94), we surmised that economic and financial equilibrium would only be achieved provided the convention centre acted as an agency entering into ad hoc agreements with most of the players of the local hotel industry.

Paradoxically, even a one hundred per cent open procedure will prove inadequate to vouchsafe fair and effective competition since those economic operators (specifically the building industry and agencies that organize conventions) who enter into agreements with the local hotel business at the project development stage will clearly have a competitive edge over the rest.

A greater degree of genuine competition might come from a two-step procedure. In particular, in objective and closely controlled situations de facto incompatible with the abstract principle of free competition, the first step might be a negotiated procedure between public authorities and "indispensable" economic operators such as the hotel industry (possibly calling into play institutional representatives such as Chambers of Commerce or trade/industrial associations), while the second step would envisage the enlargement of the private sector component i.e. the inclusion of more easily interchangeable economic operators (e.g. the building industry and agencies that organize conventions).

Point 7

There is no doubt that a homogeneous public procurement and concession legislation would favour public works and services contracts which make for high quality public services as well as an optimal use of public resources.

Point 9

Specific Community initiatives aimed to help, if not indeed oblige, public authorities to exchange experiences are doubtlessly useful (see also **Point 22**) as is the use of incentives for private sector initiators of a PPP project.

Experience in Italy has highlighted the need to provide guarantees and financial and other incentives to operators who submit valid innovative projects. In this connection, it is perhaps appropriate to set up independent entities called upon to certify the validity of the proposals and protect the private partner's innovation from the risk of being copied. In general terms this need is closely related to the comments under point 2 concerning the opportunity to grant intellectual property rights of some sort and have due regard both to the innovative content of a project and the related private investments.

The provisions of article 37 bis of the Italian PFI regulations (law 109/94) whereby only design expenses borne by the project initiator are reimbursed by the contract awardee discourage operators from initiating projects, while the possibility for the initiator to present an offer in line with the best economic proposal submitted in respect of the tender (article 37 quarter) is a limitation to genuine competition in the tender procedure.

It follows that rules should be put in place to determine the value added of projects submitted by private sector initiators.

Point 13

A major problem for the Italian business community is the banking industry's request for guarantees whenever a loan application is filed. The various forms of personal and collateral (mortgages) security still required in connection with most medium/long-term loans today are incompatible with the very concepts of PPP and PFI and irreconcilable with the very long term timeframes they involve.

Consequently, we deem it indispensable that "step-in" type clauses continue being envisaged as also other mechanisms that guarantee the financing entity in terms of budgeted cash flows and, generally, compliance with the terms of the concession. Suitable standard contract clauses should be drafted to guarantee service quality and the qualifications of the substitute concessionaire that would "step in" (without a new involvement of public authorities which the financing entity might view as an additional risk).

In our opinion, if PPPs are looked upon as an important engine of growth, competition must be made compatible with the requirements and protection of the financing bodies.

There can hardly be any doubt that standard terms and conditions and/or procedures "extending competition to step-in contract clauses themselves" might help prevent distortions and misuses of the current legislative framework.

These standard terms and conditions should clearly distinguish between economic operators and financing entities. Step-in clauses should be applied only to initiatives with an adequate equity/debt ratio and provided that business risks be mainly incurred by the economic operators while the financing entities' return should be in the form of financial interest.

By “extending competition to contract clauses” we mean that during the contract awarding procedure, the procuring public authority may include amongst its appraisal parameters its greater/lesser involvement in the event a substitute concessionaire steps in.

Dear Sirs,

1. In my opinion always the fundamental matter is to establish right definitions and the definition of “Public works concession” in the Directive 2004/18/EC is logically misleading.

2. “Public works concession” does not concern the concession of any rights to construct, but rather rights to exploit the outcome of the construction.

3. Consequently, I propose to define the “concession”, as the right to provide services to the public, and to exclude all the matters related to the concession from the Directive 2004/18/EC.

4. “Concession contract”, not connected necessarily with construction of works, would be in this case the subject of a separate legal act.

5. Works contracts resulting from a “concession contract” would come under the Directive 2004/18/EC, if the concessionaire is a “contracting authority” as defined in the Directive.

Sincerely Yours

Marek Rdultowski

Response to the European Commission Green Paper on Public-Private Partnerships and Community Law on Public Contracts and Concessions from the UK Perspective

ONE NEW CHANGE
LONDON
EC4M 9QQ

30TH JULY 2004

A&O Response to the European Commission Green Paper on Public-Private Partnerships and Community Law on Public Contracts and Concessions from the UK (London office) Perspective

1 What types of purely contractual PPP set-ups do you know of? Are these set-ups subject to specific supervision (legislative or other) in your country?

By "purely contractual" it is assumed the Commission means that the relationship between the parties is not governed by a legislative framework specific to a particular project or type of project. General legal frameworks governing for example, ultra vires, will apply in all cases.

In the UK all PPPs are contractual (although made possible by government policy). The contractual relationships may, nevertheless, be subject to Treasury or other governmental department guidelines or policies.

There are several types of such arrangements:

(a) Services contracts with a government department: where the government department pays a fee for a particular service or a number of services which the private sector party provides;

(b) Concessions: where the concessionaire charges tariffs to consumers for the use of the facility in question;

(c) Joint ventures for the development of property;

(d) Long-term co-operation agreements which give a private sector party pre-emptive or exclusive negotiating or other rights in relation to future projects. These may be in the form of agreements such as Local Improvement Finance Trust (LIFT) projects (discussed further below).

Particular projects may contain combinations of these elements.

2 In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?

Currently the negotiated procedure is the preferred procedure used in the UK for PFI/PPP projects. The negotiated procedure is used for UK PFI projects because it has the ability to allow the contracting authority both to negotiate with a number of bidders and to continue negotiations on key terms of the contract following the appointment of a preferred bidder. Both the open and restricted procedures require the contracting authority to select the preferred bidder solely on the basis of written tenders without conducting any negotiations either before or after the submission of tenders. The advantage of the negotiated procedure is that it allows a decision to be made as to the preferred supplier when there is, in the judgment of the public sector, sufficient certainty as to the key elements of the winning bid, even if it leaves certain elements of the scope or terms of contract still to be determined. Losing bidders are therefore not subjected to the full expense of employing advisers to negotiate almost fully the terms of a complicated contract to the stage at which it can be signed and the public sector can focus its scarce resource on a single preferred supplier, rather than negotiate with more than one person over the phase to financial close.

The new directive restricts the use of the negotiated procedure to specific exceptions, which are likely to apply to PPP's only in a limited number of cases.

The competitive dialogue procedure should allow the contracting authority considerable flexibility, in that it may engage in detailed discussions and negotiations with a number of bidders before a choice of contractor is made. This would allow a number of bids and rebids and additional information to be given to bidders during this process. The contracting authority would need to maintain equal treatment between bidders and transparency during the process, and this stage of the competitive dialogue reflects current practice in the UK.

Following these discussions and negotiations the final tender documents will be issued by the contracting authority. The new directive says that these documents may be based on proposed solutions that have come to light during the discussions. This could allow the contracting authority to pass proprietary design information belonging to one bidder to other bidders and is likely to be controversial and unattractive to many potential bidders.

A key issue for contracting authorities and bidders alike is what, if any, further negotiations or changes to the documentation can be made after the choice of the contractor. Article 29.7 of the new directive suggests some clarifications may be possible but the effect of the use of the procedure could be to restrict significantly the scope of any changes to the commercial deal and contract documentation after the choice of a contractor.

A number of bidders may therefore be asked to enter into long and expensive negotiations with the contracting authority so as to enable the contracting authority to decide on a final commercial and contractual deal to put to all bidders before the final selections. Compared with the existing procedures bidders may have to invest even more in bid costs (which in most cases will be irrecoverable) without knowing whether their bids are successful. This may discourage prospective bidders from participating in the procurement procedure which will impact on costs to the public sector of procuring PPP's.

We assume that by introducing the competitive dialogue procedure the Commission and the European Parliament intended to bring more flexibility to the procurement process. However, in practice the restriction of the use of the negotiated procedure and the application of the competitive dialogue procedure may make the process more difficult and/or costly.

3 In the case of such contracts do you consider that there are other points, apart from that concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these? Please elaborate.

The new directive also allows for framework agreements.

A "framework agreement", as defined by the directive, is an agreement between one or more contracting authorities and one or more contractors which establishes the terms that will govern one or more subsequent contracts during a given period.

The directive provides that the award of a framework agreement must follow all the procedures in the new directive for the award of public contracts. The term of the framework agreement may not exceed four years except in exceptional circumstances.

Subsequent contracts under the framework agreement can only be awarded to those who are party to the framework agreement. The contracting authority may have chosen either (1) a single party or (2) several parties, to become party to the framework agreement.

(1) A single party

Where all the terms of a subsequent contract can be determined from the operation of the framework agreement, a framework agreement may be entered into by a contracting authority with one party and subsequent contracts may be entered into without further competition. The contracting authority may consult the chosen party in writing to request it to supplement its original tender, but no negotiations are permitted on the terms of the subsequent contract.

(2) Several parties

Where all the terms of a subsequent contract cannot be determined from the operation of the framework agreement, there must normally be at least three parties to the framework agreement.

Before awarding the subsequent contract, the contracting authority will hold a mini competition between the parties to the framework agreement but the rules of the competition may be considerably more flexible (for instance in relation to timing) than the procedure for the award of a framework agreement or other main contract and the award criteria will need to be consistent with the framework agreement. However, negotiations on the terms of the subsequent contract are not allowed.

The current structure in the UK for projects procured under the LIFT and Building Schools for the Future (BSF) programmes includes a first agreement with subsequent contracts. The requirements for framework agreements in the new directive may not be entirely consistent with these structures. In effect, the first LIFT agreements grant exclusive negotiating rights to one party but are not capable of determining the terms of the subsequent contracts which are settled by negotiation within the parameters of the framework agreement. Similar considerations are likely to apply to the proposals for the BSF programme.

Although the requirements for framework agreements under the directive may not be entirely consistent with the LIFT and BSF structures, it may be argued that, providing the first agreement is competitively tendered, subsequent contracts entered into under it do not have to be competed under the procurement rules.

In addition to issues in relation to framework agreements, any proposals to harmonise commercial laws of the EU may cause uncertainty and have the effect of discouraging private sector parties from pursuing PPP projects.

4 Have you already organised, participated in, or wished to organise or participate in, a procedure for the award of a concession within the Union? What was your experience of this?

Yes. We have advised clients about the procedures involved. Our experience is that the UK government's current use of the negotiated procedure has preserved flexibility in the procurement process.

We would comment that the mandatory time periods required by the procurement rules are often longer than required by commercial expediency particularly where the number of known tenderers is known from the outset to be limited in number.

5 **Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions? In your opinion is genuine competition normally guaranteed in this framework?**

Competition can be constrained by factors that cannot be remedied through the procurement procedure, e.g. cultural matters, but as mentioned in paragraph 14 below, there are examples in the UK of overseas companies bidding successfully and establishing PPP businesses.

6 **In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?**

There is no reason in principle why competitive tendering rules should not apply to concessions in the same way which they apply to other PPP's.

Indeed, there may even be an argument that the tendering of concessions should be more regulated than other PPP's since the private sector party receives money direct from the public, rather than the government which may be in a better position to protects its interests.

7 **More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements?**

EU Law should be consistent with best government and commercial practice in the PPP area and further legislation in relation to procurement rules may be necessary or helpful to ensure efficient procurement of PPP's. However, we do not believe that legislation in relation to areas other than procurement would be helpful for the development of PPP's. As mentioned above, we see no reason why different rules should apply to contractual PPP's and to concessions.

8 **In your experience, are non-national operations guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organised to implement the selected project genuinely competitive?**

The OJEC procedure and the presence of numerous bodies who report on up-coming projects mean that there are adequate provisions in place regarding advertising.

It would be helpful to private sector parties if there were more information readily available regarding details and time of future projects from governments e.g. a 2-5 year plan. This information could be published in a similar way to the OJEC notices. Detailed government announcements or policies regarding projects over the next few years that may be launched should be widely available. This would allow private sector parties to evaluate the potential for setting up or expanding their businesses into particular regions, taking on or developing particular expertise, or expanding into particular industry sectors or types of work.

9 **In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and quality of treatment?**

The European Union should ensure that the tendering procedures for public projects does not inhibit competition. The European Union should seek not to regulate other areas of national law which could impact adversely upon the use and encouragement of PPP's.

The European Union institutions should strongly encourage governments to disseminate information about their current and future policy plans in relevant areas. The European Union could bring this about in a number of ways and legislation is not necessarily the best form of encouragement.

10 In contractual PPPs, what is your experience of the phase which follows the selection of the private parties?

It can be difficult for the public sector to ensure competitive tension after the appointment of a preferred bidder if significant commercial issues remain outstanding. It is essential therefore that while the principal commercial terms are clearly agreed when the bidder is selected, the process for resolving other issues (such as detailed design and development which may involve variations to the scope of the scheme) is clearly agreed in writing when the bidder is selected.

11 Are you aware of cases in which the conditions of execution – including the clauses on adjustments over time - may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered?

Many PPP contracts for the provision of services include the use of buildings and other related services. This has the effect that the facility as a whole is run by the private sector party. The provision of construction or other services by parties other than the appointed private sector party is therefore difficult to achieve without prejudicing the contractual integrity of the signed contract, for instance, in relation to the allocation of risk. While it may be necessary to give the private sector party a degree of exclusivity in relation to further work, the contract documents should ensure that the public sector party achieves value for money. Although some might regard the exclusivity as discriminating against other providers, this is to a large extent an inevitable consequence of the nature of the original contract under which one party provides services on an exclusive basis for a long time period.

12 Are you aware of any practices or mechanisms for evaluating tenders which have a discriminatory effect?

Contracting in any country will require familiarisation with the relevant local laws and customs, and to this extent it might appear that national contractors are favoured. However, in the UK there are many examples of overseas companies bidding successfully and establishing businesses in the PPP sector.

13 Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment? Do you know of other "standard clauses" which are likely to prevent similar problems?

The purpose of a step-in is to provide another party that will perform the contract on exactly the same terms as the original contracting party. Had the original contract been awarded to another bidder it would have been awarded on different and probably worse terms. It is, therefore, difficult to see that an original losing bidder could have cause for complaint that it has not been awarded the contract since it failed to provide the best terms when bidding for the contract.

From the public sector's point of view, where a party steps in, the same contract as originally agreed is preserved and so it is in no worse position.

In any event, the operation of the step-in arrangements do not breach the competition rules since they result from the operation of the original contractual arrangements which were competitively tendered.

14 **Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level? If so, which aspects should be clarified?**

Each country could be encouraged to produce its own guidelines on the contractual frameworks and processes which are tailored to their own governmental and business needs. Different sectors also require different risk allocation and contractual terms. European legislation should not provide any mandatory framework since it could in practice restrict the development of PPP's.

15 **In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.**

The project company and its financiers may wish to pass all of the risk taken by the project company to its subcontractors. This can have the effect of reducing the incentive of the project company to manage effectively issues that may arise. In addition, not all subcontractors may be substantial enough to bear the financial risks involved in assuming all the risks taken by the project company. It may be beneficial to the project in some cases for the project company to retain some risk of non-performance by a sub-contractor.

16 **In your opinion does the phenomenon of contractual PPP's, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?**

Inevitably a PPP contract is considerably more complex than a contract or sub-contract for construction or for services. By way of example, reference may be had to the guidance issued by the UK Office of Government Commerce (OGC) which set out extremely detailed considerations which need to be taken into account in contracts for UK PPPs.

17 **In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?**

No. See the response to question 14 above.

18 **What experience do you have of arranging institutionalised PPP's and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases. If not, why not?**

The UK experience of PPP is generally based upon a contractual model rather than an institutional model.

19 **Do you think that an initiative needs to be taken at community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalised project? If so, on what particular points and in what form? If not, why not?**

As mentioned in paragraph 6 above we see no reason in principle why the competition rules should not apply to institutionalised concessions in the same way that they apply to contractual arrangements, although those who are familiar with this model of PPP may wish to introduce specific modifications to ensure those processes are practicable.

20 In your view which measures or practices act as barriers to the introduction of PPP's within the European Union?

It is recognised that there is a need for procurement rules which ensure competition and equal treatment of bidders. However, EU rules should allow public authorities flexibility in achieving these aims. As mentioned in paragraphs 2 and 3 above, a number of difficulties are foreseen in relation to the restriction of the use of the negotiated procedure, the introduction of the competitive dialogue procedure and the provisions for framework agreements set out in the new directive.

21 Do you know of other forms of PPP's which have been developed in countries outside the Union? Do you have examples of "good practice" in this framework which could serve as a model for the Union? If so, please elaborate.

There are various forms of PPP's in different countries. However, most of the significant issues have been addressed in the UK in the OGC guidance.

22 More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful? Do you consider that the Commission should establish such a network?

Yes, providing it does not lead to prescriptive legislation.

GREEN PAPER ON PUBLIC-PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

SUBMISSION BY BEACHCROFT WANSBROUGHS, SOLICITORS

1. Beachcroft Wansbroughs is a leading commercial law practice with offices in eight locations in the United Kingdom and in Brussels. The firm provides legal services through more than 1250 lawyers and support staff. Our PPP team has completed more than 70 PPP projects. We act for public bodies and for private sector contractors, promoters and funders.

2. We welcome the opportunity for debate which the Commission's Green Paper provides. Our response is determined by the need for a framework within which it is realistic to expect our public and private sector clients to be able to conclude transactions of a PPP type. However, the views expressed are expressed on behalf of the firm in its own right and should not necessarily be attributed to its clients.

3. We do have reservations about whether the competitive dialogue procedure will in all cases provide a sufficiently flexible framework for complex PPPs **(Question 2**). Our concerns relate to the legislative requirement for an absolute cut-off point for the dialogue, after which only limited categories of clarification, specification or fine-tuning are permissible.

4. The writers have been involved in organising both works and services concessions. **(Question 4).** We agree that there is uncertainty around the precise scope of a concession. What is "exploitation" and how much of the consideration must consist of such a right (consider for instance third party income proposals within a PPP for a public facility), among others, are difficult questions, at the borderline of whether to categorise a PPP as a contract or a concession.

5. We would question whether the line needs to be drawn part way across the gamut of PPPs in this way. Rather, consideration should be given to treating all PPPs, as, in effect, concessions, and subjecting them to an appropriate regime similar to that which currently applies to concessions, albeit perhaps modernised (see para 6 below). While we recognise that in civil law countries the concept of concessions originally developed where the concessionaire derived a return from end users rather than from the public body awarding the concession, we do not see why, with the subsequent advent of the PFI and similar techniques to provide the public infrastructure, many of the arguments justifying a special treatment for concessions (see criteria used by the Commission in its Interpretative Communication on Concessions to distinguish concessions from public contracts) could not equally be applied to other situations where the contractor accepts a complex mix of risks and in reality has a long-term involvement alongside the public sector in the delivery of services to the public (an example would be a PFI hospital) . It follows that we consider that the answer to **Question 7** should be "Yes, provided that the award arrangements are set at a level appropriate to concessions."

6. The rules currently regarding concessions could benefit from codification **(Question 6). It** is preferable to have a self contained set of rules on which e.g. procurement officers within public bodies can rely, rather than for them to have to look to a mix of Treaty obligations, caselaw and the Interpretative Communication. We do not think it would be unreasonable to require concessions over a certain size (whether works or services) to be advertised in the OJEU. Many contractors are already geared up to search this on a regular basis and it would overcome any concerns there might be as to whether advertisement in a particular journal other than the OJEU is sufficient to fulfil obligations of transparency and non-discrimination. **(Question 5)** However, we emphasise that in our view little should be required over and above this : the competitive dialogue procedure is considered to have at least the same potential shortcomings for concessions as for other forms of PPP and in view of the

Commission's views as to the negotiated procedure for contracts, a lesser degree of regulation is needed – the level required in respect of service concessions by existing caselaw and the Interpretative Communication should suffice.

7. The Commission raises the question of step-in arrangements **(Question 13).** By the time a funder steps in however, control of the procurement should be viewed as having has effectively passed from public sector to private sector driven by the private sector's need to recover its investment. The public sector can tolerate this, of course, as there is often a community of interest with the funder. This degree of cession of control is inherent in the very nature of PFI/PPP. As it is the private sector who is determining what should happen, in order to protect its investment, there is no reason why the procurement regime, whose rationale is the opening up of **public** markets, should seek to regulate such relationships. Those whose work concerns the raising of finance may well have a view as to whether an attempt to regulate this would be liable to restrict, or make more expensive, the availability of funds to PPP schemes.

8. We would not favour regulation of subcontracting **(Questions 16 and 17).** A further level of regulated tendering, within the context of a PPP, could only extend project timetables and add to bidding costs. In any event, contractors are often closely linked to promoters (e.g. by way of being part of the same corporate group) and substantial carve-outs would be needed for the award of contracts to consortium members (as with works concessions currently, albeit the rules are hard to operate in practice **– Question 15**). The extent of the carve out would minimise the extent of any possible perceived benefit in terms of opening up markets to be gained through such regulation.

9. We would support the idea of collective consideration of such issues **(Question 22)** and if invited, would be pleased to participate.

Beachcroft Wansbroughs

EVERSHEDS

GREEN PAPER

ON PUBLIC-PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

RESPONSE BY EVERSHEDS

JULY 2004

Introduction

1. The Green Paper has been issued by the Commission for consultation, inviting comments to the various questions posed. This document sets out the response of Eversheds LLP, an experienced legal advisor in the UK PFI/PPP market.

2. Information regarding Eversheds' PPP experience is set out in an Annex to this response paper.

A brief summary of the Green Paper

3. The Green Paper acknowledges that the concept of PPP is not adequately covered within existing EU legislation, but is an increasingly important tool in the procurement of infrastructure projects in many of the Member States. The use of PPP procurement techniques has been widespread in certain jurisdictions and has been seen to offer benefits in terms of innovation, value for money and risk allocation.

4. Whilst acknowledging the potential benefits of the PPP phenomenon, the Green Paper is mainly focussed on whether existing EU legislation effectively deals with the principles of transparency, equality of treatment, proportionality and mutual recognition. In other words, whether the procedures for the award of public contracts are sufficiently tailored to the emerging PPP market.

5. The aim of the Green Paper is to launch a debate on the application of Community Law on public contracts and concessions to the PPP phenomenon. A distinction is drawn between PPPs of a purely contractual nature and PPPs of an institutional nature. It is supposed that each model merits separate study (and potentially separate legal treatment).

Finally, although the Green Paper focuses on the laws relating to the award of PPP contracts, it is noted that the Commission has also adopted measures which are designed to remove barriers to PPPs. It is to be hoped that the "debate" prompted by the Green Paper will be driven by an equal determination to encourage the wider development and application of PPPs.

Our response to the Green Paper

6. Eversheds is a member of IPFA (the International Project Finance Association) and has seen a draft of the response and Members' Recommendations. We broadly support these comments and recommendations.

7. We set out below each of the questions contained within the Green Paper and indicate our response (where appropriate):-

1. **What types of purely contractual PPP set-ups do you know of? Are these set-ups subject to specific supervision (legislative or other) in your country?**

Our response: Purely contractual PPPs are commonplace in the UK across many different sectors (both economic and social infrastructure). They are a particular feature of investment programmes in health, education, transport and (increasingly) social housing. Other areas covered include defence, law and order and waste disposal.

Supervision takes broadly two forms. First, supervision by relevant agencies of government, such as the funding government department or Partnerships UK or the Treasury. This supervision relates to the approval of business cases and the ultimate decision to award funding support to a project (in the nature of additional revenue support to local authorities for example).

Second, supervision includes guidance and assistance from various entities (including dedicated PPP units within government departments) which have resulted in standardised contractual documentation, guidance on procurement process and documentation and general management of the market place through dialogue and consultation (with contractors, funders, advisors etc).

In addition, the UK government has taken steps to legislate in order to remove barriers to PPPs. This includes, by way of example, the Local Government (Contracts) Act 1997 and the National Health Service (Residual Liabilities) Act 1996; with both of which were designed to remove legal uncertainty as to the enforceability of public sector payment obligations. Moreover, ad hoc legislation has been enacted to facilitate PPPs to remove uncertainty as to the legality of the intended commercial arrangements being entered into.

2. **In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?**

Concerns have been expressed about the introduction of the "competitive dialogue" procedure. We reiterate those concerns and highlight the following:

- how a proposed PPP project should be defined and in particular how a "very complex" contract is to be interpretated;
- the likely additional costs to be incurred by bidders in being asked to follow a competitive dialogue procedure;
- the additional burdens to be placed on the public sector in following the competitive dialogue procedure - and serious concerns as to whether they will have the necessary resources to negotiate with potential bidders;
- whether the competitive dialogue procedure tackles a real or merely perceived problem - there being no substantial evidence of collusion/corruption in the UK PPP market;

- the management of intellectual property rights under a competitive dialogue procedure;

- how bid costs are to be paid for by the public sector under the competitive dialogue procedure - particularly in the context of a project which, for legitimate reasons, does not reach financial close.

Fundamentally, the "competitive dialogue" procedure may add substantial additional cost and time to the contract award procedure - diluting market interest in projects and slowing down the pace of investment in new infrastructure.

3. **In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these? Please elaborate.**

The majority of PPP contracts on which we have advised have been procured using the negotiated procedure (most commonly under the Services Directive). This has proved to be, in general, an effective means of both ensuring competition and the most value for money/affordable solution to the public sector entity. We have advised on the interpretation of community law in relation to post-contract variations - but generally speaking have not encountered particular difficulty in terms of the application of existing community law in such circumstances.

4. **Have you already organised, participated in, or wished to organise or participate in, a procedure for the award of a concession within the Union? What was your experience of this?**

No comment.

5. **Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions? In your opinion is genuine competition normally guaranteed in this framework?**

Yes.

6. **In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?**

We believe the Commission should identify what, if any, true barriers to competition currently exist and whether additional regulation of the procedures is necessary. There is a need for more clarity and guidance and dialogue in relation to any existing concerns and future intentions - all designed to encourage development of the PPP market.

In relation to "concessions", this term of art tends to have no clear meaning within the PPP context - and it may be timely to review whether any meaningful distinction is being achieved in this context.

7. **More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements?**

We reiterate the need for guidance on the scope and application of the revised Directive 2004/18. Specifically, how a proposed PPP project should be defined for the purpose of the rules (works, services or works concession contracts) and what procedure the authority is permitted to follow (the new competitive dialogue procedure and the circumstances in which the negotiated procedure can be used)? A new draft Directive is likely to create confusion and cause delay to programmes of infrastructure investment. The existing models of PPP contract (including what may be classified as "concessions") are all catered for in the Directive.

8. **In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organised to implement the selected project genuinely competitive?**

In our experience - yes.

9. **In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment?**

The Commission should set-up an EU PPP Taskforce as suggested. This will collate and disseminate best practice, provide guidance on procurement laws and best procurement practice and offer training to less experienced Member States. The Taskforce should also act as a bridge between governments and the private sector/funders. The best way to encourage and foster competition (including transparency, non-discrimination and equality of treatment) is to encourage the development of a dynamic PPP market in which the private sector (and investors) see genuine opportunity.

10. **In contractual PPPs, what is your experience of the phase which follows the selection of the private partner?**

Following selection of the private partner (under a negotiated procedure) further negotiation has taken place, including lender due diligence. Under current UK procurement practice this has not involved change to the scope of the procurement, financial arrangements or commercial terms - but has enabled both parties to resolve any outstanding project - specific issues and undertake necessary due diligence in relation to the detail of the project.

11. **Are you aware of cases in which the conditions of execution - including the clauses on adjustments over time - may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered?**

No.

12. **Are you aware of any practices or mechanisms for evaluating tenders which have a discriminatory effect?**

No.

13. **Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment? Do you know of other "standard clauses" which are likely to present similar problems?**

Many PPP deals are structured on a DBFO basis. As such, external funders will require step-in rights as a fundamental term of lending to the project. Any steps which may remove or undermine the rights of funders in this regard will damage the PPP market. We are not aware of any problems in terms of transparency and equality of treatment - the initial procurement will govern the precise terms under which the step-in rights may be exercised and step-in rights will not change the scope of the project or financial terms.

14. **Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level? If so, which aspects should be clarified?**

Again, we reiterate the dangers of over-regulating the PPP market at community level. Instead, we believe the Commission has an important role to play in offering guidance and support to the PPP market.

15. **In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.**

In our experience sub-contracting arrangements are carefully evaluated at the time of selection of the private sector partner. This may include evaluation of the "supply chain". We do not believe that this is an area which requires any further specific treatment in terms of additional legislation.

16. **In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?**

Again - no additional rules are required.

17. **In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?**

No - on the basis that the initial procurement will ordinarily take full account of the proposed arrangements for sub-contracting (including, in large measure, identification of the proposed sub-contractors). Unnecessary constraints in relation to sub-contracting will potentially impact on value for money and risk transfer.

18. **What experience do you have of arranging institutionalised PPPs and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases. If not, why not?**

Eversheds has substantial experience of arranging institutionalised PPPs, particularly in the areas of education and health. In our experience these institutionalised PPP arrangements generally involve the award of a contract of some description. As such, the existing public procurement laws satisfactorily cater for the situation. Accordingly, we do not foresee any immediate necessity for additional legislation in this area.

19. **Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalised project? If so, on what particular points and in what form? If not, why not?**

It may be necessary for some additional guidance to be offered in this regard - taking into account the various types of institutionalised PPP arrangements. This may be something for the proposed Taskforce to look into having regard to the benefits of flexible commercial arrangements.

20. **In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?**

Most PPP projects are complex and intellectually challenging. One of the main barriers to the introduction and development of the PPP market is the negative attitude of the private sector towards abortive bid costs. Despite the maturity of the PPP market in the UK bid costs remain high and are a major factor in how private sector contractors regard individual projects in the market. A balance must be struck between the legitimate concerns of the Commission in respect of transparency etc and the fostering of participation in the market.

The public sector will be concerned to deliver projects on time and within budget. Measures which unnecessarily prolong the procurement timetable or which add additional cost to the procurement process, will be seen as barriers to the delivery of much needed new infrastructure. Accordingly, the procurement rules must strike a balance - between transparency, fairness and equality of treatment on the one hand and cost-efficient procurement on the other.

Additional barriers include:

- a continuing lack of standard form contractual documentation across Europe;
- insufficient sharing of know-how between jurisdictions;
- insufficient programme support at government department level - particularly in Countries where PPP is not yet fully developed.

21. **Do you know of other forms of PPPs which have been developed in countries outside the Union? Do you have examples of "good practice" in this framework which could serve as a model for the Union? If so, please elaborate.**

We are aware of the excellent work being undertaken by Partnerships UK in other countries - including South Africa, for example.

22. **More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful? Do you consider that the Commission should establish such a network?**

We would strongly support the creation of such a network and would be eager to participate.

Conclusion

8. In conclusion, we emphasise the following points:

- we broadly endorse the recommendations of the IPFA members.
- we support the creation of an EU PPP Taskforce and a network for encouraging the collective consideration of these and other questions;
- there should be focus on offering guidance and support around the application of the existing procurement regime (and, in particular, Directive 2004/18);

- any further additional rules/legislation should address real problems which limit competition or otherwise distort the market;

- no additional rules should be put in place which may have the unintended consequence of inhibiting the development of the PPP market - particularly where these add additional costs or time to the procurement process, without any commensurate benefits.

EVERSHEDS LLP

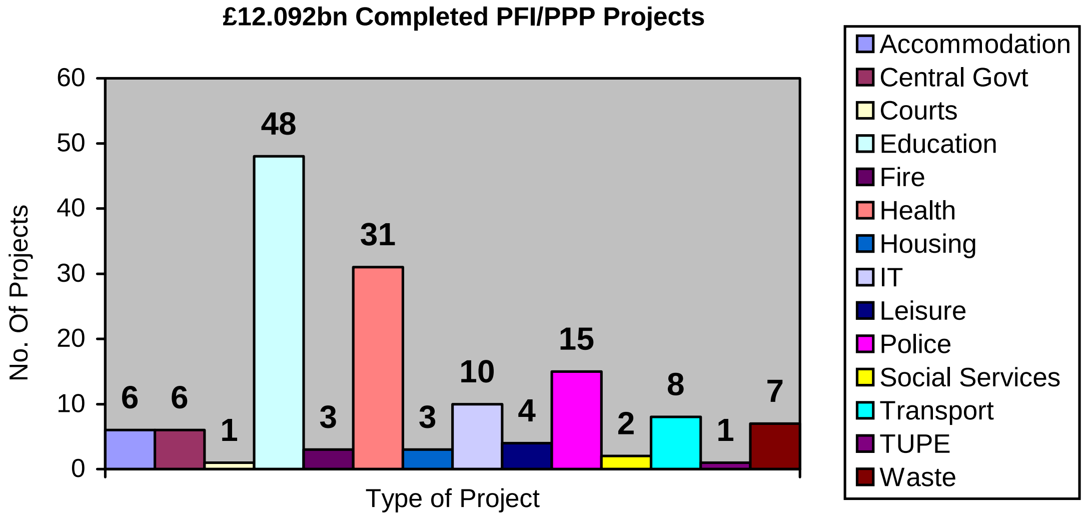
ANNEX - OUR EXPERIENCE

Eversheds LLP's multidisciplinary projects group is a leading player in the UK projects field and has an increasing reputation in international markets. We advise a huge range of public and private sector bodies (including funders) on projects worth billions.

Within the PFI/PPP market alone we have closed more projects than any other UK law firm.



Main Services

The main services which Eversheds LLP projects team can deliver include:

✓ Project finance concessions and other similar arrangements (including transport concession arrangements, major infrastructure projects and energy projects)

✓ PFI/PPP projects including strategic partnerships, NHS LIFT, Local Education Partnerships and DTCs

✓ Major outsourcings – these involve both public and private sector transactions as well as private to private sector transactions

✓ Production of guidance - Eversheds LLP were involved in the production of guidance for local authorities developing and procuring schools schemes through PFI. The purpose of this Procurement Pack is to streamline the process for Authorities by providing guidance on the process and reference for specific issues.

✓ Refinancing - we have extensive experience of acting for lenders and institutional investors on refinancing projects.

✓ Secondments - we regularly second lawyers to bodies such as the Department of Health, Private Finance Unit and the Defence Procurement Agency (MOD).

Grant Thornton UK LLP consultation response to EU Commission Green Paper: ON PUBLIC-PRIVATE PARTNERSHIPS AND EUROPEAN UNION LAW ON PUBLIC CONTRACTS AND CONCESSIONS

General Comments on Green Paper

The Green Paper appears to have as its main concern that there is not specific legislation to deal with all possible elements of PPP where market abuse may potentially occur. The questions seem to focus on obtaining evidence for this rather than on seeking views on how best to develop PPP as a vehicle for delivering infrastructure and services across the European Union.

Experience in the UK which has been used as a model elsewhere is that a co-ordinating body (PUK) along with other institutions across various sectors (4Ps, OGC, Partnerships for Health) developing best practice in the context of the roll out of real projects provides the basis for developing workable rules. Grant Thornton consider that a pan-European approach along these lines co-ordinating the experiences of national bodies is preferable to legislation which if required at all should only follow tested practices in the market which have provided value for money and affordable solutions to the public sector.

Further legislation is likely to increase bid costs, constrain innovation and prolong procurement times and should be resisted.

1. What types of purely contractual PPP set-ups do you know of? Are these set-ups subject to specific supervision (legislative or other) in your country?

There are a whole host of differing PPP arrangements in the UK and elsewhere. Private Finance Initiative ("PFI") contracts for the provision of services to a government body which takes some or all of the demand risk are the most common, however, there are also concession arrangements where by the operator exploits the opportunity to carry out an operation (eg leisure, waste).

There are also "hybrid" arrangements combining institutionalised PPPs such as LIFT (Local Infrastructure Finance Trust) in the health sector and the proposed LEPs (Local Education Partnerships) under BSF (Building Schools for the Future) in the education sector). These comprise "partnership" elements perhaps formalised though an equity participation by the public sector in a project company with a concession to carry out works (subject to periodic tests of competitiveness) including under both contractual PPP arrangements (PFI contracts) and conventionally funded arrangements .

Such set-ups generally fall under the supervision of the National Audit Office which ensures that terms are reasonable for the public body involved. Partnerships UK, 4Ps, OGC and other departmental bodies provide backup before signing a contract to ensure that terms are reasonable.

2. In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?

The competitive dialogue procedure is likely to increase bid costs and lead to longer procurement periods when compared to the negotiated procedure as implemented in the UK. For any form of the competitive dialogue procedure to work issues such as the following must be effectively addressed:

- economic advantage not being interpreted simply as price (an output specification is a hurdle rather than an absolute - if innovation encouraged in the Green Paper is to be realised then the benefits of the innovation of a solution must be given economic weight along with price);
- the protection of initial bidder's intellectual property;
- the public authority must be able to assess the affordability of projects prior to final pricing by allowing indications of price from tenderers as part of the competitive dialogue; and,
- there must be a capacity to deal with details reflecting improved information or changed circumstances post appointment of preferred partner and prior to contract signature with up to date information (eg TUPE).

Competitive dialogue cannot fully remove opportunities for corruption: that possibility would still exist as by selecting options that one bidder can deliver more/better/cheaper than others bidding can still be skewed. Similarly by sharing the good ideas from one party with all the others the incentive to come up with innovative structures is removed as there is no point spending the time if that then gets offered to everybody else for free.

This question appears to assume that the negotiated procedure does not work which is not the case. It works well in the UK (so far the most advanced market) without real complaint so the Commission would be better to focus on how to ensure it was implemented and worked similarly well across the EU.

3. In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these? Please elaborate.

Uncertainty in terms of
1) potential future EU Directives
2) any suggestion of reopening transactions already agreed

will be a negative factor for any investor. Much legislation amy have unintended consequences but the fear that legislation is proposed which may not take account of the needs of the different parties to ensure the best terms, and ignores experience in the EU country with most experience in this area can make many investors decide that the risk of participating is too high.

Interference with step in rights makes it likely that
a) banks will be much more unlikely to invest (and then on less attractive terms); or
b) public authorities have to provide alternative termination compensation mechanisms that are costly and bring project on-balance sheet.
In either case the aim of achieving low cost long term funding is defeated.

4. Have you already organised, participated in, or wished to organise or participate in, a procedure for the award of a concession within the Union? What was your experience of this?

The firm has bid for tenders, organised and supervised tenders on behalf of the public authority and acted for private sector bidders on tenders. The experience is that the negotiated procedure is already too slow (but becoming faster through adopting best practice innovation and standardisation) but it works.

5. Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions? In your opinion is genuine competition normally guaranteed in this framework?

The current framework is not a positive bar to effective competition but is open to being frustrated should a government body not wish to seek competition or pursue openness in awarding a contract. The desire for a level playing field should not be such that the incentives to research, identify and develop concepts for voluntary concession arrangements is removed. (See Q6 below).

Even EU legislation can be implemented and enforced in different ways still leading to a potentially uneven playing field - the way to deal with this is not by more legislation but by EU wide expertise and overview.

6. In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?

Legislation is only desirable if the benefits of the formal non-discrimination outweigh the drawback of the more informal pressure of budgetary constraints. This is unlikely to be the case.

7. More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements?

Providing clarity by defining the treatment of concessions may be useful. However, legislation may not be the best route for this and guidance (using a central body such as PUK in the UK) is likely to be most effective. It would be better to omit provisions for concessions that unnecessarily restrict such activity.

8. In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organised to implement the selected project genuinely competitive?

It would be reasonable to expect such opportunities when advertised by an authority to appear in the Official Journal. The selection procedure should be competitive but to prescribe the means by new legislation is likely to increase bid costs and reduce the scope for innovation.

In practice, at least in the UK, non-national operators are guaranteed access, exemplified by the success of such companies as Bouygues and Bilfinger Berger in winning contracts. However, there are suggestions that this is not the case in all countries, with some clients avoiding particular countries due to perceived lack of objectivity in awards.

9. In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment?

In particular, the following need to be considered where the private sector initiates a PPP:

- initiator to recover development costs (preferably from within the project);
- how the fact that the public sector will not specify the outputs can be dealt with in the context on non-discrimination provisions; and,
- whether limitations on the concession length may balance reward for initiative and first mover risk with long run competition.
- rewards for innovative and improved solutions
- ability to source long term low cost funding

The Commission and national authorities would probably achieve more by adopting programmes to develop best practice (and there will be a degree of trial and error in this) than to adopt a legislative route. It has to be remembered that the easiest way to ensure absolute transparency and equality is to have nothing done at all under PPP. The proposals risk creating such equality. Recognition of the role of PPPs, ongoing EIB support for them and promotion of the concept among member countries are likely to do more to ensure the development of PPPs.

10. In contractual PPPs, what is your experience of the phase which follows the selection of the private partner?

In the pre-contract signing post selection phase the efficiency and success of this process depends on the quality of the original ITN, the effectiveness of the clarification process prior to appointment and the completeness of the terms of preferred bidder appointment document. It is important that it is clear that all members of a preferred partner consortium are committed to the terms of the appointment.

Most PPP contracts are still as yet in a relatively early phase, but appear to be operating effectively. The provisions incentivising delivery of construction projects on time whereby payment only commences where construction is complete and services commence does appear to be delivering positive results.

11. Are you aware of cases in which the conditions of execution - including the clauses on adjustments over time - may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered?

We are not aware of any such cases. The provisions for variation and benchmarking and market testing were agreed as part of the competitive appointment on contract award.

12. Are you aware of any practices or mechanisms for evaluating tenders which have a discriminatory effect?

In Grant Thornton's experience the competitive process is effective in the UK. Advice is taken by procuring authorities during the process to ensure that actions are not discriminatory. The process of adopting standard documentation has been effective in providing certainty to and equality between bidders.

13. Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment.? Do you know of other "standard clauses" which are likely to present similar problems?

Step in arrangements provide protection to both the public sector and the lenders to a project ensuring continuity of service and failure to service debt. These form part of the provisions negotiated prior to contract signature and include objective tests and consequently it is difficult to argue that there is a problem with the transparency and equality of treatment in the arrangements. It would be extremely damaging to the Bankability of projects to adopt legislation requiring contracts (or elements thereof) to be re-let using a full public procurement type tendering mechanism - particularly if this applied to existing contracts.

Step-in rights have existed in project finance contracts for many years without being abused. It is important to remember that such step-in rights only operate in limited circumstances where otherwise there might be immediate termination of the contracts. Banks are loathe to use them but the fact that they exist as a "last line of defence" mean that the cost of lending remains low without the need for public sector compensation methods. Removing step-in rights is likely as a minimum to significantly increase debt costs (direct and indirect) but runs a significant risk of killing off the PPP market completely. As an example we note that one major international bank in particular has indicated that one reason that relatively little real project finance has been carried out in France is the lack of availability of the requisite step-in rights and that if this approach were implemented Europe wide it would be likely to lead to banks no longer being willing to finance most projects.

The alternative of easier termination could lead to less transparency overall rather than more as it makes it easier for public authorities for political or personal reasons as well as genuine ones to terminate contracts and pursue other alternatives or retender.

14. Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level? If so, which aspects should be clarified?

The principles set out in the current Directives should be sufficient. Whilst guidance on preferred practice has been of assistance in the UK there is a danger that unbankable provisions may be enacted in legislation without the flexibility to obtain derogations to reflect project specific issues. We would advise against legislative provisions on contractual details. It should be up to member states to deal (on a non-discriminatory basis) with the contractual framework as a whole.

15. In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.

In the case of UK PFI the competitive process has generally left subcontractors holding the risks they are best able to manage. There appears to be a competitive market with competitive pricing. Contractual provisions for operating phase subcontractors include benchmarking and market testing provisions as well as best value obligations which both protect the sub-contractor from unsustainable prices where market conditions change whilst ensuring that the public sector can benefit from efficiencies. The market testing process implies that a non-discriminatory competition is held and the public sector will be able to monitor this.

16. In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?

As long as the overall procurement process does not fetter the main contractor in a way that discriminates as between sub-contractors (ie the procuring authority requiring the inclusion of a particular (eg local) subcontractor) then there is no need for such rules. Any rules limiting the freedom of the main contractor to organise a consortium should be resisted. Unless consortium leaders are allowed to fully evaluate for subcontractors not just price but subjective criteria such as ability to deliver on time, quality of workmanship, the extent of cooperative working practices with other subcontractors then consortium leaders would be forced to increase pricing significantly to allow for the risks of having to deal with a subcontractor causing such problems. If they are allowed to take such factors into account then the current system enables that and any inflated costs from a subcontractor simply serve to make a contractor less competitive overall.

17. In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?

No. Such an initiative runs the risk of making the whole construction market (not just PPPs) practically unworkable. At a time when rapid investment in infrastructure is required and projects such as TENs are behind schedule, an initiative with no likely gain but significant likely delay as a minimum is to be avoided.

18. What experience do you have of arranging institutionalised PPPs and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases. If not, why not ?

The LIFT arrangements in the UK are a form of institutionalised PPP. The LEPs envisaged under the Building Schools for the Future Programme are another example. Both envisage that the private sector investor in the LIFT company or LEP would also (probably) be involved in the provision of services either through investment in a limited recourse vehicle or directly. In either case the initial award of the opportunity to invest in the institutionalised PPP would be made in conjunction with a competition for the provision of the initial tranche of services. Any element of services not to be commenced immediately would be subject to arrangements which would form part of the appointment to ensure competitive prices were applicable to such services. This constitutes a competitive process whilst ensuring that a disproportionate resource is not consumed in the bidding process itself.

Grant Thornton UK LLP

19. Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalised project? If so, on what particular points and in what form ? If not, why not?
In general and independently of the questions raised in this document:

In general this would not be helpful if it were to restrict the scope to develop institutional PPPs. The process of developing a new institutional PPP will often be unique and require an investment from the private sector that would not take place in the context of additional procurement risk. The public sector should nevertheless not offer guarantees of exclusivity to any private sector partner to the extent that the relevant services were not substantially defined at the time of appointment. Where underlying activities would be the subject otherwise of contracts falling within the existing procurement rules then this should provide sufficient protection.

20. In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?

As compared to the negotiated procedures competitive dialogue may hinder the growth of PPPs unless flexibly applied. Further legislation as opposed to the development and sharing across the European Union of best practice is likely to hinder the introduction of PPPs. In particular in the accession countries the skills and resources to follow complex and time consuming procedures may make PPPs an unfeasible option.

21. Do you know of other forms of PPPs which have been developed in countries outside the Union? Do you have examples of "good practice" in this framework which could serve as a model for the Union? If so, please elaborate.

We note with interest that the approach to PPPs adopted in the UK has been adopted in South Africa as a robust model and that countries as far afield as for example Canada (including Quebec), Mexico, Poland, the Czech Republic, Singapore and Taiwan, with a variety of legal frameworks and backgrounds are looking to the experiences of the UK in shaping their own PPP programmes

22. More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful? Do you consider that the Commission should establish such a network?

Clearly the sharing of best practice would be of benefit. Whether this should be under the auspices of the Commission or simply promoted by the Commission should be considered further.

Grant Thornton UK LLP

RESPONSE TO GREEN PAPER ON PUBLIC - PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS, COM (2004) 327 FINAL

Pinsents is within the top 30 of European law firms by size and has extensive experience in acting for the various types of stakeholder in public-private partnerships. We act for banks, sponsors, sub-contractors and contracting authorities in a wide range of projects in various sectors.

In 2002 we acted for the contracting authority on the largest UK PFI deal to achieve financial close in that year (Coventry New Hospitals Project which was recognised as project of the year by Project Finance International and has achieved other industry awards) and the largest UK healthcare project to close in 2003 (Derbyshire Hospitals).

We acted for the contracting authority on the first social housing PFI project to achieve financial close (Islington Social Housing) and have been involved in numerous transactions in the education (schools), healthcare, waste management, defence accommodation, roads, street scene, secure accommodation and local authority strategic partnering sectors. The majority of these transactions have been contractual PPPs but this year we have closed 4 LIFT (local improvement finance trust) projects acting for funders or specialists. LIFTs are primarily institutionalised PPPs.

We have closed PPP deals with an aggregate capital value in excess of €7bn.

In the strategic context we have drafted or assisted in the drafting of guidance / standard contracts for PPP projects in the healthcare, social housing, waste management and LIFT sectors and one of our partners is a member of the Office of the Deputy Prime Minister's Strategic Partnering Taskforce.

We set out below our comments by way of responses to the specific questions raised in the green paper COM (2004) 327.

1. What types of purely contractual PPP set-ups do you know of? Are these set-ups subject to specific supervision (legislative or other) in your country?

   In the UK the most notable contractual PPP has been created under the Private Finance Initiative ("PFI"). This was introduced in the early 1990's with the aim of introducing private sector skills and finance into the provision of public services. The basic structure of a PFI project is that the private sector obtains finance (whether from banks or the capital markets), and uses that money to design, build and operate a facility for the public benefit. In return the public sector grants the private sector partner a long term contract to run the facility (usually for around 25 to 30 years) and, once the facility has been built, pays the private sector partner a periodic fee over the life of the project.

   In most of these structures the project is project financed. This means that a special purpose vehicle (Project Co) is established by a consortium of bidders which usually comprise the principal sub-contractors (typically a construction company, services providers, sometimes equipment providers and also an additional, or 'third party', equity provider. This limited liability company then burrows typically 90% of the project's required funding from banks or by a bond issue in the capital markets.

   This is an oft-tested and proven structure and requires careful analysis, allocation and pass-through of risks.

These projects insofar as they relate to the construction and/or refurbishment of facilities or other infrastructure tend either to provide for:

- the private sector partner to be entirely responsible for the services provided at the facility (for example prisons, other secure accommodation, roads, independent sector-treatment centres (IS-TCs))

- the private sector partner to be responsible for all or most of the accommodation services which accommodation is occupied and used by the public sector e.g. acute hospitals, schools.

Another type of contractual PPP in the UK is the strategic partnership. Over the last few years an increasing number of UK local authorities have entered into long-term outsourcing arrangements with private companies to provide a broad range of their services.

There is no overall PPP legislation in the UK or in its constituent parts (PPP operates in some fields which have been devolved to the Scottish Parliament or the Welsh Assembly). The legal framework is therefore a mix of:

- common law: the duties of public bodies to act only within their powers and in a manner which is prudent and reasonable

- in sector specific legislation conferring power to enter into PPPs and/or regulating how this is done, for example:

  - The Local Authorities (Capital Finance) Regulations 1997

  - The National Health Service (Private Finance) Act 1997

  - The Local Government Act 1999

  - The Local Government Act 2000

- procurement law: the application of the EU procurement rules in the UK and the general law of procurement arising under common law and the specific requirements applicable to a particular type of public body.

There are various supervisory bodies in the UK that assist the development of PPPs and issue guidance. The principal organisations involved in overseeing PPPs include:

- HM Treasury

- Office of Government Commerce

- 4Ps (local authorities)

- Department of Health Private Finance Unit

(In the local authority and national health service the contracting authorities are not central government departments and so there is contract guidance and oversight).

There have been considerable steps forward in standardising the documentation required in a PFI procurement. This is evidenced by the issue of the third Standardisation of PFI

Contracts, which includes a large amount of drafting which is now mandatory for many PFI contracts, thus reducing the time spent negotiating such contract clauses.

The Department of Health has published a range of standard procurement and contract documentation. "Gateway Reviews" are available to examine a project at critical stages in its lifecycle to provide assurance that it can progress successfully to the next stage. New procurement projects in Civil Central Government have been subject to Gateway Reviews since 2002 and they have also subsequently been introduced into the National Health Service and local government. Additionally sector specific packs have been compiled by the 4ps, the UK's local government procurement agency, which outline issues to be taken into consideration by the parties concerned and are also aimed at reducing the time spent negotiating by the parties and reliance on external advisers.

2. **In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?**

The award of PFI contracts in the UK has generally been conducted under the negotiated procedure. Paragraph 24 of the Green Paper indicates that the negotiated procedure is designed for exceptional situations and in particular does not cover situations in which uncertainties arise from the "complexity of the legal and financial package". It would appear that the Commission is encouraging PFIs down the route of the competitive dialogue as set out in Article 29 of Directive 2004/18/EC on the co-ordination of procedures for the award of public works contracts, public supply contracts and public service contracts ("the Directive").

The competitive dialogue procedure arguably codifies current UK PFI practice under the negotiated procedure. It permits a contracting authority to open a "technical dialogue" with bidders as to proposed solutions, gradually reduce the number of participants, invite final bids and eventually enter into exclusive dialogue with one bidder prior to contract close.

So a preferred bidder stage is accommodated, as is an iterative process. In as much as this reflects current PFI practice under the negotiated procedure, this is to be welcomed. However, some of the detail of Article 29 of the Directive causes us more concern. Some of the wording used in the competitive dialogue provisions could be restrictively interpreted by a national court or by the Commission. A worst case scenario interpretation is that it provides no scope at all for post tender negotiation. Several problems are apparent:-

- The iterative process is presented as a tool for developing specifications and solutions. It could be interpreted as only allowing a series of rounds of competition on technical grounds, followed by a final bidding round where price comes into play. This contrasts with the PFI practice of having one largely technical competition followed by more than one bidding round where price is an issue. On the other hand, it is stated that contracting authorities may discuss all aspects of the contract with the chosen candidates during this dialogue. The argument in favour of this reflecting PFI practice is that "all aspects" of the contract surely includes price too.

- After the final bidding round it is then stipulated that the tenders can only be:-

    - clarified;

- specified; and

- fine tuned.

We understand that the late insertion of the concept of "fine tuning" into the directive will preserve the current ability of the parties to engage in some negotiation at the BAFO stage of a PFI award process. Without this some of the current flexibility in a PFI award would be lost.

- The new directive is unclear, but arguably there is less scope for preferred bidder negotiations under the competitive dialogue procedure than under the negotiated procedure. Indeed it is stated that the preferred bidder can only "clarify aspects" of its tender and "confirm commitments" contained in its tender. However, under the negotiated procedure it has always been unlawful to conduct negotiations with a preferred bidder that lead to the essential terms of the contract being changed after the final bidding round. We believe that the law is not becoming any stricter in this regard. However, it would be helpful if the Commission were to issue guidance on the competitive dialogue procedure that confirms that preferred bidder negotiations can take place under the competitive dialogue procedure just as extensively as they could under the negotiated procedure, i.e. as long as the preceding competition is not impugned. In particular, on the limitations of the parties to conduct detailed preferred bidder negotiations under the negotiated procedure see Commission Decision N264/2002, *London Underground Public Private Partnership.*

On the one hand it is to be welcomed that "particularly complex" projects are to have the benefit of this new procedure. On the other hand it is particularly unhelpful that some PPPs may not be considered sufficiently complex to merit use of the competitive dialogue procedure. PPPs that aren't "particularly complex" apparently will not warrant use of competitive dialogue procedure. Letting a PFI under the restricted procedure would be unworkable and so this may act as a disincentive to the standardisation of PFIs.

The danger to successful and beneficial public procurement arising from too restrictive an interpretation of what negotiations can take place between a contracting authority and a preferred bidder is considerable. The resource requirements implicit in these transactions is considerable and detailed discussion and the completion of design can identify different solutions to aspects of the project to the benefit of all parties.

3. **In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these? Please elaborate.**

- As with any other public contract that is tendered under the OJEU regime, bidders are reluctant to bring challenges when they suspect that the public procurement rules are being infringed. The biggest hurdle to challenging breaches in PPP award processes appears to be the cost of bringing actions in national courts.

- Frequently bidding consortia undergo changes to their membership prior to contract award. The law on the extent to which changes to consortium membership may occur is not clear and so guidance from the Commission would be welcome. It is submitted that a practical test should be applied. This would look at the extent to which the newly constituted consortium would have reached the same stage in the competition as the original consortium on the basis of an evaluation by reference to the same criteria used in earlier stages of the project.

- There is uncertainty in the law as to how to classify mixed contracts involving, e.g. works and services, or land and works. The *Gestion Hotelera*[1] case is difficult to interpret and so more guidance from the Commission would be welcome. For example, it would be useful to have guidance on how to apply the test for what constitutes the "main object" of a transaction.

- The private sector is particularly concerned to reduce its bid costs and to be able to arrive at a position of preferred bidder as soon as possible. Even now the rules do not facilitate this and the complex contracts procedure will likely exacerbate the problem by requiring the process to remain "competitive" (i.e. with at least 2 bidders) even longer.

4. **Have you already organised, participated in, or wished to organise or participate in, a procedure for the award of a concession within the Union? What was your experience of this?**

Leisure services PFIs in the UK may fall within the definition of a "services concession" set out in the European Commission's Interpretative Communication of 2000. We understand that often the risk of operating the leisure facility rests with the private sector contractor. The contractor's primary revenue stream is also often earned principally from charging public users of the leisure facility.

Leisure services PFIs in the UK are subject to standardised contracts and guidance. The guidance from the 4Ps as to their award assumes that they will be tendered through the OJEU.

Our experience is that leisure services PFIs are subject to the same competitive rigours as non-concessive PFIs. Classification as a concession has not compromised opportunities for tenderers throughout the EU in any way.

We are also aware of the circumstances in which Luton Borough Council let a 30 year concession for the finance, expansion and operation of Luton airport. A full OJEU advertised tendering process was adopted for this procurement exercise even though the relevant directive did not require this. Four out of seven of the shortlisted candidates on this project were non-UK entities: (being German, Danish, Irish and American respectively). Therefore classification of this project as a concession did not compromise opportunities for tenderers throughout the EU in any way.

It is our general experience that even where there is not a legal obligations to do so contracting authorities frequently procure on the basis of issuing an OJEU notice in order transparently to comply with their internal and external obligations to demonstrate prudence and value for money.

5. **Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions? In your opinion is genuine competition normally guaranteed in this framework?**

As mentioned in the above response to Question 4, our experience is that concessions in the UK are subject to the same rigours as other public contracts.

[1] Case C-331/92 Gestion Hotelera v Communidad Autonoma de Canarias

6. **In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?**

We believe that attempts to extend the public procurement rules beyond the directives - to e.g. services concessions – via an expansive interpretation of the *Telaustria*[2] case is unhelpful. Service concessions should not be brought formally within the scope of the public procurement directives.

In our view the public procurement rules should be regulating the spending of public money. Where the user pays in large part for a service this justification for regulating the choice of concessionaire is absent. Often the contracting authority is able to make money from letting service concessions rather than having to pay money out.

If the Commission insists on catching service concessions by reference to general Treaty principles, the very furthest it should go is to regulate services meeting needs in the general interest. The policy justification for this could possibly be that there is a public character to the services and the state is therefore in some way responsible for their correct provision.

There seems to be no justification for concessions for services that are not in the general interest (e.g. retail outlets, catering outlets) to have to be let by open tender. Guidance from the Commission that such concessions do not fall within any controls (whether the public procurement rules or the EC Treaty) would be welcome.

The issue of getting best value for money from concessions is one for national law and administrative requirements.

7. **More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements.**

We do not consider new legislation is necessary or desirable. In our view, if any levelling out of the rules applicable to contracts and concessions is to happen, it is the rules governing non-concessive contracts which should be relaxed.

8. **In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organised to implement the selected project genuinely competitive?**

We are not aware of any competition for a PPP being compromised because of it having been privately initiated. Contracting authorities are aware of the need to maintain a level playing field in the competition that follows pre-advert contact with the market. It is our understanding that contracting authorities will generally ensure that a fair competition ensues. This is not only because of the public procurement rules, but also because of internal rules. For example, standing orders exist within local authorities to ensure that value for money is achieved through a competitive process and decision makers in all public bodies are required by law to behave prudently. Audit requirements give rise to the need for transparency.

[2] Case 324/98 Telaustria Verlags v Telekom Austria

We are however aware that sometimes the private sector initiator of the scheme can be aggrieved when its idea is adopted by a contracting authority and it receives no benefit from having given the idea to the contracting authority. It is natural that the private sector party itself will wish to derive some benefit from having proposed a scheme. The tendency for public bodies in the UK to take ideas from the private sector without giving them anything in return is indeed acting as a disincentive to investment by the private sector in developing PPP schemes in the UK. We have known a number of clients in the private sector decline to invest for this reason.

9. **In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment?**

Privately initiated PPPs could save the public purse money. Once a private sector partner comes up with an idea for a project, it currently has to rank as equal to all its competitors in subsequently bidding for that project. As mentioned in the answer to question 8 above this acts as a disincentive to innovative ideas from the private sector. In order to strike a balance between incentivising innovation and maintaining a level playing field, we believe that a contracting authority should be free to adopt a certain *de minimis* proportion of its contracts via direct award to a private initiator. Obligations could be imposed on the private sector initiative to let sub-contracts (or a certain proportion of them) in a transparent and competitive manner.

10. **In contractual PPPs, what is your experience of the phase which follows the selection of the private partner?**

We have extensive experience in the negotiations which follow selection of the preferred partner.

11. **Are you aware of cases in which the conditions of execution – including the clauses on adjustments over time – may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered?**

It is inevitable with contracts lasting as long as 25 years that some variations will be necessary. In particular there are significant risks that a bank is not prepared to accept over such a long contract duration, for example the risks arising from changes to the law.

In our experience the contractual parties only make contractual variations within the scope of what was initially agreed in the contractual framework. Such changes are often dealt with by reference to an external mechanism (e.g. a schedule of rates, a system of benchmarking, market testing or the retail prices index). Alternatively they may be dealt with by reference to the original financial model (e.g. a certain profit margin will be retained by the operator in the event of a change in the law). Therefore the operation of such clauses does not infringe the principle of equality of treatment. The contractor is not being given any advantage over the other bidders which tendered for the contract. It should be for the parties to agree on the best way of addressing price and risk issues over the duration of the contract. They have the best understanding of those issues and the interface issues which arise through change.

12. **Are you aware of any practices or mechanisms for evaluating tenders which have a discriminatory effect?**

In our experience, contracting authorities in the UK are generally well disciplined in putting together objective bid evaluation criteria. They are often scrupulous in putting together an audit trail that sets out the criteria in advance of bids being opened. This is often accompanied by a bid evaluation methodology that details how the criteria are to be applied and how scores are to be awarded.

The problem that arises in practice is that scores are allocated by human beings. No amount of preparation of the ground can avoid the subjective application of seemingly objective criteria. This can make it difficult to challenge the way in which the criteria have been applied. It is a high burden for the aggrieved bidder to show that there was a "serious and manifest error" in the application of the criteria in order to succeed with a challenge. It is however important that proper judgment is exercised by skilled evaluators and it will be inappropriate for judicial or administrative authorities to second guess property decision making.

13. **Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment? Do you know of other "standard clauses" which are likely to present similar problems?**

We do not share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment. Nor are we aware of any other standard clauses which could present problems in terms of transparency and quality of treatment.

At least as far as the UK PFI is concerned, the way "step-in" rights operate is as follows:-

- The senior debt provider has no security over assets. It therefore relies on the income stream flowing from the contracting authority to the project company vehicle.

- In order to protect the senior debt provider from the eventuality that the project company vehicle fails adequately to perform, the senior debt provider can "step in" to the project company vehicle's shoes to ensure that the subcontracted arrangements (e.g. for construction and facilities management) keep on flowing through to the contracting authority.

- From a contracting authority's perspective senior creditors should be encouraged to step in to projects and to manage out issues. This is considerably more advantageous to the public sector than termination which could impose substantial organisational and financial burdens.

- Imposing regulatory rigidity in this area would disincentivise the senior creditors from exercising this right and add to the risks to the project since step in is likely to occur in circumstances where speedy action is required to protect the project.

14. **Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level? If so, which aspects should be clarified?**

- Land development arrangements can, depending on their structure, seem to be caught by the public procurement rules. This can often be because of the wide ambit of the definition of "public works contracts". This seems wrong where the contracting authority is selling land and has little interest in the use to which that kind is put. As with service concessions, the contracting authority is often making financial gains from private development of its land rather than paying out money. Guidance from the Commission on these arrangements would be welcome, particularly on where the line is to be drawn between cases where there is procurement activity and cases where the contracting authority is merely carrying out a land transaction. For example, a contracting authority may include minor development covenants in a property agreement in order to protect its investment. However, it would be stretching the ambit of the public procurement rules to consider that the contracting authority is procuring works in this context.

- The new rules contain a general 4-year restriction (except in exceptional cases) on the duration of frameworks. The directive does not specify what will constitute exceptional cases, but it provides that they must be "duly justified, in particular by the subject of the framework agreement". The Office of Government Commerce in the UK has suggested that a longer duration would be justified for a maintenance contract for the London Underground, in view of the significant capital expenditure this would entail. It would be very useful to have guidance from the Commission on the exceptional situations in which longer term frameworks are justified. Otherwise the future of some PPP models in the UK may be in jeopardy.

15. **In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.**

We are not aware of any problems with subcontracting. Indeed many private sector companies have longstanding relationships with their subcontractors that help the prime contracts to run smoothly. It would do considerable damage to the PPP market to deprive private sector companies of the right to use the subcontractors that will offer them the best terms and service levels so long as the proposed PPP contract has been appropriately procured.

16. **In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?**

We do not believe that the private partner should have to apply the public procurement rules to its selection of subcontractors. This would run counter to the fundamental rule that only bodies governed by public law have to apply the public procurement rules.

Furthermore, in the PFI context this would be wholly inappropriate. Under the PFI in the UK, the private partner (known as a Special Purpose Vehicle ("SPV")) is generally merely an umbrella company adopted for the purposes of a clean contract. The "subcontractors" that sit beneath that SPV/umbrella company will generally have been the members of the consortium that bid for the project and so they will have already been selected by the contracting authority under the public procurement rules. To introduce rigidity into the sub-contract level would decrease the ability of the SPV and its principal sub-contractors to manage their risks, potentially increase costs or reduce the level of risk transfer to the private sector and add to the cost and duration of the procurement process.

17. **In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?**

We do not consider it necessary or desirable for the subcontracting rules to be increased. If anything, they should be reduced.

The rules on subcontracting of works concessions are at odds with the general lack of regulation of subcontracting pursuant to the award of public contracts. It would be helpful if this additional layer of regulation were removed, as it is not clear what purpose it serves. Whilst a contracting authority can require the concessionaire to award a minimum of 30% of the total value of the work to subcontractors, there is no obligation to do so if the concessionaire is simply requested to state what proportion it would subcontract. It is not clear as to what purpose is served by the concessionaire telling the contracting authority what proportion of the contract it will subcontract. This does not alert the subcontracting market to opportunities.

18. **What experience do you have of arranging institutionalised PPPs and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases. If not, why not?**

We would estimate that around 95% of all PPPs involving the creation of a public-private institution are not purely institutional PPPs. Rather they are a hybrid of a contractual PPP and an institutional PPP. Hence they will usually involve the procurement of works, services or supplies. Therefore the selection of the private sector party will be regulated by the public procurement rules. This is certainly the case with the "Building Schools for the Future" and "NHS LIFT" models in the UK.

Building Schools for the Future is a new programme designed to transform strategic capital investment in all secondary schools in England. The programme will be delivered locally through a Local Education Partnership ("LEP"). The LEP will take the form of a joint venture between the Local Education Authority, a government body called Partnerships for Schools and a private sector partner appointed following a competitive tendering procedure carried out in accordance with the public procurement rules. The LEP will enter into a strategic partnering agreement with the LEA which will give the LEP the first right to deliver identified strategic projects over a 10 year period. Amongst the LEP's tasks will be to enable the delivery of projects funded through a variety of procurement routes e.g. PFI.

NHS LIFT (or Local Improvement Finance Trust) is a Government-sponsored programme designed to stimulate investment in local primary healthcare and social care facilities. The corporate and contractual structure of LIFT is similar in many ways to PFI projects but has certain special features. For example LiftCo, the LIFT procurement vehicle, will be owned 60% by the private sector and the balance of 40% by the public sector. It also involves a long-term partnering arrangement rather than a one-off procurement of buildings/services. LIFT also provides a framework of all primary health and social care facilities within the applicable LIFT area throughout a 20 or 25 year "exclusivity" period.

Local authorities in the UK have recently acquired powers to set up trading joint ventures. These may be purely institutional PPPs. For example, if the local authority makes windows for its housing stock it may wish to sell these windows on the open market. It is likely to do this through a company set up in conjunction with the private sector. In this sort of arrangement the local authority is unlikely to be procuring anything. However it is very common for local authorities to go out to tender to select private sector partners, even where this is not required by the public procurement rules. This is because their internal rules require them to hold some sort of competition in most circumstances where there could be interest in the market for involvement in local authority activity.

19. **Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interest in an institutionalised project? If so, on what particular points and in what form? If not, why not?**

We do not consider that any initiative needs to be taken in relation to institutionalised projects. We do not believe that the public procurement rules apply to bona fide joint ventures where there are no contracts for services, works or supplies between the parties. Where public contracts are involved, the public procurement rules will bite in any event.

It could be envisaged that the private sector across Europe might want an opportunity to invest in purely institutional public-private joint ventures. However, such arrangements could only be made subject to a call for competition if there were to be a wholesale revision of the rules on public procurement. These would need to extend beyond contracts for works, services and supplies to also catch opportunities for capital investment. The criteria for selection of the co-venturer would present significant difficulties given the risk sharing inherent in these arrangements.

If such a wholesale revision to the public procurement rules were to be considered, *de minimis* thresholds would be important. It would be unacceptably onerous for contracting authorities to have to advertise such opportunities below capital investments of, say, EUR 5 million.

Paragraphs 67 and 68 of the Commission's Green Paper suggest that pure capital transactions might already require advertising if they give the private sector some "definite influence" over state economic services. As we read it, the *Baars* case (Case C-251/98) found that Article 43 EC Treaty on the freedom of establishment of individuals was infringed by discriminatory tax legislation, which gave a tax break to company shareholders having "definite influence" over companies, only where such companies were established in the Netherlands and not elsewhere.

It is not clear to us why the Commission considers that Article 43 and the *Baars* case translates into a positive obligation to advertise capital transactions. As we understand it, the free movement provisions of the EC Treaty do not contain positive obligations. These have to be introduced by legislation. It would be helpful if the Commission could provide more guidance on this issue.

In general and independently of the questions raised in this document:

20. **In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?**

The at first sight general rule under the revised public sector procurement directive that frameworks may not last beyond four years poses a considerable problem for many PPP models that have been developed in the UK. A fairly recent model involves the establishment of an institutional PPP, which is contracted to various public sector bodies to provide services/works over a long duration e.g. 25 years. The private sector partner is selected through an OJEU-advertised tendering procedure. However, since the services/works are provided under what could be construed as a framework agreement, the legitimacy of such PPPs now seems to be in question.

21. **Do you know of other forms of PPPs which have been developed in countries outside the Union? Do you have examples of "good practice" in this framework which could serve as a model for the Union? If so, please elaborate.**

We do not have detailed knowledge of other forms of PPPs developed outside Europe. Anecdotally we understand that Australia is at the forefront of PPP advancement worldwide. The Australian PPP programme involves a competitive procurement process. However, it is not as regimented as in Europe and the process does not take so much time as a consequence. Private sector operators in the UK would be happier with quick procurement processes that cut down their bid costs and enabled a preferred bidder to be selected at an earlier stage.

22. **More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful? Do you consider that the Commission should establish such a network?**

We believe that there should be less regulation on PPPs, not more. In our view, there is no case for adding additional burdens on top of the already very onerous public procurement rules. Representatives of the Commission indicate that the Commission is in favour of PPPs in order to stimulate growth and create jobs in Europe[3], so it should be simplifying their award. Adequate EU-wide competition can be had for such projects by applying the current rules. Indeed, simplification of the current rules to a set of basic principles would be preferable. Information exchange between the Member States on the ways to achieve maximum competition with minimum regulation would be a good idea.

PRICEWATERHOUSECOOPERS

On 30 April 2004 the Commission of the European Communities (the "Commission") issued a Green Paper on Public-Private Partnerships ("PPPs") and Community Law in Public Contracts and Concessions (the "Green Paper") and invited interested parties to send their comments on the questions set out in the Green Paper. The following is PricewaterhouseCoopers' response to the Commission's invitation.

Introduction

1 PricewaterhouseCoopers has advised on 246 **closed** projects globally, valued at US 43.9 billion. As such we are the leading adviser on PPP projects having advised on more projects which have reached contractual and financial closure than any other adviser. We have experience of advising both public sector and private sector clients and therefore bring the perspective of both sides of such contracts in our response to the Green Paper.

2 PricewaterhouseCoopers refers to the network of member firms of PricewaterhouseCoopers International Limited, each of which is a separate and independent legal entity. We have submitted a single consolidated response to the Green Paper drawing on the experience of these firms. Given the wide experience that we have it has not been practical to list all of our experiences of PPPs or of the issues raised in the Green Paper. Therefore our responses are general in nature and we do not list our experiences from each of the countries where we have experience.

3 Where we have made reference to specific experience in many cases the examples used are UK based. This is not because we believe that the UK should be seen as the only significant, or the best, PPP market but because, with more than 10 years experience and more than 650 closed PPP projects, it has the greatest wealth of examples and the most in-depth experience.

4 We are not lawyers (or experts in EU procurement law) and therefore highlight that our response to the Green Paper is not from a legal perspective but from that of a financial and commercial adviser and is based on our practical experience advising both the public and private sectors on a large number of PPP projects in a wide variety of countries and sectors.

5 Many of the questions in the Green Paper raise complex issues for which there are not short or simple responses. We believe that there are other questions and issues which it might be relevant for the Commission to consider when analysing the PPP market which are not covered in the Green Paper. These relate both to the procurement field and wider areas of EU involvement and activities which impact the development of the European PPP market. We would be happy to discuss these further with the Commission.

6 PricewaterhouseCoopers has recently published its views on PPPs in Europe in , *Developing PPPs in New Europe*, which addresses some of the issues raised in the

Green Paper as well as wider issues which relate to the interaction of the EU with the development of the European PPP market (such as State Aid and accounting issues and the interaction between EU grants and PPPs). This paper was developed prior to the release of the Green Paper. It is available from:

Http://www.pwc.com/Extweb/service.nsf/docid/A2F9309C016FAADD80256EA6004F516C

Some general observations

7 The Green Paper's scope (except for the last three questions) is focused largely on a narrow procurement perspective. While procurement is an important part of the overall PPP process we believe that it is crucial for the future development of the PPP market in Europe that any EU approach to PPPs is holistic. We therefore believe that what is really required is for the Commission (encompassing both a variety or relevant Directorate Generals and other EU institutions) to undertake a more wide-ranging review of the development of PPPs and the impact which these organisations have, or potentially could have, on the market.

8 As noted in the Green Paper it is difficult to define PPPs and the term is not defined at Community level. While the Green Paper's distinction between contractual and institutional PPPs is one way to sub-classify PPPs it does not help in setting the boundaries of what is, and what is not, a PPP. We believe that unless the EU is able to adequately define PPPs, and to achieve a broad consensus in the market that this definition is appropriate, it would not be right for the Commission to proceed with a legislative approach.

9 Given this we believe that it is best to require governments and procurement agencies to ensure that they observe the general principles enshrined in the Treaty (as set out in Paragraph 8 of the Green Paper, in particular the principles of transparency, equality of treatment, proportionality and mutual recognition) in the procurement of PPPs. This can be achieved by providing guidance, rather than for the Commission to try and develop detailed rules and regulations.

10 Experience to date, both in the PPP sector and in the wider public sector procurement market, is that EU legislation has often caused uncertainty as to which rules apply in what circumstances and how rules and directives should be interpreted in particular situations. There are also a number of anomalies where contracts which may be very similar in commercial or economic terms can be treated very differently depending on how they are classified under EU law.

11 While one of the aims of the Green Paper may be to seek to address some of these anomalies, many in the PPP market believe that increased regulation and legislation (such as bringing service concessions within the scope of EU legislation) is more likely to increase the degree of confusion and uncertainly rather than reduce it. A widening of the scope will also increase the burden of

compliance. The PPP market is very sensitive to uncertainty and any increase in uncertainty is likely to increase risk and hence the cost of procurements and contracts.

12 There are a number of countries which have successfully undertaken PPP projects and programmes which do not have detailed rules and regulations but have adapted or interpreted general country specific and EU requirements to the procurement of PPPs. In our experience guidance and oversight from the national treasury is needed as a catalyst to develop projects. We acknowledge that any national treasury's role may be less significant for projects undertaken at, and funded by, local or city authorities.

13 PPP markets, being public sector driven, are by structure largely "national" geographical markets. There are a very small number of "international" PPPs (Galileo would be an example) or "cross border" PPPs (cross border TEN-T projects for example) but the vast majority of PPPs operate within country borders. While the EU itself has some specific interests in such multi-Member State projects it should be aware that these are the exception. The Commission needs to be wary that it does not seek to develop legislation or structures which are designed to aid the development of such projects (which fit the EU's own agenda) to the possible detriment of the wider market.

Specific responses and observations

The following outline our specific responses to the various questions set out in the Green Paper.

2 Purely contractual PPPs and community law on public contracts and concessions

Q. 1 What types of purely contractual PPP set-ups do you know of? Are there set-ups subject to specific supervision (legislative or other) in your country?

14 There are a very large number of types of PPP set-ups. These vary both between countries and within countries, with sector specific models and different procurement agencies following different models and approaches (individual ministries, municipalities or regions may follow different set-ups and different legislation or rules may apply for specific sectors or levels of government).

15 Answering this question is further complicated by the lack of a definition for PPPs (within specific countries or generally across Europe). It is not practical to list all of the various forms of contractual or non-contractual structures which are considered to be types of PPP; to do so would be a research project in itself. It should also be noted that this is a dynamic area where there is constant evolution and new structures and approaches are being developed as circumstances change and the boundaries of PPPs are expanded (for example the development in the UK

of multiple project contracts such as Local Improvement Finance Trusts ("LIFT") in the health sector and Partnerships For Schools in the education sector).

16 In some cases there are classes of contract type, for example the UK Private Finance Initiative ("PFI"), where there are specific rules, procedures and standard contract terms which apply to most contracts of this nature. In other cases PPP structures may be set-up on an individual project specific basis.

17 Similarly with legislation, the situation varies between countries. For example Poland has a motorway law (twice amended to enable a specific PPP project to go ahead) and is also in the process of developing a general PPP law. Similarly France is in the process of developing a legislative approach to PPPs which includes sector specific legislation.

18 Regarding general enabling legislation, some countries have decided to develop specific generic PPP legislation, or are in the process of doing so (for example France and Poland), others (such as the UK or the Czech Republic) have decided not to. In most countries there will be some need to pass pieces of specific legislation to remedy specific issues. Examples include where existing laws do not allow for something which it is proposed be included in a PPP project or where there is some uncertainty which specific legislation can remedy (such as the powers of a National Health Trust to enter into long term binding contracts).

19 Similarly supervision models vary considerably. In come cases there are requirements for the sign off or approval of projects by third parties (independent of the public sector sponsoring department) at various stages of the procurement process (for example the "Gateway process" in the UK, which is not specifically devised for PPPs but applies to all significant public sector procurement projects). In other cases there may be no external supervision of the procurement process.

20 There are many different approaches to the supervision of the contract operations. In many cases the supervision is enshrined in the terms of the contract with agreed performance criteria, monitoring and penalty/performance regimes set out in detail. In other cases there may be an external supervision approach for a single contract (for example the PPP Arbiter for the London Underground PPP contracts) or there may be sector specific regulatory bodies (such as in the water sector) which oversee PPP contracts. However, in the majority of cases PPP contracts are "supervised" under the terms of the contract with monitoring and performance regimes agreed between, and carried out by, the various parties to the contract.

2.1 *Phase of selection of the private partner*

Q.2 In the Commission's view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the *fundamental rights of economic operators. Do you share this point of view? If not, why not?*

21 Given that competitive dialogue is a new procedure (unlike the negotiated procedure where there is a significant body of evidence), and is therefore to date untested, it is difficult to give a definitive answer at this stage. The following is therefore based on our experience of a variety of procurement approaches and procedures for PPPs, our knowledge of the requirements of both public and private sector parties and discussions with these entities regarding competitive dialogue.

22 Our belief is that competitive dialogue is not particularly well adapted to the procurement of PPPs. While there may be some instances in which it is appropriate, in many cases the use of competitive dialogue would not satisfy the needs of the public procurement authority to undertake an efficient and effective procurement. Reasons include:

- there is a real danger that the competitive dialogue approach to the procurement of PPPs will result in increased transaction costs (mainly for bidders but also for the procuring agency) as:

  - bidders may be required to give very full submissions at an early stage of the procurement, when there are potentially a large number of bidders still in the competition (so their percentage chance of eventually winning is proportionally small). They will therefore incur significant costs. These may be further increased if there are several rounds of "dialogue" and at each stage of which they are required to rework their proposition as well as attend "dialogue" meetings;

  - public sector costs will also increase as they will be involved in all of the "dialogues" and will have to assess (potentially a large number) of detailed submissions;

- competitive dialogue could result in the perception that the public sector does not know what it wants or how to procure it, which could deter bidders. It is the responsibility of the public sector to decide on the appropriate project structure based on an analysis of its own needs and its objectives. Competitive dialogue could be seen as an abdication of that responsibility;

- in addition to conducting a complex round of "dialogues" with a number of parties, ensuring that each bidder is treated equally and that the details of all submissions are kept confidential from each party will require a high level of public sector inputs, both in terms of skills and resources. Our experience is that public sector procurement agencies are often pressed to supply the capability or resources to conduct negotiations with one or two short-listed bidders;

- under this approach bidders are effectively being asked to improve the quality of the project using their own intellectual capital on an unpaid basis. This may seem to be a good idea from the public sector's perspective but this will not be the case if the best bidders decide that they do not want to bid or are unwilling to incur further costs in developing their proposals;

- bidders are likely to be concerned that they will be surrendering their intellectual capital (which is one of the main differentiating factors in PPP bids, where bids are assessed on the quality of proposals as well as the price) either to the public sector, who will use it for its own benefit and against the bidder which provided it in the first place, or to other bidders who will be asked to bid against the revised project specification incorporating the original bidders ideas;

- there are other (lower cost) ways in which the public sector can seek to consult with the market whether a proposed project's scope, structure and risk allocation is appropriate, these include road shows and industry days (potentially at various stages of the procurement), the use of appropriately experienced advisors (who understand what is, and is not, acceptable to the market, both technically and financially) and a revision of the project requirements at a Best And Final Offer ("BAFO") stage when full bids have been received but only a small number of bidders are asked to go to the expense of revising a full bid (at this stage it is a more practical proposition for the loosing bidder to have some, or all, of his costs for this final stage reimbursed);

- if project structures change significantly during the "dialogue" stage it is possible that the revised project will be sufficiently different from that originally envisaged, that additional planning and approvals will need to be undertaken to enable the procurement of the revised project to go ahead. There will be delays while such processes are undertaken or revised (such as planning and permitting, environmental impact assessments etc.). Given that the public sector expect the project to change during the "dialogue" stage this may also result in them being less diligent in ensuring that an appropriate level of project preparation is undertaken in the early stages of procurement;

- it is worth noting that the changes required to project structures at the later stages of the procurement process are often required by the project funders. Funders are often reluctant to become involved in the detail of bids until BAFO or a bidder has achieved preferred bidder stage. Certain markets require significant funder involvement in projects at initial bid stage (e.g. Greece and Ireland), with a view to minimising funder changes at a later stage. The consequence is that bidders have incurred significant bidding costs which may have reduced the number of interested bidders. Therefore even under a competitive dialogue approach it is almost inevitable that there will be a need for some degree of negotiation at a later stage;

- unless the “dialogue” stage is very well managed such an approach could result in drawn out procurements.

23 We have no objection to competitive dialogue being an additional tool in the procurement armoury, although there is concern that the process could lead to bidder fatigue. However, we believe that, if the intention of the Commission is that the availability of the new competitive dialogue procedure should result in it being made more difficult for the negotiated procedure to be used for PPP procurements, then this would have a very negative effect on both existing and developing PPP markets.

24 There is a perception in the market that the Commission has an anti-negotiated procedure bias and that the introduction of competitive dialogue is a further attempt to restrict the use of the negotiated procedure. This seems to be based on the belief that such procurements can result in less competitive processes than under other procurement procedures. We do not agree with this premise. Genuine attempts were made to use the restricted procedure in early PFI projects in the UK (for example the first two PFI prison projects at Fazakerley and Bridgend). However such an approach was found to be impractical and, after considerable expense and significant delays, such procurements were re-launched under a negotiated procedure. From our involvement in many PPP procurements which have followed the negotiated procedure (from both the public and private sector sides) we find that these can be highly competitive. As with other procurements there is a need for the public sector to have the necessary resources, capabilities and support to be able to run a proper competitive procurement, but these requirements are the same for any procurement, PPP or not.

25 In markets such as Canada and Australia, it is common for the procuring authority to appoint a “probity auditor” whose responsibilities include ensuring a fair process is followed through the procurement. Should the EU be concerned about transparency issues or inequality between bidders then the use of a probity auditor in conjunction with a negotiated procedure is preferable to the implementation of competitive dialogue.

26 We note that there appears to be an inconsistency in the availability of the competitive dialogue in that it is an alternative procurement method under the “Classical” Directive but not under the “Utilities” Directive. PPPs are common in the utilities sectors.

27 The following comments relate to our current experience of “transposing” the concept of competitive dialogue in the context of the French PPP market (where competitive dialogue has been introduced in the "Code des Marchés Publics" and more or less in all of the new PPP procedures). In general we have found that the competitive dialogue concept has generated considerable misunderstandings and uncertainty. Article 29 of the EU March 2004 directive is quite unclear on the practical way the procedure should be conducted. Queries include:

- is it possible to limit the number of candidates allowed to take part in the dialogue and on what basis? If it is not, then the procedure is likely to be unmanageable. (e.g. how can the public sector conduct a large number of dialogues in parallel?);

- on which criteria do you eliminate solutions? Will a candidate, whose solution has been eliminated, be permitted to submit a final offer on a different basis? There is a general apprehension that this elimination process will be a source of conflicts and litigations;

- what level of detail is to be provided by the bidders during the dialogue phase (e.g. financial)? Are formal proposals expected at this stage or simply conceptual documents? There is an understanding that the dialogue is mostly about refining technical solutions. Are financial options expected to be part of the dialogue as well?

- is the public sector expected to issue new terms of reference at the end of the dialogue to serve as a common basis to all bidders for the BAFO? If not, and many legal experts in France believe it to be the case, (i.e. each candidate should submit a BAFO on the basis of its latest proposal when the dialogue is closed), how do you ensure equality among bidders as they will bid on potentially very different proposals?

- how does the public sector enforce the confidentiality of information submitted during the dialogue? There is a real danger that many candidates, having supplied similar ideas, will be able to claim their paternity and challenge the procedure. There is a lack of clarity as to what is confidential information and what is common knowledge arising from the normal learning process during the dialogue;

- there is uncertainty as to how to interpret the "...clarified, specified and fine-tuned" of paragraph 6 of art 29. What level of negotiation will be permitted at each stage? For example, will the financial proposals be able to be firmed up at this stage? Is so, it is likely that this stage could last several months, which would be contrary to current public sector expectations that this phase will be very short (a few weeks).

28 On the basis of this current and relevant experience, we would suggest that competitive dialogue should be (i) clarified by the Commission as a matter of urgency, (ii) tested in practice before being it is allowed to be generalised and transposed into all Member States domestic legislation.

Q3. In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these? Please elaborate.

29 We are not in a position to give a legal response to this question, but there is a need to ensure that under Community law the general approaches developed to date for PPP contracts will continue to be open to procuring authorities. These would include ensuring that:

- a whole life costing approach is allowed;
- an outputs specification approach is allowed;
- it is possible to evaluate on qualitative as well as quantitative criteria ("value" not just "cost")
- that negotiation, so long as it is competitive, continues to be allowed.

Q4. Have you already organised, participated in, or wished to organise or participate in, a procedure for the award of a concession within the Union? What was your experience of this?

30 The response is dependent on whether a narrow or wider definition of concession is intended, which reflects the confusion currently existing from EU legislation. We have considerable experience of undertaking contracts involving the private sector in the long-term service provision of "public" services, which are defined by many as long term concessions. As advisers to the public sector we have been involved in the organisation of such procurements. We have also participated (as advisers to private sector bidders and consortia) in such procurements.

31 It is not practical to document our experience of this considerable involvement.

32 However, we would stress from our experience that the complexity and flexibility required to procure a complex concession (or a complex PPP) call for the use of the negotiated procedure. We do not believe that the use of the negotiated procedure creates inequality among bidders, reduces competition or leads to disputed outcomes or litigation (there has been very little litigation in relation to the UK PFI market).

Q5. Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions? In your opinion is genuine competition normally guaranteed in this framework?

33 We are not in a position to speak from a legal standpoint in terms of the Community legal framework; however our experience is that Member States are undertaking PPP procurement processes (which presumably are compliant with the current framework) which do allow for the effective participation of non-national companies. Barriers to entry for non-national companies are not normally as a result of the legal framework but rather a lack of local presence and experience. Changes in procurement law will not solve this challenge.

34 The UK PPP market is arguably the most open and competitive PPP market in the EU. There are a variety of reasons for this but a significant contributor to the openers of the PPP market is the level of PPP dealflow which has attracted non-UK bidders. We are aware of some 66 non-domestic bidders being involved in UK PPP projects completed to date.

35 Developing PPP markets are likely to attract non-national bidders who will work with local parties to mutual benefit, with the international elements providing PPP specific expertise (which domestic players, by definition, do not have) and domestic elements providing the inputs which it would be impractical, or uneconomic, for international elements to provide. However, non-national bidders are less likely to bid if they cannot find a suitable local partner.

36 We have seen a number of international bidders invest in domestic companies to improve their chance of bidding successfully in both developed and developing PPP markets.

37 While there is a predominance of domestic players in some markets we do not consider this to be specifically associated with PPPs and their procurement. This predominance is due to wider market/procurement factors and this position is mirrored in the make up of successful bidders for traditionally procured public sector contracts.

Q6. In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?

and

Q7. More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements?

38 Although there is an obvious distinction in terms of EU legislation, in market terms there is less distinction between concessions and other forms of contractual PPP. Therefore we have answered these two questions together.

39 We would not be in favour of additional regulation in this area at an EU level. Market experience shows that, if well procured under a clear national framework, it is already possible for PPPs to be procured in an effective way which ensures competition and satisfies other EU general requirements.

40 There are existing problems in that there are anomalies in the current legislative framework which deals with contracts which are economically or commercially similar but which fall (or do not fall) under different parts of EU legislation. We believe that the approach to take is to require procurement authorities to observe the fundamental principles set out in the Treaty. This can be done in two different ways:

- require procuring authorities to undertake this within the framework of national laws; or

- impose specific laws at the EU level.

41 We favour the first option, given that:

- as there is difficulty in defining the subject matter (we do not believe that it is possible to define PPPs) it seems to be impractical to define a legislative framework for them;

- it is difficult to develop a comprehensive EU legislative framework when existing national frameworks vary greatly;

- there is considerable uncertainty in the market as to how current EU legislation should be interpreted and where it does, and does not, apply;

- there is concern in the market that additional legislation will not achieve the aim of providing a more consistent approach and hence be effective in reducing uncertainly, risk and costs but that more legislation and regulation will result in increased uncertainty and costs of compliance and the additional risks will result in higher transaction and finance costs.

42 In short that the actual costs of additional legislation is likely to outweigh the intended cost reductions from intended greater consistency.

43 A practical approach would be to adopt the first approach but to combine this with a concerted and comprehensive approach to provide more guidance as to what the

fundamental principles mean within the context of PPPs and how current legislation impacts on PPPs. In addition to doing this within a procurement setting (the subject matter of the Green Paper), the Commission should also provide guidance on other areas where the EU impacts on the PPP market (see discussion of this in our thought leadership paper).

2.2 *Specific questions relating to the selection of an economic operator in the framework of a private initiative PPP*

44 We do not understand why the EU has felt it necessary to give such prominence to the issue of private initiative PPPs in its consultation document.

45 Unsolicited bids or sole-source procurement (or private initiative PPPs), no matter what the legal and regulatory environment in which they are allowed, are not and can never be a substitute for public sector prioritisation of service needs and procurement through a transparently competitive process.

46 Our experience across Europe and in other international markets is that private initiative projects (PPPs or otherwise) are not value for money for the state or the taxpayer. Such initiatives are often viewed with suspicion by other market participants as transparency is impossible to ensure and consequently proper competition is seldom ensured.

Q8. In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organised to implement the selected project genuinely competitive?

47 A good procurement agency will seek to maximise the market interest and response to a project and therefore will seek to inform, and not discriminate against non-national operators. There may be an increased danger that such projects are not so widely advertised as publicly sponsored projects. This may have an adverse effect on non-national operators who will not have such good information sources outside their home markets.

48 However in practice the quality of the procurement and the degree of competition depends more on the competence of the procuring entity, and its advisers, and the absence of political or other influences than on the type of procurement or the way that the project is initiated.

49 A requirement to advertise in the OJEU is a prime safeguard. Most good procurement agencies will also advertise in other ways and in addition contact likely interested parties. We do not see why there should be any difference in these requirements for private initiative or public initiative schemes.

See also comments on 2.2 above.

Q9. In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment?

See also comments on 2.2 above.

2.3 ***The phase following the selection of the private partner***

Q10. *In contractual PPPs, what is your experience of the phase which follows the selection of the private partner?*

50 In most PPP procurements a negotiated procedure is used. In some cases procurements may allow for a BAFO stage. By the time a preferred bidder is appointed there is normally a fully developed project scope, agreed prime contract arrangements and strong funder support. Nevertheless, the degree of certainty at the time of selection of the winning bidder, is dependent on the procuring authorities requirements which vary across countries, sectors and over time.

51 Where there is no BAFO stage, or variant bids may have been allowed, there may be a greater need for clarification and negotiation after the preferred bidder has been selected.

52 Practice will depend on whether there is simultaneous or sequential commercial and financial close, the degree to which funders have been involved prior to the appointment of a preferred bidder and the time scale between these two events.

53 In some cases a reserve bidder may be retained to help to maintain competitive pressure during any negotiations post preferred bidder, although consideration has to be given to reimbursing the costs incurred by such a reserve bidder during this period.

Q11. Are you aware of cases in which the conditions of execution – including the clauses on adjustments over time – may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered?

We are not aware of any.

54 However, we would note that PPPs are often very long term contracts and there must be mechanisms which allow for flexibility to adjust to changing circumstances over time. It is simply not practical to have to re-tender the entire PPP every time that there is a material change. Questions to consider are:

- up to which point should it be possible to amend the PPP contract by simple negotiated variation (for example up to a percentage of the original contract?) and how do you ensure that you get value for money at this point (by the use of benchmarking?). The Commission needs to consider what its views are on the use of re-basing clauses, or scheduled reviews designed to adjust the original contract at regular intervals;

- how to ensure that there are mechanisms that deal with larger changes (for example those due to unforeseen additional needs or major regulatory change) other than by creating a new PPP for the modified part when the change is an addition (often not a practical solution where the result will be that there are two different operators on the same facility), or re-tendering the entire scope (hardly an attractive proposition for the public sector which will have bear the re-tendering costs and delays and will be required to pay compensations to the original operator).

Q12. Are you aware of any practices or mechanisms for evaluating tenders which have a discriminatory effect?

55 We have interpreted this question to relate to the PPP subject matter rather than traditional procurement. In our experience PPP procurement is less liable to be discriminatory than traditional procurement although this is market perception rather than based on research. This may be due to the level of scrutiny of PPP procurement, including the number of specialist legal, technical, financial advisers and funders participating in the PPP process.

56 The quality of the evaluation of tenders and the degree to which they have a discriminatory effect depends on the quality and independence of the evaluation body. Our experience is that this varies from procurement to procurement and from country to country.

57 Therefore the quality of the procurement and the degree of competition depends more on the competence of the procuring entity, and its advisers, and the absence of political or other influences, than on the type of procurement (PPP or traditional).

Q13. Do you share the Commission’s view that certain “step-in” type arrangements may present a problem in terms of transparency and equality of treatment.? Do you know of other “standard clauses” which are likely to present similar problems?

58 We fail to see how step-in rights affect transparency and equality of treatment.

59 We do not share the Commission’s views regarding step-in arrangements. Step-in arrangements are the norm in developed PPP markets. All bidders will be aware

that such clauses will be incorporated into the final contract and therefore there are no issues of transparency or equality of treatment, as all are in the same position. If there are material failings or problems with the contract then these clauses can be invoked.

60 Step-in arrangements are seen by the financiers of these projects as a vital requirement. If there is no ability for the financiers to seek to remedy a failure of the project company (whether due to insolvency, non-performance or any other specified reason) then the risks which they face rise substantially. They will either seek a higher compensation for taking these risks or seek to mitigate these risks in other contract terms (such as requiring full compensation on termination). This will result in higher overall project costs for the public sector and are likely to diminish value for money.

61 The option of step-in is also generally seen to be a benefit by the public sector, who may not have the capability or the inclination to take over a project/service/asset using internal resources and, due to time pressure, would probably not be able to undertake an effective and competitive procurement to find a new private sector party to take over the contract in any case. Given the situation which is likely to exist at the time that a step-in clause is invoked, it is highly unlikely that there would be enough market interest (to step-into the contract at a time of difficulty) to ensure that there could be an effective and competitive competition even if any of the parties wanted it or it was required under procurement legislation.

62 The public sector will normally have the right to approve the step-in agent, so is protected from the contract being taken over by an unsatisfactory agent.

Q14. Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level? If so, which aspects should be clarified?

63 The contract for an individual PPP should be the outcome of the procuring entity achieving the aims and requirements of the public sector within the practical constraints imposed on it by competitive market forces. If the resulting contract is beneficial for the public sector then it should go ahead with the PPP, if not then it should seek to procure the service in an alternative manner, or not at all. Given the almost infinite variety of projects and the many different structures and contractual terms which are needed to deliver such projects, it is difficult to envisage how a contractual framework which fits all PPPs can be devised at Community level.

64 This view is reinforced by the practical experience of countries which have sought to develop and implement standard contract terms for specific types of PPP contracts (UK PFI contracts for example). Consistent enforcement has proved to be very difficult with considerable exceptions where non-standard contract terms have been used or where procurements have not used the standard form at all. It should be noted that the main driver for standardisation has been a desire to reduce

procurement costs (for both the private and public sector) and not an intention to standardise for procurement and compliance reasons.

Q15. In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.

and

Q16. In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?

and

Q17. In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?

65 Our experience is that most PPP contracts are concluded with a consortium, which already has all its substantial subcontractors in place. This is because if a bidder is to provide a firm price and specification for its bid then it needs to know what the individual costs of the elements of its bid are that it is going to subcontract. It therefore needs to have certainly as to these costs prior to bidding.

66 As a common method of bidding is to use a Special Purpose Vehicle ("SPV") as the bidding entity (which is not usually capable of directly delivering construction or operational services), it is not unusual for close to 100 per cent of the scope of the contract to be subcontracted.

67 Therefore any requirement that subcontracted services are to be competitively bid, after the bidding entity has been awarded the contract, will make the SPV approach to PPP contracting redundant. Such an approach would have a very substantial negative effect on both existing and developing PPP markets.

68 We have not encountered any specific problems in relation to subcontracting and do not see any justification for more detailed rules in this area or a supplementary initiative at Community level.

3 *Institutionalised PPPs and the community law on public contracts and concessions*

Q18. What experience do you have of arranging institutionalised PPPs and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases. If not, why not ?

69 We have limited experience of such PPPs. We have been involved in a number of local authority joint venture companies and housing regeneration joint ventures.

There have also been some PPPs of an institutional nature in the UK (including National Air Traffic Services, Qinetiq and some Wider Markets Initiative projects) at central government level. There are also a number of new PPP initiatives including LIFT in the UK health sector and Partnerships For Schools in the education sector which have elements of institutional PPPs in their arrangements.

70 We are not aware that Community law on public contracts and concessions are not complied with in such cases. We would note that the bundling of projects, or the more complex, flexible partnering and alliancing deals could not take place if each contract had to be competed separately.

Q19. Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalised project? If so, on what particular points and in what form ? If not, why not?

71 We would see no fundamental difference between the approach regarding a call for competition which should be taken for institutional PPPs as being different than that for contractual PPPs.

72 In both cases the requirement is for some clarification and guidance as to which existing EU legislation and rules affect PPPs rather than new initiatives or regulations (see answers to Questions 6 and 7 above).

In general and independently of the questions raised in this document:

Q20. In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?

73 There are many which vary from country to country and from time to time (as political landscapes change). We outline some of these in our *Developing PPPs in New Europe* paper; however, for PPPs to be undertaken, and for programmes of PPPs to develop in an efficient and effective way, a number of conditions need to be present:

- a demonstrable, strong, clear, long-term political will;

- a good understanding at a political, and policy level, of what PPPs are, where they are appropriate and how to use them;

- an understanding, at all relevant levels of government (national, regional and local) and at the EU, of how PPPs should be structured and procured;

- an appropriate level of public sector institutional capability and capacity to be able to develop and undertake complex projects and procurements;

- a suitable ‘enabling environment’ or ‘framework’ in the following areas:

  - legislative;

  - regulatory;

  - commercial; and

  - financial.

74 To the extent that these are not present the development of PPPs will be restricted.

75 PPPs will not happen on their own. It is up to the governments of the Member States to decide what use they wish to make of PPPs, to identify appropriate PPP projects and to ensure that they have the capabilities to procure them in an efficient and effective way. We believe that it is important that the EU provides support to Member States who wish to develop PPP programmes and does not provide obstacles to their development (in procurement or other areas). We provide further commentary on this in our thought leadership paper.

Q21. Do you know of other forms of PPPs which have been developed in countries outside the Union? Do you have examples of “good practice” in this framework which could serve as a model for the Union? If so, please elaborate.

76 PPPs have been developed in a number of other countries outside the Union including Australia, Canada, Japan, Mexico and South Africa. Many other countries are currently in the process of investigating or developing PPPs.

77 In most cases the approaches taken are either not substantially different from those which have been used in the Union (in many cases they are based on the approaches and experience of PPP development in the UK and other European countries) or they are country specific and as such are unlikely to provide examples of best practice or act as a model for the Union.

78 An exception to this might be the Alliancing experience in Australia.

79 Importantly, the Union can draw on the wealth of publicly available guidance and research on PPPs in many markets in formulating its own guidance.

Q22. More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a *collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful? Do you consider that the Commission should establish such a network?*

80 If properly constructed this could be useful, but such a network should focus on practical issues and should involve those actors who have an in-depth, practical understanding and experience of PPPs and the relevant markets within the Union. It should combine representatives of both the public and private sides of the market and include advisers and multinationals which have in-depth practical experience of developing PPP projects. It should not be limited to discussing theoretical and policy issues.

81 We have outlined in our thought leadership paper some of the issues which we think need to be addressed. The following is a summary of our main recommendations.

Developing PPPs in New Europe – our recommendations

82 Given the actual, and potential, impact which the actions and regulations of the EU can have on the development of PPPs in the New Europe, serious consideration needs to be given as to how the EU should coordinate its activities in this area. Our recommendations are as follows:

Improving knowledge and understanding of PPPs at the EU level

83 The Commission should set up a cross-EU PPP Group whose role would be to coordinate EU activities which affect the PPP market and assess the impacts which EU actions, or inactions, have on the development of PPPs. This should be supported by a small Central Unit which would act as a knowledge unit and centre of excellence for PPPs within the EU.

Institutional capacity, information and training

84 The EU should address the poor level of information, public sector institutional capacity and knowledge about PPPs which exists within many Member States, and the EU itself. It should fund a number of initiatives, including comparative studies on the actual benefits which PPPs can deliver and the development and provision of practical training and encourage the secondment of civil servants (and advisers) to and between PPP units of Member States.

EU approach to PPP development

85 PPPs are hard to define and vary greatly in nature. It is therefore unlikely that developing a legislative approach to PPPs will be either practical or desirable. The approach taken by the EU should be one of interpreting and clarifying the way that

existing (and future) rules and regulations interact with PPP procurements and their development. Additional legislation should be resisted.

Co-financing using private finance and PPPs

86 Combining PPP approaches with grant funding provides a considerable challenge. The EU should assist Member States to address the issues involved in combining EU funding and grant requirements with private sector finance and PPP approaches. A taskforce should be set up to identify and address the issues involved and the EU should assist Member States to select and implement pilot projects. The experience gained in doing so should be disseminated and practical guidelines produced so that maximum benefits are gained from the lessons learned.

RWE Thames Water

GREEN PAPER ON PUBLIC-PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS COM(2004) 327 final

Position RWE Thames Water

Introduction:

RWE Thames Water welcomes the Commission's Green Paper, which has raised some important issues that deserve to be debated at EU level.

RWE Thames Water is the world's third largest private water service provider and part of the energy and water group RWE. In its Europe region, RWE Thames Water operates water and waste water service for 28 million customers in 6 countries (on global level: over 70 million customers in 20 countries).
RWE Thames Water is in the unique position to be the owner and operator of the water and waste water services for the one of the biggest cities in the world - London. This background provides us with a thorough understanding of the importance of Public Private Partnerships for the water sector in Europe and in the world. The provision of safe and affordable water and waste water services to people is one of the key concerns of public authorities and private operators. Water has also been high on the political agenda of the European Union over the past years.

Water and sanitation are vital to human life and to the environment. One of the key elements about the water sector is its local character with production, distribution and treatment of the services planned and provided on municipal level. This led to a high degree of diversity in the organization and management of the water and wastewater sector according to local customs and needs. Subsidiarity is therefore crucial when aiming at establishing legal clarity as to how the public and the private sector can work together in Public-Private Partnerships. In doing so, the focus must be on ensuring that key obligations such as high-quality service, affordability, security and safety of supply are fulfilled.

In our view, the Green Paper does not provide sufficient clarity about the Commission's understanding of PPPs and why and how it distinguishes between contractual and institutional PPPs. Contractual PPP's seem to include an extremely wide variety of partnerships such as:

- Operational management contracts with no capital investment ("O&M Contracts")
- Operational management contracts with ongoing maintenance investments ("Concession Contracts")
- Operational management contracts with large upfront investment followed by steady maintenance investments (PFI's or DBFO's)

In addition to the variable capital investment element above, other important factors include the size of the contract (in financial or geographical terms), the duration of the contract (1 year – 40 years) and the risk transfer expected within the contract.

In contrast, the institutionalized PPP appears to be one specific from of PPP where the public and private sector jointly invest in a company vehicle to deliver the "service contract on behalf of the public sector".

In RWE Thames Water's opinion, the key term of "concessions" is not clearly defined and can have different meanings in the member states according to local historical evolution of the sector and the ownership of assets.

We suggest that the Commission clarify its understanding of the concession model with regards to water services and provide more information on what role concessions play in PPPs. Central aspects of a differentiation between public procurement contracts and PPPs should be the distribution of risks and responsibilities between the private and the public partner; the ownership of assets and the complexity, length and scope of the partnership etc.

Considering that there is still a lack of level playing field and competition in the water sector in Europe, RWE Thames Water urges the European Commission to focus on the implementation, enforcement and evaluation of existing rules and regulations with regards to public services provision, in addition to any potential new proposals in the context of PPPs.

RWE Thames Water input on specific questions asked by the Commission

1. What types of purely contractual PPP set-ups do you know of? Are these set-ups subject to specific supervision (legislative or other) in your country?

The organization of water services provision is very local and different concepts have evolved across Europe. Whereas in some member states public-private partnership in the water sector has a long-standing tradition it is inexistent in other member states.

In England and Wales, private companies and institutions own the assets and provide water and wastewater services. The operators have a legal obligation to provide these services to all citizens, which is enshrined in a 25-year license awarded and renewed by the relevant public authority. The UK situation is quite unique as the private operators fulfill a role typically given to the public authority. Service provision can be carried out by the owner operator itself or is outsourced to a third party to operate (as in the case of Dwr Cymru, previously known as Welsh Water). In both cases the asset ownership and operation is in private hands.

In Scotland and Northern Ireland, water supply and wastewater treatment are still effectively under direct Government control with asset ownership and management being carried out by government appointed authorities (Scottish Water and Northern Ireland Water Services respectively).

Subsequently there are two different forms of PPPs in the UK:

- In Scotland and Northern Ireland, a concession is typically understood as a long-term contract (20-30 years) between a public authority and a private undertaker. The authority awards the right not only to operate the water supply or wastewater treatment service on its behalf to the private undertaker (OPEX) but also the obligation to carry out required capital expenditure (CAPEX) over the length of the contract. The ultimate obligation for ensuring sufficient and high-quality water supply and wastewater treatment standards, however, still lies with the authority and is not transferred to the undertaker. The undertaker does not necessarily have a direct relationship with the customer but is generally rewarded by the authority. No concessions involving direct cash collection from the end consumer have yet been let in Scotland or Northern Ireland.

- Another type of PPP is the outsourcing of service provision and capital investment in the form of “Private Financing Initiatives” PFIs (DBFO’s), which previously have been awarded in Scotland and two are currently planned in Northern Ireland. They are typically set up to bridge a financial gap in public infrastructure investments with private resources. In these cases the private partner invests in the design and building of the assets and operates them over a 25-40 year term. It recovers the costs in the form of a service payment from the water undertaker appointed by the Government, rather than from the end consumer. The risks are shared between the public sector/private partner and financial institutions.

2. In the Commission’s view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?

This form of dialogue has occurred on a number of projects both in the UK and Holland as part of the procurement process following advertising in the Official Journal of the EU and pre-qualification. In this instance, all pre-qualified candidates are invited to consult on a range of issues from technical solution, contractual conditions and funding proposals. The Competitive Dialogue would be a sensible approach providing that the Municipality or awarding body do not adopt suggestions (technical and commercial) which by their nature favour one party over another thus discouraging effective competition.

3. In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts? If so, what are these? Please elaborate.

No.

4. Have you already organised, participated in, or wished to organise or participate in, a procedure for the award of a concession within the Union? What was your experience of this?

RWE Thames Water has participated or tried to participate in procedures for the award of a concession within the European Union. The transposition process of EU regulation into national law can lead to differences in the award procedures across the member states. This is partly due to the historically diverse development of the sector but also due to a lack of enforcement of existing EU regulations.
In our experience the national rules and regulations are generally clear to the interested parties bidding for a concession contract.

5. Do you consider that the current Community legal framework is sufficiently detailed to allow the concrete and effective participation of non-national companies or groups in the procedures for the award of concessions? In your opinion is genuine competition normally guaranteed in this framework?

RWE Thames Water considers that the current Community legal framework is sufficient to ensure effective participation of European operators in the UK in tender procedures of services contracts and concessions. Competition for industrial clients exists and is enforced. For domestic clients, the UK regulator creates a competitive environment through so-called ‘comparative competition’ and effective benchmarking of the operators.

6. In your view, is a Community legislative initiative, designed to regulate the procedure for the award of concessions, desirable?

Before considering any legislative initiatives, RWE Thames Water encourages the European Commission to clarify the term ‘concessions’. As it stands, some concession contracts could be discussed in the context of public procurement whereas others fit better in the context of PPP.
The water sector in Europe is diverse and locally organized. Based on the principle of subsidiarity, the relevant public authority should maintain its right to choose how it organizes water supply and waste water treatment (either by itself or through a third party). By choosing a concession model with a third party a municipality chooses to enter into a long-term and complex partnership with the concessionaire to supply water and/or waste water treatment. This requires flexibility for embedding the social and environmental obligations, the technical needs and financial and managerial possibilities of the task into the concession arrangement.

The principles of transparency, fairness, equality of treatment, non-discrimination etc. are laid down in the Treaty of the European Union. The Directives on public procurement (2004/17/EC and 2004/18/EC) were adopted in 2004 and are now being transposed into national law and implemented. Additional legislation for concessions would not add value at the current stage.

7. More generally, if you consider that the Commission needs to propose new legislative action, in your opinion are there objective grounds for such an act to cover all contractual PPPs, irrespective of whether these are designated as contracts or concessions, to make them subject to identical award arrangements?

See answer to question 6.

8. In your experience, are non-national operators guaranteed access to private initiative PPP schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested operators? Is the selection procedure organised to implement the selected project genuinely competitive?

We do not see the need to treat privately initiated PPPs separately from publicly initiated PPPs. Due to the specific character of the water sector, the initiative to set up PPPs generally derives from the public authority.

9. In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment?

See answer to question 8.

10. In contractual PPPs, what is your experience of the phase, which follows the selection of the private partner?

This depends on the conditions of the specific contract agreed and on the local requirements.

11. Are you aware of cases in which the conditions of execution – including the clauses on adjustments over time – may have had a discriminatory effect or may have represented an unjustified barrier to the freedom to provide services or freedom of establishment? If so, can you describe the type of problems encountered?

N/A

12. Are you aware of any practices or mechanisms for evaluating tenders, which have a discriminatory effect?

N/A

13. Do you share the Commission's view that certain "step-in" type arrangements may present a problem in terms of transparency and equality of treatment? Do you know of other "standard clauses" which are likely to present similar problems?

N/A

14. Do you think there is a need to clarify certain aspects of the contractual framework of PPPs at Community level? If so, which aspects should be clarified?

The Green Paper does not provide sufficient clarity about the Commission's understanding of PPPs and why and how it distinguishes between contractual and institutional PPPs. The Commission should also clarify its understanding of the concession model with regards to water services and which role it plays in PPPs.
Central aspects should be the distribution of risks and responsibilities between the private and the public partner; the ownership of assets; and the complexity, time and scope of the partnership.

On the basis of this clarification and existing EU rules and regulations, RWE Thames Water does not consider further legislation on PPP to be needed.

15. In the context of PPPs, are you aware of specific problems encountered in relation to subcontracting? Please explain.

In his role as an entrepreneur and long-term partner, the private operator is interested to fulfill its contractual obligations with the public authorities in the most efficient way. The rules and regulations for sub-contracting and the obligations to be met by the operator are laid down in the contract thus setting the necessary framework.

RWE Thames Water believes, in order to ensure a maximum of flexibility and cost-efficiency in response to contractual and local requirements, that the operator of a water and waste water service is free to choose on the modalities of sub-contracting specific tasks to other companies.

16. In your opinion does the phenomenon of contractual PPPs, involving the transfer of a set of tasks to a single private partner, justify more detailed rules and/or a wider field application in the case of the phenomenon of subcontracting?

See answer to question 15.

17. In general, do you consider that there is a need for a supplementary initiative at Community level to clarify or adjust the rules on subcontracting?

See answer to question 15.

18. What experience do you have of arranging institutionalised PPPs and in particular, in the light of this experience, do you think that Community law on public contracts and concessions is complied with in such cases. If not, why not ?

A recent and novel example of an institutionalized PPP has occurred in Scotland. Scottish Water, the government appointed authority, sought partners from the private sector to join with it to deliver its 4 year capital investment programme.

The partners were selected from a fully assessed EU compliant tender process based upon technical capability, price and partnering approach. Having selected two consortia, these were then invited with Scottish Water to set up a jointly owned company to deliver their 4-year investment programme.

Clearly, this process is in contrast to occasions where jointly owned companies are created first and operating concessions are awarded later.

RWE Thames Water is of the opinion that it should be in the discretion of the public authority to decide through which route it chooses to select a private partner for a long-term institutionalized PPP. RWE Thames Water is not in favour of further EU regulation with regards to private investments in companies. Investment decisions are made on the basis of strategic or commercial considerations. Investors (private and public) do need the assurance that European Union respects the principle of free movement of capital.

19. Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalised project? If so, on what particular points and in what form ? If not, why not?

The Scottish Water example quoted in question 17 is one potential way in which competition could be utilized to select potential operators for institutionalized projects.

The Green Paper further suggests that there are some cases of institutionalized PPP where the public-private undertaking awards services contracts to its private partner without a tendering procedure.

RWE Thames Water maintains its position that a public entity should be free to choose whether to tender concession contracts or not. We believe, however, that the Commission should provide more clarity on the rules and procedures applicable to this type of situations, in order to ensure a level playing field and maximum transparency.

We believe there needs to be clarity in what influence the new jointly owned company and in particular the private shareholder as part of that jointly owned company should have in the assessment process for selection of the new concessionaire, i.e. the risk of undue influence needs to be eradicated.

20. In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?

One obstacle for Public-Private Partnerships in the European water sector are public monopolies; i.e. in Germany, where the public sector has an exclusive right to provide waste water treatment.

21. Do you know of other forms of PPPs which have been developed in countries outside the Union? Do you have examples of “good practice” in this framework which could serve as a model for the Union? If so, please elaborate.

N/A.

22. More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for the exchange of best practice, would be useful? Do you consider that the Commission should establish such a network?

The European Commission has communicated its interest to enable evaluation and benchmarking in its White Paper for Service of General interest. This would be particularly valuable for the water sector.
Regular benchmarking would include environmental, social and economic aspects of the sector and unveil best practices.
The question of a network of appropriate actors should be raised in this context.

Kommentti vihreän kirjan: Julkisen ja yksityisen sektorin yhteishankintasopimuksista sekä julkisia hankintoja ja käytöoikeussopimuksia koskevasta yhteisöjen oikeudesta:

Kysymys 9:

Kumppanuusrakenne valtaa alaa myös paikallishallinnon toimialoilla, kuten kultuuri-, liikunta- ja nuorisotoimessa. Toiminnassa ja palveluhankinnassa immateriaalisen innovaatioiden merkitys on yhä keskeisempi. Nykyinen hankintalainsäädäntö ei motivoi uusien ratkaisujen kehittämiseen ja niiden tarjoamiseen, kun toteutus joudutaan kilpailuttamaan tasapuolisesti huomioimatta innovaation kehittäjää. Innovaation luoja ei siten saa toiminnastaan mitään lisäarvoa. Uuden toiminnan tai aloitteen tekijällä tulisi olla systemaattinen oikeus neuvottelumenettelyn kaltaiseen prosessiin innovaation tarjoamisen yhteydessä.

Hankintalainsäädäntöön tulisi luoda selkeä menettelytapa, jossa voidaan huomioida myös muut immateriaalioikeudelliset arvot kuin patentit tai selkeä tekijänoikeudenalaisuus. Kulttuuri-, liikunta- ja nuorisotoimen palveujen kilpailuttamisen osalta keskeisessä osassa on sosiaalisiin-, kouluttaviin- ja toiminnallisiinprosesseihin liittyvä innovointi, jota ei voi todentaa tekijänoikeuksien mukaan.

Kumppanuusjärjestelmien ja tuottajien taitojen kasvaessa näiden hankintojen arvo voi kasvaa merkittäväksi. Vastuuta kulttuurisidonnaisista ja vaikeasti kilpailutettavista sosiaalisperusteisista hankinnoista tulisi siirtää enemmän päätöksentekijöille ja lisätä joustavuutta, joka motivoi innovaatioiden kehittämiseen ja tarjoamiseen.

B-1049 Bruxelles

Grünbuch zu öffentlich-privaten Partnerschaften und den gemeinschaftlichen Rechtsvorschriften
für öffentliche Aufträge und Konzessionen (Grünbuch PPP) vom 30.04.2004
und Weißbuch zu Dienstleistungen von allgemeinem Interesse
Hier: Stellungnahme und Anregungen

Juli 2004

Sehr geehrte Damen und Herren,

zu dem vorliegenden Grünbuch der EU-Kommission zu öffentlich-privaten Partnerschaften vom 30.04.2004 (Grünbuch PPP) und zum vorliegenden Weißbuch „Dienstleistungen von allgemeinem Interesse" nehme ich gerne Stellung und gebe dazu folgende Anregungen aus der Sicht eines Bürgers:

1. Das Europäische Parlament hat ausdrücklich bekräftigt, dass Wasser keine übliche Handelsware ist. Deshalb besteht keinerlei Grund, wirtschaftliche Rahmenbedingungen für die Daseinsvorsorge auf dem Wassersektor auf europäischer Ebene zu schaffen und Wasser als Wirtschaftsgut zu deklarieren.

2. Das vorhandene Ausschreibungsrecht ist völlig ausreichend. Neue Vorgaben im Ausschreibungsrecht würden nur die marktbeherrschende Stellung großer Konzerne beschleunigen und die Existenz öffentlicher Unternehmen, die noch immer unter demokratischer Kontrolle stehen, außerordentlich gefährden.

3. Der bestehende Ordnungsrahmen, d.h. die bestehenden Gesetze und Verordnungen sind völlig ausreichend. Sie ermöglichen einen sinnvollen Querverbund, z.B. innerhalb der verschiedenen Sparten von Stadtwerken und sind Grundlage für sichere, nachhaltige und preisgünstige Leistungen auf dem Wassersektor.

4. Durch eine Privatisierung und Liberalisierung der Wasserversorgung sehe ich, wie viele andere Bürger auch, keine Vorteile für Bürger bzw. Verbraucher.
Einen Eingriff in funktionierende Strukturen, wie sie jetzt mit der Einführung von Ausschreibungspflichten angedacht sind, halte ich für nachteilig und überflüssig.

5. Die Liberalisierung des Energiesektors in Europa kann keinesfalls als gelungenes Beispiel für einen besseren Wettbewerb angeführt werden. Vier Stromkonzerne teilen sich zum Beispiel in Deutschland den Markt (Oligopol!), die Strompreise gehen rasant nach oben, die Investitionen werden zurückgefahren auf Kosten höherer Gewinnmargen.

6. Bislang ist durch kein Beispiel ernsthaft nachgewiesen, dass durch Privatisierung von Dienstleistungen der Daseinsvorsorge mehr Effizienz erzielt worden wäre.
Die Privatisierungsbeispiele, die hier oft als gelungen bezeichnet worden sind, sind in Wahrheit und erwiesenermaßen misslungen. Zum Beispiel die Wasserversorgung in England und Wales oder der Energiesektor in den USA.
Eine österreichische Studie zum internationalen Vergleich der Wasserwirtschaft vom 15.10.2003 kommt zum Ergebniss, dass privatwirtschaftlich geführte Unternehmen ebenso wie Großbetriebe nicht a priori effizienter sind als öffentliche Unternehmen.

7. Das Recht auf kommunale Selbstverwaltung garantiert in Deutschland, dass die Kommunen frei entscheiden dürfen, ob sie die Leistungen der öffentlichen Daseinsvorsorge durch eigene Unternehmen oder durch Dritte erledigen lassen. Diese Regelung hat sich bewährt. Sie ist ein wichtiger Bestandteil im Rahmen des in der EU geltenden Subsidiaritätsprinzips und darf nicht durch eine Regelung zu verpflichtenden Ausschreibungen ersetzt werden.

8. Die Beteiligung eines privaten Kapitalgebers oder eine Vollprivatisierung hat also nicht zwangsläufig eine positive Auswirkung auf die Qualität der Dienstleistungen.
Den Städten und Gemeinden bzw. den öffentlichen Unternehmen muss es daher meines Erachtens auch ohne Ausschreibungspflichten völlig frei bleiben, die horizontale Kooperation mit anderen öffentlichen Unternehmen oder durch Bildung von Zweckverbänden oder Anstalten des öffentlichen Rechts frei zu wählen.
Hier dürfen die Zuständigkeiten nicht von der lokalen bzw. nationalen Ebene auf die europäische Ebene verlagert werden. Hier ist vor allen Dingen die in Deutschland verfassungsrechtlich garantierte kommunale Selbstverwaltung zu respektieren.

Gerne darf ich mich bedanken für die Gelegenheit zur Stellungnahme. Ich bin Ihnen sehr dankbar, wenn Sie meine Anregungen und Bedenken in die Gesamtbewertung einbringen.
Ich bin mir sicher, dass weit über zwei Drittel der Bevölkerung die Wasserversorgung (und auch Abwasserentsorgung) nicht privatisieren lassen wollen.

Mit freundlichen Grüßen

The Commission also received around 300 short notes protesting against any attempt to privatise the water sector (not published for technical reasons). The Commission received similar notes from the municipalities of Aichhalden and Steinach im Kinzigtal, the Gesellschaft des Bürgerlichen Rechts Schwarzwaldwasser, the Stadtwerke Bühl Gmbh and the city of Fürth.

Re: Green Paper on Public/Private Partnerships

The EC Directives and the interpretations given by the European Court make up a body of law which is aimed, among other things, at strengthening the single market and creating an open transparent competitive environment in which procurement by public bodies takes place. The objectives pursued involve certain constraints on public bodies compared to commercial concerns which prevent them enjoying the flexibility and responsiveness possessed by the latter. Public bodies cannot operate in the same way as commercial entities to take advantage of value for money options or to correct mistakes and errors made in fixing the requirements for a particular project or purchase. Public bodies must set out their requirements in detail and may not alter substantive requirements during a procurement process. In addition the legal framework creates considerable administrative costs for a public body and also creates an environment in which litigation can flourish and where fear of litigation may be a significant factor operating on the practices of the public body. Value for money principles can often become secondary to the need to get the process right and to avoid the possibility of expensive and lengthy litigation which can delay or prejudice a project. From a policy perspective at EC level there is a need to ensure a uniform system of rules but this may involve a cost in terms of flexibility, the balance between the two is a matter which should be kept under review. If commercial practices are worth replicating for the public sector sufficient flexibility should be built in to allow State bodies to operate in a more commercial fashion subject to basic requirements such as non discrimination and transparency. I would suggest that it is important in any structure for PPP's that the regime is not unduly restrictive especially for large complex projects which may have a very long life and require adjustment over time due to unforeseen circumstances and changing environmental conditions. Substance rather than form needs to be emphasised in any regulatory regime so that procedural rules are not too detailed and do not operate as obstacles, as for example where minor non-material breaches could create serous threats to major projects.

The Green Paper points out that under the current Directives a public authority must use the open or restrictive procedure and can only opt for the negotiated procedure, or indeed the new competitive dialogue process, in certain exceptional circumstances and the provisions allowing the exceptions must be interpreted strictly. The point is also made that a difficulty in establishing prior pricing arising from the complexity of the legal and financial package is not sufficient to justify invoking the negotiated procedure. A similar constraint presumably applies to the competitive dialogue procedure, if the parameters of the legal and financial package required can be specified in advance by the contracting authority it should invite offers under the usual procedures from the market and can not assume that it can invoke the competitive dialogue for any PPP. There may also be uncertainty about the scope of the competitive dialogue and it may be difficult to distinguish clearly where it should be used rather than invoke the negotiated procedure and what are the distinctions between the two types of procurement process.   What is a "particularly complex contract" is not defined and there are no objective criteria specified.   The competitive dialogue process is unclear and contracting authorities will differ considerably in size and sophistication; no common standard for what is a particularly complex project is laid down resulting in uncertainty whether the process can be used in a particular case. Clearly the competitive dialogue cannot apply to all PPP's and over time fewer PPPs may be capable of invoking the procedure if the requirements of contracting bodies become more standardised

The degree of flexibility for projects may also create problems. For example how feasible is it to allow participants to change the makeup of a particular consortium between the discussion stage and the final bid stage?   Can contracting authorities allow parties to swap partners or to amalgamate or to bring in new partners in the process? Difficulties arise because of the need to protect solutions suggested by particular parties but it would not necessarily be possible for the contracting authority in dealing with the consortium to know that an idea belonged to one of the partners which might wish to change to a different group or to even to make a separate bid on its own. The problems in providing protection for an idea or concept could be extremely difficult and the problem arises if the best idea overall concept can not win the competition and can not be utilised by the contracting authority.

Further problems arise for a contracting authority in assessing a PPP and selecting parts of the package on offer or comparing the bid to a traditional design and build procurement. In other words a full comparison for value for money purposes across a spectrum of possibilities may create considerable legal difficulties. The prospect of going through a full PPP assessment and then having to scrap the process and return to the market for traditional procurement would impose considerable costs on both the contracting authority and commercial concerns as well as causing delay to the project with a consequent price escalation and possible prejudice to the provision of infrastructure services. In relation to the Commission's second question the competitive dialogue procedure in theory offers an attractive option but it may be important to allow flexibility so that there can be a price testing exercise with a more traditional contractual arrangement and the option to revert to a more standard contractual solution in a competitive dialogue competition. Economic operators should not be required to engage in multiple tendering exercises for the one project. Provided a sufficient number of parties engage in the competitive dialogue procedure and provided it is transparent and safeguards the interests of those participating, it should be allowed maximum scope to develop a market solution which offers genuine economic advantages and value for money to the contracting authority including deciding not to adopt the complex legal and financial provisions which originally justified the competitive dialogue itself but perhaps revealed that the transfer of risk was not an economic option for the contracting authority.

The terms of the competitive dialogue are so open that there is a risk that litigation will arise and "legislation" by way of judgments from Court of Justice is undesirable. The legislative framework should contain sufficient to guidelines for all parties in the use of PPPs and limit uncertainty not in terms of detailed rules but by way of defining the principles to be applied. Emphasis should be on the principles involved not technical rules. The framework should be regularly reviewed and up-dated.

In relation to the third question put by the Commission dealing with problems other than the selection of the tendering procedure I would suggest that there are issues arising in terms of the protection of the strategies suggested by particular parties in the competitive dialogue process and the extent of those rights is unclear as is the extent to which compensation might be given to a party for the use of a solution by other parties. In addition public private partnerships can have a considerable life time and there are downstream considerations which will apply. While a contract may provide for a number of possibilities into the future it is not possible to provide for every eventuality. Contractual adjustments may be needed to accommodate technical innovation or market conditions and the changing the needs of a society may require alterations to the arrangements entered into.

In relation to the comment on avoiding excessive duration for PPP contracts in the Green Paper I would suggest that some of these projects must inevitably have a very long life. The Procurement Directives did not favour long term contracts but by their nature some PPP's must have a lifespan of twenty or thirty years. In some instances this is why a legislative framework is needed to control the exploitation of the concession. Step in arrangements are essential given the life span of certain projects and their importance and cost. Private partners subject to commercial pressures may experience severe financial difficulties or could even cease to operate. In this context it may necessary to re-negotiate the contractual arrangements in a variety of circumstances, even on a short term basis to allow time for the possibility of a new competitive procedure for a new concessionaire. Infrastructure cannot be allowed to stand unused for a period and continuity for services is essential. A State will always exist but a commercial partner can not provide that level of certainty into the future. A commercial entity may decide that a particular contract is no longer viable and wish to change the terms of a contract, terminate its involvement or even to refuse to fulfil its contractual obligations. Suing to enforce observance may not be a viable option for the contracting authority and while step in rights may allow it to operate the service itself this is not always practical or desirable. It may be essential to re-negotiate or to seek to transfer the operation of the particular scheme to a new operator. It is not possible in advance to provide for every eventuality. The contracting authority itself may also wish to terminate the arrangement where it is no longer required or where alternative provision is desirable. This may require a compensation package to be provided which is not covered by the initial contract and this could create legal difficulties but some flexibility in terminating or restructuring the PPPs may be necessary on policy grounds or even to enhance or improve services and limitations on such adjustment should not be unduly restrictive. In the same way the existing provisions in the directives to allow extensions to contracts are very restrictive and do not permit the expansion of a particular PPPs which may have become necessary or highly desirable but was unforeseen. The same model for extensions should not be applicable to PPPs

In relation to question 13 I do not believe that contractual step in provisions present a problem for transparency or equality but there are potential problems in invoking such rights and these options to provide for necessary changes to a project are desirable and should not be unduly restrictive.

Christopher Tobin

LIBRO VERDE SUL PPP

CONTRIBUTO DELL'ISTITUO GRANDI INFRASTRUTTURE

OSSERVAZIONI PRELIMINARI

La complessità del "fenomeno del partenariato pubblico-privato" impone un preliminare sforzo chiarificatorio dei concetti-base su cui si fondano le argomentazioni del Libro Verde ed i relativi quesiti.

Innanzitutto, si osserva che, come affermato nelle prime righe di apertura del Libro Verde, il termine PPP non è definito a livello comunitario, per cui, con tale sigla, si fa riferimento in generale a "forme di cooperazione tra le autorità pubbliche ed il mondo delle imprese" (punto 1.1.1). Tuttavia, al punto seguente (punto 1.1.2), si elencano gli "elementi caratterizzanti normalmente le operazioni di PPP", riassunti in 4 aspetti base: (1) la lunga durata, 2) il finanziamento garantito dal privato, 3) il ruolo importante del privato in tutte le varie fasi dell'intervento – dalla progettazione alla gestione –, 4) "la ripartizione dei rischi, con trasferimento di rischi al privato, normalmente a carico della parte pubblica".

Ora, non si può non rilevare che gli elementi sopra richiamati risultano essere propri della concessione di lavori come definita dalle Direttive (sia in vigore – 93/37/CE – che di nuova approvazione – 2004/18/CE) e come esplicitati nella Comunicazione interpretativa del 2000, ove, ai punti 2.1.1 e 2.1.2, ne sono delineati gli elementi di differenziazione rispetto all'appalto, individuati, in sintesi, nell'elemento del "rischio di gestione", legato "all'investimento effettuato o ai capitali investiti, in particolare se l'autorità concedente paga un prezzo". Pertanto, il "rischio economico", cioè l'alea legata all'aspetto finanziario, è elemento proprio e distintivo delle concessioni. Di conseguenza, il Libro Verde, che dichiara di fondare la propria analisi del PPP non su categorie giuridiche de iure condendo, bensì "alla luce del diritto comunitario degli appalti pubblici e delle concessioni" – punto 1.2.8, 1^a e 2^a riga –, dovrebbe giungere coerentemente alla conclusione che il PPP contrattuale va inquadrato nel vasto fenomeno concessorio.

Ma, le premesse sopra ricordate sono presto smentite dal riferimento agli appalti particolarmente complessi da affidarsi con la nuova procedura, introdotta dalla Direttiva 2004/18/CE, del dialogo competitivo, ritenuta "particolarmente adatta all'aggiudicazione dei contratti qualificati come appalti pubblici in occasione dell'attuazione di un PPP di tipo puramente contrattuale" (punti 2.1.1 – 24-25-26-27 e quesito 2).

Da qui un certo disorientamento, essendo l'appalto così come definito e disciplinato nel diritto comunitario, fenomeno sostanzialmente diverso rispetto agli elementi indicati come propri del PPP nel Libro Verde e, come evidenziato, riconducibili invece alla concessione, sia nella forma classica di concessione a remunerazione dell'utente sia di concessione a favore esclusivamente dell'Ente, con remunerazione a carico di quest'ultimo.

Ma anche ipotizzando per un momento di superare tale contradditoria impostazione del Libro Verde, ammettendo che nel fenomeno PPP contrattuale siano ricompresi anche gli appalti complessi, non si comprende quale ulteriore disciplina si possa immaginare per il PPP contrattuale in forme di appalto, dal momento che la Direttiva Unificata ha introdotto la procedura specifica del dialogo competitivo proprio per gli appalti particolarmente complessi.

In via conclusiva, a parere dell'IGI occorre preliminarmente un chiarimento di fondo circa la definizione stessa del PPP contrattuale come indicata nelle premesse citate, che appare corretta se riferita al solo fenomeno concessorio.

A questo riguardo, si ribadisce che contratti di lunga durata che assommano ai compiti progettuali, esecutivi, di manutenzione e di gestione, anche il fondamentale elemento del rischio dei ricavi, non sono altro, ai sensi del vigente diritto comunitario, che concessioni e come tali da sottoporre ai soli obblighi di pubblicità e termini, ribaditi da ultimo dalla Direttiva 2004/18/CE.

RISPOSTE AI QUESITI

1. Quali tipi di operazioni di PPP puramente contrattuali conoscete? Tali operazioni sono oggetto di una regolamentazione specifica (legislativa o di altro tipo) nel vostro Paese?

1. In Italia, il fenomeno di PPP puramente contrattuali è molto diffuso. L'esperienza più importante è certamente quella autostradale, ma, negli ultimi anni, soprattutto sotto la spinta delle innovazioni introdotte dalla legge n. 109 dell'11 febbraio 1994, come successivamente modificata, il PPP si è andato molto sviluppando, grazie al fatto che i privati possono non solo suggerire all'amministrazione concedente le opere di PPP da inserire in programma, ma anche rendersi promotori di iniziative per le quali presentano il progetto preliminare e il piano economico-finanziario. In questo modo, si solleva l'amministrazione da una serie di adempimenti senza perciò compromettere la concorrenzialità dell'operazione, dal momento che il concedente, dopo aver riconosciuto il pubblico interesse dell'iniziativa, deve scegliere con gara le imprese che, nella successiva fase negoziata, concorreranno con il promotore per l'affidamento della concessione.
2. Si tratta, tuttavia, di una procedura non certo snella perché i momenti concorsuali rischiano di moltiplicarsi se già nel momento programmatorio le proposte da inserire in programma riguardanti la stessa opera fossero più di una, anche se con caratteristiche diverse, oppure se si dovessero candidare due o più promotori sulla stessa opera. La proposta dell'IGI è nel senso di mantenere fermo il meccanismo delineato negli articoli 37 bis e seguenti, soltanto, però, per il caso che l'iniziativa della promozione sia unica, se cioè non vi è una pluralità di promotori.
3. Meno diffuso è, invece, il PFI. Soltanto recentemente, con la modifica introdotta nella citata legge 109 dalla legge n. 166 del 2002 è stata legislativamente sancita la possibilità di una concessione bilaterale, senza cioè la presenza dell'utente (art. 19, 2-ter). Questa forma di concessione non è facilmente distinguibile dall'appalto

misto di costruzione e di gestione. Nel Libro Verde, par. 23, si ipotizza che i pagamenti del partner pubblico possano essere fissi.

4. Come si è già accennato, la legge n. 109 disciplina la concessione ad iniziativa del promotore negli articoli 37-bis e seguenti. Per quanto riguarda la concessione ad iniziativa dell'amministrazione, la procedura di aggiudicazione è modellata sullo schema della licitazione privata. Contrariamente alla Direttiva comunitaria, nel nostro ordinamento la scelta del concessionario è dunque procedimentalizzata, e ciò, diversamente dall'art. 3 della Direttiva 93/37, per il quale l'unico obbligo è quello della pubblicità. Gli articoli della 109 ai quali fare riferimento sono soprattutto il 19 e il 21.
5. Quanto ai settori ex esclusi, oggi speciali, la situazione italiana è analoga a quella europea, nel senso cioè che non è disciplinato il modo in cui viene scelto il concessionario. Nella Comunicazione interpretativa del 2000 (par. 3.3), è prospettata una soluzione che presenta molteplici aspetti problematici.
6. Innanzitutto, non è sempre agevole stabilire quando un ente possa considerarsi "operante specificamente in uno dei quattro settori".
7. In secondo luogo, non si capisce quale sia l'aggancio normativo in base al quale si afferma essere applicabile la Direttiva 93/37 nel caso di ente non operante specificamente nei quattro settori.
8. Infine, andrebbe chiarito un aspetto di non secondaria importanza, quello cioè degli appalti che il concessionario dei settori esclusi affida "a valle". Dai paragrafi 3.2.1.1 e 3.3 della richiamata Comunicazione interpretativa, sembra emergere che il concessionario dei settori esclusi sia tenuto soltanto a rispettare la pubblicità quando appalta la quota-lavori che è tenuto ad affidare a terzi. In sostanza, nei settori ex esclusi si verificherebbe la medesima situazione che si incontra nei settori classici.
9. Se la soluzione è in questi termini, appare necessario un chiarimento della Commissione, anche perché questa conclusione sembra contrastare con quanto

stabilisce l'art. 2, comma 1 lett. b) della Direttiva 93/38 laddove considera enti aggiudicatori a tutti gli effetti i concessionari di diritti speciali o esclusivi.

10. L'occasione sarà anche propizia per dirimere in termini chiari il contrasto che sembra esservi tra la Commissione e la Corte di Giustizia, a proposito dei servizi pubblici di interesse generale, per i quali la Corte non sembra imporre particolari procedure al di fuori del rispetto della non discriminazione in base alla nazionalità, mentre la Commissione è orientata a sostenere l'obbligo della gara per la scelta del concessionario.

2. Secondo la Commissione, il recepimento nel diritto nazionale della procedura del dialogo competitivo permetterà alle parti interessate di disporre di una procedura particolarmente adeguata all'aggiudicazione dei contratti qualificati come appalti pubblici in occasione dell'attuazione di un PPP di tipo puramente contrattuale, pur preservando i diritti fondamentali degli operatori economici. Condividete questo punto di vista? Se no, perché?

Il quesito rimanda all'interrogativo di fondo evidenziato nelle premesse a queste OSSERVAZIONI ed all'affermazione per cui il PPP contrattuale non può che identificarsi nella concessione, nelle sue diverse forme: ciò che si può comunque rilevare è che la procedura del dialogo competitivo appare, per l'ordinamento italiano caratterizzato da forte livello di procedimentalizzazione anche nell'affidamento delle concessioni, non inidonea in sé a disciplinare le concessioni di iniziativa pubblica, almeno di quelle particolarmente complesse.

Tuttavia, sul piano giuridico, non si capisce come il dialogo competitivo possa applicarsi alle concessioni, visto che la Direttiva 2004/18/CE lo prevede soltanto per gli appalti. Si può semmai immaginare di poterlo applicare per gli appalti affidati dal concessionario, ma occorre che la Commissione chiarisca questo aspetto, come i punti precedenti che ne sono il presupposto.

3. Per quanto riguarda questi contratti, esistono secondo voi altri punti, oltre a quelli relativi alla scelta della procedura di aggiudicazione, che potrebbero causare problemi riguardo al diritto comunitario degli appalti pubblici? Se sì, quali e per quali ragioni?

Come nella domanda 2, non è possibile rispondere se non viene chiarito che cosa significhi l'espressione "aggiudicazione dei contratti qualificati come appalti pubblici in occasione dell'attuazione di un PPP di tipo puramente contrattuale".

4. Avete già organizzato, partecipato, o avuto l'intenzione di organizzare o partecipare ad una procedura di attribuzione di una concessione nell'Unione? Che esperienza ne avete ricavato?

Come già evidenziato precedentemente, il ricorso alla concessione è assai frequente in Italia e non presenta aspetti di particolare difficoltà, salvo un eccesso di proceduralizzazione che sarà evidenziato più avanti, soprattutto per la concessione ad iniziativa privata.

5. Ritenete che l'attuale quadro giuridico comunitario sia sufficientemente preciso per garantire la partecipazione concreta ed effettiva di società o gruppi non nazionali alle procedure di aggiudicazione di concessioni? Secondo voi, in questo contesto è attualmente garantita una concorrenza reale?

La legislazione italiana in materia di concessioni è particolarmente dettagliata, le procedure articolate e tali da garantire sicuramente un elevato livello di trasparenza. Purtroppo, ciò comporta che le procedure non sono rapidissime: questo dipende appunto, dal fatto, che l'affidamento della concessione è completamente procedimentalizzato allorché l'iniziativa è presa dalla pubblica amministrazione.

Se poi si tratta della concessione ad iniziativa del promotore, i passaggi procedurali sono almeno tre, con eventualità di altri sub-procedimenti concorsuali. Infatti, gli artt. da 37 bis a 37 nonies della legge 109/90 come modificata dalla 166/2002, prevedono una dettagliata disciplina, che può essere sintetizzata per sommi capi, come segue:

1) obbligo dell'Amministrazione di pubblicare un programma triennale con indicazione degli interventi passibili di iniziativa da parte privata o di entità pubbliche;

2) ricevimento delle proposte, di norma, entro il 30 giugno, con tutti gli elaborati richiesti: verifica di completezza entro 15 giorni ed in caso di accettazione, messa in gara entro i 4 mesi successivi;

3) espletamento della gara in 2 fasi: A) procedura ristretta basata sulla proposta del promotore, eventualmente modificata dall'Amministrazione, per la scelta delle imprese che concorreranno con il promotore nella fase successiva; B) aggiudicazione della concessione a procedura negoziata tra il promotore e le due migliori offerte della fase A);

4) diritto del promotore di adeguare la propria offerta a quella meglio classificata, risultando di conseguenza aggiudicatario.

6. Pensate che un'iniziativa legislativa comunitaria mirante a regolamentare la procedura di aggiudicazione di concessioni sia auspicabile?

La concessione è fenomeno specifico che vede, tra l'altro, l'apporto di capitali di rischio da parte del concessionario privato: sarebbe quindi assolutamente negativo e controproducente regolamentare la procedura della concessione, sul modello dell'appalto. Non a caso in Italia, dove la disciplina della concessione era perfettamente equiparata a quella dell'appalto, la finanza di progetto è rimasta bloccata fino a quando non è stato introdotto l'istituto del promotore, che, quale concessionario ad iniziativa privata, consente, pur con notevoli pesantezza procedurali, di by-passare l'inerzia dell'Amministrazione pubblica.

Tuttavia, un'iniziativa legislativa, almeno relativa alla concessione di lavori pubblici, sarebbe auspicabile, per chiarire taluni aspetti rilevanti. Infatti, la

Comunicazione interpretativa del 2000 ha creato non pochi problemi laddove afferma che il concessionario-amministrazione aggiudicatrice debba essere scelto previa pubblicità. L'allineamento di questa concessione a quella a favore dei privati pone, a proposito degli appalti "a valle", l'interrogativo se il concessionario-amministrazione aggiudicatrice, prescelto attraverso un confronto concorrenziale, implicito nell'obbligo di pubblicità, debba avvalersi di imprese terze soltanto per la quota che è tenuto ad affidare all'esterno o per tutto il 100% dei lavori.

Un altro punto oscuro della Comunicazione interpretativa riguarda la scelta del concessionario nei settori speciali.

In linea generale, va ricordato che il concessionario ha necessità di poter contare su procedure certe per essere sicuro dei tempi preventivati. Sarebbe opportuno stabilire un meccanismo di indennizzo per tutte le amministrazioni coinvolte nell'operazione, anche a titolo di pareri, di nullaosta. Così come sarebbe utile ed incentivante, se fossero previsti indennizzi automatici e immediati nel caso di ripensamenti da parte del concedente. In sostanza, si pensa ad un sistema di controgaranzie reciproche.

7. In maniera più generale, se ritenete che sia necessario che la Commissione proponga una nuova azione legislativa, esistono a vostro parere ragioni oggettive per regolamentare tramite un tale atto tutti i PPP di tipo contrattuale, siano essi qualificabili come appalti pubblici o come concessioni, per sottoporle a identici regimi di aggiudicazione?

Con riferimento ai PPP di tipo contrattuale, si ribadisce quanto più sopra evidenziato: se si tratta, come affermato nel quesito, di appalti pubblici, le procedure sono previste in dettaglio e sono state recentemente ridefinite anche con riferimento specifico agli appalti complessi. Se, invece, si tratta di concessioni, vale quanto affermato al punto precedente. Il fatto che si tratti di PPP contrattuali – cioè secondo il Libro Verde appalti e concessioni – non è ragione di per sé sufficiente per creare una specifica regolamentazione, che per di più vedrebbe la sottoposizione di appalti e concessioni ad "identici regimi d'aggiudicazione".

8. In base alla vostra esperienza, l'accesso degli operatori non nazionali alle formule di PPP di iniziativa privata è garantito? In particolare, nei casi in cui le amministrazioni aggiudicatrici invitano a presentare un'iniziativa, tale invito è generalmente oggetto di pubblicità adeguata ad assicurare l'informazione di tutti gli operatori interessati? Viene organizzata una procedura di selezione realmente concorrenziale per garantire l'attuazione del progetto stesso?

Non vi è dubbio che l'accesso degli operatori non nazionali è sostanzialmente garantita dalla pubblicità, che è assicurata in Italia da un sistema normativo articolato a livello centrale e periferico e che è fin troppo pesante e dettagliato.

9. Quale sarebbe secondo voi la migliore formula per assicurare lo sviluppo di PPP di iniziativa privata nell'Unione europea pur garantendo il rispetto dei principi di trasparenza, di non discriminazione e di parità di trattamento?

Il migliore sistema è quello di lasciare l'iniziativa ai privati. Come già accennato, il balzo in avanti della finanza di progetto in Italia ha coinciso con il promotore. La ragione di ciò è che le pubbliche amministrazioni sono, anche culturalmente, legate all'appalto ed hanno, in generale, poca dimestichezza con un'operazione complessa come il PPP.

10. Che esperienza avete riguardo alla fase successiva alla selezione del partner privato nelle operazioni di PPP contrattuali?

Se la domanda si riferisce alla fase successiva alla selezione ed anteriore al contratto, l'esperienza indica un'attività rallentata a causa della presenza di molte amministrazioni che debbono rilasciare permessi, autorizzazioni, nullaosta ecc.

11. Siete a conoscenza di casi nei quali le condizioni di esecuzione – comprese le clausole d'aggiornamento – hanno potuto avere un'incidenza discriminatoria o hanno potuto costituire un ostacolo ingiustificato alla libera prestazione di servizi o alla libertà di stabilimento? Se sì, potete descrivere l tipo di problemi incontrati?

Non siamo a conoscenza di condizioni d'esecuzione con effetto discriminatorio. In tutti i contratti, ed ancor più che in quelli di lunga durata, le clausole di aggiornamento sono fondamentali, altrimenti queste iniziative risultano disincentivate. Ovviamente, è necessario che si tratti di clausole chiare e che non siano rimesse alla discrezione del concedente, ma basate su criteri oggettivi e predefiniti, tenendo a riferimento il principio generale dell'equilibrio economico-finanziario del contratto.

12. Siete al corrente di pratiche o di meccanismi di valutazione di offerte con conseguenze discriminatorie?

No, non siamo a conoscenza di pratiche o di meccanismi di valutazione delle offerte aventi effetti discriminatori, tanto più che nel nostro ordinamento i meccanismi di valutazione delle offerte sono normati ed è quindi difficile che si producano discriminazioni. Ciò non esclude, tuttavia che nella pratica vi possano essere delle anomalie.

13. Condividete la constatazione della Commissione secondo la quale alcune operazioni del tipo "step-in" possono porre problemi in termini di trasparenza e di parità di trattamento? Conoscete altre "clausole tipo" la cui attuazione potrebbe causare problemi simili?

Le clausole di adeguamento/aggiornamento sia dei prezzi che delle altre condizioni contrattuali, tanto in forma automatica che consensuale, sono, come già rilevato, fondamentali nei contratti di lunga durata, per i quali i concorrenti non possono scontare in sede di offerta eventi che dipendono da circostanze risalenti agli assetti economici generali.

14. Ritenete che sia necessario chiarire a livello comunitario alcuni aspetti attinenti al quadro contrattuale dei PPP? Se sì, su quale(i) aspetto(i) dovrebbe incentrarsi tale chiarificazione?

Più che agli aspetti contrattuali, sarebbero necessario chiarimenti sulle Direttive ed in particolare specificare: 1) se la scelta del concessionario-amministrazione aggiudicatrice esige la previa pubblicità con un bando; 2) se è concepibile, in questo caso, un confronto concorrenziale tra soggetti diversi, sia per quanto riguarda i requisiti sia per ciò che concerne la capacità di finanziamento; 3) se il concessionario-amministrazione aggiudicatrice possa eseguire in proprio la quota dei lavori che non è tenuto ad affidare a terzi; 4) se in tale ultimo caso, il concessionario-amministrazione aggiudicatrice possa avvalersi di imprese collegate; 5) se l’amministrazione possa affidare a società interamente da essa posseduta la funzione di concedente; 6) se l’amministrazione possa affidare a società interamente da essa posseduta la funzione di concessionaria; 7) se le azioni di questa società sono liberamente negoziabili oppure c’è bisogno di una gara per poterle vendere ai privati; 8) se il socio privato possa eseguire con la propria organizzazione i lavori che non devono essere affidati a terzi; 9) se l’impresa collegata di un concessionario privato, incaricata di eseguire la quota non riservata a terzi, possa a sua volta subappaltare i lavori; 10) se i concessionari dei settori esclusi sono scelti secondo la procedura di cui alla Direttiva lavori, vuol dire che essi non sono tenuti ad appaltare a terzi tutti i lavori ricompresi nella concessione, ma possono eseguire direttamente una quota del totale; 11) se la Direttiva sulle transazioni commerciali si applichi ai Lavori Pubblici.

15. Nel contesto delle operazioni di PPP, siete al corrente di problemi particolari incontrati in materia di subappalto? Quali?

Non risultano problemi particolari in materia di contratti derivati, riferentesi cioè agli affidamenti a terzi da parte del concessionario privato, che è fenomeno di natura prettamente contrattuale e come tale deve restare a carattere privatistico.

16. Il fenomeno dei PPP di tipo contrattuale, che implica il trasferimento di un insieme di compiti ad un unico partner privato, giustifica secondo voi l'introduzione, riguardo al fenomeno dei subappalti, di norme più dettagliate e dal campo d'applicazione più vasto?

L'introduzione di ulteriori norme disciplinanti i contratti derivati è da considerare negativamente, in quanto imporrebbe vincoli non necessari, che rischiano di disincentivare il concessionario chiamato spesso ad un investimento importante e che, per ciò stesso, deve essere gravato solo di vincoli assolutamente indispensabili.

17. In maniera più generale, ritenete che si dovrebbe prendere un'iniziativa complementare a livello comunitario al fine di chiarire, o sistemare, le norme relative ai subappalti?

No, nell'ambito delle concessioni occorre preservare ai rapporti derivati il livello propriamente contrattuale e la natura di rapporti privatistici, salvo gli obblighi di pubblicità imposti dalle norme vigenti.

18. Quale esperienza avete del lancio di operazioni PPP di tipo istituzionalizzato? In particolare, la vostra esperienza vi porta a pensare che il diritto comunitario degli appalti pubblici e delle concessioni sia rispettato nel caso di operazioni PPP istituzionalizzate? Se no, perché?

In Italia sono frequenti le "operazioni di PPP di tipo istituzionalizzato" ed il diritto nazionale ha creato una disciplina abbastanza organica della materia che fa ritenere, in generale, che il nostro paese sia tra quelli in ambito UE che rispettano ampiamente in questi interventi i principi del diritto comunitario in tema di appalti pubblici e di concessioni.

19. Ritenete che debba essere presa un'iniziativa a livello comunitario per chiarire o precisare gli obblighi degli organismi aggiudicatori riguardo alle condizioni che devono regolamentare la concorrenza tra operatori potenzialmente interessati da un progetto di tipo istituzionalizzato? Se sì, su quali punti particolari e sotto quale forma? Se no, perché?

Mentre il nostro ordinamento già prevede l'obbligo di scelta con procedura concorsuale del socio privato nonché di messa in gara dell'attribuzione di appalti allo stesso, non vi sono disposizioni specifiche nel diritto comunitario sulla materia e pure la Comunicazione interpretativa del 2000, nella sua versione finale, ha stralciato ogni riferimento alle società miste. E' quindi evidente che tale vuoto normativo non agevola la corretta costituzione di PPP istituzionalizzati, anche perché il puro richiamo ai Trattati si palesa, nella pratica, troppo debole. Da qui, la necessità di un intervento sia interpretativo – a breve termine – che legislativo – a medio termine –, per sopperire ad una carenza di disciplina comunitaria che agevola l'affermarsi di situazioni distorsive della corretta concorrenza. Così, ad esempio, andrebbe specificato in quali condizioni sia ammessa la costituzione di società pubbliche o miste per costituire un intervento coerente con la concorrenza: il presupposto dovrebbe essere la carenza di presenza e di capacità di imprese private in quel settore o in quell'area territoriale specifica.

Inoltre, alle società pubbliche o miste titolari di concessioni attribuite senza gara, ovvero con scelta del partner privato senza gara pubblica, dovrebbe essere impedito di ampliare l'oggetto statutario della propria attività a nuovi campi ovvero partecipare a gare in concorrenza con imprese private sia all'interno sia al di fuori del proprio ambito territoriale di origine.

Più in generale, dovrebbero essere disciplinati tutti quei molteplici aspetti che violano la parità di trattamento e ne rendono discriminatoria, per effetto dei vantaggi di cui godono società pubbliche o miste, la presenza nel mercato a scapito delle imprese private o che si traducono in distorsioni del mercato stesso, con conseguenti ostacoli evidenti all’apertura del Mercato Unico.

In maniera generale, ed indipendentemente dai problemi sollevati in questo documento:
20. Quali sono le misure o le pratiche che ritenete di ostacolo alla creazione di PPP nell’Unione europea?
21. Conoscete altre forme di PPP sviluppate nei paesi al di fuori dell’Unione? Conoscete esempi di ‘buone pratiche’ sviluppate in questo contesto, cui l’Unione potrebbe ispirarsi? Se sì, quali?
22. In termini più generali, e tenuto conto dei considerevoli investimenti necessari in alcuni Stati membri, al fine di realizzare uno sviluppo economico-sociale durevole, pensate che sia utile una riflessione collettiva su tali questioni che prosegua ad intervalli regolari tra gli attori interessati e che permetta uno scambio di ‘buone pratiche’? Ritenete che la Commissione dovrebbe dare impulso ad una tale rete?

Quanto al quesito 20, si rimanda alle note del precedente punto 19.

Quanto al quesito 21, si ritiene che la legislazione italiana sul promotore e sulle società miste rappresenti un esempio, cui la disciplina comunitaria potrebbe ispirarsi per il PPP contrattuale di iniziativa privata e di quello istituzionalizzato.

Infine, quanto al quesito 22, si ritiene certamente utile una riflessione collettiva sul PPP che contribuisca a chiarire i molteplici interrogativi sollevati dall’IGI e consenta, su impulso della Commissione, uno scambio di “buone pratiche”.

Commenti e Risposte Al Libro Verde Della Commissione UE Sui PPP e Sul Diritto Comunitario Degli Appalti e Delle Concessioni

L' l'Istituto Studi Sviluppo Aziende Non Profit (ISSAN) è un'Associazione non riconosciuta, di studi e di ricerca sulle organizzazioni *non profit* e di formazione per gli operatori di queste organizzazioni, con sede presso l'Università di Trento.

É composto da circa 40 soci pubblici e privati, tra cui varie Università (*Innsbruck, Bologna, Cergas-Bocconi Milano, Udine*), organizzazioni di categoria (*Federsolidarietà, Con.Solida, Consorzio Nazionale della Cooperazione Sociale "Gino Mattarelli", Federazione Trentina delle Cooperative, FIBA CISL)* e enti pubblici locali (*Comune di Trento e di Rovereto, Provincia di Trento e Regione Trentino Alto Adige*). Dal 1994 svolge numerose ricerche, pubblica diversi volumi e working papers ed organizza convegni e seminari a carattere nazionale ed internazionale approfondendo aspetti rilevanti relativamente al settore *nonprofit*, (per es. tra le ricerche condotte dall'Istituto vi è l'analisi di modelli per la formazione continua per le imprese sociali, monitoraggio diffusione ed incremento dell'imprenditoria sociale; L'inserimento lavorativo dei soggetti con problematiche psichiatriche: buone pratiche dei servizi offerti dall'impresa sociale).

In quest'ambito negli ultimi due anni, l'Istituto si è impegnato nella realizzazione di una ricerca sulla esternalizzazione dei servizi alla persona e sui rapporti pubblico-privato nella gestione ed erogazione di tali servizi.

Con questo documento ISSAN si propone di rispondere ai quesiti posti nel Libro Verde sulle operazioni Partenariato Pubblico-Privato (di seguito Libro Verde) con cui la Commissione ha avviato una consultazione in merito all'applicazione del diritto comunitario degli appalti e delle concessioni al fenomeno dei PPP. I quesiti posti nel libro verde saranno trattati nell'ottica delle problematiche relative ai servizi sociali ed in particolare ai servizi alla persona, quindi, di quelle attività che ai sensi libro Bianco sui servizi d'interesse generale sono "*basati sul principio di solidarietà, si concentrano sulla persona e garantiscono che i cittadini possano beneficiare in maniera concreta dei propri diritti fondamentali e contare su un livello elevato di protezione sociale*"[1].

[1] Libro Bianco sui servizi d'interesse generale, Bruxelles, 12.5.2004, COM (2004) 374, def., p.to 4.4.

Domanda 1

Quali tipi di operazioni di PPP puramente contrattuali conoscete? Tali operazioni sono oggetto di una regolamentazione specifica (legislativa o di altro tipo) nel vostro paese?

Come è stato specificato in apertura del documento, tutte le riflessioni di seguito proposte saranno riferite ai servizi alla persona, caratterizzati da una forte differenziazione dei bisogni, la cui domanda negli ultimi anni ha visto una crescita rilevante, creando notevoli tensioni nell'offerta degli stessi e un aumento dei costi rispetto alle risorse disponibili. Tutto ciò ha determinato l'esigenza da parte degli enti locali di ricorrere a procedure di esternalizzazione di tali servizi mediante il coinvolgimento del settore privato, ed in particolare del settore *non profit*.

Con riferimento a quest'ultimo aspetto, nell'ordinamento italiano è stata approvata nel 2000 la legge quadro n. 328[2], con l'obiettivo esplicito di creare un sistema integrato di interventi e di servizi sociali.

Uno degli aspetti caratterizzanti la legge è la previsione di un **attivo** coinvolgimento delle organizzazioni del Terzo settore[3], non solo nell'erogazione dei servizi, ma anche nella progettazione e realizzazione concreta degli interventi e dei servizi, in forza della legittimazione loro conferita dalla capacità di cogliere i bisogni sociali e le problematiche che emergono in un determinato territorio e darvi risposte adeguate.

Le modalità di rapporto pubblico-privato previste dalla legge in questo settore, sono l'istituto dell'autorizzazione e dell'accreditamento, che nel nostro ordinamento erano già previste per i servizi sanitari.

Nel *sistema di accreditamento*, il partner privato partecipa alle varie fasi della progettazione e realizzazione (talvolta anche del finanziamento, sia pur in minima parte) mentre l'ente pubblico si concentra principalmente sulla definizione degli obiettivi, della qualità dei servizi offerti e della politica dei prezzi, facendosi garante del monitoraggio/controllo dei soggetti erogatori del servizio.

Per effetto di questo sistema **la fase della selezione del soggetto privato** si concreta nell'accertamento, in capo allo stesso, del possesso di determinati requisiti, quali ad es. le capacità logistiche (ambienti, strutture e attrezzature), le competenze professionali, le interrelazioni (maturate con il sistema istituzionale e sociale locale), che lo "accreditano" presso l'ente pubblico come soggetto idoneo a garantire adeguati standard di servizio.

Nella fase successiva il soggetto accreditato dialoga con l'ente pubblico predisponendo un progetto/proposta di intervento ([4]) e giunge alla stipula di un contratto per lo svolgimento del servizio sulla base degli elementi concordati.

Tale procedura costituisce ormai una prassi consolidata ([5]) e, in alcuni casi, è stata anche formalizzata dal legislatore nazionale ([6]), ad esempio:

- nel settore della formazione (vedi esempio della provincia BZ)([7])

[2] Legge 8 novembre 2000, n. 328, "LEGGE QUADRO PER LA REALIZZAZIONE DEL SISTEMA INTEGRATO DI INTERVENTI E SERVIZI SOCIALI", pubblicata su G.U. n. 265 del 13 novembre 2000 – S.O. n. 186.

[3] Con questo termine ai sensi della legge italiana si intende fare riferimento alle seguenti tipologie organizzative: organismi non lucrativi di utilità sociale, organizzazioni di volontariato, associazioni ed enti di promozione sociale, organismi della cooperazione, cooperative sociali, fondazioni, enti di patronato.

[4] Spesso, tuttavia, l'elemento progettuale non è presente ed anzi, talvolta, non è neppure richiesto e/o previsto.

[5] A questo riguardo non va disconosciuto il ruolo rivestito dalla Comunità europea che proprio nella gestione dei finanziamenti del Fondo Sociale Europeo ha imposto il modello dell'accreditamento. Il risultato di queste spinte comunitarie è stato quello di obbligare i soggetti erogatori ad essere accreditati dal giugno 2003.

[6] Ad esempio secondo il modello di accreditamento previsto dal legislatore italiano per i soggetti che intendono realizzare attività formative, settore disciplinato con Decreto Ministeriale 166/2001.

➢ nel settore dei servizi socio assistenziali (vedi esempio della Regione Veneto ([8]) e Lombardia ([9])

Quali vantaggi comporta questo modello di PPP?

L'analisi di alcune esperienze in corso a livello nazionale permette di rilevare che **il modello dell'*accreditamento* realizza un forte PPP,** che risponde alla necessità di assicurare vuoi maggiori finanziamenti, vuoi soprattutto *know-how*, metodi ed esperienze di cui il privato è portatore.

Attraverso la definizione dei criteri per l'*accreditamento*, inoltre, l'ente pubblico dispone di uno strumento estremamente flessibile in grado di adattarsi alle esigenze del territorio ([10]). Non va

[7] A partire dal 1999, il Servizio del Fondo Sociale Europeo della Provincia autonoma di Bolzano ha cominciato ad elaborare un modello di accreditamento dei fornitori di servizi formativi. É interessante rilevare che il modello sviluppato, da un lato, si pone in linea con le direttive impartite a livello nazionale (DM 166/2001) e, dall'altro lato, risponde appieno alle specificità del mercato d'offerta altoatesino e riesce dunque a soddisfare le esigenze del territorio e della realtà locale.In tal senso, fra i criteri previsti dalla Giunta regionale per l'accreditamento si segnala: la disponibilità di una sede stabile dislocata sul territorio provinciale, nonché la possibilità riconosciuta anche agli enti di formazione ed in particolare alle università che non hanno una sede stabile in provincia, di presentare progetti in partnership con altri purché chi presenta il progetto sia accreditato e garantisca la qualità dell'intervento formativo.

[8] Ci si riferisce, in particolare, alla legge della Regione Veneto del 16 agosto 2002, n. 22 recante la disciplina sull'*Autorizzazione e accreditamento delle strutture sanitarie, socio-sanitarie e sociali*, laddove l'autorizzazione rappresenta la soglia rigorosa di garanzia al di sotto della quale non è consentito esercitare attività socio-sanitarie e, l'accreditamento, costituisce invece "*un livello superiore di impegno richiesto affinché il cittadino possa considerare il soggetto erogatore, oltre che di buon livello qualitativo, anche allineato con le scelte della programmazione regionale*".

Invero, il sistema dell'accreditamento e dell'autorizzazione, come prefigurato dal legislatore, non è stato, ad oggi, ancora attuato. Più in generale va osservato che gli orientamenti della legge riflettono una profonda evoluzione della politica e degli strumenti operativi previsti a livello regionale e, più in generale, a livello nazionale per la gestione di determinati servizi.

Alla base di quest'evoluzione possiamo trovare:

- la progressiva attuazione del federalismo regionale, ad opera della legge cost. 18 ottobre 2001;
- la revisione del sistema di programmazione, secondo il modello previsto ad es. dalla legge 8 novembre 2000, n. 328 recante "*Legge quadro per la realizzazione del sistema integrato di interventi e servizi sociali*";
- l'equiparazione dei soggetti pubblici e privati nell'erogazione dei servizi (nel caso dei servizi sanitari e socio-sanitari prevista a livello nazionale dal d.lgs. 229/99), per cui appare definitivamente abbandonata la prospettiva dell'intervento del privato soltanto con funzione sussidiaria rispetto al pubblico.

Il sistema dell'accreditamento richiede, comunque, un'attenta valutazione dei requisiti in capo alle strutture erogatrici, a salvaguardia dell'interesse dei cittadini utenti e della qualità dei servizi.

[9] Ci si riferisce in particolare alla l.r. 11 luglio 1997 n.31 recante le *Norme per il riordino del servizio sanitario regionale e la sua integrazione con le attività dei servizi sociali* laddove è stabilito (art. 4) che l'erogazione delle prestazioni specialistiche avviene attraverso rapporti fondati sull'accreditamento, in modo da definire un livello di sicurezza e tutela del cittadino.

Come per la Regione Veneto si può ritenere che gli standard di accreditamento costituiscano un secondo livello di impegno, richiesto alle strutture sanitarie, affinché il cittadino possa considerare il soggetto erogatore coerente con le scelte ed i vincoli regionali, mentre il primo livello è rappresentato dall'autorizzazione all'esercizio rilasciata dalla Regione o dalla ASL

La stessa l.r. 31/97, che ha previsto il processo dell'accreditamento delle strutture socio sanitarie, pubbliche e private, ha sancito anche l'introduzione nelle stesse di sistemi di verifica e controllo della qualità delle prestazioni e dell'efficienza delle risorse finanziarie. In particolare si è stabilito che le aziende sanitarie devono assicurare lo svolgimento di tutte le attività necessarie per la produzione, l'erogazione ed il controllo di prestazioni e di servizi secondo le norme ISO 9000.

[10] Con riferimento al modello nazionale per l'accreditamento delle sedi formative si rileva che il modello appare costruito e pensato per favorire un innalzamento dei livelli della qualità dei servizi formativi ed orientativi e per consentire la creazione di sistemi regionali con una base comune di confronto e dialogo.

dimenticato, infatti, che nell'organizzare la gestione dei servizi l'ente pubblico non può prescindere dallo *scenario di riferimento* e, in particolare, dal contesto territoriale rappresentato di volta in volta dalla conformazione del territorio, dal numero di abitanti, dal modello di sviluppo locale ecc.([11]).

Infine, va evidenziato che il modello dell'accreditamento se integrato dalla previsione dell'elemento progettuale, laddove il finanziamento pubblico è rilasciato al soggetto accreditato previa presentazione di un programma/progetto conforme alle linee guida predefinite, risulta doppiamente vantaggioso: sia perchè favorisce la crescita di una cultura della progettazione, sia perché facilita l'ente pubblico nella programmazione a lungo termine degli obiettivi da perseguire.

I progetti presentati, infatti, dovranno porsi in linea con gli obiettivi e le priorità di carattere generale previsti dall'ente pubblico.

Quali svantaggi comporta questo modello di PPP?

Il sistema dell'accreditamento pur non ponendosi in contrasto con i principi generali del Trattato CE, *in primis* gli articoli 43 e 49, rischia di creare situazioni provvisorie di oligopolio.

Ciò si verifica, ad esempio, quando per l'accreditamento è previsto un bacino di utenza minimo da parte del soggetto accreditando; ne discende allora che non vi potranno essere più di un certo numero di soggetti accreditati. Tale circostanza non sembra contrastare con la disciplina comunitaria della concorrenza, posto che *a priori* non si pongono limitazioni all'accreditamento di soggetti provenienti dagli altri Stati membri.

Sotto il profilo funzionale va osservato che in alcuni settori questa situazione (oligopolio) si presenta addirittura vantaggiosa se non necessaria per una migliore erogazione dell'attività.

Valga per tutti il caso dei servizi di assistenza a persone con problemi mentali e/o portatrici di handicap: i progetti assistenziali si basano, infatti, su "terapie" di 3-5 anni (almeno), per cui risulterebbe devastante interrompere un progetto in corso di terapia per riattivarne un altro con altri prestatori, laddove è evidente che ogni prestatore utilizza proprie metodologie e technicalities.

Analoghe argomentazioni possono essere riproposte anche per i settori degli asili nido e in molti altri comparti.

Va altresì osservato che l'affermarsi di situazioni di provvisorio oligopolio richiedono un'attenta gestione sul piano economico, al fine di evitare che i soggetti erogatori si allineino in una fase di acquiescenza dello *status quo*.

É corretto ritenere, infatti, che anche l'esercizio di attività per la soddisfazione di bisogni di interesse generale con una forte connotazione sociale e culturale non sia necessariamente svincolato dall'applicazione di metodi gestionali finalizzati alla logica, se non del profitto, quanto meno della miglior performance economica. Lo impongono, oggi più, che mai esigenze di contenimento della spesa pubblica.

Da un punto di vista operativo ciò si traduce nella necessità da parte dell'ente pubblico di predisporre un corretto sistema di monitoraggio e controllo (*ex ante*, *in itinere*, *ex post*) sull'attività.

Proprio per soddisfare queste due esigenze, il modello, da una parte giunge a definire un set di requisiti discriminanti per poter realizzare una selezione qualitativa dei soggetti che richiedono l'accreditamento e, dall'altro, individua un set minimo di indici di valori e condizioni minime, rispetto alle quali le autorità pubbliche competenti (Regioni e Province) possono operare integrazioni ed ampliamenti.

[11] Tale orientamento si pone in linea con le osservazioni proposte nel Libro Verde dei *Servizi di interesse generale* dal COMITATO ECONOMICO E SOCIALE, laddove si esplicita che "*gli Stati membri devono essere autorizzati e incoraggiati ad adottare speciali provvedimenti di deroga, anche di tipo fiscale, volti a creare condizioni giuridiche o economiche di discriminazione positiva che consentano di mantenere in vita tali servizi nelle zone difficilmente accessibili*".

Passando ora alle procedure diverse dall'accreditamento, nel 2001, in attuazione della legge 328/2000, è stato emanato un atto[12] di indirizzo e di coordinamento sui sistemi di affidamento dei servizi alla persona che prevede, tra le modalità di rapporto pubblico-privato, (enti locali e terzo settore), il ricorso alle procedure ristrette e negoziate **dell'appalto concorso** e **della trattativa privata.**

Entrambi gli strumenti rientrano nella tipologia delle operazioni PPP di tipo contrattuale, ed in particolare:

- l'appalto concorso (è previsto in generale dall'art. 91 del R.D. n. 827/1924; in maniera più completa, relativamente al settore dei lavori pubblici, dall'art. 21 della L. 11 febbraio 1994, n. 109, come modificata dall'art. 7 del D.L. n. 101/1995 convertito in Legge n. 216/1995): prevede che l'aggiudicazione avvenga sulla base del criterio *dell'offerta economicamente più vantaggiosa* e ciò è possibile facendo riferimento ad **indicatori organizzativi** (es. contenimento del turn-over, qualificazione organizzativa del lavoro); ed **indicatori di processo** (es. conoscenza dei problemi sociali del territorio e delle risorse sociali della comunità). In questa procedura i potenziali affidatari compilano, almeno in parte il progetto di servizio, indicando le condizioni ed i prezzi a cui sono disposti ad eseguire la prestazione. Infatti nel bando di gara vengono indicati solo gli elementi essenziali della prestazione, spetta ai concorrenti progettarla in modo da raggiungere il miglior risultato utilizzando le risorse disponibili.
- la trattativa privata, ovvero procedura negoziata, si ha quando le amministrazioni consultano le imprese di loro scelta e negoziano i termini del contratto con una o più di esse. Essa è attuata in genere tramite **convenzione** intesa, in questo ambito, come contratto tra ente locale (comune) ed enti non *profit.* Con tale strumento il soggetto pubblico riconosce all'affidatario del servizio, i requisiti necessari per perseguire gli obiettivi d'interesse pubblico; stabilisce di mettere a disposizione proprie risorse finanziarie o strumentali al fine del raggiungimento di tali obiettivi; sancisce il proprio diritto a controllare e verificare l'operato del soggetto privato nell'ambito e nei termini della convenzione stessa.

Si possono citare anche altri esempi di operazioni di PPP puramente contrattuali.

Ci si riferisce, in primo luogo, ai casi di *sperimentazione gestionale* previsti nel settore socio – sanitario (d all'art. 4 l. 30 dicembre 1991 n. 421 e dell'art. 9bis del d.lgs. 30 dicembre 1992 n. 502). Più precisamente le norme in questione stabiliscono la possibilità di adottare *programmi di sperimentazione*, autorizzati dalle Regioni e dalle Province autonome di Trento e Bolzano "*aventi ad oggetto nuovi modelli gestionali che prevedono forme di collaborazione tra strutture del Servizio Sanitario nazionale e soggetti privati*".

Tali programmi, secondo la previsione normativa, devono essere motivati da **ragioni di convenienza economica,** di **miglioramento della qualità dell'assistenza e di coerenza con le previsioni della programmazione territoriale**; devono inoltre **privilegiare, nell'area del settore privato, il coinvolgimento con le organizzazioni non lucrative di utilità sociale.**

Ci si riferisce, in secondo luogo, al settore della programmazione e del coordinamento dello spettacolo dal vivo nella provincia di Trento.

Lo strumento adottato è quello di un *Protocollo di intesa* fra Amministrazione e i principali interlocutori sul territorio (associazioni e società cooperative) nel quale sono fissati alcuni importanti presupposti per la definizione di quello che vuol essere "*uno stretto e continuativo rapporto di confronto e di partenariato*". Gli obiettivi del PPP mirano a:

- elevare la qualità artistica della proposta culturale per qualificare i consumi culturali;

[12] DECRETO DEL PRESIDENTE DEL CONSIGLIO DEI MINISTRI, 30-03-2001, Atto di indirizzo e coordinamento sui sistemi di affidamento dei servizi alla persona ai sensi dell'art. 5 della l. 328/2000 (GU n. 188 del 14.08.2001).

- attuare l'attività di programmazione, coordinamento delle attività al fine di rendere coerente la proposta culturale nel suo complesso;
- sviluppare le collaborazioni con i vari soggetti sia per quanto riguarda la produzione, sia per quanto riguarda le attività collaterali;
- favorire i processi di innovazione sia sotto il profilo dell'ideazione delle iniziative sia sotto l'aspetto degli assetti organizzativi;
- elaborare un'attività di valutazione dei progetti e delle iniziative al fine di definire indicatori coerenti con l'attività di valutazione stessa in rapporto con le esigenze del pubblico e la ricaduta economico sociale sul territorio;
- incrementare la stabilità e la solidità dei soggetti, sotto il profilo organizzativo, finanziario e patrimoniale, ecc…

Infine va rilevato che attraverso l'istituzione di PPP 'intelligenti' la Pubblica Amministrazione può orientare l'operato dei privati a perseguire obiettivi ad. es. di sviluppo economico e sociale.
In tal senso si riportano alcuni esempi che riguardano protocolli di intesa stipulato tra la Provincia autonoma di Trento (sia direttamente mediante articolazioni interne – es. Servizi e Dipartimenti – e i propri enti funzionali/Agenzie – es. Agenzia Provinciale per l'Ambiente, Comprensori, ecc… -) e la Federazione Trentina delle Cooperative, aventi ad oggetto :
- per la promozione nelle scuole dei principi, dei valori e delle caratteristiche dell'agire sociale ed economico della cooperazione trentina ([13]);
- per la partecipazione istituzionale e la collaborazione nel campo dell'educazione sanitaria alimentare;
- per favorire lo sviluppo di iniziative comuni in materia di risparmio energetico e di incentivazione all'utilizzo di fonti alternative di energia;
- per la promozione e diffusione di sistemi di gestione ambientale, l'utilizzo e la produzione di merci e servizi ecocompatibili, l'applicazione di una Agenda 21 Locale e la sperimentazione nell'ambito di valle di buone pratiche di ecogestione.

In conclusione, l'importanza dei PPP nell'ambito dei processi virtuosi di sviluppo socio economico è circostanza che si sta vieppiù affermando.
Sempre più spesso nelle premesse agli accordi di PPP gli stessi partner rafforzano questa convinzione riconoscendo espressamente che "*la stipulazione di accordi che vedano come protagonisti da una parte i soggetti istituzionali e gli enti pubblici e dall'altra il variegato mondo delle imprese private e delle associazioni sia con finalità lucrative che sociali e solidaristiche, al fine di perseguire obiettivi condivisi che rientrano all'interno delle strategie di interesse pubblico, è ormai considerato un approccio efficace e centrale per la cosiddetta programmazione negoziata di sviluppo di un territorio*" ([14]).
Con riferimento al settore dei servizi alla persona e al settore delle attività culturali il PPP si rivela formula vantaggiosa sotto molteplici punti di vista.
Innanzitutto, consente all'ente pubblico di coinvolgere in maniera crescente la società civile nello svolgimento di azioni di interesse generale, *in un'ottica di sussidiarietà orizzontale.*

[13] In questo caso la Federazione Trentina delle Cooperative in *partnership* con la Sovrintendenza Scolastica, l'Agenzia provinciale per l'Istruzione e l'Assessorato regionale per la Cooperazione si è impegnata tramite i propri associati a sviluppare modalità didattico educative rivolte alle scuole sui temi dello sviluppo sostenibile con particolare riguardo al rapporto tra consumi, alimentazione, comunicazione, ambiente e mondialità.

[14] Tratto dalla premessa all'Accordo volontario rivolto a favorire lo sviluppo di iniziative comuni in materia di risparmio energetico e di incentivazione all'utilizzo di fonti alternative di energia, stipulato tra la Provincia Autonoma di Trento e la Federazione Trentina delle Cooperative.

In secondo luogo tale formula attribuisce una posizione di primo piano alle associazioni del territorio nel perseguimento (condiviso) di obiettivi generali di coesione sociale e sviluppo economico, contribuendo a colmare il divario tra istituzioni e società civile.

Infine, permette di organizzare la gestione dei servizi con modalità che meglio rispondono (rispetto allo strumento degli appalti) alle esigenze dei singoli settori.

Domanda 2

Secondo la Commissione, il recepimento nel diritto nazionale della procedura di dialogo competitivo permetterà alle parti interessate di disporre di una procedura particolarmente adeguata all'aggiudicazione dei contratti qualificati come appalti pubblici in occasione dell'attuazione di un PPP di tipo puramente contrattuale, pur preservando i diritti fondamentali degli operatori economici. Condividete questo punto di vista? Se no, perché?

La procedura del *dialogo competitivo* ([15]) formalizza la facoltà per le amministrazioni aggiudicatici di attivare, previa idonea selezione (mediante pubblica evidenza), un dialogo con alcuni soggetti potenziali fornitori di beni/servizi ecc… finalizzato all'individuazione della/e soluzione/i più soddisfacente sulla quale le parti saranno, infine, chiamate a presentare le proprie offerte.

Questa modalità è stata formalizzata per la prima volta dall'art. 29 della Direttiva 2004/18/CE del 31 marzo 2004, relativa al *coordinamento delle procedure di aggiudicazione degli appalti pubblici di lavori, di forniture e di servizi*, con riferimento specifico al caso di appalti particolarmente complessi, laddove le amministrazioni si trovino nell'impossibilità oggettiva, non per carenze loro imputabili, "*di definire i mezzi atti a soddisfare le loro esigenze o di valutare ciò che il mercato può offrire in termini di soluzioni tecniche e/o di soluzioni giuridico/finanziarie*" ([16]). Di conseguenza, nella misura in cui il

[15] Questa modalità procedurale è oggi prevista dall'art. 29 della Direttiva 2004/18/CE del 31 marzo 2004, nel caso di appalti particolarmente complessi. Gli Stati membri, infatti, possono prevedere che l'amministrazione aggiudicatrice, qualora ritenga che il ricorso alla procedura aperta o ristretta non permetta l'aggiudicazione dell'appalto, possa avvalersi del dialogo competitivo conformemente al presente articolo, nel quale l'unico criterio per l'aggiudicazione dell'appalto pubblico è quello dell'offerta economicamente più vantaggiosa.

La procedura è cosi strutturata: le amministrazioni aggiudicatrici pubblicano un bando di gara in cui rendono noti le loro necessità e le loro esigenze, che definiscono nel bando stesso e/o in un documento descrittivo e successivamente avviano con i candidati selezionati un dialogo finalizzato all'individuazione e alla definizione dei mezzi più idonei a soddisfare le proprie necessità. Nella fase del dialogo esse possono discutere con i candidati selezionati tutti gli aspetti dell'appalto. Durante il dialogo le amministrazioni aggiudicatrici garantiscono la parità di trattamento di tutti gli offerenti.

L'amministrazione aggiudicatrice prosegue il dialogo finché non è in grado di individuare, se del caso dopo averle confrontate, la o le soluzioni che possano soddisfare le sue necessità.

Infine, dopo aver dichiarato concluso il dialogo e averne informato i partecipanti, le amministrazioni aggiudicatrici li invitano a presentare le loro offerte finali in base alla o alle soluzioni presentate e specificate nella fase del dialogo. Tali offerte devono contenere tutti gli elementi richiesti e necessari per l'esecuzione del progetto.

Su richiesta dell'amministrazione aggiudicatrice le offerte possono essere chiarite, precisate e perfezionate. Tuttavia tali precisazioni, chiarimenti, perfezionamenti o complementi non possono avere l'effetto di modificare gli elementi fondamentali dell'offerta o dell'appalto quale posto in gara la cui variazione rischi di falsare la concorrenza o di avere un effetto discriminatorio.

Le amministrazione aggiudicatrici valutano le offerte ricevute sulla base dei criteri di aggiudicazione fissati nel bando di gara o nel documento descrittivo e scelgono l'offerta economicamente più vantaggiosa conformemente all'articolo 53.

A richiesta dell'amministrazione aggiudicatrice, l'offerente che risulta aver presentato l'offerta economicamente più vantaggiosa può essere indotto a precisare gli aspetti della sua offerta o a confermare gli impegni in essa figuranti, a condizione che ciò non abbia l'effetto di modificare elementi fondamentali dell'offerta o dell'appalto quale posto in gara, falsare la concorrenza o comportare discriminazioni.

[16] Cfr. 31esimo considerando Direttiva 2004/18/CE, nel quale si riportano gli esempi dell'esecuzione di importanti progetti di infrastruttura di trasporti integrati, di grandi reti informatiche, di progetti che

ricorso a procedure aperte o ristrette non consente di aggiudicare gli appalti, il dialogo competitivo si presenta come una procedura flessibile che salvaguarda sia la concorrenza tra operatori economici sia la necessità delle amministrazioni aggiudicatici di discutere con ciascun candidato gli aspetti dell'appalto.

Il dialogo competitivo è rivolto, per espressa previsione del legislatore comunitario, alle ipotesi di *appalti particolarmente complessi* e si presenta come una procedura nuova, a cavallo fra il modello tradizionale dell'*appalto concorso* (che, secondo la terminologia comunitaria, rientra fra le procedure aperte) e il modello del *project financing* ([17]).

Trattandosi di un istituto recente mancano allo stato attuale forme di applicazione del *dialogo competitivo* dalle quali si possano trarre conclusioni in ordine al quesito *de qua*.

Il sistema del PPP permette, per la sua stessa natura di accordo convenzionale, un intenso dialogo fra le parti, circostanza che si rivela strategica soprattutto nei settori dei servizi alla persona e di natura culturale laddove le complessità e la delicatezza delle attività poste in essere ha (quasi) sempre 'imposto' una fase di negoziazione dell'attività che il soggetto erogatore va a svolgere.

Formalizzare questa negoziazione attraverso la soluzione del *dialogo competitivo* non appare la soluzione migliore, dal momento che introdurrebbe degli elementi di rigidità all'interno di uno schema (quello del PPP) che vede nella spontaneità e flessibilità (spesso, infatti, è il privato che propone al pubblico di erogare servizi/attività altrimenti mancanti, secondo una logica di piena sussidiarietà orizzontale) il proprio elemento di forza.

Va da sé che l'amministrazione, allorchè lo ritenga opportuno, potrà comunque applicare, anche nei settori oggi organizzati secondo modelli di PPP, la soluzione del dialogo competitivo mutuandola dalla disciplina comunitaria degli appalti pubblici.

Domanda 9

Quale sarebbe secondo voi la migliore formula per assicurare lo sviluppo di PPP di iniziativa privata nell'Unione europea pur garantendo il rispetto dei principi di trasparenza, di non discriminazione e di parità di trattamento?

Il modello del PPP non è uno strumento per eludere le problematiche legate al rispetto dei principi del Trattato CE. Inoltre, quando attraverso PPP si giustificano delle 'fugh dalla disciplina comunitaria (soprattutto in materia di diritto della concorrenza e degli appalti pubblici), queste vengono arrestate dalle decisioni della Corte di Giustizia e degli stessi giudici nazionali.

Ciò che gli operatori richiedono, come è emerso dalla *Relazione sulla consultazione pubblica in merito al Libro Verde sui Servizi di interesse generale*, ([18]) è maggior chiarezza sulla disciplina applicabile, partendo dal presupposto che determinati settori/servizi/attività giustificano/rendono necessario e opportuno un trattamento diverso, derogatorio rispetto alla normativa in materia di concorrenza.

Si pone innanzitutto la questione di definire quali servizi/attività hanno natura economica e quali non, poiché dalla qualificazione discende l'applicazione di regole diverse.

Sul punto la Commissione europea nel Libro Verde sui *Servizi di interesse generale* ([19]) ha riconosciuto che "*non sarebbe nè auspicabile, nè fattibile fissare a priori un elenco definitivo di tutti i servizi di interesse generale che non sono da considerarsi di natura economica*". La consultazione avviata dal Libro Verde ha fatto rilevare opinioni divergenti su questo argomento ([20]).

comportano un finanziamento complesso e strutturato, per cui non è possibile stabilire in anticipo l'impostazione finanziaria e giuridica.

[17] Disciplinato nell'ordinamento italiano dagli artt. 37*bis* - 37*nonies della legge 11 febbraio 1994 n. 109 (Legge Merloni) e s.m.*

[18] Documento di lavoro predisposto dai servizi della Commissione il 29 marzo 2004 (SEC/2004/326).

[19] Documento della Commissione (COM/2003/270def) del 21 maggio 2003.

[20] Cfr. Pt. 4.4., *Relazione sulla consultazione pubblica in merito al Libro Verde sui Servizi di interesse generale* del29 marzo 2004 (SEC/2004/326).

In attesa di ulteriori sviluppi ([21]) una prima provvisoria soluzione potrebbe essere quella di stabilire per quali attività e servizi e in quali circostanze nel settore dei servizi alla persona e di natura culturale il modello dei PPP può derogare alla disciplina comunitaria (in materia di diritto della concorrenza e degli appalti pubblici).

Domanda 14

Ritenete che sia necessario chiarire a livello comunitario alcuni aspetti attinenti al quadro contrattuale dei PPP? Se sì, su quale(i) aspetto (i) dovrebbe incentrarsi tale chiarificazione?

Sì.

Nell'ambito delle operazioni di PPP relativo all'affidamento dei servizi alla persona occorre tener conto della natura di tali servizi. Infatti, la maggior parte di essi ha carattere relazionale cioè basato sulla relazione tra fornitore-utente (si pensi ai servizi di assistenza ai disabili, ai malati terminali, agli anziani ecc.).

In questo contesto la procedura selettiva dovrebbe essere volta ad individuare il fornitore migliore sia dal punto di vista tecnico-economico che qualitativo. Ciò significa che l'organismo aggiudicatore deve disporre di informazione il più possibile completa per valutare le prestazioni del fornitore. Quest'ultima valutazione diventa più complessa con riferimento ai servizi alla persona trattandosi di servizi non standardizzabili. Una soluzione potrebbe essere quella di specificare meglio il criterio dell'offerta economicamente vantaggiosa, dando maggiore enfasi agli elementi qualitativi e professionali che il partner privato deve possedere.

In particolare, maggiore risalto dovrebbe essere dato al "rapporto con il territorio" inteso non come elemento di discriminazione per gli operatori che non appartengono all'area in questione, bensì come reale capacità di rispondere, in maniera efficiente, ai bisogni sociali presenti nell'ambito locale di riferimento. É necessario perciò fare riferimento alla capacità del fornitore di creare rapporti sinergici con le risorse di un dato contesto locale e alle modalità con cui lo stesso si coordina con i servizi esistenti nel territorio ed interagisce con gli altri attori locali.

Dal contratto di PPP dovrebbe perciò emergere con maggiore chiarezza la valorizzazione degli aspetti qualitativi del soggetto fornitore, intesa non solo come competenza tecnica nel settore e come affidabilità economico-finanziaria, ma come capacità dello stesso di dare risposte apprezzabili ai bisogni che è incaricato di soddisfare.

In particolare, con riferimento ai soggetti de Terzo settore, andrebbe considerato il valore aggiunto che tali organizzazioni hanno rispetto alle imprese lucrative, che è dato dalla loro natura **distributiva** che si estrinseca nella produzione di beni "meritori" che vengono offerti sul mercato a prezzi inferiori rispetto ai costi.

Inoltre occorre sottolineare che per i servizi alla persona risulta particolarmente rilevante l'inclusione di norme che regolino il controllo che l'amministrazione può svolgere sul merito qualitativo e quantitativo della fornitura di un servizio già durante l'erogazione e non solo al termine del periodo dell'affidamento.

La previsione di *reports* (rendiconti periodici di controllo) potrebbe essere utile in tal senso, in quanto darebbe la possibilità all'ente locale di controllare l'andamento della gestione e di valutare la *performance* del fornitore in termini di obiettivi/risultati, costo/qualità ecc. Inoltre, bisognerebbe prevedere nel contratto delle penalità per il mancato o imperfetto raggiungimento degli obiettivi previsti (per esempio nel caso del servizio di pasti a domicilio per anziani, la scarsa qualità del cibo può essere intesa quale raggiungimento imperfetto dell'obiettivo) al fine di evitare comportamenti che possano ostacolare il perseguimento dell'interesse pubblico al

[21] Per il 2005 è attesa una Comunicazione sui servizi sociali di interesse generale nella quale dovrebbe essere elaborato un approccio sistematico al fine di individuare e riconoscere le caratteristiche specifiche dei servizi sociali e sanitari di interesse generale e fornire una migliore definizione del quadro in cui tali servizi operano.

soddisfacimento dei bisogni sociali. Ovviamente questo sistema non deve essere tale da tradursi in maggiori costi per l'ente locale e perciò nella vanificazione dell'obiettivo insito nell'esternalizzazione del servizio ossia la riduzione dei costi di gestione e il perseguimento dell'interesse pubblico.

Domanda 19

Ritenete che debba essere presa un'iniziativa a livello comunitario per chiarire o precisare gli obblighi degli organismi aggiudicatori riguardo alle condizioni che devono regolamentare la concorrenza tra operatori potenzialmente interessati da un progetto di tipo istituzionalizzato? Se sì, su quali punti fondamentali e sotto quale forma? Se no, perché?

Sì.

Come si è già più volte sottolineato, con riferimento ai servizi alla persona, la legge 328/2000 prevede un maggior coinvolgimento delle organizzazioni del Terzo settore nelle attività di progettazione e realizzazione delle politiche del territorio, il che presuppone l'attivazione di collaborazioni tra i partner pubblici e privati, per sperimentare forme gestionali innovative, anche mediante società miste. Un esempio può essere quello di una società mista composta da una cooperativa sociale[22] di tipo a) e da un comune, per la gestione di un servizio di assistenza agli anziani (es. la gestione di una casa di riposo). In questa tipologia di organizzazione mista il ruolo del socio pubblico è quello di controllare l'attività svolta; mentre il socio privato ha un ruolo di gestione ed erogazione del servizio.

In tale tipo di operazioni di PPP il punto critico è rappresentato dai criteri utilizzati nella scelta del partner privato, per cui si rende necessaria l'attivazione di meccanismi di trasparenza e pubblicità .

La prima considerazione che il soggetto pubblico dovrebbe fare è quella relativa al ruolo del partner privato e al tipo di attività da svolgere. Nel campo dei servizi socio-assistenziali al partner privato viene richiesta una particolare attitudine ad instaurare rapporti fiduciari con gli utenti del servizio, quindi, nella scelta del soggetto in questione si deve porre un'attenzione particolare alle risorse umane più che a quelle tecnologiche e finanziarie.

Da questo punto di vista è necessario che il soggetto pubblico, nella scelta del partner privato, preveda criteri e procedure che tengano conto delle peculiarità delle organizzazioni non lucrative. Occorre, cioè, che valorizzi le specificità di queste organizzazioni, non nel senso di attribuirgli vantaggi ingiustificati, ma di riconoscerne la propria, naturale contiguità di fini rispetto all'ente pubblico stesso. Quindi, a monte deve esserci una condivisione che valorizzi gli aspetti culturali e professionali delle organizzazioni del terzo settore.

La valorizzazione di relazioni di tipo fiduciario con organizzazioni *non profit* che si mostrano più vicine all'amministrazione non dovrebbe contrastare con la realizzazione di una corretta competizione tra partner potenziali, giacché per accedere alla categoria in questione sono già previste forme di controllo.

In questo contesto l'utilizzo delle procedure di selezione competitive ma differenziate serve ad assicurare che agli utenti del servizio venga garantito un elevato livello di qualità e tutela.

L'intervento comunitario si rende necessario per chiarire in quali casi e secondo quali criteri, la specificità delle organizzazioni del terzo settore, giustifichi le deroghe alle norme concorrenziali previste dall'art. 86.2 del Trattato, secondo il quale " (…) *Le imprese incaricate della gestione di servizi di interesse economico generale o aventi carattere di monopolio fiscale sono sottoposte alle norme del presente trattato, e in particolare alle regole di concorrenza,* ***nei limiti in cui l'applicazione di tali norme non osti all'adempimento, in linea di diritto e di fatto, della specifica missione loro affidata.*** *Lo sviluppo degli scambi non deve essere compromesso in misura contraria agli interessi della Comunità*".

[22] In virtù dell'art. 11 della Legge 381 del 1991 che detta la disciplina delle cooperative sociali.

Occorre, quindi, un'iniziativa comunitaria che chiarisca in che modo deve avvenire il bilanciamento tra la specifica missione d'interesse generale, attribuita ai soggetti del terzo settore nella gestione ed erogazione dei servizi alla persona e il rispetto delle regole concorrenziali.

Domanda 20

Quali sono le misure o le pratiche che ritenete di ostacolo alla creazione di PPP nell'Unione Europea?

Alla luce delle argomentazioni proposte all'interno del documento, ciò che emerge, con riferimento ai rapporti di partenariato pubblico-privato relativamente all'accezione ente locale/terzo settore, è la mancanza di un quadro complessivo di riferimento a livello nazionale oltre che a livello comunitario.

In particolare, si nota poca chiarezza in merito alle regole da applicare nelle procedure di selezione dei soggetti affidatari dei servizi alla persona, nonché degli elementi di cui tener conto ai fini della scelta di un'organizzazione rispetto ad un'altra.

L'ostacolo principale risulta, quindi, essere l'incertezza della normativa comunitaria sul punto specifico con conseguenti rischi di mancata trasparenza in cui di fatto lo svolgimento di tali procedura rischia di realizzarsi.

Si è parlato in precedenza dell'atto di indirizzo del 2001 (vedi domanda 1) che individua tra le modalità di affidamento dei servizi alla persona le procedure ristrette e negoziate non fornendo alcun criterio per scegliere tra l'una o l'altra procedura; né il diritto comunitario fornisce chiarimenti in tal senso, giacché la Commissione europea, si è limitata a specificare varie volte che ai servizi sociali non si applica la disciplina degli appalti con riferimento alla selezione dei candidati e in materia di aggiudicazione[23], lasciando agli Stati membri la libertà di scegliere quale procedura utilizzare.

Quindi, sulla base di quanto sopra detto, se un comune volesse esternalizzare una servizio socio-assistenziale (es. gestione di un asilo nido) ad un soggetto del Terzo settore, potrebbe stipulare legittimamente un contratto (convenzione) sulla base di una procedura individuata dallo Stato membro, priva di riferimenti alla qualità del partner privato e avente come unici riferimenti comunitari, oltre ai principi comunitari generali del Trattato CE, l'obbligo dell'avviso dell'aggiudicazione del servizio ed il possesso da parte dell'affidatario delle competenze comprovate nel settore in questione.

Si tratta di un punto critico perché crea il rischio di una forte incertezza nella valutazione delle specificità dei soggetti non profit e di una disomogeneità nella valutazione degli stessi a seconda dello Stato membro in cui la procedura ha luogo. La procedura seguita dunque potrebbe rivelarsi poco potenziali soggetti fornitori, rendendo difficile non solo valutare se gli obiettivi che hanno spinto all'esternalizzazione del servizio siano stati raggiunti (abbattimento dei costi per l'ente locale e perseguimento dell'interesse pubblico) ma anche vigilare sulla qualità del servizio erogato.

Inoltre, con riferimento alle operazioni di PPP contrattuali tramite gara, occorre specificare meglio i criteri di scelta dell'offerta economicamente più vantaggiosa, tenendo conto del fatto che nel contesto dei servizi alla persona il senso della collaborazione pubblico-privata dovrebbe essere quello di una reale integrazione volta ad un comune pensare, progettare e agire per la stessa finalità, ossia, il benessere della persona e della comunità.

Occorre, infine ricordare che l'esternalizzazione dei servizi richiede la raccolta di informazioni da parte dell'organismo aggiudicatore relativamente al potenziale fornitore del servizio al fine di valutarne le prestazioni.

[23] COMUNICAZIONE INTERPRETATIVA DELLA COMMISSIONE sul diritto comunitario degli appalti pubblici e le possibilità di integrare aspetti sociali negli appalti pubblici, Bruxelles, 15.10.2001, COM(2001) 566 def., p. 19.

Tale difficoltà si traduce in costi di transazione più alti in quanto comprensivi anche dei costi di raccolta delle informazioni. Questo rappresenta un ostacolo per il lancio di operazioni di PPP soprattutto quando il rapporto ha per oggetto l'affidamento dei servizi alla persona.
Quindi è necessario un quadro più chiaro e trasparente possibile per dare l'opportunità alle organizzazioni con fini sociali di contribuire ancora di più allo sviluppo del modello europeo di società.

Dear Sir,

The European Commision has launched a draft of a Green Paper regarding the
PPPs . Unfortunately we only have it in French (see Attach.) and ask you
for assistance
sending me that paper in English.
I am very interesting in PPPs possibilities and therefore sending to you
letter concerning
information about EC countries expierence of PPPs system implementation.
Sincerely Your
Vytautas karlavicius

Dear Sir,
After the end of privatization of the most great objects in the Lithuania it
is necessary to solve
the problem of the new investment indraft. The Public Private Partnerships {
PPP} may become the nice implementation
for that and therefore I am looking for the information
about the European expierence concerning PPP
There is nothing happening in Lithuania in this area up till now and that is
why I am trying to reach you and to learn some information on the PPP-s.
My sphere of interest is as follows:
- what should be the assumptions for the legal basis of the country which is going to start implementation process of the PPP;
- are there any specific EU legal requirements for the PPP-s;
- specimen of the manual for preparation of the implementation of the PPP-s;
- specimen of the contract agreements;
- specimen of bylaws of the institution which is going to start to implement PPP-s;
- types of the projects most suitable for the PPP-s;
- what are the main differences of provisions related to the law on Concessions and the PPP-s;
-relation between EC Structural Funds and PPP-s in the municipal and region development projects.

Your explanations and comments of the European expierience will greatly
contribute to the PPP-s implementation in Lithuania.
Sincerely yours
Vytautas Karlavicius

Szanowni Państwo

Myślę, że z powodu bardzo dużej liczby formalności bardzo długo potrawają w Polsce przygotowania do pierwszych projektów realizowanych zgodnie z nową ustawą o partnerstwie publiczno-prawnym, która jest przygotowana przez Rząd Polski.

Myślę, że konieczność przygotowania licznych analiz, programów i planów opóźni realizację wspólnych projektów. Moim zdaniem małe prywatne firmy w ogóle będą nimi zainteresowane i jak widać w Europejskim i Polskim systemach zamówień publicznych przetargi wygrywają najwięksi. Znowu pieniądze europodatników popłyną szerokim strumieniem do najbogatszych.
Nie mówiąc o tym, że
przy zmianach czy to w KE czy w Rządzie danego kraju niektóre projekty mogą stracić dofinansowanie.
Uważam również, że władze Unii powinny przyjrzeć się systemom zamówień publicznych, ponieważ w wielu krajach są korupcjogenne. Praktycznie w każdym kraju Unii można ustawiać przetargi, nie mówiąc o arbitrażu.

Opinion to the GREEN PAPER ON PUBLIC-PRIVATE PARTNERSHIPS AND COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

provided by
Wojciech K, Helman
“Synergia 99” Ltd, Gdańsk, Poland
w.helman@synergia99.com.pl

at: MARKT-D1_PPP@cec.eu.int

1. *What types of purely contractual PPP set-ups do you know of? Are these set-ups subject to specific supervision (legislative or other) in your country?*

Whatever the type: contractual or institutional, PPPs are still a rare novelty in Poland. There is no direct legal foundation for the PPPs in the form of an Act. There is no single and legally authorised body for such control, hence it is not clear, who would conduct supervision over PPP set-ups in Poland. There are no sound standards or a record of “best practices”, thus making a track of PPP set-ups difficult. The partner-selection process is generally governed by the Public Tender Act. However, this is just a part of a PPP process.

2. *In the Commission’s view, in the context of a purely contractual PPP, the transposition of the competitive dialogue procedure into national law will provide interested parties with a procedure which is particularly well adapted to the award of contracts designated as public contracts, while at the same time safeguarding the fundamental rights of economic operators. Do you share this point of view? If not, why not?*

Public Authorities have, generally, limited knowledge of the marketplace and operators’ point of view, and often seem not to be fully able to clearly state *what they want* in this specific area of PPPs, and further, to transfer such knowledge into clear best-partner acquisition procedures. Procedures, provided by the Commission, translating “competitive dialogue” into clear and fair clauses will be of much help. On the other hand, regulations should contain a degree of flexibility and openness, in order not to loose the meaning of the competitive dialogue, specifically when complex PPPs are concerned.

3. *In the case of such contracts, do you consider that there are other points, apart from those concerning the selection of the tendering procedure, which may pose a problem in terms of Community law on public contracts?*

Effort should be put when designing regulations and procedures so that possible corruption in eliminated, or at least narrowed to a minimum.

8. *In your experience, are non-national operators guaranteed access to private initiative schemes? In particular, when contracting authorities issue an invitation to present an initiative, is there adequate advertising to inform all the interested*

operators? Is the selection procedure organised to implement the selected project genuinely competitive?

Firstly, the proposed Bill on PPP in Poland suggests that only public contracting body takes the initiative towards a PPP. Secondly, depending on the scope of contracts, dissemination of information is to be done according to Public Tender Act. Thirdly, private initiators have no gain in securing genuine competitiveness – it is chiefly the interest of the public. Fourthly, the public need to have the right tools to evaluate the genuine market value of proposals from the private. And this remains clearly a weak spot of the public in Poland. Additionally, the public seem not to fully know how to secure genuine competitiveness of bids in untypical, or large-scope projects. Proposals and procedures put forward by public bodies tend to be too rigid for the private to find sufficient space for their interest, or too loose, what may result in imbalanced gain, in favour of the private at the cost of the public.

9. *In your view, what would be the best formula to ensure the development of private initiative PPPs in the European Union, while guaranteeing compliance with the principles of transparency, non-discrimination and equality of treatment?*

In more complex, multi-faceted PPPs, open competitions could be organised for conceptual solutions to problems, considered a separate stage of a PPP process. Competitions would be the pre-tender part of the process, where problems are spotted and evaluated, so that results could be used as a benchmarking tool when constructing further tenders aiming at selection of a best partner. Private initiative PPPs should be explicitly marked as possible and welcome.

10. *In contractual PPPs, what is your experience of the phase which follows the selection of the private partner?*

No such experience in record.

11. *(-)*

12. *Are you aware of any practices or mechanisms for evaluating tenders which have a discriminatory effect?*

At the stage of defining the project and translating it into requirements for the public tender there is often space for misunderstanding and impartiality – resulting in discrimination.

13. *(-)*

14. *Do you think there is a need to clarify certain aspects of the contractual framework of PPs at Community level? If so, which aspects should be clarified?*

At Community level:

- General indications should be provided, chiefly encouraging public authorities to take more active approach to solving their problems through a partnership, together with private partners.

- A clear message should be sent to the public authorities, that it is not exclusively for the public to take initiative towards PPP, but also reception of proposals from the private, through proper evaluation and public process, can be a good way to a successful PPP.
- At lower and more detailed level:

standards of analyses should be set, that will help the public find answers to crucial questions: what they actually want, what they need in terms of information, analyses, goals, terms of cooperation, so that public interest is secured in the best possible manner, and simultaneously sufficient space is left for the interest of the private – that meaning the design and use of the evaluative tools that will best suit the intention.

15. (-)

16. (-)

17. (-)

18. (-)

19. Do you think that an initiative needs to be taken at Community level to clarify or define the obligations of the contracting bodies regarding the conditions requiring a call for competition between operators potentially interested in an institutionalised project? If so, on what particular points and in what form? If not, why not?

There is a vast space, within which concepts for a complex subject-matter projects are formulated. Depending on definition of such concepts, genuine competition is – or is not-possible. On the one hand, public bodies should be able to precisely describe their problem, expected result, formulate measures of control and be able to check if the need is properly satisfied. This itself, in more complex ventures is not easy. It requires a set of analyses and considerations, which probably are being done in very different manners, depending on Member State, experience gained, legal requirements (or lack of these in particular areas), nature of a project, leading to results difficult of comparison with other projects. On the other hand, such statements and expectations make a foundation of a project and a call for competition, possibly lacking in clarity, objectivity in further evaluation or containing gaps in problem-considerations. This may lead to confusions and misunderstanding among interested operators, raising the issue of compliance with primary Community regulations on public tenders.
The phase of evaluating their own position by public bodies, using right tools to do so, objective and comparable definition of a project within the Community should be a matter of the Community legislation, or a clear, official guidance.

20. In general and independently of the questions raised in this document: In your view which measures or practices act as barriers to the introduction of PPPs within the European Union?

Within UE – differences in regulations governing PPPs processes in particular Member States.
In Poland – PPPs are still a novelty. Firstly, approaches to PPPs by public bodies are feeble and in most cases refer to the single-facet projects, leaving apart urgent, yet more complex problems. Secondly, there is a problem of providing sufficient bridging financing for local authorities, having financial difficulties in providing proper input on their part.

Furthermore: difficulty in proper defining and analysing the problem and creating the right, often sophisticated selection and implementation procedures; lack of guidance or clear legal rules (unsteadiness of law, lack of an Act on PPP); fear of the private market combined with insufficient understanding of it, or – on the other hand – corruptive approach. Lastly, passiveness, “tidal”, short-sighted thinking, lack of strategic approach. This all may lead to imbalances between public and private in the process of the PPP. In consequence, building a negative picture of the PPP phenomenon.

21. (-)

22. More generally, given the considerable investments needed in certain Member States in order to pursue social and sustainable economic development, do you think a collective consideration of these questions pursued at regular intervals among the actors concerned, which would also allow for exchange of best practice, would be useful? Do you consider that the Commission should establish such a network?

A network for the regular exchange of practice established and co-ordinated by the Commission would be of much help, especially to the New Member States.

LIVRO VERDE SOBRE AS PARCERIAS PÚBLICO-PRIVADAS E O DIREITO COMUNITÁRIO EM MATÉRIA DE CONTRATOS PÚBLICOS E CONCESSÕES

Ponto 1

Permitimo-nos sugerir a seguinte noção de Parceria Público-Privada:

DEFINIÇÃO DE PARCERIA PÚBLICO-PRIVADA

Formas de cooperação reguladas por contrato oneroso, celebrado na sequência de procedimento concorrencial, entre as autoridades públicas e as empresas privadas ou instituições do terceiro sector, tendo por objectivo assegurar, por um período de tempo adequado à plena realização dos fins contratados, a construção e exploração de uma infraestrutura pública ou a montagem e, ou exploração de um serviço ou bem público, por parte de um parceiro privado, bem como o seu financiamento, ou a gestão e participação em entidades empresariais, ou outras, de origem pública ou que prossigam um objecto de interesse público.

Ponto 2

Compreendendo que não é possível definir de forma fixa a duração da relação contratual, julgamos, no entanto, que se lhe deveria fixar um período máximo.

Período esse que considerasse não só o prazo inicialmente contratado como a prorrogação, ou prorrogações, desse prazo.

É uma medida essencial para que não estejamos a eliminar a concorrência por prazos superiores ao razoável e, por outro lado, que não estejamos a criar projectos de fraca viabilidade e que só a conseguirão graças a prorrogações sucessivas de prazo.

A cooperação entre os parceiros ocorrerá verdadeiramente, mediata ou imediatamente, sobre todos os aspectos do projecto a realizar.

Sendo o financiamento dos projectos a sua pedra angular, achamos que a UE, para os projectos desenvolvidos pelos seus Estados membros, deveria/poderia criar ou mecanismos de garantia, ou mecanismos de crédito, especialmente agressivos para os projectos desenvolvidos em áreas consideradas prioritárias.

Estamos a falar, naturalmente, de instrumentos que vão para além dos actualmente existentes no âmbito do Banco Europeu de Investimentos.

Quanto ao papel do sector público, se é verdade que ele se centra nas preocupações enunciadas, não o é menos que também o deve preocupar a saúde da empresa que suporta o projecto, já que uma qualquer dificuldade desta se poderá traduzir na debacle do projecto. Ou seja, o acompanhamento público, tendo em conta a natureza dos projectos deve ser constante, profundo e tecnicamente muito sólido.

A distribuição precisa de riscos deve ser avaliada não só no momento da adjudicação e celebração do contrato ,mas ao longo de toda a vida do contrato. Por outro lado, dada a longevidade dos contratos, deve considerar-se ab initio as formas de alteração dessa distribuição dos riscos, nomeadamente quando ela decorre de factores exógenos imprevistos ou imprevisíveis (p. ex. mudanças tecnológicas ou demográficas).

Ponto 3

Sendo verdade que o fenómeno PPP teve na sua origem as restrições orçamentais, entendemos que as suas virtualidades e o seu futuro deverão fundar-se noutras preocupações.

De facto, o desenvolvimento das parcerias com a consequente incorporação de novas e equilibradas empresas deve ser também utilizado como forma de estruturar o tecido económico e de estimular a actividade empresarial. Por outro lado, e porventura mais importante, permite aos Estados incorporar todas as vantagens da gestão privada em serviços públicos essenciais, sem que estes percam as características de universalidade e de igualdade de acesso que lhe são imanentes.

Desta forma, a par das imposições genéricas que decorrem da lei, os Estados dispõem também de instrumentos contratuais que permitem melhorar a caracterização dos direitos e obrigações das partes bem como as sanções pelo incumprimento.

Ponto 4

A experiência vem demonstrando que as PPP são dotadas de uma enorme plasticidade e que este sua característica lhes tem permitido a adaptação a múltiplos sectores e, dentro de cada um deles, a projectos muito diferentes.

O que deve conduzir a UE, a nosso ver, a fixar um conceito de PPP em que, pela sua latitude, possa incluir-se todo o tipo de contratação pública com essas características, independentemente do sector. Ou seja, as PPP não são, a nosso ver, uma solução marginal e residual para sectores limitados, como o dos transportes, mas antes um instrumento que, pela plasticidade já referida, tenderá a ser usado cada vez mais e em sectores diversificados.

Testada a aptidão das PPP para o sector dos transportes, julgamos que faz sentido que a UE promova medidas específicas, legislativas e de politica, quanto à sua utilização nas redes transeuropeias de transportes.

Ponto 5

O recurso às PPP não só não é a solução milagrosa para as restrições orçamentais como não pode constituir um factor de incerteza quer para as empresas quer para o sistema financeiro, nem um compromisso desproporcionado para as gerações seguintes.

Assim, o lançamento e a contratação de PPP devem implicar, para ambas as partes, um planeamento rigoroso e estudos prospectivos detalhados. Ao mesmo tempo, e após a comunicação do Eurostat, importa acautelar que a assunção integral, pelas empresas do risco de construção e de disponibilidade não redunda na assunção a prazo, de riscos fatais para os projectos.

Julgamos que assumem, neste caso especial necessidade de ponderação os seguintes aspectos:

- o reflexo da evolução cientifica e tecnológica na execução dos contratos
- o reflexo da evolução demográfica, nomeadamente quando esta se traduz numa diminuição da população, com, pelo menos, as seguintes potenciais consequências:

- incapacidade do projecto para pagar o investimento
- desnecessidade da infraestrutura a curto prazo

Ponto 6

A criação de estruturas próprias para enquadrar, gerir e acompanhar a execução das PPP, por parte dos Estados membros, apesar de não ser ainda generalizada é de extrema importância.

No entanto, julgamos que essas estruturas, independentemente do seu formato e organização, deveriam contar com a participação dos operadores económicos que operam no sector quer como contratantes quer como financiadores.

Por outro lado a própria União Europeia deverá começar, desde já, a pensar na criação de uma estrutura que acompanhe este tipo de projectos e possa desenvolver alguma actividade de enquadramento e de planeamento prospectivo.

Ponto 7

É válido, a este propósito, o que se disse acima sobre a plasticidade das PPP's, sendo que ao nível municipal, por se tratarem de projectos de menor dimensão, é possível uma maior inovação com menor risco.

Ponto 8

O crescimento do fenómeno PPP não permite que ele continue a desenvolver-se sem um regime jurídico específico.

É verdade que as entidades públicas estarão obrigadas a respeitar os princípios constantes dos Tratados mas tal não nos parece suficiente.

A criação de um verdadeiro mercado único a nível europeu é claramente potenciada com a criação de um regime jurídico comunitário específico para as PPP.

Importa, no entanto, dizer que não se trata, nem pouco mais ou menos, de produzir uma versão adaptada das Directivas de mercados públicos, nomeadamente da Directiva das Empreitadas de Obras Públicas.

Não sendo esta a sede para desenvolver esse regime, julgo que, para além das preocupações já conhecidas, nomeadamente quanto à fase de adjudicação dos contratos, o regime jurídico das PPP deve dar uma especial atenção, entre outras, às seguintes questões:

- Execução dos contratos
- Modificação dos Contratos e seus limites
- Prorrogação do Prazo do contrato e seus limites
- Obrigações das partes no termo do contrato
- Intervenção das Instituições financeiras nos projectos contratados em PPP.
- Consequências da inviabilidade financeira dos projectos, tendo os investimentos realizados.

Pontos 9 a 16

As dúvidas e incertezas esplanadas ao longo destes pontos evidenciam a necessidade de fixar um regime jurídico próprio para as PPP's. Essencial, aliás, para estimular um verdadeiro mercado europeu de operadores comunitários que, com certeza e segurança, possam operar em toda a Europa.

O procedimento de diálogo concorrencial parece especialmente vocacionado para as operações de PPP, dado que permitirá ao parceiro público centrar-se mais na definição da necessidade a prover (definição funcional),deixando para o parceiro privado a tarefa de saber/conceber como prover a essa necessidade. Desta forma, potencia-se a inovação e permite-se que o parceiro público possa, desde logo, contratar com os inerentes ganhos de eficácia.

Em Portugal tem vindo a ser utilizada, julgamos que com sucesso, uma fórmula semelhante à agora proposta pela Comissão que consiste na organização de concursos públicos em várias fases, onde os próprios concorrentes vão apresentando propostas e desenvolvimentos ao projecto inicialmente sujeito a concurso.

Urge, contudo, impor algumas cautelas. Na verdade, o facto de a solução ser desenhada com a ajuda daqueles que, posteriormente, irão apresentar as propostas finais permite que estes possuam um conhecimento dos projectos e soluções que é ,sem dúvida, mais alargado do que o daqueles concorrentes que não participaram nessa fase do processo concursal. Por outro lado, será de configurar a possibilidade de o parceiro público se apegar demasiado a uma solução proposta por um parceiro privado que, na prática, poderá excluir todos os outros candidatos (dado que apenas o parceiro que propôs tal solução a poderá concretizar tecnicamente).

Neste caso a segunda parte do denominado diálogo concorrencial – o convite à apresentação de propostas – ainda que potencialmente abstracto poderá, na prática, ter apenas um concorrente como destinatário.

Refira-se que o diálogo concorrencial tem que ser, ele próprio, detalhadamente regulado e balizado. Desde logo para não permitir que entre a apresentação das propostas e a celebração do contrato o objecto do concurso seja desvirtuado ou modificado.

Por outro lado não há contrato de Concessão, ou contrato de outra qualquer forma de PPP, que não seja, para este efeito, “particularmente complexo”.

A nossa experiência tem-nos ensinado que as especificidades de cada país, podendo ser compreensíveis, evoluem com demasiada facilidade para regras que:ou limitam a concorrência na fase de escolha dos candidatos ;ou permitem decisões com escassa e difusa fundamentação ,comunicadas aos concorrentes não porque lhes assista esse direito mas como uma *"graça"* da Administração.

Merece aqui um especial cuidado o recurso frequente a fases de pré-qualificação não reguladas, mas nas quais se tomam decisões fundamentais em matérias que cabem no âmbito da concorrência.

A fixação de uma regulamentação europeia homogénea mínima é essencial à criação de um verdadeiro mercado de operadores comunitários do sector, com vantagens para as Administrações que, desta forma, podem ter nos concursos entidades melhor preparadas e com competências específicas que lhe permitem apresentar propostas mais vantajosas.

Pontos 17 e 18

Salvo melhor opinião o direito comunitário em matéria de contratos públicos e concessões pode ser inspirador e, porventura, regime subsidiário relativamente às PPP mas não pode ser o direito regulador das PPP.

Afigura-se-nos mais correcto construir, a partir dos princípios vertidos nos Tratados, um regime jurídico autónomo para as PPP que fixe um regime geral e subregimes específicos para cada um dos tipos de PPP, como p. ex. as Concessões.

Tendo em conta a importância económica crescente das PPP, a sua integral abertura à concorrência tem que ser fixada a través de instrumentos legislativos imperativos. A não ser assim poderemos estar a desvirtuar gravemente a construção de um mercado interno forte e concorrencial.

Ponto 19

Achamos que, a propósito do Direito das Sociedades Europeias, deve/pode ser feita uma reflexão sobre a questão de saber se as empresas que desenvolvem actividades tituladas por contratos de Parceria Pública-Privada devem ter na sua criação e gestão alguma especificidade. Desde logo se devem ser exclusivamente dominadas, como todas as outras, apenas pelo princípio da autonomia da vontade, ou deverão incorporar algumas normas ou princípios imperativos, decorrentes da natureza pública dos bens que gerem.

Ponto 20

Deve ponderar-se se deve deixar-se fora do âmbito deste trabalho a consideração das parcerias em que intervém o hoje chamado terceiro sector ou sector social. Ou seja, deve ponderar-se se quando as entidades públicas estabelecem Parcerias com entidades do terceiro sector estão obrigadas, ou não ,ao cumprimento dos mesmos procedimentos concursais.

Ponto 25

Para além do que já se disse acima sobre o "diálogo concorrencial" merece a pena enfatizar que não deve confundir-se a possibilidade/vantagem dos privados participarem na definição dos projectos passíveis de adjudicação com recurso a uma PPP com a possibilidade de os privados interessados em concreto num projecto participarem na definição do próprio objecto do concurso.

Ou seja, quando as empresas são chamadas a participar num procedimento concursal, seja qual for a modalidade escolhida, o objecto do contrato a celebrar a final deve estar definido com clareza e rigor desde o início. O que pode mudar durante o procedimento concursal são as formas, os instrumentos ou as técnicas utilizadas para a concretização do objecto.

Ponto 28

Compreende-se que até agora o regime jurídico das concessões de obras públicas se tenha desenvolvido com grande proximidade e dependência do das empreitadas de obras públicas.

Com a criação de um regime próprio para as PPP's o regime das concessões tem que passar a integrar-se como um sub-regime daquele ou, eventualmente, a ser adoptado como o regime geral e regime regra das PPP.

Em qualquer caso tal implicará um muito maior detalhe e desenvolvimento, desde logo ao nível comunitário, dos vários aspectos desse novo regime jurídico.

Pontos 29 a 33

Pela dimensão económica que assumem hoje as Concessões e genericamente as PPP é inaceitável a fixação de regras para cada caso concreto.

Parecendo-nos bem os princípios gerais fixados no Ponto 30 importa tirar-lhe as adequadas consequências de que destacamos:

- obrigatoriedade de abertura universal dos procedimentos de concurso;
- criação de regras homogéneas e comuns a todo o espaço comunitário;
- criação de um verdadeiro mercado europeu de concessões /PPP's

- Regulação rigorosa e pormenorizada de todo o procedimento, desde o início do procedimento concursal até à adjudicação;
- Regulação das relações entre concedente e concessionária ao longo da vida do contrato, nomeadamente tendo em vista evitar que eventuais alterações ao contrato o transformem noutro contrato.
- Ponderação das vantagens em criar um regime específico, mais estimulante, para as PPP's que incidam nas redes transeuropeias.

Pontos 34 a 36

A afirmação de que "nem sempre é fácil determinar, na origem, se o contrato objecto do processo é um contrato público ou uma concessão" é a evidência das preocupações que já manifestámos.

Em primeiro lugar entendemos que é inaceitável que as modificações decorrentes da fase de negociações dos contratos possam conduzir à modificação da natureza do contrato.

Em segundo lugar demonstra-se que é necessário fixar com rigor os conceitos e os regimes jurídicos correspondentes.

De facto, não é aceitável que o procedimento relativo aos concursos para atribuição de concessões possa assumir maior ligeireza ou menor clareza para os concorrentes do que os relativos aos concursos para atribuição de empreitadas.

Com efeito, a forma de adjudicação de concessões, excepto as de obras públicas, não se encontra regulada, pelo que, por um lado, existem diferenças substanciais entre as várias regulamentações nacionais e, por outro, os critérios que presidem à adjudicação são fixados casuisticamente por cada entidade adjudicante.

Parece impor-se um especial critério às adjudicações feitas a empresas públicas, pois, são as mais das vezes realizadas sem a precedência de qualquer concurso.

Quanto a nós, os problemas que emergem das parcerias público-privadas são idênticos quer sejam qualificadas como contratos públicos quer como concessões, pelo que se exige uma regulamentação unitária. Não nos parece que o facto de nas concessões o parceiro privado assumir todos ou parte dos riscos do projecto seja razão suficiente para que não se estabeleça um regime pormenorizado relativo à escolha do parceiro.

Deste modo, parece-nos ser de concluir que as PPP colocam problemas específicos que devem ser tratados unitariamente, muito embora, relativamente à escolha do parceiro privado, se possa colher a experiência obtida com a regulamentação dos contratos públicos.

Julgamos que é da natureza destes procedimentos (concessões) que eles possam conter um menor grau de automatismo na apreciação conducente à adjudicação. Tal facto, no entanto, não pode decorrer de obscuridades ou lacunas na regulamentação. Antes é a contrapartida da sua especial complexidade.

Assim, e tal como já dissemos, somos claramente a favor de uma acção legislativa forte que crie um regime jurídico para as PPP's e, dentro deste, um para as Concessões. E, tal como já dissemos, tal acção legislativa não deve ater-se exclusivamente à face concursal e adjudicatória, mas antes, começar antes daquela e debruçar-se também sobre a execução e extinção dos contratos.

Pontos 37 a 41

A possibilidade de os privados tomarem a iniciativa de operações PPP não pode conduzir à eliminação da concorrência ou à subtracção desses contratos ao mercado.

Entendemos sobre esta matéria o seguinte:

1 – Aos operadores económicos deve ser permitido proporem operações de PPP

2 – Apresentadas as propostas, junto das autoridades públicas, e se estas entenderem que a Parceria proposta é do seu interesse, assumem com o proponente dois compromissos: o de lhe pagar, no final do procedimento concursal, os custos incorridos e o de lhe assegurar, enquanto concorrente, a presença na fase de negociações que venha a ocorrer antes da apresentação da proposta final.

3 – A adjudicação é sempre precedida de um procedimento concorrencial universal.

Ponto 42 e 43

As preocupações manifestadas nestes dois pontos reconduzem-nos à questão que já referimos da necessidade de regulamentação ir muito para além da escolha do parceiro privado.

Ponto 44 a 51

Sendo certo que as Parcerias Público-Privadas assumem a cada dia que passa uma importância crescente e que tal crescimento é feito, em grande medida, à custa da diminuição dos mercados clássicos de empreitadas julgamos que o direito comunitário deverá ir muito além da mera imposição dos princípios gerais.

Impõe-se, nomeadamente, uma detalhada formulação das especificações técnicas, o que permitirá:

1. uma correcta apreciação de interesse por parte dos potenciais concorrentes a uma adjudicação;

2. aumentar a comparabilidade entre as Propostas apresentadas e, consequentemente, reduzir a subjectividade associada à avaliação dessas Propostas; e
3. estabilidade nas relações contratuais durante a vida da PPP.

De acordo com a experiência portuguesa em Concessões Rodoviárias, refira-se a título exemplificativo, algumas características técnicas que importará fazer constar dos Objectos das operações de PPP por forma a maximizar o valor utilidade das mesmas:

1. identificação prévia de corredores ambientalmente aprovados;
2. identificação detalhada do Objecto e Limites da Concessão, com identificação exaustiva – em texto e em planta – de todos os Sublanços, Nós, Ligações, Praças de Portagem, Áreas de Serviço, etc. que integram o Objecto da PPP.

Existindo vantagem em desenvolver o mercado interno e em dar às empresas europeias a possibilidade de actuarem livremente na totalidade desse mercado, tal será fortemente potenciado se estas puderem operar com base em regras idênticas desenvolvidas a partir de uma matriz comum.

Julgamos adequadas as preocupações expressas de que os documentos fornecidos aos concorrentes no início do procedimento concorrencial, tenham um grau de desenvolvimento tal que obstem a que no final se contrate coisa diversa do que foi submetido ao mercado.

Questão essencial e raramente abordada tem a ver com a avaliação das consequências para a concorrência do prazo longo de vigência deste contratos.

Entendemos, por isso, que os próprios contratos devem prever, obrigatoriamente, os mecanismos da sua revisão quando esta se torna necessária por motivos exógenos ao projecto,a saber : as mudanças tecnológicas referidas mas também as variações demográficas ou outras.

Por outro lado, sendo cada um dos projectos concebido no pressuposto de que o seu equilíbrio se obtém num determinado período de tempo – o da vigência do contrato- deve limitar-se a possibilidade de prorrogação desse prazo, a qualquer título, para além de um limite razoável. Admitimos que tal possibilidade não deve ir além, no total, de 20% do prazo inicial, ressalvadas situações especiais devidamente caracterizadas.

Ponto 51 e 52

A questão da subcontratação, tal como é referida, é a demonstração da necessidade de assegurar todas as regras da concorrência na adjudicação das PPP's, sob pena de podermos estar a comprometer a viabilidade das empresas construtoras, nomeadamente de pequena e média dimensão.

Por outro lado pode ser razoável admitir que em contratos de PPP em que o valor dos contratos de construção ultrapassem determinados montantes (200 ME?) uma parte desses trabalhos (25%?) seja objecto de concursos públicos. No entanto, a assumir-se este caminho, deve ter-se presente que tal implicará uma menor atractividade do negócio para as empresas de construção e, ao mesmo tempo, uma maior incerteza nos preços.

Ponto 53 a 56

No caso das PPP institucionalizadas a principal preocupação é a de que a escolha do parceiro privado seja feita de forma transparente e através de procedimentos concorrenciais de participação universal.

Por outro lado, as entidades assim criadas, e por via da sua participação pública, não podem ter qualquer tipo de vantagens competitivas. O que nos leva a pensar que as entidades desta natureza apenas podem desenvolver as actividades que já desenvolviam no momento da sua criação, ou da sua transformação por entrada do parceiro privado.

Importa também ter presente que deve acautelar-se, nestes casos, que não estejamos perante meras operações de privatização parcial ou de tomadas de participação de capital. Pelo que tal implicará a definição de regras quanto a prazos, natureza e competências do parceiro privado e participação na gestão.

Ponto 57 a 64

Afigura-se-nos inaceitável que os Estados promovam a criação de entidades de capital misto com o objectivo de estas irem disputar concursos para atribuição de contratos públicos.

Parece-nos que é razoável admitir que os Estados entendam que determinadas actividades que devem ser desenvolvidas sob forma empresarial o sejam por empresas com participação pública maioritária, ou não. É uma decisão soberana dos Estados aplicável quer a actividades e empresas já existentes quer a empresas e actividades a criar.

A questão essencial é a decisão, necessariamente subsequente, de entender que os operadores económicos devem participar nessa empresa. É a concretização dessa decisão que deve ser feita, tal como se disse nos comentários aos Pontos 53 a 56, através de um procedimento concorrencial.

Ou seja, quando a PPP institucionalizada é criada, a entidade empresarial objecto da PPP é já titular do contrato que vai executar.

Ponto 65 a 69

O que parece aqui estar em causa é a realização de operações de privatização.

A ser assim nada têm a ver com PPP’s.

Green Paper

Public-Private Partnerships and Community Law on Public Contracts and Concessions

[ref. Brussels, 30.4.2004: COM(2004) 327 final]

A Review

Introduction:

I have designed, structured and implemented private sector energy and infrastructure projects, both in the U.K. and most parts of the world, since 1975. I have also worked for extended periods for: (a) an investment bank; (b) a commercial lender; and (c) a development bank. Hence, I am well versed in the underlying features and project characteristics which lead to successful PPP's, as well as those that can lead to failure!! I now operate as an independent consultant in this field.

Commentary:

In general, I am concerned at the direction and focus of this Paper. My basic concerns are:-

1. The prime driver for governments to adopt Public-Private Partnerships ("PPP"'s) and generically similar structures is budget expenditure constraint. The desire to introduce competition into the provision of public services, greater efficiency in the delivery of such services, and innovation are, in reality, secondary objectives.

   All governments have an underlying responsibility to provide a range of public services. If funding is not an issue, then governments will provide such services themselves. This is the case in most rich countries. On the other hand, PPP offers those governments who are less well off to achieve the same objectives,.................................... but at a cost.

   One exception that could be cited is the USA, where many public services are provided by public-interest (i.e. not-for-profit) entities. However, those service providers in effect enjoy indirect governmental financial support and are highly regulated, so that from a financial perspective they represent government risk in the finality. Default has been rare indeed!

2. A second driver for governments to adopt PPP's is the possibility that the funding commitments that arise thereunder can be classified as 'off balance sheet'. Given that debt usually represents 80-90% of the PPP funding, this can be an attractive feature.

   In February 2004, the EU, under a Eurostat Decision, directed that those PPP's where:-

   (a) the private sector bears the construction risks; AND
   (b) the private sector bears at least one of either availability or demand risk,

   could be deemed to be 'off balance sheet' for the host government.

It is my considered view that these criteria do not go far enough. This view was also partly reflected by the IMF Paper on PPP's published in March 2004. Detailed analysis of many PPP's show that, when a PPP fails to perform, the public sector, i.e. government, invariably has to buy out the financiers, particularly lenders. This represents a significant contingent liability on the host government's balance sheet, which under the current Eurostat criteria would pass unnoticed. Similar circumstances as this arose in the collapse of Enron, World.com, etc.. A more detailed assessment as to the risks posed by PPP's is required for government accounting purposes.

3. The Green Paper focuses only on one aspect of PPP's, the pre-contractual phase, when issues of structure and procurement are being faced. However, PPP's are contractual arrangements which span 15-30 years, and the conduct after contract signing and financial close is ignored at one's peril. There is little point in laying down rules (viz. the Green Paper) for the architecture and purchase of the edifice, if all hell can be let loose inside the edifice once built!! Hence, the Green Paper is only a part response to an issue, and the Commission should recognise that.

4. The Green Paper particularly focuses on PPP procurement. However, there is growing confusion and lack of clarity as to what constitutes works/services contracts and public/private services. This Paper does little to clarify the position. Much of this is due to the use of the term "partnership" to represent a contractual relationship, which put to the test and in reality is adversarial. The concept of sharing gains and losses is alien to most PPP's. Secondly, there are many different interpretations and definitions within Member States as to what "PPP" represents. There are even differences of opinion within governments, e.g. the U.K.!!

   I would commend the EU to address and endorse the Procurement Guidelines prepared by the EBRD and World Bank, which express simply and clearly the procurement expectations of public and private sector projects funded by these institutions.

5. The fundamental rules of the EU Treaty include the need for PPP's to demonstrate:-

   - Equality of treatment;
   - Transparency
   - Proportionality
   - Mutual recognition.

   However, the very nature of PPP's are that they are less transparent than conventional procurement:-

   - The PPP concessionaire will be a 'Special Purpose Vehicle' (SPV), which has minimal equity capital and limited liability, i.e. the pure equity input will represent only 1-5% of the project costs, the balance of equity being made up from subordinated equity and shareholder loans;

   - The SPV will not be a 'high street name', and its annual report and accounts not readily accessible to the public, if at all. The SPV shareholders might even be located offshore for tax reasons;

   - The shareholders of the SPV will, most probably, not have to consolidate their investment in the SPV into their accounts. Hence, the costs and returns of the SPV, i.e. the PPP concession, will not be visible through parent company accounts;

- The government or government agency, who awarded the PPP and who will be contractually obliged to pay unitary payments, e.g. availability, through the life of the PPP concession, will have moved, via the PPP structure, the obligation to pay from the Capital to Current Account. Under many regimes, therefore, the expenditure on servicing the PPP becomes a current expenditure and effectively removed from sight.

- Finally, the incentive for both PPP shareholders and participants and for governments to be transparent is removed by PPP's!! SPV shareholders will not wish the public/taxpayer to know, or be able to assess, how much money they are making from investing in PPP's, and the governments will not wish to be open to criticism by the public and taxpayers for unwise investments. PPP's largely remove this possibility.

Conventional public asset procurement is much more transparent in comparison.

Unless the issue of transparency through all PPP project phases is tackled, PPP's will be open to hidden abuse and manipulation.

6. The Treaty also promotes the internal market and competition. However, in many ways PPP's have retarded progress towards competition.

   Experience over the last 10-15 years of PFI/PPP's in many sectors have shown the number of serious bidders are low, - sometimes lower than what many IFIs' would deem "competitive" under their procurement rules. Furthermore, in many instances the number of bidders is decreasing with time, as companies are reluctant to commit to the inherent, high up-front costs of the process.

   An additional negative impact of PPP's is that the adoption of PPP's has in some sectors, e.g. water, created private sector monopolies, which have to be heavily regulated if the public interest is to be protected.

   The inherent complexity of PPP's dictates against significant changes to this scenario in the future. The high up-front costs of PPP's determine for many companies and financiers a minimum PPP project value below which they will not express interest. Furthermore, there is a fixed up-front cost element applying for all PPP's, which is unavoidable. The result is that many companies, who are less well resourced, experienced and informed as to what are their rights and obligations under PPP projects, are tempted to enter the market, but are found wanting in the event, to the ultimate disadvantage of the public. Finally, experience has shown that when a new, small entrant to the PPP market is seen to be successful, it is often later swallowed up by one of its larger, PPP competitors!

7. There are significant differences in EU Member countries as to the underlying legal framework and practice relating to public/private sector projects and the normal conduct of companies. In the UK, Anglo-Saxon law allows for termination, bankruptcy, etc. of PFI/PPP concessionaires. The same does not necessarily apply in other EU Member States, who have different legal procedures in such circumstances.

   A good example, cited in the Green Paper, are the circumstances surrounding "step-in" rights. In any normal off-balance sheet project financing conducted by the private sector, lenders will insist on "step-in" rights in the event of failure to perform by the project owners. As lenders may be providing 50-90% of the funding, is this not reasonable, irrespective of anybody's procurement rules??

For the EU to place any limitations on such a procedure will be against all fundamental private sector project financing principles and deter the main private sector financiers (i.e. lenders).

It has been noted, however, that in some EU Member jurisdictions such "step-in" rights under PPP's may be constrained. This implies that some risk (and, therefore, contingent liability) is retained by the host government, limiting the "off balance sheet" nature of the transaction.

In the short-term, any prospect of convergence on these matters seems remote, if ever. Hence, the prospect of any meaningful EU-driven framework initiative for PPP's in this area is unlikely to succeed. Moreover it may confuse!!

8. The Green Paper fails to address issues of conflict of interest, both within bidding groups, concessionaires, PPP participants and advisers. Again, the EBRD and World Bank criteria on such issues have much to commend, in the absence of an EU alternative.

9. Another issue, upon which the Green Paper remains silent, is the topic of innovation, i.e. when a promoter presents a PPP scheme, which has not been the subject of a public bidding process, for adoption by the host government. The EU would be well advised to adopt the "Swiss Challenge"-type of procurement procedures in such circumstances, as have the IADB and ADB, so that PPP innovation can flourish.

10. The Green Paper has also not given consideration to the possible transfer or sale of PPP SPV shareholdings, which experience has shown often arises after a few years' PPP operations. In the same context, no consideration has been given to the potential desirability and impact of the development of a secondary equity market in PPP SPV shares.

    Such sales and transfers have both beneficial and negative impacts. On the one hand, the sale or transfer of SPV shares to third parties will broaden the investor interest and involvement in the financial markets for PPP ventures, increasing the overall availability of PPP equity. However, the withdrawal of a key PPP SPV partner at an early stage in a PPP project could weaken the operational strength of the PPP itself, reducing the possibility and opportunity for future operational innovation and efficiencies. Furthermore, the consumers, i.e. the public, will wish to know that the owner of any PPP, of whose services they avail themselves, has interests and aspirations in line with the public services provided, e.g. they are not casino owners!!.

    In some instances, host governments impose constraints on such transfers or sales, but the rules are not consistent. Some guidelines are preferable to none, if the public interest is to be protected.

Conclusion:

The consultation process for this Green Paper is in many ways admirable. However, it is a pity that the Commission has not felt bold enough to produce a draft Directive, to which one might comment or respond, rather than raise through a Green Paper some questions, whose relevance and inherent understanding of the topic of PPP many might question.

On reflection what is called for are:-

(a) A set of EU Procurement Guidelines, which are clear, readable, comprehensive, unambiguous and unequivocal, and which address the issues of public/private PPP-type structures, transparency, competition, and conflicts of interest; and

(b) Guidelines for the Good Governance of PPP's, covering transparency, accountability, the conduct of on-going PPP operations, and the inherent contingent liabilities of PPP's.

I fear that the Green Paper misses the target on both accounts.

Your Ref:
Our Ref:
Date: 30 July 2004

Dear Sirs

GREEN PAPER ON PUBLIC-PRIVATE PARTNERSHIPS AND THE COMMUNITY LAW ON PUBLIC CONTRACTS AND CONCESSIONS

I should be obliged if you would note, at the outset, that the views expressed in this letter are my personal views, as an experienced PFI / PPP practitioner, and may not necessarily represent the views of the Highland Council.

I welcome the current initiative which attempts to clarify and extend community law relating to Public-Private Partnerships.

I also welcome the recognition that it may be necessary to utilise a **competitive dialogue procedure** at the conceptual stage in order to formulate proposals that can be encapsulated within Output Specifications, and the like, at a later stage in the procurement process.

I particularly welcome the development of the concept of the **Institutional PPP** that will set out the legal framework for the establishment of an entity held jointly by both public and private sector parties. This will overcome the current difficulty that a public body has if it wishes to provide services to its private sector partner. The proposed arrangement would appear to make it possible for the public sector to provide services to the private sector should it be value for money to do so. This is important for local authorities such as the Highland Council as we provide a range of services to the general public, over a 26,500 sq. km. area, and where there may be a shortage of private sector organisations capable of delivering an efficient service in a cost-effective manner.

The new arrangement will ensure that the European Union's rules on **Public Procurement** for **Public-Private Partnerships** will apply to **Joint Ventures** thereby ensuring consistency of approach and transparency of procurement and operation. The proposals will also give greater flexibility to the procurement approaches adopted by the Highland Council.

I hope these comments are of some assistance.

Yours faithfully

Alister W. Coutts

Dr Alister W Coutts
Director of Property & Architectural Services
& PPP Projects Director

Dear Sir,

May I make some observations on your Green Paper on PPP? They are at quite a high level, and there are in addition many other detailed points which can be made but would be appropriate for a document covering best practice.

- The primary objective of a PPP should be VFM - getting the best value for public money. Objectives such as effective competition and legal clarity should have subsidiary roles - they both exist to help achieve the best course of public action. [paragraph 7 & others]

- The public sector should determine its best strategy according to its business case for each of the options it faces. Within its political constraints, each PPP decision it makes should have a financial basis for selecting an option. [paragraph 7 & others]

- The emphasis should be on deals, not rules. In arriving at the best deal, public sector negotiators should have maximum flexibility and minimum constraints, and be supported by guidelines and best practise. [paragraph 31]

- Before the concession is contractually agreed, public sector control is exercised by the procurement process, including the type and degree of competition needed in the public interest. After the concession is contractually agreed, public sector control is defined by the concession contract itself. [paragraph 22]

- In the UK, we tend to mix the definitions of PPP and PFI. Many contracts provide both a direct service to the public as well as an infrastructure service to a public authority. [paragraphs 22 & 23]

I hope these points are useful.

With best regards,

David Iron
PPP/PFI Adviser

ANSWERS

TO THE CONSULTATION ON

EUROPEAN COMMISSION

GREEN PAPER ON THE ENHANCEMENT OF THE EU FRAMEWORK

FOR INVESTMENT FUNDS

15 November 2005

General assessment

The Italian Banking Association (ABI), with over 800 member banks, represents the entire Italian banking industry. Generally speaking, we agree with the analysis set out in the Commission Green Paper on the Enhancement of the EU Framework for Investment Funds. In particular, Italian banks concur on the need to devise a series of measures to foster the development of the European investment fund industry based on the legislation currently in place.

Directives 2001/107/EC ("UCITS II") and 2001/108/EC ("UCITS III"), supplementing Directive 1985/611/EC ("UCITS I") have only been in force for just over a year, so their impact on the state of the investment fund industry cannot yet be adequately gauged.

Moreover, the supervisory approach of national authorities in interpreting and implementing UCITS directives is very different, so that it is premature to adopt a new directive as provided by the Lamfalussy procedure, a principle-driven one, until we have to achieved real convergence in supervisory approaches between EU Member countries.

Rather than a full legislative revisitation of asset management, which would be lengthy, complicated, and hence of dubious cost/benefit value, what is needed, in our view, is a series of initiatives to overcome, in the short term, the main problems in implementing the amended UCITS directive, which largely coincide with those indicated in the Green Paper, and -- in the medium to long term -- to foster a common regulatory approach on some key general matters, including products that substitute for investment funds (unit-linked insurance policies and structured products), hedge funds and private equity funds.

Changes to existing legislation -- Priority actions

Q1: Will the above initiatives bring sufficient legal certainty to the implementation of the Directive?

The initiatives designated as priority actions in the Green Paper -- i) eliminating the uncertainty surrounding the recognition of funds launched during the transition from UCITS I to UCITS III; ii) simplifying the notification procedure for passporting funds; iii) implementing the Commission's Recommendations on the use of derivatives and the simplified prospectus to improve risk management standards and fee transparency; iv) further clarifying the definition of eligible assets -- certainly reduce the areas of uncertainty that now exist, due to the differing ways in which national authorities have interpreted and implemented the UCITS directive in national law and regulations.

We therefore agree on the need for the swiftest possible completion of the work that the Commission and the CESR have begun on these issues, so as to hasten the transition from mere recommendations to legally binding provisions.

However, these initiatives are not sufficient to guarantee legal certainty to the implementation of the directive. Further initiatives are also needed (see answer to the Q2 below).

Q2: Are there additional concerns relating to day-to-day implementation of the Directive which need to be tackled as a priority?

In our view there are at least three problems in implementation that require priority action and that the Green Paper must accordingly mention.

1. First, we urgently need solutions, and pragmatic ones, to spur convergence among the supervisory approaches of different national authorities. These are particularly distant today, among other things because in some Member States UCITS are traditionally designed almost exclusively for marketing abroad, and those States are thus less interested than others in providing adequate investor protection. Typical here is Luxembourg, which despite its limited pool of resident investors sells units of a large number of UCITS in other EU Member States.

In our view, the CESR should adopt procedures for:

- sufficiently frequent periodic verification of the persistent gap in supervisory approaches within the EU;
- publicizing the outcome of the verifications;
- devising appropriate case by case solutions to narrow the gap.

Where solutions appear most urgently needed is on the prospectus, which even in the simplified form of Directive 2001/107/EC has differing content in different States.

2. Second, there is an aspect concerning the funds rules, which are mentioned in Articles 28 and 29 of the UCITS directive but left entirely up to national law. This state of affairs, together with the fact that under the directive the issuer can leave out of the complete prospectus information that is given in the fund rule and not attach the rule to the prospectus, means that in practice the information and contractual documentation of UCITS is anything but uniform.

The areas in which uniformity of information on fund rules are most necessary are:

- the way in which investment limits are set out;
- the thresholds of tolerance/irrelevancy of error in calculating unit values, which are sometimes envisaged in the regulations of individual Member States but for the most part are not specified.

In this regard, an initiative (e.g. a Recommendation) is needed to harmonize the modes for setting out both investment limits and any threshold of irrelevancy of error in calculating the value of the unit adopted by funds rules in conformity with national regulations.

3. Finally, in line with actions on eligible assets, let us stress the need for a Recommendation to harmonize the rules on securities lending by UCITS in order to foster convergence on ceilings for such operations and on the use of the proceeds.

Making better use of the current legislative framework

Q3: Would an effective management company passport deliver significant additional economic advantages as opposed to delegation arrangements? Please indicate sources and likely scale of the expected benefit.

In our view an effective management company passport may be more effective than delegation arrangements, given that it would eliminate or at least reduce resort to delegation, which implies that some activities performed by third parties also in other Member States are controlled, at least, by the management company.

The advantages, however, depend on the solutions adopted to ensure that the management company interacts with the supervisory authorities in the States where the funds are instituted.

Thus we agree on the desirability of an effective management company passport, but we should like to emphasize that rules are needed for the appropriate subdivision of supervisory tasks on management companies between the competent authorities of the different Member States.

The Commission, with the CESR's support, should therefore draft an initial proposal, highlighting the advantages and disadvantages of the main features in connection with the effective management company passport.

Q4: Would the splitting of responsibility for the supervision of the management company and the fund across jurisdictions give rise to additional operational risks or supervisory concerns? Please describe sources of problem and steps that would have to be taken to manage such risks effectively.

We do not think that the splitting of responsibility raises any special problems, even for operational risks, provided that the rules for the division of competence and the operational procedures for their implementation are clearly defined.

The fact remains that the purpose of the management company passport is to foster efficiency in the European investment fund industry without jeopardizing investor protection, which is one of the distinctive features of UCITS, and that this point must be taken into account in defining the above-mentioned rules.

Q5: Will greater transparency, comparability and attention to investor needs in fund distribution materially enhance the functioning of European investment fund markets and the level of investor protection? Should this be a priority?

Distribution is certainly essential to the investment fund industry. The distribution network is responsible for relations with investors both in initial subscription and subsequently, when investors may want to switch or redeem their units. Depending on the sales policy of the distribution intermediaries themselves, this activity may involve group or third-party UCITS, both Italian and foreign, and may be remunerated by remission of management fees by management companies.

The idea of fostering transparency in the costs of distribution and clarifying the applicable conduct of business rules is a good one, considering that it is in line with recent choices on the part of the Italian supervisory authorities.

Nevertheless, in our view a number of aspects relevant to framing future EU initiatives properly, need to be cleared up at the outset:

- the indication of information on distribution network costs must be: i) readily comprehensible to investors and consistent with the criteria used in remitting management fees to distributors, which generally have incentive mechanisms, with differentiated rates depending on the number of units sold in a given period (often, quarterly); ii) regulated in order to avoid distortions, which would be the risk if the cost of each single distributor had to be indicated: iia) when management companies use the distribution network of a third party this could result in moving to the maximum remitting rate, once it is clear what the limit is; iib) when distribution networks market many asset management products, that they may offer them without indicating the distribution cost. As a consequence concise, synthetic ways of showing these costs must be found. In Italy, considering the technical and commercial problems with such indication, the new rules require that the simplified prospectus specify the average management fee remitted to salesmen;

- the best forum for displaying this "synthetic" information would appear to be the simplified prospectus, which should be supplemented accordingly, especially for UCITS marketed in more than one Member State, considering that every State will have a different distribution network and hence a different cost;

- rules of conduct for salesmen must be consistent with the provisions of the MiFID on investment services. The distribution of investment fund units, in fact, can be classed as part of the service of placement of financial instruments, and as such is subject to MiFID and the implementing measures now being issued on placement services. From this standpoint, the rules applying to the sale of UCITS need to be specified as regards:

  a. suitability*,* considering that orders to buy and to redeem UCITS units (as non-complex instruments) could be deemed eligible for execution without assessment of suitability (*execution only*);

  b. the information that the salesman must give to the investor;

  c. advice, specifying in particular that this is not part of the marketing service but is to be considered as the investment service of "providing investment advice".

Q6: Will clarification of "conduct of business" rules applying to firms which retail funds to investors contribute significantly to this objective? Should other steps (enhanced disclosure) be considered?

Certainly clarification of the conduct of business rules applying to firms selling funds to investors is needed, in order to bring about convergence of supervisors' approaches in different countries and thus foster a level playing field. See, therefore, the answer to Question 5.

Q7: Are there particular fund-specific issues that are not covered by ongoing work on detailed implementation of MiFID conduct of business rules?

The specificity of investment funds is the lack of a clear perception in all Member States, today, of:

- the fact that distribution is an investment service;
- the role of distributors in the interval between sale and subsequent orders by investors (redeem, buy new units or new segments, switch to other funds).

Accordingly, we think that once the MiFID implementing measures are passed the CESR must clarify the specific modes of application to distribution of UCITS.

Long-term actions

For industry efficiency

Q8: Is there a commercial or economic logic (net benefits) for cross-border fund mergers? Could those benefits be largely achieved by rationalisation within national borders?

Cross-border fund mergers need to be favoured, because they can generate specific scale economies, as the resulting product will be marketed in various States. Isolated instances of mergers have occurred, but they turn out to be highly complex and not even always possible, because of the constraints of national laws (in particular, fiscal treatment).

From this perspective, Italian banks consider that the Commission should undertake specific surveys to identify the present impediments to cross-border mergers and on this basis, within the CESR as well, conduct a discussion on possible solutions.

The industry attaches great importance to such an initiative.

Q9: Could the desired benefits be achieved through pooling?

Theoretically, fund pooling could produce economies of scale in management. In our view, however, the risks (of which the background document to the Green Paper gives examples) -- circumvention of the investment ceilings on individual pooled funds and, especially when funds are governed by different national laws, of problems in division of responsibility for investment decisions -- substantially outweigh the benefits and do undermine the level of investor protection of the funds.

Q10: Is competition at the level of fund management and/or distribution sufficient to ensure that investors will benefit from greater efficiency?

The investment fund industry architecture is already open in terms of competition between management and distribution companies, as is shown especially in some countries by:

- the increasing sales of foreign fund units. In Italy, for instance, the number of domestic funds (1623) is much lower than that of foreign funds whose units are marketed (3183);
- banks' offer of third-party investment funds.

Achieving benefits in terms of efficiency for investors implies the adoption of all the measures described in our answers to the preceding questions.

Q11: Which are the advantages and disadvantages (supervisory or commercial risks) stemming from the possibility to choose a depositary in another Member State? To what extent does delegation or other arrangements obviate the need for legislative action on these issues?

Passport for depositaries are a long-run objective, and in any event one that can be pursued only on condition that roles, responsibilities and requirements are strictly harmonized. To introduce the passport without harmonization of the rules governing depositaries would introduce market-distorting arbitrage between national rules.

Harmonization is thus a prerequisite to a depositary passport in order to ensure cost reductions, a level playing field for depositary banks and an equal level of investor protection.

Today, focusing on the costs of depositaries is misleading, insofar as these costs are different and proportional, in each Member State, to the activities depositaries are required to perform under national law.

1. Let us recall that there are major differences in the approaches of the various Member States in this field, some of which are mentioned by the Comunication from the Commission on "Regulation of UCITS depositaries in the member States: review and possible developments" (30 march 2004). They may have different provisions concerning:

- who is allowed to act as depositary;
- the level of responsibility in calculating the value of units and the conduct of controls, the custody of financial instruments and of funds' liquidity, as well as checks on the legitimacy of instructions from management companies.

Moreover, the idea that instituting a European passport for depositary banks is a way of achieving economies of scale and thus reducing costs for investment funds needs careful analysis. The passport would allow depositary banks to centralize a number of operations in a single State, and thus reduce costs. But it would not remove the need for the depositary to comply with the regulations of the various States in which it performs its activity. The complexity of the organization that the bank would have to create to meet the specific requirements of national regulations could perceptibly diminish scale economies.

2. The existing differences between national regulations on depositaries reflect the divergent approaches on investor protection, and they mean that the service offered by the depositary differs from one country to another, and so therefore does the cost.

3. Soon the extension of the categories of financial instrument in which UCITS can invest under Directive 2001/108/EC, such as OTC derivatives and non-harmonized investment funds, such as closed-end and hedge funds, will make UCITS business more complicated, which implies a greater involvement of the depositary bank in investor protection.

4. From another standpoint, future rules changes will have to redefine the role of depositary banks as regards verification of legitimacy in executing asset management companies' instructions, which must be separate from the liquidation of the instructions in the regulated market. This necessity follows from the growing complexity of investment techniques and from the evolution of settlement systems.

Q12: Do you think that on-going industry-driven standardisation will deliver fruit within reasonable time-frames? Is there any need for public sector involvement?

As long as the directive is differently interpreted and differently implemented depending on country, standardization will be hard to achieve. To make industry-driven standardization possible, we must eliminate those interpretative and implementing differences by increasing convergence in supervisory approaches and where possible legally binding provisions.

Q13: Does heavy reliance on formal investment limits represent a sustainable approach to delivering high levels of investor protection?

Formal investment limits certainly represent an effective way to guarantee high levels of protection for retail investors. For institutional and professional investors as defined in MiFID, however, multiple limits constitute an unwarranted rigidity. Therefore, in order to favour the growth and innovation of UCITS, it might be helpful to differentiate the investment limit regime depending on whether the funds' are designed for the general run of investors or for special categories.

Q14: Do you think that safeguards -- at the level of the management company and depositary -- are sufficiently robust to address emerging risks in UCITS management and administration? What other measures for maintaining a high level of investor protection would you consider appropriate?

The safeguards envisaged in the UCITS directive are sufficient to deal with the new risks stemming from innovation in investment techniques, on condition that there is convergence on the way the various safeguards are interpreted and implemented: eligible assets, depositary bank, internal control systems with special reference to techniques for monitoring financial and operational risks.

Competition from substitute products

Q15: Are there instances resulting in a distortion of investor's choice that call for particular attention from European and/or national policy-makers?

Investment funds face competition from some substitutes that enjoy less strict rules on information transparency for investors, such as certain structured products and unit-linked insurance policies. This distorts competition and lowers the level of investor protection.

In our view, therefore, there is a need to begin a process, which may well be medium term, to overcome this regulatory disparity.

The European market in alternative investments

Q16: To what extent to problems of regulatory fragmentation give rise to market access problems which might call for a common EU approach to a) private equity funds; b) hedge funds and funds of hedge funds?

Some Member States have passed specific rules for hedge funds, including those structured as funds of funds, but taking totally different approaches depending on the priority assigned to investor protection. The result is fragmented regulation and national barriers that prevent an enhancement of the European industry in these alternative investment products.

We accordingly consider it necessary to begin a process of convergence in regulatory approach, but limited to a few especially important issues for investors (such as the minimum subscription threshold and information requirements).

Q17: Are there particular risks (from an investor protection or a market stability perspective) associated with the activities of either private equity or hedge funds which might warrant particular attention?

The Italian banking industry believes that in any Community regulatory initiatives the main focus must be on informational transparency on the risks associated with private equity and hedge funds (typically, volatility and liquidity risk).

Q18: To what extent could a common private placement regime help to overcome barriers to cross-border offer of alternative investments to qualified investors? Can this clarification of marketing and sales process be implemented independently of flanking measures at the level of fund manager, etc.?

A common placement regime could certainly help to reduce the fragmentation currently characterizing the European private equity and hedge fund industry. However, action in this sphere must be undertaken jointly with action on the other issues of specific relevance for these types of fund (see answer to Q16).

Modernizing UCITS law?

Q19: Does the current product-based prescriptive UCITS law represent a viable long-term basis for a well-supervised and integrated European investment fund market? Under what conditions, or at what stage, should a move toward principle-drive, risk-based regulation be contemplated?

As matters now stand, in our view it is premature to try to assess the effective ability of UCITS law to sustain the development of European investment funds in the long run. To be able to institute principle-driven legislation we would first have to achieve real convergence in supervisory approaches between EU Member countries and complete the priority short-term actions of CESR and Commission.

ASSOGESTIONI
associazione del risparmio gestito

Milan, 15 th November 2005

Mr. Alexander Shaub
Director General
DG Internal Market and
Service
European Commission
Markt-consult-
investmentfund@cec.eu.int

Prot. N. 829/05

Dear Mr Shaub,

Assogestioni, the Italian Association of the Investment Management Industry, appreciates the Commission's initiative and is glad to participate in the consultation on the Green Paper concerning the strengthening of the legal framework relating to investment funds in the European Union.

Assogestioni represents one of the largest investment management industries in Europe and its members include Italian investment management companies of both banking and insurance affiliation as well as independent companies, the main foreign management companies operating in Italy, investment firms and banks offering portfolio management services and pension funds.

At the end of August 2005 its 226 members managed, as segregated portfolios and collective investment schemes, around 1,016 billion euro.

Assogestioni is a member of EFAMA (European Fund and Asset Management Association) and EFRP (European Federation of Retirement Provision).

Assogestioni has worked in close collaboration with EFAMA, and broadly supports EFAMA’s position, with particular regard to the short-term priorities. Therefore, in our considerations we will keep to the matters that are more specifically of interest to members of Assogestioni.

We are at your disposal for any further information and we look forward to contributing to the future regulatory work of the Commission.

With kindest regards,

Director General

Fabio Galli

A. GENERAL ASSESSMENT

Our preliminary considerations will cover 4 main topics:

1) the future leading role of the Commission;
2) the broader landscape of investment products regulation;
3) the case for further harmonisation;
4) the long term view.

A.1 The leading role of the Commission

The aim of the Green Paper is to analyse the structure of the investment management industry, with particular regard to UCITS, and to assess the regulatory changes needed to improve its efficiency and competitiveness, to the benefit of both investors and management companies.

We believe that an open and extensive consultation by means of a Green Paper, while representing an excellent first step, must necessarily lead to a conclusive assessment under the Commission's leadership. Indeed, we advocate that, in a complex and fragmented environment, where a vast number of issues and stakeholders might have divergent views, the Commission should take it upon itself to steer the legislative process in accordance with well identified guidelines.

A.2 The broader landscape of investment products regulation

While sharing most of the premises evoked by the Commission, we wish to emphasize that the elements of inefficiency identified are in many cases attributable to the market structure and to the regulation of related sectors, particularly the banking and insurance sectors, whose role in distributing investment funds and/or producing substitute investment instruments is also decisive for the level of competition in the investment management industry. Thus the inefficiencies that the Green Paper intends to analyse should be assessed in the wider framework of the regulation of financial, banking and insurance intermediaries, comparing the regulatory framework of investment management companies to that of other players involved in the distribution and production of substitute investment products.

Should that not be the case, there would be a significant risk of introducing costly and complex regulatory changes that would be of little effect or, even worse, that might lead to a worsening of the competitive landscape.

By way of example, investment flows in the cross-border retail market are in many cases determined by the distribution policies of banks and other authorised intermediaries; in a number of cases distribution policies are more important than the individual client’s decision-making process. In this sense, flows of investment fund subscriptions are often determined by the practices of distributors, hence regulation of distributors could be more relevant than the regulatory system governing investment management companies.

A.3 The case for further harmonisation

Assogestioni believes that harmonisation of new types of funds should be assessed with the aim of allowing retail access to techniques and types of investment which could provide for better diversification, better risk spreading and return improvement. Such investment classes would otherwise remain the reserve of high market segments, such as private banking or institutional investors, to the detriment of the smaller investor.

In addition, there is no evidence that harmonisation pre-empts or affects the development of non-harmonised products. In fact, harmonisation can be conducive of a higher level of trust and protection among both retail and institutional investors. Should harmonisation crowd out non-harmonised products, that would be a market response to the benefit of regulation.

Harmonisation has already proven to be a strengthening factor for the whole European investment industry, which has remained largely unaffected by frauds and malpractices and has consequently been able to market the UCITS label worldwide. Such an approach could be extended to other types of funds to the benefit of the competitiveness of the European industry.

A.4 The long term view as the way forward

There is ample evidence of the fact that resolution of the majority of the so called priority matters, as identified by the Green Paper in the chapter “Making existing legislation deliver”, is already underway with the assistance of the CESR in the ordinary revision procedure and will only need the next 12 to 18 months for a satisfactory resolution.

It is therefore vital that the Commission commits itself on the matters referred to under chapter 3 (“Beyond the existing legislative framework”). The Green Paper will only be able to be an effective guide to the Commission’s action if the in-depth analysis leads to a review of the overall legal framework, which requires particular effort with regard to consistency and linking with the legislation of the related sectors referred to previously. Without such an effort, the Green Paper would otherwise remain an exercise of limited significance, that disregards the asset management industry’s development requirements in the medium and long term.

With these general considerations in mind and in addition to the detailed EFAMA response to the Green Paper, we wish to focus our considerations on some issues both as regards priority actions, and long term challenges.

B. PRIORITY ACTIONS

B.1 Management company passport

We consider it useful for the European Commission to intervene to clarify whether "an open ended investment company" may designate management companies having their registered offices in another Member State.

As indicated in the CESR consultation document on the Guidelines for the implementation of the transitory measures contained in directives 107/2001/EC and 108/2001/EC on this matter, there is no convergence of all Member States. For instance, the Italian Consolidated Finance Law (Legislative Decree 58/98) was amended to provide open ended investment companies with the possibility to designate harmonised management companies authorised in other EU States. This choice, which we feel is in line with the objectives for the creation of a European passport.

Along this line the Commission should provide the possibility for a management company to set up mutual investment funds in another member state. Although the Directive introduced the possibility of delegating certain company functions to third parties in order to provide the industry with greater flexibility, the instrument under discussion does not appear to be the most suitable mean for achieving its intended purpose. The delegation of functions, by its very nature, requires the delegating party to be always responsible for the activities carried out by the delegated party. Evidently, such requirement pre-empts a wide use of delegation. This problem is ever more evident whenever the delegator and delegated company are not in the same member state and the possibility of control by the former over the operations of the latter may be reduced. In such a framework, it is felt that a valid alternative to delegation, of some or of all company functions, could be provided if, *ab origine*, the roles of fund management and of promotion are split between two different investment management companies, along the lines of the applicable Italian regulations on the subject.

The fact that the management companies would consequently be subject to monitoring by Supervisory Authorities belonging to different Member States does not seem to be an obstacle to the aforesaid approach. It is in fact felt that with regard to the duties of the CESR, the latter may carry out a role of coordination between the Supervisory Authorities, possibly also through the creation of "harmonised" control procedures.

B.2 Distribution, sales and promotion of funds

B.2.1 Transparency

It could be argued that, with regard to the standards of information to the public currently in force for fund subscribers, there is already an overload of information. There is no apparent need for further requirements, which could actually prove detrimental to the ability of the investor to select the appropriate fund. More effectively, the standardisation process, which is being applied in the context of the simplified prospectus, should be extended to all investment instruments that are not currently covered by any regulation in this regard.

Moreover, the level playing field with other financial and insurance players would greatly benefit if standard requirements were applicable not only to *ex ante* transparency (information from prospectus) but also to ex post information. It is indeed of the utmost urgency to implement legislation on the subject of continuous information (periodic ex-post reporting) for substitute investment products. There is ample evidence that league tables of insurance and structured products are not currently possible due to lack of comparable information of net returns.

B.2.2 Conduct of business rules

On the matter of conduct of business rules, it is of the utmost urgency to extend the MIFID regulations on conflicts of interest and on client suitability also to insurance intermediaries. Again, while emphasis placed on the transparency of offer conditions is essential, the lack of a uniform regime for conduct of business rules of all players undermines the level playing field of their business operations.

C. LONG-TERM CHALLENGES

Need they be long term ?

The matters requiring a more systematic and detailed evaluation are not necessarily long term. New pieces of regulation may be required in order to create a coherent level playing field, but the UCITS regulatory system already possesses solid regulatory principles which only need to be clarified, sometimes detailed, and coordinated with those of other directives that already exist.

In general our members feel that an overall review of the architecture of the investment management regulation is necessary, with the aim of removing the current regulatory asymmetries regarding offer of services and products of a banking, financial and insurance nature having similar features and characteristics. The progress achieved by means of the Lamfalussy procedure in the matter of securities regulation leads us to suggest its further application to investment management regulation.

More in particular we deem that the revision of the regulatory framework should pay specific attention to a number of matters, namely:

1) fund governance and fund oversight;
2) distribution of funds and related products;
3) harmonisation of other types of funds.

C.1 Fund governance and oversight

C.1.1 Two levels of oversight

It would appear to be necessary to define the European fund governance model more precisely, i.e. to specify the duties and responsibilities of the depositary bank. Although the industry can claim an impeccable track record, cases of crises or fraud must be prevented through harmonised mechanisms of control and responsibility.

The European regulatory framework attributes a pivotal role to the depositary bank. Such approach should be further developed and promoted as the key feature of investor protection. In order to do so, a two tier governance system would allow an important degree of flexibility while preserving the key role of the depositary.

The two levels of harmonised fund governance may be envisaged as follows:

1) a minimal and compulsory oversight level, revolving around the depositary bank;
2) an additional optional level, which can be freely turned down by the individual jurisdictions or even by individual management companies, that could see the role of other parties, such as auditors or independent directors.

C.1.2 Passport of the depositary bank

We believe it necessary to proceed with a precise harmonisation of the functions of the depositary, at least with regard to the following topics: core functions of the depositary, conflicts of interest in case of affiliation, the respective liability to the shareholder of the management company and the depositary.

In this context, however, we believe that the most relevant issue is represented by the responsibilities of the depositary bank. In fact, although the minimum responsibilities of the depositary are, in theory, harmonised by the Directive, differences in the national legal systems in the Member States create a plurality of approaches, or worse, an area of uncertainty.

Once the respective responsibilities are clearly defined, a passport for the depositary would be more acceptable from the regulators' point of view and easier to implement.

C.1.3 NAV calculation, errors and materiality thresholds

It would seem opportune to tackle the question of the incorrect valuation of fund shares, if necessary through intervention by the CESR. Given the current situation of different thresholds in each member state, it would be particularly desirable to establish a Europe-wide "harmonised" error materiality threshold.

Each jurisdiction currently follows an individual approach, whereas it is clear that the fund shareholder, who should be able to rely on a harmonised system of NAV adjustment for UCITS funds, must be equally protected regardless the origin of the product. Different systems imply that fund subscribers may be significantly penalised or favoured during the subscription or repayment phase depending on the fund's jurisdiction of origin.

C.1.4 A revision of risk control regulation

With regard to the extension of the limits of fund investments, it is widely felt that a detailed examination on the matter of risk control should be addressed. A clear definition of the function of the risk compliance and of alternative applicable risk monitoring techniques would seem urgent in this context.

C.2 – Distribution

In order to enhance the cross-border competitiveness of the investment funds industry, there need to be a separate framework of responsibilities applicable to the distributor. The contractual relationship between the mutual fund and the client could be distinguished from the contractual relationship between the distributor and the client. This latter contract could regulate, among other provisions, a specific fee for the advisory service.

Finally, as regards the question of a private placement regime, we believe that it would be in the best interest of investors and of the investment industry to harmonise the definition of qualified investor.

C.3 Alternative investments: new types of funds

A high degree of investor protection is not so much guaranteed by the kind of assets that can be included in the UCITS portfolio but rather by the degree of transparency of the instruments which allows the manager to identify the risks connected to the investment product and to adequately diversify them. It is significant that the initial resistance to include derivatives among eligible assets may be considered as fully overcome. Instead a particular emphasis has been put on the risk management process.

C.3.1 Funds of hedge funds

It would be desirable to proceed to an overall harmonisation of investment products intended for retail investors. To this end, the conditions already exist for an amendment of certain specific provisions of the Directive in order to encompass various kinds of non-harmonised funds for retail investors. Such amendment would not even require the broader revision that we advocate.

A similar conclusion, moreover, is reached by a survey carried out by EFAMA and Assogestioni with reference to hedge funds. This survey, soon to be published, highlights the existence of a partial “de facto harmonisation” of the regulations on hedge funds in nine European member states. All these member states qualify hedge funds as collective investment schemes; they prescribe the same structural options as the UCITS directive; they impose the presence of both an authorised investment management company and of a depositary bank; they call for specific professional requirements for company directors that set up a hedge fund; they prescribe standards of transparency of information regarding the risks associated with the hedge fund.

On the other hand, the above-mentioned survey shows elements of divergence in the regulatory approaches of each Member State, for instance: a minimum subscription amount for the purchase of hedge fund shares is not always prescribed nor a maximum number of participants in the fund imposed; moreover, for those hedge funds where “retailisation” is allowed, regulation does not mandate identical restrictions on investments (in terms, for example, of limits on the use of leverage or, for the fund of funds, of hedge fund targets in which to invest).

In this context, Assogestioni considers it appropriate to undertake initiatives for the harmonisation of funds of hedge funds which may be offered to retail investors. This could be done within the context of the UCITS Directive by taking at least the following aspects into account: 1) the recognition of the possibility for a UCITS to invest its assets in hedge fund shares; 2) the provision of less prescriptive risk spreading limits on investment with respect to those envisaged by the current types regulated by the UCITS Directive, and ample possibility of recourse to financial leverage; 3) the provision of specific standards of transparency of the risks associated with hedge funds; 4) regulation of the role of the prime broker; 5) the so-called “insolvency” of the hedge fund, where the fund’s assets are not able to cover the obligations assumed in its name by the manager towards third parties.

C.3.2 Venture capital and real estate closed-end funds

Up to now only open-ended funds have benefited from harmonisation. There is widespread agreement in a number of jurisdictions that closed-end funds are a suitable investment vehicle for the retail market. Furthermore, harmonisation is often perceived by institutional investors as robust guarantee of investibility.

Harmonisation of closed-end funds should define the following structural aspects, inter alia:

1. constraints and conditions of subscription and redemptions of shares;
2. eligible assets, risk spreading rules and other limits to investments;
3. fund governance rules which are specific to closed-end types of funds;
4. listing requirements.

Comments of the
Federal Association of the German Cooperative Banks/
Bundesverband der Deutschen Volksbanken und Raiffeisenbanken
(BVR)
on the European Commission's
Green Paper on the Enhancement of the EU Framework
for Investment Funds (SEC(2005)947)
of 12 July 2005

Berlin, 14 November 2005

I. Introduction

We thank the European Commission for the opportunity to comment on its Green Paper on the enhancement of the EU framework for investment funds. Before replying to the specific questions posed in the paper, we should like to begin by making the following general points:

May we introduce our association: As the central organization of the cooperative banking group Bundesverband der Deutschen Volksbanken und Raiffeisenbanken (BVR) functions as promotor, representative and strategy partner of its members. 1300 German Volksbanken and Raiffeisenbanken with over 15 million members and some 30 million customers are a pillar of German banking and a major force in the German economy.

We share the Commission's view that the **investment fund industry** has grown dramatically in importance in recent years, not least due to the **increasingly significant role** it plays in provisioning for retirement and building up assets.

With this in mind, it is quite correct to analyse the extent to which the existing UCITS legislative framework is able to accommodate these changes and whether some adjustments may be necessary, particularly to allow greater efficiency in cross-border investments.

At the same time, it should be remembered in this context that tougher distribution standards make the required provision of broad sections of the public with suitable longer-term investment products more difficult. The more complicated and more expensive distribution structures are, the less likely it is that the (broad) sections of the public who are not particularly interested in events on, and the workings of, the capital markets will also be able to enjoy the benefits of investing in financial products. This is the conclusion drawn particularly in the Sandler Report on the British distribution system published in 2002. A major criticism in this report was the **"deterrent effect" of a complicated, difficult-to-understand distribution network for financial products**. In response to the Report, the British government announced that it would be introducing changes to support the provision of all sections of the public with longer-term investment products.

May we specifically point out the following:

- We welcome the Commission's basic approach of focusing initially on exhausting the possibilities offered by the existing legislative framework.
- Before any concrete plans are made by the Commission, we believe it is absolutely essential to carry out a **cost-benefit analysis** examining all the implications of further measures at both European and national level. We are convinced that the findings of both the stock-taking exercise and the impact assessment will confirm that the best way to proceed is by building on the existing European legal framework.
- In view of the **acknowledged high level of protection** offered by European investment law, we see no need for the Commission to take action concerning new risks associated with managing and administering investment funds. The main **existing safeguards** are as follows: The investment firm is monitored and managed by its corporate governance and regularly examined by auditors. The compliance function ensures that market timing and late trading rules are observed. Firms follow voluntary codes of conduct. In Germany, monitoring functions are exercised by the depositary, which, as a bank, is in turn subject to strict supervision. Finally, potential civil law responsibilities also exist. With all this in mind, we are convinced that there is no need for further action at EU level to increase investor protection.
- Reference is made several times in the Green Paper and its supporting documents to possible connections between the quality of investment advice, the interests of the customer and distribution architecture (sale of in-house versus third-party products). In the Commission's background paper, for example, the question is raised in Chapter 3.2.1 as to whether advice offered by a distributor operating in an "integrated architecture" is really in the investor's interests or primarily in the interests of the financial services provider. **We firmly reject the notion that customers are only able to invest in the "best" product in an open architecture** and that there is thus a need for regulatory measures to create an environment of this kind. Instead, we support the view expressed by the Commission on page 35 of the background paper – namely that distributors of third-party funds have incomplete and/or slower access to important product information. The more funds or other investment products distributors include in their active portfolio over and above a certain amount, the less knowledge they will have about each individual product. This highlights the **advantage of the practice common in many European countries of limiting the range of products** on which distributors offer active investment advice. Distributors are able to have comprehensive, detailed and up-to-date information about these products. This enables them to supply advice which is in the interests of the investor and will assist him in making his investment decisions.
- As far as **hedge funds** are concerned, any **regulation – if considered at all – should only take place at international level** so that offshore funds can be in-

cluded. We do not believe that a go-it-alone approach by Europe would serve any useful purpose. On the contrary, it would seriously weaken the internal market for financial services because it would probably trigger a massive exodus of funds from the (then regulated) EU internal market to the (still unregulated) offshore centres. Open-end **real-estate funds** should be recognised Europe-wide as a highly secure and stable retail investment product.

- We understand the reference to the **MiFID** on page 6 of the Green Paper to mean that the marketing of UCITS falls within MiFID's scope. This makes good sense since it makes no difference whether a financial services company sells the investor a share, a fixed-income security or a unit in a fund. We see no need for action going beyond this.

II. Specific questions

Question 1: Will the above initiative bring sufficient legal certainty to the implementation of the Directive?

The **approval process and approval criteria** for cross-border distribution **should be the same throughout the EU**. Standards should be introduced (e.g. specifying a uniform list of requirements to be met, short approval processing periods and default approval times). This is the only way to prevent differences between member states at administrative level.

The **use and risk measurement of derivatives and financial instruments** should be based on a binding **harmonised standard.** Restrictions on the definition of authorised instruments which have no basis in the directive should be avoided.

In some member states – such as Germany – **high standards on cost transparency** have already become established. Such standards, like the total expense ratio (TER), for example, could be used as a **basis for a common European standard**. This would also help to create a level playing field for European suppliers. We understand that the EFAMA (European Fund and Asset Management Association) is already working on a European standard of this kind.

Question 2: Are there additional concerns relating to day-to-day implementation of the Directive that need to be tackled as a priority?

The **time to market** is in **need of improvement** compared to that for rival products. Uniform standards should be established and short approval processing times (e.g. three weeks) prescribed for plain vanilla products. **Approval processing times** of this kind, **after expiry of which approval may be deemed to have been granted**, should cover the above products.

Question 3: Would an effective management company passport deliver significant additional economic advantages as opposed to delegation arrangements? Please indicate sources and likely scale of expected benefit.

We would welcome an effective European passport for management companies. Along with the international distribution of funds, this would open up a further opportunity of establishing and marketing corporate funds in the home state or in a new market swiftly and efficiently. It must be borne in mind, however, that the cost-effectiveness of such an opportunity depends very much on harmonisation of the supervisory criteria. Only if all administrative requirements are defined unequivocally can it be assumed that fund managers will concentrate on a single location and use it as a base from which to launch their products directly in other member states. The main reasons for establishing bases in various jurisdictions were, and are, the continual changes in administrative practices and the legal environment relating to approval criteria and eligible products. Only consistent and reliable standardisation is likely to result in cost savings for fund management companies, which can then also be passed on to investors. More important than an effective European passport for management companies is, however, in our view an improvement in the viability of the European passport for investment funds by, for example, introducing uniform standards and short approval processing periods (see our reply to question 1).

Question 4: Would the splitting of responsibility for the supervision of the management company and the fund across jurisdictions give rise to additional operational risks or supervisory concerns? Please describe sources of problem and steps that would have to be taken to manage such risks effectively.

If administrative requirements and the legal framework are harmonised, the risks will be low. We believe it is possible to make a sufficiently clear distinction between rules relating to companies and those relating to products to avoid overlaps and thus unnecessary costs. A very important point will be to ensure that corporate funds are permitted to delegate totally all administrative responsibilities to a management company.

Question 5: Will greater transparency, comparability and attention to investor needs in fund distribution materially enhance the functioning of European investment fund markets and the level of investor protection? Should this be a priority?

Chapter 2.2.2 of the Green Paper states that investors are faced with increasingly complex products and thus need better and user-friendly disclosure of performance and charges. In chapter 2.3.2 of the background paper, the question is raised as to whether existing disclosure makes all the relevant charges associated with funds sufficiently visible to investors. With this in mind, we assume that the transparency referred to in question 5 relates first and foremost to cost transparency.

We can only confirm the Commission's statement in the background paper that **member states sometimes apply a differentiated approach to the issue of how much information is supplied to investors**. As far as fund distribution in Germany is concerned, we would like to stress that investors are supplied with comprehensive information irrespective of the size of the investment, so that small investors, in particular, can always be sure of having a complete picture of the characteristics of the fund and the associated costs. The **MiFID** and its planned technical implementing measures contain extensive rules which also cover fund units. These are subject to the same requirements as those applying to all other financial instruments. There is no need for any additional rules and regulations aimed specifically at funds. It would be extremely problematic if the MiFID's provisions were called into question before they have even entered into force and been implemented in practice. **We therefore firmly reject any proposals leaning in this direction such those in Chapter 2.3.3 of the background paper**.

As far as the other questions raised in Chapter 2.3.2 of the background paper are concerned, we advocate implementation on the basis of a standard European code of conduct, which could be developed by EFAMA, for example. We understand that EFAMA is already working on pan-European standards of this kind. The Commission should wait until these are finalised and can be evaluated before considering a legislative solution.

Along with such pan-European standards, which should also cover classification, nomenclature performance measurement, etc., competition and generally accessible media will also ensure that the investor, as a responsible consumer, is able to make an effective comparison of products.

Reference is made several times in the Green Paper and its supporting documents to possible connections between the quality of investment advice, the interests of the customer and distribution architecture (sale of in-house versus third-party products). In the Commission's background paper, for example, the question is raised in Chapter 3.2.1 as to whether advice offered by a distributor operating in an "integrated architecture" is really in the investor's interests or primarily in the interests of the financial services provider. **We firmly reject the notion that customers are only able to invest in the "best" product in an open architecture and that there is thus a need for regulatory measures to create an environment of this kind.** The key point is that firms have an obligation to supply customers with "suitable" advice and that this is implemented in practice. There is no indication that this obligation is not being complied with. In the absence of firm evidence of abuse, interference in distribution structures would not be compatible with the Commission's "better regulation" approach. Instead, it should be left to the market to decide which is the preferred distribution structure.

Furthermore, the preference for open architecture is based on a totally unrealistic premise. No bank or financial services provider is in possession of sufficient analyses of the past or potential future performance of all funds available on the market. There are currently 2,353 funds open to the general public operated by German investment firms alone.[1] To these must be added the foreign funds which are open to the general public in Germany as well as restricted-access funds – not to mention the large number of other financial products that would also have to be taken into account when giving appropriate investment advice. **Neither banks nor financial services providers are in a position to monitor the performance and quality of all these funds and other investment products.** Whilst it is true that information about funds is also available from data providers, these normally disclaim all liability for errors. Nor is it possible to access any reliable central and independent compilation of all product information that would allow the "best fund" or the "best investment product" to be determined. **What is more, any decision concerning the "best fund" or the "best investment product" would inevitably relate to past performance.** But there is no guarantee that today's "best fund" will also be tomorrow's. This is why, in the context of the MiFID, the Commission quite rightly requires a description of past performance to "contain a prominent warning that the figures refer to the past and that past performance does not provide a reliable indicator of future results"[2]. Finally, differences in the investment needs of different types of investors entail placing a different emphasis on the various product requirements. Such an analysis can only be

[1] BVI, Investment 2004, Daten Fakten, Entwicklungen, Übersicht, p 82.

[2] Cf. Article 3(e)(iv) of the Commission's Working Document ESC/23/2005-rev. 2 of 29 September 2005. There is even discussion as to whether a description of past performance should be permitted at all. This view is totally at odds with the notion of designating a "best fund" or "best product".

made on a case-by-case basis. So a standardisation of product evaluation, which references in the Green Paper and background appear to be leaning towards, would be neither appropriate nor feasible, in our view.

We therefore support the view expressed by the Commission in Chapter 3.2.1 of the background paper, namely that distributors of third-party funds have incomplete and/or slower access to important product information. There is a danger of giving misadvice, in our view, if the evaluation of a product fails to consider all the necessary information. The more funds or other investment products distributors include in their active portfolio over and above a certain amount, the less knowledge they will have about each individual product. It can consequently be argued that the quality of the advice will decrease in inverse proportion to the number of products included in the portfolio. **This highlights the advantage of the practice common in many European countries of limiting the range of products on which distributors offer active investment advice. Distributors are able to have comprehensive, detailed and up-to-date information about these products. This enables them to supply advice which is in the interests of the investor and will assist him in making his investment decisions.** These are not normally – as the background paper suggests – "in-house products"[3], where conflicts of interest may be assumed to be associated with their distribution as it can be shown for our group exemplarily. Our 1,300 member banks are legally, financially and operationally autonomous. With regard to the distribution of investment funds, they focus mainly on the over 100 retail funds of the "Union Investment" which is the central investment company of the German co-operative network. These funds cannot be called "in-house-products" because "Union Investment" is a separate undertaking and no co-operative banks is a major shareholder of the "Union Investment". A conflict of interests is avoided consequently. Additionally, the distribution of third party funds is organized via a separate distribution platform being part of the co-operative network with the result that the client of the Volksbank and Raiffeisenbank can get worldwide nearly any fund he is longing for.

We therefore see no basis for the background paper's criticisms, particularly on page 34, of integrated architecture. On the contrary, we believe the above arguments underline the need to confine distribution structures to familiar and reliable partners – which constantly have a name and reputation to lose in the stiff competition on the market.

[3] Commission Staff Working Paper, Annex to the Green Paper on the enhancement of the EU framework for investment funds; Background Paper (Com(2005)314 final), pp. 6, 34.

Question 6: Will clarification of "conduct of business" rules applying to firms which retail funds to investors contribute significantly to this objective? Should other steps (enhanced disclosure) be considered?

Please see our replies to questions 5 and 7.

Question 7: Are there particular fund-specific issues that are not covered by ongoing work on detailed implementation of MiFID conduct of business rules?

The **MiFID and its planned technical implementing measures contain comprehensive rules**, which also cover fund units. These are subject to the same requirements as those applying to all other financial instruments. They include the information requirements under Article 19(3) of the MiFD, the suitability test for advice and asset management under Article 19(4) of the MiFID, rules on inducements and best execution. **There is no need for any further rules or regulations aimed specifically at funds.** It would be extremely problematic if the MiFID's provisions were called into question before they have even entered into force and been implemented in practice. Any proposals leaning in this direction such as those in Chapter 2.3.3 of the background paper are therefore to be firmly rejected.

Question 8: Is there a commercial or economic logic (net benefits) for cross-border fund mergers? Could those benefits be largely achieved by rationalisation within national borders?

There are most certainly **benefits** to be gained from cross-border fund mergers. This will enable international suppliers to offer their range of products throughout Europe. A **fundamental prerequisite** for such mergers, however, is that investment units receive the **same tax and supervisory treatment** throughout Europe. The differences between national tax regimes are probably the greatest obstacle at present.

Question 9: Could the desired benefits be achieved through pooling?

We doubt whether there is any need for regulation at all on virtual pooling. Progress in this area depends on establishing appropriate technical standards and processes, in our view.

The approval of master-feeder funds, on the other hand, would require amendments to the existing UCITS Directive. We believe **master-feeder funds offer considerable potential for rationalisation** and possibly represent an alternative to cross-border fund mergers. In our opinion, neither general principles of investment law nor investor protection concerns should stand in the way of introducing master-feeder funds. However, we see **potential problems here, too, owing to the heterogeneous nature of tax and supervisory rules** in member states.

Question 10: Is competition at the level of fund management and/or distribution sufficient to ensure that investors will benefit from greater efficiency?

Competition between distributors and managers of funds which are open to the general public is extremely well developed. This is due, first, to the number of products on offer and companies offering them. A second reason is the lively rivalry to innovate existing both among fund management companies and with competing issuers of securities (e.g. certificates). This requires all involved constantly to keep abreast of new developments. Germany is currently experiencing a strong influx of large foreign funds onto the market, which is stepping up competition still further. Finally, distribution structures are changing more and more rapidly. Funds are now offered on Internet platforms, traded on exchanges, sold from fund supermarkets, etc. All this demonstrates that there is **no need, either in the area of fund production or fund distribution, for regulatory action by the Commission to increase competition.**

Question 11: Which are the advantages and disadvantages (supervisory or commercial risks) stemming from the possibility to choose a depositary in another Member State? To what extent does delegation or other arrangements obviate the need for legislative action on these issues?

The idea of being able to choose a depositary in another member state is in principle to be welcomed in the interests of greater competition. **It will only make good sense to allow such a possibility, however, when the rules governing depositaries have been harmonised at a high level** so that an equally high level of investor protection, which the depositary serves by exercising the functions assigned to it particularly under Article 7 of the UCITS Directive, can be ensured. Harmonisation must, above all, cover the depositary's monitoring function. As things stand, there are big differences in the role and responsibility of depositaries from one member state to another. **Opening up the market without prior harmonisation would lead to regulatory arbitrage, to the detriment of investor protection.** It would not be acceptable if funds were able to opt for the most inexpensive depositary service, for example, without having to ensure that high security standards, such as those existing in Germany, were in place. In our view, the depository function should be performed solely by banks in order to ensure the high level of investor protection required. To preserve the independence of the depositary function, we feel that personnel and company-law sovereignty, which does not preclude membership of a group, is sufficient.

Question 12: Do you think that on-going industry-driven standardisation will deliver fruit within reasonable time-frames? Is there any need for public sector involvement?

We see no need whatsoever for legislation at either European or national level in the area of standardisation. **Standardisation should be left to the industry itself**, in line with the principle of subsidiarity. Whilst the industry's successful ongoing efforts to standardise the clearing and settlement of share certificates should be supported, there is no need for additional European regulation.

Question 13: Does heavy reliance on formal investment limits represent a sustainable approach to delivering high levels of investor protection?

We make a distinction between investment limits due to issuer diversification and those imposed by defining eligible instruments. As far as investment instruments are concerned, the focus should be on the overall risk, not on their composition. Only a material approach can take proper account of the increasing complexity and innovation in this area. Issuer diversification should be maintained as a principle of investment law. Generally speaking, suppliers which invest in transparent and efficient risk-measurement systems should be rewarded. As soon as a supplier meets a certain (previously) defined standard, it should be allowed to manage funds with more freedom from formalised investment limits. These should be replaced with risk measures that reflect the overall risk of the fund. This will tell investors exactly how much risk is associated with the product they have acquired and will protect them more effectively than would excessively formalised investment limits.

Question 14: Do you think that the safeguards – at the level of the management company and depositary – are sufficiently robust to address emerging risks in UCITS management and administration? What other measures for maintaining a high level of investor protection would you consider appropriate?

Given the existing and acknowledged high level of protection, we see **no need for action by the Commission in this area**. To mention just a few of the safeguards already in place: the investment firm is monitored and managed by its corporate governance and regularly examined by auditors. The compliance function ensures that market timing and late trading rules are observed. Firms follow voluntary codes of conduct. In Germany, monitoring functions are exercised by the depositary, which, as a bank, is in turn subject to strict supervision. Finally, potential civil-law responsibilities also exist. With all this in mind, we are convinced that there is no need for further action at EU level to increase investor protection.

Question 15: Are there instances resulting in a distortion of investor's choice that call for particular attention from European and/or national policy-makers?

In Chapter 3.3. of the Green Paper and chapter 4.2 of the background paper the Commission discusses a possible lack of a level playing field between UCITS and other investment products. The discussion culminates in the above question and suggests there is a need for action when revising the UCITS directives. Irrespective of whether or not there is really a lack of a regulatory level playing field between UCITS and the investment certificates and unit-linked insurance products specifically mentioned by the Commission, we believe it should first be discussed whether there is a need for European regulation of these particular alternative products at all. As far as investment certificates are concerned, it is clear that specific European regulation of this product group would not reflect market realities. The Commission itself states that certificates are traded primarily in Germany, Switzerland and Hong Kong.[4] **Quite apart from the questionable need for regulation at European level, certificates – which, legally speaking, come under the category of bonds – are covered by the MiFID and the Prospectus Directive and thus already subject to extensive European regulation.**

In some member states, the fact that different investment products receive different national tax treatment has led, and continues to lead, to possible distortions of the investor's choice. Distortions based on tax treatment cannot, however, be eliminated by regulation geared towards particular products. Against this background, it is above all national policymakers in the member states who need to take action regarding the lack of harmonisation in tax law.

Question 16: To what extent do problems of regulatory fragmentation give rise to market access problems which might call for a common EU approach to a) private equity funds; b) hedge funds and funds of hedge funds?

The treatment of **private equity funds** under company law, tax law, supervisory law and investment law differs from one member state to another. This makes cross-border distribution complicated and gives rise to many uncertainties. We would wel-

[4] Commission Staff Working Paper, Annex to the Green Paper on the enhancement of the EU framework for investment funds; Background Paper (Com(2005)314 final), footnote 127 on p. 52.

come a common EU-wide solution which made it possible to sell private equity products across borders.

Hedge funds are now regulated in several member states, including Germany. European harmonisation might, at first glance, seem a logical way of creating a level playing field in Europe. It must be borne in mind, however, that, even today, most hedge funds are located in unregulated or only lightly regulated offshore centres. A purely European approach would merely heighten this effect. What is needed, therefore, is a solution at international level.

Open-end **real-estate funds** should be recognised Europe-wide as a highly secure and stable retail investment product. Now that they have been accepted well by private investors in the member states, a European framework for open-end real-estate funds would be desirable.

Question 17: Are there particular risks (from an investor protection or a market stability perspective) associated with the activities of either private equity or hedge funds which might warrant particular attention?

In the case of private investments offered on the so-called "grey" market, a well-known problem that has existed for some time now is that these are distributed under largely unregulated and uncontrolled conditions. Adequate transparency of such investments would facilitate management companies' investment decisions.

Question 18: To what extent could a common private placement regime help to overcome barriers to cross-border offer of alternative investments to qualified investors? Can this clarification of marketing and sales process be implemented independently of flanking measures at the level of fund manager etc.?

In our view, a common European private placement regime is not necessary, as private placement customer groups differ greatly in the member states and national regulation thus makes more sense.

Question 19: Does the current product-based prescriptive UCITS law represent a viable long-term basis for a well-supervised and integrated European investment fund market? Under what conditions, or at what stage, should a move toward principle-based, risk-based regulation be contemplated?

We welcome the Commission's basic approach of focusing initially on exhausting the possibilities offered by the existing legislative framework. Prior to publication of the Green Paper, the Expert Group on Asset Management discussed a thorough overhaul of EU legislation which would consolidate all areas of law relating to asset management. This project should be scheduled for the medium term at the earliest, and after a cost-benefit analysis of all the implications of such an approach has been carried out. At this stage, a move towards a more principle and risk-based – and thus more flexible – approach could be contemplated.

Société Générale response to the consultation of the Commission on the Green Paper on the enhancement of the EU framework for investment funds

Dear Commissioner,

The Société Générale is one of the leading financial service groups in the eurozone and one of France's largest companies by market capitalisation (EUR 33.1 billion at 31/12/04). The Group, which employs 92,000 people, realised a net banking income of EUR 16.4 billion and a net income of EUR 3.1 billion in 2004.

Present in the main European financial markets such as France, Ireland, Luxembourg, Germany and Spain, the Société Générale provides custody & trustee services to around 2,300 funds and manages 1,235 billion USD of assets under custody, and its subsidiary Euro-VL provides valuations for nearly 3,700 funds representing assets of USD 348 billion in 2005.

The firm, represented by our locations in France, Luxembourg, Ireland, Germany and Spain, thanks you for offering us the possibility to provide the European Commission services with comments regarding the Green Paper on investment funds. We hope that we can provide with helpful comments to the European Commission, based on our experience.

As being an active member of the French Association of Securities Professional (AFTI), we strongly support AFTI contribution.

We consider the role of the depository, which was introduced in the European Union as part of the legal framework of collective investment resulting from Directive 85-611, as essential. We therefore ask the Commission to take in account the function of depositary when it will write its White Paper.

The Société Générale would like to stress three specific points.

First, the Group is in favour of a harmonisation of the rules concerning asset management. It is necessary to create a stronger framework in which investment funds can continue to expand throughout Europe. In order to do so, and prior to any measure, it is necessary to define in a text the respective role and responsibilities of all market participants in Europe (distributors, management companies, transfer agents, depositaries etc.). Such definitions are essential in particular to sustain investor confidence.

Second, we think that the harmonisation can only be done in a proper way by the Commission, in a directive proposal which would be adopted according to the Lamfalussy procedure.

Having a European passport without a directive would not reduce the costs as there are currently too many differences among member countries regarding responsibilities. This would affect the level of safeguards and undermine investor confidence.

Moreover, without having a directive, fund industry participants have already started a standardisation process at the domestic and European level, aimed at defining and providing a framework for specific tasks. These initiatives of the industry are successful but they can only be limited to specific area as the differences in the provisions of domestic laws remain on the role and responsibilities of market participants.

A directive could set at a level 1 clear definitions and principles concerning the passport. The implementing measures will then be adopted at a level 2 by the Commission, after the advice of the Committee of European Securities Regulators.

Third, having regarded the two models concerning the clearing of UCITS, the Société Générale considers that the central securities depositary (CSD) model, used in France, Germany, Portugal, Norway…, is a success. In this model, the CSD operates by means of bilateral settlement and delivery agreements as is done for other securities. The alternative model, the “transfer agent” model (TA), which entails multilateral settlement and delivery agreements, appears to be most costly (because of the standardised process for settlement and delivery and for clearing) and risky (use of a limited number of regulated CSDs rather than a multitude of TAs, which are less tightly regulated).

If you wish to get more details or comments on any point of this letter, please do not hesitate to contact me (bruno.prigent@socgen.com).

Yours sincerely,

Bruno Prigent
Head of Investors Securities Services

Communication from the Commission - Developing the trans-European transport network: Innovative funding solutions - Interoperability of electronic toll collection systems /* COM/2003/0132 final */

COMMUNICATION FROM THE COMMISSION - Developing the trans-European transport network: Innovative funding solutions - Interoperability of electronic toll collection systems

TABLE OF CONTENTS

PART I: MORE EFFECTIVE FINANCIAL AND MANAGEMENT INSTRUMENTS FOR DEVELOPING THE TRANS-EUROPEAN TRANSPORT NETWORK

1. Financing the trans-European transport network: Diagnosis of the current situation

1.1. An under-funded network

1.2. Public funds in need of better coordination

1.3. Highly selective private investment

1.4. Exclusively private funding

1.5. Joint public/private funding

1.6. The funding requires a more appropriate framework

2. Resolving the issue

3. Towards better coordination and synergy based on new structures

3.1. Funds

3.2. Structures

3.3. Setting up transnational legal entities to coordinate individual projects

3.4. The development of new Community funding instruments

3.5. EU guarantees for the political risks of the trans-European transport network

PART II - TOWARDS A EUROPEAN ELECTRONIC TOLL SERVICE

1. Introduction

2. Update on standardisation work

3. Access to toll systems in new Member States, and the situation for heavy goods vehicles

4. Aim of the Directive

5. Achieving that aim

6. Combining satellite positioning and mobile communications with microwave technologies in the short and medium term, but opting exclusively for the more modern technology in the long term

7. The long-term technical solution for deploying the European service: imposition of the satellite solution from 2008 for new systems and from 2012 generally

8. Timetable for implementing the European service

9. Implementation of the European service: a Regulatory Committee

COMMUNICATION FROM THE COMMISSION - Developing the trans-European transport network: Innovative funding solutions - Interoperability of electronic toll collection systems

Without high-performance transport networks, economies cannot be competitive. The creation and smooth operation of the trans-European transport network, which became official Community policy 10 years ago, is a key condition for the success of the internal market and to ensure sustainable mobility in an enlarged EU. However, traffic on the network is continuing to grow apace but unevenly, while at the same time there is growing insistence on sustainable development and an imminent need to incorporate the networks of the future Member States. Moreover, transport infrastructure is still under-financed, for lack of adequate funds and the absence of a framework conducive to investment.

Accordingly, in its White Paper European transport policy for 2010: time to decide [1] the Commission already drew attention to the clear mismatch between the advertised objectives and the financial means available from the Union. The fact is that the budget the Member States put aside for developing such transport infrastructure and the funds made available by the EU are insufficient. It is no small paradox to note that the Treaty makes the Community responsible for producing guidelines for the development of the trans-European transport network without granting it the financial resources to execute that task.

[1] COM(2001) 370, 12.9.2001.

There seems to be little possibility at present of seeing a significant short-term increase in the public funding allocated to these infrastructure projects, in view of the combined effects of the current economic slowdown and budgetary constraints. The Member States are setting themselves other priorities for using this public funding, even though people and businesses in the EU suffer every day the tangible consequences of increasingly pronounced modal imbalance and the failure to adapt the network to growing mobility. Use of public-private partnerships (PPPs) to supplement public financing may be envisaged for some types of project. However, there are still too many unknowns regarding the projects to be carried out - particularly railway and cross-border projects - and regarding transport policy choices. The private sector has insufficient confidence to commit to financing them. Moreover, PPPs almost always require major public financial support in the form of subsidies or guarantees.

There is no denying, however, that one of the keys to a successful enlargement will be the creation of a proper transport infrastructure network which supplies the links still missing between the Fifteen and with the new member countries and enables full benefit to be derived from the European single area. This will involve infrastructure being modernised or newly built not just in the future member countries, but also in the existing EU Member States, given that some projects have not yet been carried out, that new traffic flows will develop and that connections between the two zones are few and far between.

The question of how to fund this new infrastructure clearly appears to be one of the main issues in the context of enlargement.

In the meantime, we need to make sure that the collection of fees through the introduction of infrastructure charging does not compromise traffic fluidity. This means making sure that toll systems are interoperable.

This Communication examines the situation of infrastructure in the trans-European network and its financing and shows the need to implement, without delay, a set of complementary measures centring on a more effective use of the funding earmarked for trans-European infrastructure. These measures rest on two major pillars:

* better coordination of public and private financing of the trans-European transport network,

* together with an effective European electronic toll service.

These measures should help make the policy framework more stable in the long run and create stable conditions for financing major trans-European network projects. The presentation of a legislative instrument, through an amendment of Directive 1999/62/EC on the charging of heavy goods vehicles for the use of certain infrastructures (the "Eurovignette") by June 2003, following the Brussels European Council of 20 and 21 March 2003, will enable a Community approach to be taken to the question of infrastructure charging and will define the conditions for implementing the cross-financing evoked in the Transport White Paper. The "European electronic toll service" will offer travellers on the trans-European road networks a single subscription contract as a basis for providing new services.

PART I: MORE EFFECTIVE FINANCIAL AND MANAGEMENT INSTRUMENTS FOR DEVELOPING THE TRANS-EUROPEAN TRANSPORT NETWORK

Introduction

The Maastricht Treaty, which entered into force in 1993, made the Community responsible for a policy promoting the interconnection and interoperability of networks to enable Europe to derive full benefit from an area without frontiers. In this context, the Community was given the task of establishing a series of guidelines covering the objectives, priorities and broad lines of action envisaged in the sphere of trans-European networks. [2] This led inter alia to the adoption in 1996 of Decision 1692/96 on guidelines for the transport network. [3] The main objective of this policy was - and still is - to fill in the gaps in the major infrastructure networks, gaps which hamper the free movement of goods and persons (transport), electricity and gas (energy) and ideas (telecommunications). This Communication covers only the trans-European transport network (TEN-T), however, given the significant differences with the energy and telecommunications sectors.

[2] Article 155.

[3] European Parliament and Council Decision of 23 July 1996, OJ L 228, 9 September 1996.

The gaps in the networks are due primarily to the fact that, until recently, networks were planned on a national basis. They did not always take due account of the trans-European dimension. Today, this lack of a trans-European perspective has left its mark in the form of the persisting barriers to smooth operation of the internal market [4]. In this context, the White Paper [5] pointed to the delays in completing the projects planned for the trans-European transport network as one of the chief sources of inefficiency and congestion on the main corridors which comprise it. The fast-approaching enlargement, which will inevitably generate significant growth in traffic volume [6] on the road and rail infrastructure - some of which is obsolete or offers far less capacity than required - only adds to the need to fill in the missing links in this network. Ten years after the entry into force of the Maastricht Treaty and almost as long after the Essen Summit, the development of the trans-European transport network is stagnating. There are many reasons for this, mainly as a result of:

[4] The closure of the Mont Blanc tunnel following the accident on 24 March 1999 combined with the lack of suitable alternatives, particularly rail services, is symptomatic of this situation, which had an adverse impact on the economy of the Valle d'Aoste region, and of Italy as a whole, in terms of gross domestic product. The amount of the impact between 1999 and the beginning of 2002 is estimated in a range between 3000 and 3200 million EUR, due one third, to an increase in transport costs and for the remaining to a deficit of exports towards other countries of the Union (Source: Dipartimento per lo Sviluppo delle Economie Territoriali della Presidenza del Consiglio, 2003).

[5] COM(2001) 370.

[6] The White Paper forecasts growth of 24% in passenger traffic and 38% in freight traffic over the period 1998-2010 in the fifteen current European Union countries. If nothing is done to spread the demand more evenly, heavy goods traffic is expected to increase by around 50%. The increase in traffic could easily be twice as high in the new Member States and between them and the current Union countries, bearing in mind, in particular, the relocation of highly labour-intensive industries to these countries.

- the lack of political will on the part of the decision-makers in the Member States who have taken insufficient account of the trans-European dimension of the projects;

- the inadequacy of the financial resources dedicated to the trans-European network from public (national and Community) and private sector sources, since full use has not been made of public-private partnership option;

- the fragmentation of the entities responsible for the projects, leading to serious difficulties with the coordination of resources and the management of the projects;

This document sets out to take stock of the situation regarding transport infrastructure financing, explore ways of making that financing more effective, and relaunch the debate, among the parties concerned, about the means to be deployed in future to ensure the efficiency of the transport network on which the competitiveness of the enlarged EU will depend to a large extent over the next few decades.

1. FINANCING THE TRANS-EUROPEAN TRANSPORT NETWORK: DIAGNOSIS OF THE CURRENT SITUATION

Though the Community was given new powers over the planning of trans-European networks, these were not accompanied by a large enough financial package to build such networks. At the same time, beyond intentions, the Member States are running into problems as a result of budgetary constraints in financing the infrastructure identified in the European Parliament and Council Decision on guidelines for the development of the trans-European transport network, particularly the cross-border sections. A framework better adapted to these financing problems is needed to meet the challenges of building this infrastructure. The funds available - especially public funds (including Community funds) - are often poorly coordinated, making them less effective, while private investment remains highly selective and is far from sufficient to meet the funding requirements for building the network.

1.1. An under-funded network

The difficulty facing trans-European network projects is funding. The estimated cost of the trans-European transport network alone is around EUR350 billion for all the projects to be completed by 2010, plus over EUR100 billion more for projects involving the future Member States. Although the objectives set by the EU for development of the networks are, rightly, ambitious, the results are failing to live up to expectations, with spending on the priority transport projects by the end of 2001 still no more than 25% of the total estimated cost. Only three of the 14 priority projects endorsed by the Heads of State and Government in Essen in December 1994 have been completed [7] and some of the other 11 are still at the preliminary studies stage. The longest delays are on the cross-border sections of these projects, which are less profitable and have lower priority than the national sections. This is particularly true of the projects in the Alps and the Pyrenees. [8]

[7] The Øresund fixed link between Sweden and Denmark, Milan-Malpensa airport and the upgrading of the Cork-Dublin railway line.

[8] See report by the European Parliament's Committee on Budgets on the Commission proposal to amend the Regulation on the granting of financial aid in the field of TENs (rapporteur: Mr Turchi).

The Member States, which used to invest, on average, 1.5% of their GDP on building transport infrastructure in the 1980s, now invest less than 1%. [9] Consequently, the Member States put EUR15 to EUR20 billion a year into the various trans-European transport network projects. This funding is clearly inadequate to complete all the planned projects by 2010 and, strictly speaking, takes no account of the new needs which will emerge with enlargement. This lack of commitment to funding transport infrastructure could be regarded as surprising, considering the very sharp parallel increase observed in demand for mobility and the importance of transport to the functioning of the economy.

[9] All transport infrastructure combined.

As well as funding from the Member States, the trans-European transport network also receives Community financing, as in addition to the part it plays in identifying the individual components of the trans-European network, the Community's mandate also covers the financial aspects. Accordingly, a budget has been earmarked for the trans-European networks, backed up by Council Regulation (EC) No 2236/95 laying down general rules for the granting of Community financial aid in the field of trans-European networks, as amended by Regulation No 1655/99 of the European Parliament and of the Council (the "TEN Financial Regulation"), to support projects of common interest, studies and works. This co-financing mainly takes the form of direct grants, though the TEN Financial Regulation also allows guarantees for loans or subsidies of the interest on loans. Alongside this, the Community also helps finance these networks via the Structural Funds (Cohesion Fund and ERDF). In the case of links inside the future Member States, the Pre-Accession Structural Instrument is helping to develop the networks in these countries. The total Community contribution in the European Union (all instruments combined excluding European Investment Bank loans) for the entire period from 2000 to 2006 adds up to around EUR20 billion. [10] Clearly, the Community support therefore covers only a (very) small fraction of the funding requirements and is far from sufficient to make a contribution to developing the networks.

[10] The trans-European transport network budget for 2000-2006 totals no more than EUR4.17 billion, which is nowhere near the real needs.

It is clear from these figures that the budget the Member States are allocating to investment in the trans-European network and the funds made available by the EU itself are insufficient. To put it plainly, at the current rate of investment it would take almost 20 years to implement the schemes scheduled for completion by 2010. The new priorities which have emerged since the trans-European networks policy was introduced include those relating to enlargement - which will entail the (re)construction or upgrading of networks not only in the new Member States but also in the current members of the European Union, plus interconnections between these two zones. Another new factor which must be highlighted is the need to contribute towards an effective shift to the most environmentally friendly modes of transport, as called for by the Göteborg European Council, by targeting investment on such modes. Added to this, there is the need to contribute towards building a knowledge-based society by adapting the transport networks to use new technologies, following the example set by the Galileo project.

The fact is that while demand for mobility is growing, the construction of new and, in particular, cross-border transport infrastructure seems to be at a standstill. This transport policy, with its ambitious objectives for building new infrastructure, still lacks adequate financial resources to turn them into reality. As clearly stated in the White Paper on transport policy, if this state of affairs were to persist, it could have far-reaching consequences for safety, the environment and the quality of life of local communities and for the competitiveness of the entire production system in the enlarged Europe of the future.

1.2. Public funds in need of better coordination

Apart from looking for new sources of funding, one of the most striking aspects raised by implementation of these major projects is, without doubt, the lack of coordination between the different sources of public funds. This coordination is a problem since it is necessary to establish a delicate balance between different priorities, which do not necessarily coincide, at regional, national and Community and level.

Taking the Community funding first, the Structural Funds (ERDF), the Cohesion Fund and PASI can make a significant contribution - often over 50% of the total cost - to projects, which gives the Community authorities considerable weight in the programme for implementing them , while complying with the subsidiarity principle. This situation is conducive to the development of the TENs but this possibility is limited principally to the "cohesion countries" and less-developed regions. Assistance from the trans-European transport network budget, on the other hand, is, in theory, intended to act as a catalyst for starting up such projects, by demonstrating their feasibility and economic and financial viability. It can also serve as a lever to mobilise other sources of funding, both public and private, and to provide easier access to loans. However, this option is rarely used. Given the complexity of the projects and their ever-increasing cost, the current rules on financial aid, limiting support to 10% of the total cost, do not provide sufficient incentives to start up some of these projects. Under these circumstances, it is becoming harder and harder for the trans-European transport network budget to perform these catalyst and leverage functions.

Secondly, experience also shows that, when applying for financial support, States prefer to spread Community resources among a host of projects instead of concentrating on a more limited number to enable the Community funding to act as a catalyst. This failure to choose targeted priorities is highly damaging to the general effectiveness of these funds.

This is why, in terms of managing the trans-European network budget, the Commission cannot accept a scattering of funds among many small-scale projects but wishes instead to focus on financing the priorities identified in the White Paper (bottlenecks, short sea shipping, improving links with the outlying regions).

In addition, unlike the Community support from the trans-European network budget or the Cohesion Fund, which takes the form of direct grants (donations in a way), the contribution from the European Investment Bank consists of loans at advantageous rates, [11] often guaranteed by the Member States. As a result, the European Investment Bank is one of the leading providers of funds for major trans-European infrastructure projects and its lending policy is guided by the Bank's own assessment criteria and operates under an independent management system. For example, the proportion of European Investment Bank loans allocated to rail (24% of all loans granted to transport between 1997 and 2001 [12]) is far lower than the percentage of direct grants from the trans-European transport network budget allocated to railway infrastructure (approximately two-thirds in 2000). Consequently, road continues to take the lion's share (35% between 1997 and 2001) of the European Investment Bank loans.

[11] The European Investment Bank can grant 20-year or longer term loans at advantageous rates based on its AAA rating.

[12] Part of this 24% is earmarked for purchases of transport equipment but also covers infrastructure not forming part of the TENs. This means that the share taken by TEN railway infrastructure is even smaller. In compensation, the European Investment Bank has a separate line for loans granted to major infrastructure (6% of the total) for all modes together, but of which rail takes a substantial share.

Finally, at national level, planning of trans-European transport infrastructure often involves a proliferation of uncoordinated projects [13] rather than a selection of consistent priorities responding to the growth in traffic flows within the EU and between the EU and its leading partners (and future members) outside.

[13] For which funding is not always provided.

The degree of commitment of the Member States to the development of the trans-European transport network also depends on certain factors, such as their geographical location, and in particular their degree of isolation from the centre of the EU. It also depends on their attachment to a traditional approach to infrastructure planning which tends to discourage innovative solutions, and relies almost exclusively on public funding.

1.3. Highly selective public investment

In view of the severe budgetary constraints on the Member States and of the no less severe need for new infrastructure - particularly with enlargement on the horizon - fully public funding of such infrastructure in the medium term appears increasingly Utopian. To rely solely on funding of this type would pose a risk of delays in completing these networks - with unacceptable consequences - as already pointed out in the White Paper.

1.4. Exclusively private funding

Experience shows that exclusively private funding of transport infrastructure is not the best option for bringing large-scale projects to fruition. One of the rare recent examples of any significance is the Channel tunnel which - leaving aside its undeniable technical success - is in financial terms no model for investors wishing to venture into building infrastructure of this type. Because of the nature of the constraints involved, investment in major transport infrastructure does not lend itself to funding by the private sector alone. Apart from the substantial sums involved, the operating risks plus those inherent in the construction phase, the payback period on the infrastructure, the uncertainty surrounding both the returns [14] and the long term all militate against fully private funding of such infrastructure. Consequently, the public authorities tend not to look for mixed (public-private) financing solutions. This traditional view therefore discourages private investors.

[14] Especially taking account of the running costs which are added to the construction costs.

1.5. Joint public/private funding

Though budgetary constraints thus weigh very heavily on the capacity for public funding, there are nevertheless means of strengthening the leverage exerted by public money to attract private capital, such as the concession system, [15] which has proved its worth and is continuing to do so. Throughout the 19th century the granting of concessions fuelled the boom in the railways, a sure sign that, at the time, funding of railway infrastructure predominantly by private investors appeared sufficiently attractive and profitable. Nevertheless, in the vast majority of cases, infrastructure funding remained the prerogative of the authorities, with private investors responsible only for track-laying and infrastructure management. In more recent times, motorway or airport concessions have become common practice in many countries, where they have proved their worth. [16] Starting in the 1950s, the motorway networks of France, Italy and Spain were built largely with the aid of concessions, allowing rapid development of this infrastructure without massive State debts.

[15] Or other forms of public-private partnership based on the principle of the public and private sectors sharing both risks and profits.

[16] Whether through the introduction of real or shadow tolls.

Today public private partnerships (PPPs) are still a viable option for financing transport infrastructure in Europe, but they face major economic, legal and, in some cases, political obstacles. The Commission believes that good practice needs to be spread and that, in the medium term, the existing regulatory framework needs to be updated to make PPP schemes even more attractive, particularly for private investors. In a number of Member States, a start has already been made on such revision of the classic administrative law on concessions.

It is in this context that the Commission is going to produce a Green Paper on public-private partnerships and European public contracts law. The purpose of the Green Paper will be to launch a major public consultation regarding the rapid development of various forms of PPP and the legal regulation of public contracts through Community law. To produce an informed debate, the Green Paper will examine the current situation, identify points of legal uncertainty and suggest possible options for the future. This consultation will enable the Commission to assess whether the legal framework needs to be improved and/or supplemented in order to give economic operators better access to the various PPP operations undertaken in the European Union. In the context of trans-European transport networks, PPPs need to meet a series of basic conditions:

(1) the definition of the project in question must be clear;

(2) there needs to be a clear long-term political will, so as to avoid calling into question the initial decisions;

(3) the players involved must work to ensure a high-quality partnership;

(4) perfect transparency must exist concerning the costs, the terms of the concession and the operating conditions, and the project in general. In particular, guarantees must be given that the private sector will not be forced to bear a series of additional costs beyond the forecasts which it took into consideration when it was selected;

(5) financial guarantees must be clearly specified and there must be an established, stable legal environment;

(6) the project must be on an appropriate scale, from the economic point of view;

(7) the project must be capable of generating revenue within a reasonable timescale, including from ancillary activities;

(8) the project must provide for revenue-sharing beyond a jointly agreed minimum revenue guaranteed by the State (though without such revenue being comparable to disguised aid);

(9) the project must also provide for clear, detailed risk-sharing so that each partner remains in control of the risk it is best placed to bear.

In practice, however, these conditions are not always met. What these projects offer is a (low) financial return in the long term plus a sometimes high construction and operating (traffic) risk. The complexity of PPPs also produces the situation that the abovementioned criteria for achieving success are rarely met properly for the whole of a major trans-European transport network project. Nevertheless, it is feasible for the cross-border parts of a specific project and clearly defined sections of a trans-European transport network to meet these conditions and, no doubt, interest private capital.

Alongside this, other restrictions emerging in this process must not be underestimated:

(1) reticence on the part of some Member States to encourage PPPs;

(2) the increasingly protracted negotiations, another disincentive;

(3) the amount needed in order to take part in a tendering procedure, related to the size and complexity of the project;

(4) the desire for returns in the short term, whereas most of the projects are long-term to very long-term;

(5) the political context, which is often fluctuating, generates uncertainty which has an impact on the economics of the projects and made discourage private investors.

PPPs are an attractive instrument, and are proving very popular in many sectors, but their success depends on certain factors or conditions being present: small-scale projects, projects with easily calculable returns and risks, motorways, bridges or airports. They can also be useful whenever the input from the private sector provides a means of maximising the results and keeping closer control over costs than could be achieved by a similar project managed by the public sector. By contrast, this solution is rarely neutral in terms of costs, which in many cases end up to be higher than in the case of fully public financing, because of private investors' higher transaction costs [17] and capital costs. Clearly, then, use of PPPs cannot be held up as a "miracle" solution for a public sector facing budgetary constraints. On the contrary, experience shows that a poorly prepared PPP can generate fairly high costs for the public sector.

[17] Relating particularly to the identification, sharing and cover of risk.

The technical characteristics, structural complexities and political uncertainties surrounding the conditions for operating trans-European railway network schemes make this type of project a difficult case which goes far beyond the examples of PPPs to date. However, a close watch will have to be kept on the attempt by the French and Spanish governments to award a concession for operation and construction by a private consortium of the Perpignan-Figueras international stretch of priority project No 3 (TGV Sud). Generally, the process of opening up the railway market to competition - already underway within the EU - will bring improvements in railway companies' commercial services and make it even more attractive to invest in projects of this type.

1.6. The funding requires a more appropriate framework

Specifically, experience of funding projects through PPPs has been confined mainly to infrastructure costing far less than what is forecast for the major trans-European infrastructure projects on the drawing board today. [18] The greater the private-sector participation in these projects, the greater the need to put in place guarantee mechanisms; in particular, recent PPPs have included arrangements to provide financial compensation to the operator should actual traffic levels fall short of the forecasts, a solution which, in some cases, could prove particularly costly to the State. In this context, the diversity of the projects suggests it would be difficult to come up with a single model for PPPs and that a case-by-case approach is more appropriate. However, it is worth doing more to promote PPPs at trans-European level, targeted on specific projects or parts of projects [19] of a kind which could fit in with these constraints (roads, airports, [20] terminals and ports). New ideas, innovative clauses and something going beyond a traditionally "public" approach are necessary to encourage this trend at Community level.

[18] For example, the international section of the Lyon-Turin project alone will cost over EUR6.5 billion and the Brenner section almost EUR5 billion.

[19] HSL Zuid is a prime example. The private sector is financing 20% of the project, corresponding to the superstructure, while the public funds are intended for construction of the infrastructure and cover all the associated risks.

[20] In Greece the new Athens Spata airport was built and co-financed by a consortium of private undertakings and banks and by the Structural Funds. To guarantee sufficient revenue, the concession contract stipulated that the existing airport was to be closed when the new one opened.

Coordination between the various (public or private sector) parties involved in a project is one of the most influential aspects involved in the success of a project, in particular in the case of trans-frontier infrastructure. Establishing a structure to manage the project and with responsibility for its funding is a particularly complex problem.

The transport network is characterised by the wide range of projects which need to be implemented, their service life (sometimes spanning several centuries), the major risks entailed (financial, technical, environmental and political) and the resultant highly uncertain rate of return. Consequently, there is no single answer to the question of infrastructure funding. Solutions must be sought through a variety of instruments which it must be possible to use in combination and which need to be adapted to each category of project. In this context, the creation of - single - structures for the management of projects, capable of dealing with both the financial and administrative constraints, is a priority.

In a context marked by a shortage of resources, the objective is to create a more appropriate framework for funding major transport infrastructure, drawing principally on instruments which already exist but which need to be reinforced.

In the case of the PPP framework, for example, the Commission largely responded to this demand over four years ago when it published a communication on public-private partnerships for financing trans-European transport network projects [21] which clearly defined the conditions for forming PPPs for infrastructure projects. Regulation No 1655/99 provides for contributions to venture capital (maximum 1% of the trans-European transport network budget) under the aegis of the European Investment Bank to help set up public-private partnerships on trans-European network projects.

[21] COM (97) 453: Communication from the Commission on public-private partnerships in trans-European transport network projects.

In practice, the Community has at its disposal four budget instruments actively funding major trans-European transport infrastructure: the ERDF, the Cohesion Fund, the Pre-Accession Structural Instrument (PASI) [22] and the budget line for trans-European networks, which provide funding in the form of grants. The Cohesion Fund Regulation already stipulates that "the Commission shall support beneficiary Member States' efforts to maximise the leverage of Fund resources by encouraging greater use of private sources of funding". In fact, Community co-financing from the ERDF and the Cohesion Fund can be used to support projects following a PPP format. [23] This is made possible by the high rate of support available from these Funds. In this way, after fruitful discussions with the Commission, Greece took the decision to form PPPs for some of its road projects so that the money "saved" could be put towards rail projects.

[22] Commission staff are studying forms of PPP which could qualify for funds from the PASI. DG REGIO "Guidelines for successful public-private partnerships" (March 2003).

[23] This should also be the case with the PASI.

Another important point to note is the considerable progress made, in recent years, with the economic and regulatory framework and financial instruments, making it easier, in theory, to put PPPs in place. Reference ought to be made here to the initiatives already taken by the

Commission:

- In an interpretative Communication of 29 April 2000, the Commission clarified the position of Community law regarding concessions. Concessions are not currently covered by the Directives on public contracts (except for works concessions, the award of which is subject to certain provisions of Directive 93/37). In its interpretative Communication, the Commission clarified the principles deriving from the provisions of the EC Treaty regarding fundamental freedoms, and in particular the obligations of opening to competition and equal treatment. The Court of Justice has confirmed this interpretation, notably in its judgment in the Telaustria Case. [24]

[24] Case 324/98, judgment of 7 December 2000.

- The Commission took the opportunity of the recasting of the Directives on public contracts [25] to introduce a new procedure for awarding contracts, known as "competitive dialogue". This procedure applies to complex contracts, especially where the awarding body is unable to determine which technical means might meet its requirements, or the legal and/or financial package of a project. The competitive dialogue procedure allows dialogues to be pursued with different candidates in parallel in the initial stage. Once the awarding body is able to identify the solution or solutions liable to meet its requirements, the dialogue ends. It is then followed by a phase of submission and evaluation of tenders.

[25] COM(2000) 275 final.

- In July 2000, the Commission also adopted a proposal for a regulation amending the existing Regulation on State aid (Regulation No 1107/70) authorising certain State aid to help set up PPPs.

- The introduction of the single currency offers considerable advantages for funding cross-border projects, particularly by removing the exchange risk.

2. RESOLVING THE ISSUE

A fresh approach is needed to promote a new culture of transport infrastructure funding in Europe which complies with Article 155 of the Treaty establishing the European Community ("the Community may support the financial efforts of the Member States and ... the Commission may, in close cooperation with the Member States, take any useful initiative to promote such (financial) coordination") and to facilitate synergy between the public and private sectors.

Transport infrastructure plays an essential part in the proper functioning of the economy since it enables economic growth potential to be increased through economies of scale and network economies. [26] Certain avenues need to be explored to make the management of these limited resources more efficient and to locate possible new sources of funding. This presupposes, among other things, that single management instruments will be put in place for each project. The new approach proposed is therefore based on the following range of options:

[26] What a network gains through the addition of a new node in terms of traffic generated and the scope for new links. Missing links create special network effects (e.g. the high-speed line which bypasses Paris to the south). A network must attain a critical mass to survive in competition with rivals. It therefore needs strong and coordinated funding.

1. Greater synergy in public investment: whatever the principal method of funding, whether it is public or private, the size, complexity and cross-border nature of the main trans-European transport network projects mean there is a need for better definition of priorities and coordination of funding.

2. The introduction of legal and financial management structures modelled on a European company: The introduction of structures specially created for each major project and benefiting from European company rules could provide the legal and financial transparency and coordination that are lacking in many financial packages for infrastructure projects.

3. Active promotion of the involvement of private capital requires innovative clauses and politically courageous action to overcome the conditions and restrictions set out in 1.5. The options tried out in practice include:

(a) Concession schemes under which most of the risks are borne by the private investor on the basis of active demand management.

(b) Various systems enabling private partners to be involved as early as the project design phase, e.g. the private initiative system or the organisation of opening to competition on the basis of general functional requirements (output specifications).

(c) The introduction of quality indicators and "progress clauses" enabling the private investor to realise profit on the initial investment throughout the lifetime of a project.

(d) The possibility of extending these methods to cover several interconnected projects (possibly beyond national frontiers).

It will need to be ensured that these solutions are compatible with the requirements of transparency and equal treatment. For example, experience shows that Member States often have difficulty reconciling private initiative with the obligations of transparency and equal treatment of all potential candidates. Some Member States even contend that where the initiative comes from the private sector there is no longer any need for an opening to competition, though this is of course contrary to the Treaty.

4. The definition of a stable and predictable Community framework for charging for infrastructure use. Such an approach would increase the efficiency of infrastructure use, thereby making infrastructure more profitable and attractive to investors. It would help to improve service quality by financing maintenance costs. Reflecting the generated costs of transport more accurately could in some well-defined cases enable investments to be recouped. The presentation of a legislative instrument, through an amendment of Directive 1999/62/EC on the charging of heavy goods vehicles for the use of certain infrastructures (the "Eurovignette") by June 2003, following the Brussels European Council of 20 and 21 March 2003, will enable a Community approach to be taken to the question of infrastructure charging and will define the conditions for implementing the cross-financing evoked in the Transport White Paper.

5. Lastly, consideration could also be given to increasing specific funds and introducing Community loans or guarantees for other loans which are specifically dedicated to targeted trans-European transport network projects.

3. TOWARDS BETTER COORDINATION AND SYNERGY BASED ON NEW STRUCTURES

3.1. Funds

In its resolution on the White Paper on the common transport policy [27], the European Parliament favours a coordinated approach by setting up "within the Financial Perspective a new European transport fund as a financial instrument with a substantial budget allocation, which would be applied across all Member States and deal with all modes of transport". Apart from this proposal, the scope and precise content of which still have to be determined, the need for coordinated management of all public and private sector funds dedicated to the trans-European transport network remains a priority, since public funds - whether national or Community - do not appear to be used optimally. In the context of the trans-European transport network they are often scattered among a large number of projects with no real order of priority being observed. This scattering of resources sometimes has a negative effect on the development of the trans-European transport network, as witnessed by the delays in completing these projects.

[27] Resolution of 12 February 2003. Rapporteur Mr Juan de Dios Izquierdo Collado. Point 82.

The Commission's proposal to increase its maximum share of funding in trans-European transport network projects from 10% to 20% reflects its desire to focus on a limited number of priority projects with high trans-European added value. The emphasis thus placed on certain infrastructure, and its translation in a financial sense into Community public funding, would also send the markets a strong signal of public commitment to these projects and should thus make it possible to attract other resources to them.

3.2. Structures

Where the promotion and active coordination of trans-frontier trans-European network projects is concerned, the idea of creating a European structure to promote and act as a catalyst deserves consideration.

3.3. Setting up transnational legal entities to coordinate individual projects

While European Economic Interest Groups (EEIG) seem to be suitable for handling the initial project phases (studies), they often prove far less flexible during the actual works, on account of the fact that the EEIG partners are responsible without limitation, and not solely as regards their participation.

In view of the number of players involved in setting up a European project, and the financial resources and technical expertise needed, the funds allocated to the project need to be managed in a coordinated manner during the development phase and not just the initial phase. It is therefore essential to find a legal instrument which allows more effective coordination at transnational level.

The approval by the Council, on 8 October 2001, of the Statute for European companies already goes some way to providing part of the answer. When it becomes effective in 2004, the approval of such companies should make it much simpler to set up companies to manage cross-border projects and should produce substantial economies of scale. It is within this European company framework, and in accordance with Community law on public contracts, that consideration could be given to setting up project companies for every major cross-border trans-European transport network project, in line with the spirit, though not the structure, of the Galileo joint undertaking.

The introduction of a coherent legal structure is a key step towards increasing the prospects of success of cross-border projects, in particular to secure the necessary funding. A European company would have a key advantage in this respect since it will have a single legal personality enabling it to operate in several EU Member States. Eurotunnel has already indicated that this would be a benefit which would enable it, over time, to avoid the need to comply with both English and French law. In this respect, a European company will also have a psychological advantage: if, for instance, a French company is taken over by an Italian company, the resulting company will not be Italian but European.

European companies will be governed by Community legislation directly applicable in all Member States or, failing this, by the law of the place where the company is registered. It will be governed by Community legislation directly applicable in all Member States.

- In this context, the setting up of European companies to manage each major trans-European transport network project could prove a considerable advantage. The creation of a company to manage a trans-European transport network project would in particular enable companies with registered offices in more than one Member State to merge and operate throughout the European Union and especially in the two countries concerned by the project;

- From the financial point of view, the setting up of a company would enable the various players to have a clear picture of the economic and financial situation regarding the project, which is not easy if there are several companies operating under different laws;

- Having a single company would also reduce administrative and legal costs. Such savings are generally quite considerable in the case of a multinational group;

- With regard to the choice of tax regime, which is probably one of the most important aspects and which has not been satisfactorily dealt with up to now, in particular because it requires unanimity within the Council, European companies should be free to choose which law will apply once they have a subsidiary in a given country. In this way, European companies could make it more attractive for the private sector to participate in such projects [28]; in particular, if a European company is set up by merger, any value added that is still latent will not be immediately taxed, which will be an advantage compared with ordinary law;

[28] Except as regards very specific adjustments to existing tax legislation, the tax regime issue for European companies is still unresolved, as it is for any company with places of business in several different countries. Initially it is planned to allow companies to choose their tax base as soon as they have at least one subsidiary in the country in which they wish to be taxed. The longer-term objective is to achieve a single consolidated tax base at EU level for company taxation.

- Better coordination should allow economies of scale and probably make it possible to lean more heavily on the financial markets to borrow capital. The existence of a single company is likely, for example, to make it easier to sign a global funding agreement for the project through competitive tendering;

- The existence of a single entity will make it easier to identify the roles and responsibilities of the various players and the risks to be shared between them, in particular those of the public sector and those of the private sector. First of all, it is essential to ensure that the tasks of this type of company are clearly defined. The main task of the company should be to complete the development of the cross-border project by bringing in public [29] and possibly private funds. To guarantee the transparent operation of such companies, it will be necessary to put a supervisory body in place to ensure that their decisions properly reflect the thinking of the public, national or Community authorities. This means that European companies, with their flexible arrangements, will be able to employ both a single-tier system (Chairman and Board of Directors) and a two-tier system (Executive Board and Supervisory Board).

[29] See, for instance, the Øresund consortium.

It should also be remembered that European companies provide for the broad involvement of their staff in operation and control functions, whether through social negotiations or the minimum requirements already laid down in the Regulation. These aspects are particularly important in the framework of railway infrastructure, an area in which employers and employees in most Member States remain attached to the public dimension of the undertaking.

3.4. The development of new Community funding instruments

Nearly ten years after the publication of the Commission's White Paper on Growth, Competitiveness and Employment, which proposed that Community loans be issued to fund trans-European networks, existing financial and budgetary instruments have been shown to be inadequate, as witnessed by the growing delay in the completion of the trans-European transport network programme, especially the priority projects. It will be recalled that the European Council (meeting in Brussels in December 1993) agreed that "Additional funding will be provided, as far as is necessary, to ensure that priority projects do not run into financial obstacles which would jeopardise their implementation. With this in mind, the European Council called upon the ECOFIN Council to study, together with the Commission and the EIB, procedures which would enable the Community to mobilise up to an additional ECU 8 billion per annum in loans for operators involved in setting up networks. The possibility thus provided should not run counter to the efforts undertaken by the Member States to reduce public debt, nor to the stability of financial markets".

The redirection and reprogramming of financial resources decided on by the Berlin European Council, the second review of the trans-European transport network master plans now under way (for all modes) and the definition of a trans-European network for rail freight open to competition are providing fresh momentum for trans-European transport network policy in an enlarged Europe. This will need to be at the heart of the next review of the Financial Perspective.

In this context, it is hard to see how the EU will be able to avoid a debate about a substantial increase in the Community funds given over to building the trans-European transport network. This in no way prejudges the work in progress on the new Financial Perspective, but illustrates the specific nature of the trans-European network, the completion schedule for which goes well beyond the traditional financial planning framework. A future increase in funds for completing the trans-European networks would make it possible to create major arteries linking the countries of the enlarged EU.

3.5. EU guarantees for the political risks of the trans-European transport network

Guarantees provide an essential service for loan activity since they cover the associated risk, even if they are as not as publicly visible as loans. It should be emphasised that the rules for monitoring public debt do not refer to guarantees given by States and regions. Sovereign guarantees may therefore ensure the flexibility need to cope with the current budgetary constraints.

Title XV of the Treaty [30] refers to the possibility of Community action in the form of a guarantee for trans-European transport network projects. This possibility, which is formulated very clearly, has been used only rarely up to now in the trans-European network Financial Regulation to provide, as a form of support, assistance with the cost of premiums on loan guarantees granted by financial institutions where:

[30] There are also other references to guarantees in the Treaty. Article 103(1) stipulates that "A Member State shall not be liable for or assume the commitments ... of another Member State, without prejudice to mutual financial guarantees for the joint execution of a specific project". The European Investment Bank may also provide guarantees, under Article 267, though it very rarely makes use of this option.

- the project is considered cost-effective;
- the project is already benefiting from the mobilisation of public and private funding;
- the project is receiving Community funding;
- the project is partly funded from revenue derived from charging.

With these four conditions, it would be possible to consider using Community guarantees or a Community loan. [31]

[31] The same concern led to the creation of the European Investment Fund (EIF) in 1994. In

2000, responsibility and expertise in this area were taken over by the European Investment Bank.

For external actions, there is a Guarantee Fund [32] which receives payments from the Community budget to cover such operations. The Guarantee Fund under the Community budget also provides guarantees for European Investment Bank loans to third countries. At the moment, these guarantees cover only political risks, namely the risks associated with the non-transfer of foreign currencies, expropriation, armed conflict and civil unrest, and commercial risks. However, the European Investment Bank has been asked by the Council to cover commercial risk through non-sovereign guarantees for 30% of its loans.

[32] Article 3 of Regulation 2728/94: "The Fund shall rise to an appropriate level, hereinafter referred to as 'the target amount'. The target amount shall be 10% of the Community's total outstanding capital liabilities". Article 4(1): "The payments provided for under the first indent of Article 2 shall be equivalent to 14% of the capital value of the operations until the Fund reaches the target amount".

Given the options which exist at EU level, the political decision not to carry out a project could be interpreted as being a political risk due to environmental, budgetary, etc. causes. This interpretation could be extended to the non-completion of related network projects which are economically crucial for a project (network risk) but not for meeting the EU's formal commitments (to open up markets). The EU could provide guarantees for projects jointly with the Member States involved and the European Investment Bank. The main function of these guarantees is demonstrate the EU's interest and confidence in a particular project. They would be joint guarantees and the biggest backers would be the Member States benefiting from the project. The EIB's involvement would lend technical credibility to these guarantees since it would be responsible for assessing the project's vulnerability to the risks covered. In particular if a member State does not fullfil its commitments in terms of transport infrastructure implementation, or if it changes its priorities, without previously consulting other member States or interested parties. For instance, this consists in assessing what would be the economic damage to the Lyon-Turin project of a new road development in the Alps (doubling the Fréjus road tunnel, Mercantour tunnel). To cover these guarantees, a fund to mutualise risk between the various trans-European transport network projects could be set up. As with all insurance systems, it would be a question of mutualising the risks of a maximum number of projects.

A reserve fund, adopting a form to be agreed with the EIB could be set up, based on premiums paid by participating enterprises and the public authorities concerned, including the EU.

The allocation of the reserve would be commensurate with the probability of materialisation of the limited risks run. The contributions from the Community budget to the reserve would come from the TEN budget line with the need for an amendment to the current Regulation, or possibly from contributions from the Structural Funds and the Cohesion Fund. The practical implications of such an approach should be examined in the context of the work on the new Financial Perspective.

CONCLUSIONS

Financing of the trans-European transport network in an enlarged European Union will in future make it necessary to:

- use innovative means to promote the involvement of private capital so as to overcome the conditions currently preventing the general use of public-private partnerships;

- ensure coherence and complementarity between the management structures for these types of project, in particular by setting up new transnational entities such as "European companies";

- review the level of Community resources in the context of the ongoing debate about the future Financial Perspective.

PART II - TOWARDS A EUROPEAN ELECTRONIC TOLL SERVICE

27 June 2003

HIGH LEVEL GROUP

ON THE TRANS-EUROPEAN TRANSPORT NETWORK

REPORT

1. SUMMARY AND CONCLUSIONS 4

2. THE POLICY OF THE TRANS-EUROPEAN NETWORK SINCE MAASTRICHT.. 11

2.1. THE FIRST ACHIEVEMENTS 11
2.2. THE NECESSITY OF REFORMULATING THE COMMUNITY GUIDELINES. 13

3. NEW INFRASTRUCTURE: AN ESSENTIAL CONTRIBUTION FOR ENLARGEMENT 16

3.1. INTEGRATE THE NETWORKS OF THE NEW MEMBER STATES 16
3.2. INFRASTRUCTURE FOR ENLARGEMENT IS A MATTER FOR ALL 16

4. THE MANDATE GIVEN BY THE COMMISSION... 18

4.1. THE COMPOSITION AND MANDATE OF THE GROUP 18
4.2. THE WORK PROGRAMME.. 18

5. THE NECESSITY OF A SELECTIVE APPROACH 21

5.1 GENERAL REMARKS 21
5.1.1. An insufficient and sometimes incoherent provision of infrastructure at the European level.. 21
5.1.2. The foreseeable development of traffic 22
5.1.3. The constraint of financing.. 22
5.1.4. The need for greater concentration, selectivity and coordination............... 23
5.2. CRITERIA AND METHODS FOR EXAMINING THE PROJECTS 23
5.2.1. Take stock of progress and delays with existing priority projects.............. 23
5.2.2. The need to stick to strict criteria... 24
5.2.2.1 A two stage method.. 25
5.2.2.2 The pre-selection.. 25
5.2.2.3 The evaluation of the pre-selected projects.. 26
5.2.2.4 Comparisons with the approach of the Christophersen Group................ 26

6. RECOMMENDATIONS OF THE GROUP.. 28

6.1. CARRY OUT THE PRIORITY PROJECTS.. 29
6.1.1. Priority projects in the process of completion (List 0)................................ 29
6.1.2. Priority projects to start before 2010 (List 1)... 32
6.1.3. Longer-term priority projects (List 2)... 38
6.1.4. Other important projects for territorial cohesion (List 3) 39
6.2. DEVELOP GENUINE MOTORWAYS OF THE SEA...................................... 41
6.2.1. An untapped potential 41
6.2.2. Process proposed to launch projects.. 41
6.3. BETTER MANAGE TRANSPORT 43
6.3.1. Build a European rail network... 44
6.3.1.1 Make national networks interoperable 44
6.3.1.2 Dedicate part of the rail network to freight.. 44
6.3.2. Integrate air traffic management 45
6.3.3. Manage river traffic 46
6.3.4. Watch maritime traffic... 46
6.3.5. Remove airport capacity constraints.. 47
6.4. IDENTIFY THE MAIN AXES 47
6.4.1. More coherent planning 48

6.4.2. Take into account the experience of the pan-European corridors 49
6.4.3. A task to be continued within the framework of the revision of the guidelines 49
6.5. DEVELOP LINKS WITH NEIGHBOURING COUNTRIES OF THE UNION . 51
6.5.1. Switzerland: a particular case 51
6.5.2. The Western Balkans 52
6.5.3. Eastern European countries (Russia, Belarus, Ukraine, Moldavia)............ 52
6.5.4. Mediterranean Countries 53
6.6. FACILITATE THE IMPLEMENTATION OF THE NETWORK....................... 54
6.6.1. Ensuring the necessary funding 54
6.6.1.1 Taking into account the constraint of public finance 55
6.6.1.2 A strongly anchored principle of territoriality 56
6.6.1.3 Community financial instruments to meet the challenge 57
6.6.1.4 Greater efficiency for Community financial aid 59
6.6.1.5 The public-private partnership: better management of risks and costs 61
6.6.2. Adapt the political and legal framework 63
6.6.2.1 The laws related to concessions 63
6.6.2.2 Infrastructure Charging 64
6.6.3. Organise the coordination of investment 64
6.6.3.1 Coordination within the major European axes 64
6.6.3.2 Transnational legal entities for major cross-border projects 65
6.6.4. Adapt the assessment methods to sustainable development 65
6.6.4.1 More homogeneous economic assessment methods 65
6.6.4.2 Taking sustainable development into account.. 66
6.6.4.3 The environmental impact assessment procedures 66
6.6.4.4 Facilitate these procedures by transnational commissions of enquiry 67
6.7. SIMPLIFY THE FUTURE REVISIONS OF THE LISTS OF PRIORITY PROJECTS 69
6.7.1. A necessary periodic revision.. 69
6.7.2. The list of the priority projects evolves 69
6.7.3. The bottom-up approach is no longer enough 70

7. LIST OF MEMBERS... 71

8. LIST OF MEETINGS 75

1. SUMMARY AND CONCLUSIONS

1. The High-Level Group on the trans-European transport network (TEN-T) was mandated by the Vice-President of the Commission in charge of Transport and Energy to identify by the summer of 2003 the priority projects of the trans-European transport network up to 2020 on the basis of proposals from the Member States and the acceding countries. This exercise is part of a broader review of the Community guidelines for the development of the trans-European transport network. The Group, which was chaired by Mr Karel Van Miert, consisted of one representative from each Member State, one observer from each acceding country and an observer from the European Investment Bank. The Group met on 10 occasions between December 2002 and June 2003.

2. The High-Level Group confirms the need to reformulate the trans-European transport network guidelines decided upon by the European Parliament and the Council in 1996. The network is characterised by a worrying increase in congestion, due to the persistence of bottlenecks and of missing links and a lack of interoperability. The prospect of enlargement to include 12 new countries accentuates the need for a new approach to preserve the competitiveness of the European economy and to guarantee a balanced and sustainable development of transport. A new impetus must therefore be given to create a real trans-European network.

3. One of the major tasks of the Group was to select a restricted number of priority projects on the transport network of the expanded Union. Such projects are essential to complete the internal market on the scale of the European continent and to reinforce economic and social cohesion. The Group also studied the obstacles of a financial, legal and administrative nature to the implementation of these priority projects.

4. The High-Level Group recommends that the Commission takes all the necessary initiatives to implement its recommendations. The Group also suggests that the other Community institutions, within the context of their respective competencies, take all measures to support the Group's recommendations. It will not be possible to put these recommendations into practice unless there is strong political and financial commitment from the Member States. The Group therefore invites all the Member States - both current and future members - to mobilise to attain, with the support of the Community institutions, the objectives formulated in the report.

1.1. Carrying out priority projects by 2020

5. In accordance with the Group's mandate, the list of priority projects includes only "*the most important infrastructure for international traffic, bearing in mind the general objectives of the cohesion of the continent of Europe, modal balance, interoperability and the reduction of bottlenecks*". In addition, an assessment was made as to "*how well each project fits the objectives of European transport policy, the added value for the Community and the sustainable nature of its funding up to 2020*".

6. The Group considers that this label of "priority project" must lead to the coordination and concentration of Community financial resources - whatever their origin or designation - and of the financial contributions of the States and local authorities allocated to the trans-European transport network. This label must also serve as a reference for the loan policy of the European Investment Bank. The Group thinks that this label, thanks to suitable legal structures, will help to attract private investors.

Finishing 5 of the Essen projects before 2010

7. Among the 14 priority projects identified by the Christophersen Group and confirmed by the European Councils of Essen and Dublin, only three have been finished and five will be completely finished before 2010. The Group nevertheless notes the significant progress made in the majority of the six remaining projects since important sections will be completed before 2010. [1] As regards the other sections, the Group agreed on new timetables and, considering the commitments taken by the Essen and Dublin European Councils, decided to integrate them, together with extensions in the territory of future Member States, in new priority projects with a time horizon of 2020.

8. The High-Level Group recommends that all measures be taken for these projects, such as they were conceived when endorsed by the European Council of Essen in 1994, to be completed and made operational between now and 2010. Sections which it will not be possible to complete by that date should in any case be fairly well advanced. This degree of advancement will be taken into consideration, moreover, when judging the appropriateness of keeping them on the list of priority projects beyond the year 2010, during future reviews of the guidelines for the development of the trans-European transport network. The Group recommends that the Commission follows the progress of these projects with the greatest attention and takes every useful initiative to ensure that the deadlines provided for in this report are met. The policies on awarding Community funding will have to depend particularly on the proper progress of the projects.

Starting new 22 priority projects in an expanded Union with a time horizon of 2020

9. The Group established its own methodology to assess and identify, amongst the candidate projects proposed by the present and future Member States the new priority projects to be carried out between now and 2020. Amongst 100 projects that the Group had to examine, 24 delegations agreed on a set of new priority projects which were grouped together synthetically in the report, depending on their belonging to a certain number of major traffic axes on the scale of the expanded Union. Belgium and Luxembourg did not approve the report because the upgrade of the rail link between Brussels and Luxembourg was not included in List 1. Greece also disagreed because it wanted to add the Ionian/Adriatic intermodal corridor in List 1 instead of List 3.

[1] The sections to be achieved by 2010 are included in "List 0" of the report. The sections to be achieved after 2010, and the extensions in the acceding countries, are included in "List 1".

10. The Group has set, as a general condition, that works must begin by 2010 at the latest on all of the sections[2] concerned. Given the absence of an agreement between the States concerned on the financing or itinerary of four of these priority[3] projects, the Group recommends to these States that they pursue their preliminary studies and negotiations in order to decide on their itinerary, completion date and funding. Given their importance for the trans-European network, the Group recommends that the Commission takes all useful steps to aid their execution, especially as concerns the high-capacity rail link across the Pyrenees.

11. Without neglecting the funding of other projects of common interest in the transport field, the Group is of the opinion that the Commission and the European Investment Bank ought to concentrate their financial efforts as far as possible on the priority projects.

12. A key priority is the Galileo project to develop a satellite radionavigation system for civil use. Galileo will help to improve efficiency and safety in all transport modes, while at the same time guaranteeing the European Union's technological independence in this area.

13. Given the prospect of an increasing demand for transport, inland infrastructure projects must complete missing links in the network or help to eradicate bottlenecks. Railway projects will also have to improve the European network's interoperability. Particularly careful attention will have to be paid among these projects to two major obstacles to the achievement of the trans-European network, namely, first of all, the crossing of natural barriers such as the Alps and the Pyrenees and, secondly, cross-border projects, which have often in the past been the victims of a blatant lack of coordination and commitment between and by national authorities.

14. The objective of sustainable development requires a shift in modal balance to be operated in favour of transport modes which are alternatives to road, namely rail, inland waterways and short-sea shipping. Accordingly, among the priority projects, the Group has selected works geared to improving navigability on several sections of the Rhine-Main-Danube route, including the Meuse, and on the Seine-Escaut route. To promote short-sea shipping, it has defined four "motorways of the sea", for which the Member States concerned will have to devise projects of common interest. The success of the motorways of the sea depends notably on improving logistics chains, the simplification and automation of administrative and customs procedures and the introduction of common traffic management systems.

15. The Group also identified, although not exhaustively, other important projects for the territorial cohesion which come under the logic of the current structural financial instruments[4].

[2] These projects are included in “List 1”.

[3] These projects are included in “List 2”.

[4] These projects are included in “List 3”.

16. The Group also identified several "horizontal" or cross-cutting priorities aimed at a better management of the European transport system, the effectiveness of which will be closely connected to the introduction of accompanying regulatory measures. The integration of traffic management systems on the basis of common techniques and standards for an optimised use of the existing networks will require incentive aid. A group of measures to manage more efficiently the allocation of capacities, particularly for freight transport, appears moreover unavoidable, with regard in particular to requirements imposed by the sustainable development of transport. In this context, the Group recommends particularly keenly the gradual introduction, with the support of all market operators, of a European rail network dedicated to freight transport.

17. The Group's mandate was to identify priority projects for the internal market. The Group did, however, identify a number of connections with third countries which are of interest for the development of the European Union's external trade and in order to improve the transit conditions of some new Member States. Consequently, the Group recommends that they be developed, particularly with the help of structural financial instruments - in the case of sections within Union territory - or in the framework of transit or association agreements between the Community and the third countries concerned (such agreements could even include a financial component), in the case of sections outside the Union.

1.2. Facilitating the creation of the trans-European network

18. The priority projects selected by the Group represent funding estimated at €235 billion between now and 2020, approximately €112 billion of which is for the Essen/Dublin projects still to be carried out[5]. What is more, these new priority projects represent only a part of the investment needed for the trans-European network of the expanded Union. The Group stresses indeed that the total cost of the network, including priority projects and other projects, is estimated at more than €600 billion, exclusive of maintenance costs.

19. The Member States are currently investing less than 1% of their gross domestic product in building transport infrastructure and devoting only one third of this investment to achieving the trans-European network. The Group considers that the latter is currently suffering from under-investment, which may prevent a fair number of the network projects, notably some priority projects, to be completed within the desired time frames, despite their positive repercussions on the entire economy of the Union. In addition, cross-border projects are often held up through the intrinsic difficulty of coordinating, at intergovernmental level, their timetable, their financial planning and the related administrative procedures for such projects.

Guaranteeing funding for priority projects

20. The Commission estimates that the Community share in funding the construction of the trans-European transport network will be about €20 billion between 2000 and 2006[6]. In the eyes of the Group, this contribution does not appear to be an adequate

[5] Including both sections in List 0 and in List 1

[6] This amount comprises contributions from the trans-European network budget, the Cohesion Fund and the Structural Funds.

inducement, particularly to carry out cross-border projects. The Group therefore welcomes with interest the Communication from the Commission - Developing the trans-European transport network: Innovative funding solutions[7].

21. Both the commitments entered into at the European Council of Essen and the recommendations of the new priorities made by the Group risk remaining a dead letter if the European Community does not release new financial resources. In particular, the Group recommends to the budgetary authorities that they should positively consider an appropriate allocation of funds, and one which truly acts as an inducement, be set aside for the trans-European transport network within the forthcoming financial perspectives, considering that the investments required in the period 2004 – 2013 for the priority projects alone stand at €208 billion.

22. Recurrent delays are jeopardising the viability of other sections on the route concerned, in particular on cross-border projects. Hence, the Group defends the idea that the Community could play a more active role in financing the cross-border projects. The Commission has already proposed an amendment to the Financial Regulation aimed at raising the share of the TEN budget for certain vital cross-border sections from 10% to 20%. The Group recommends to re-examine this initiative, as a possible first stage of a system permitting a greater modulation of the intervention rate depending on the benefits for other countries and more generally as one of the possible solutions to increase the Community role for cross-border projects .

23. The Group is keen to stress the crucial role of the European Investment Bank (EIB) through its loan policy. It suggests to develop the financing capacity of the bank through various financial engineering techniques in particular for cross-border projects. Moreover, it suggests that the EIB strengthen its links with the European Commission.

24. The coordination of projects and of financial resources, particularly for the construction of cross-border projects, must be strengthened. By their very nature, trans-European network projects benefit the whole of the Union. Consequently, Member States should go beyond a purely national logic which has led - apart from a few, all too rare exceptions - to their excluding funding for any infrastructure outside their territory.

25. The investments needed to carry out the recommended priority projects of the trans-European transport network represent, on average, 0.16% of GDP. They are, however, key productive investments that will improve the potential for economic growth, boost the dynamics of the internal market and contribute to sustainable development and territorial cohesion. In the light of what has just been said, the Group draws the attention of economic policy decision-makers to the incongruity in the long term between what is at stake in carrying out these projects and the constraints curbing public funding.

26. Finally, given the extent of the financial requirements, the Group is calling for initiatives to promote public-private partnerships. An appropriate legal framework, particularly as regards concession rights and charging for infrastructure use, must be introduced at Community level. Such partnerships must also be based on a distribution of risks which is acceptable for the private sector. New guarantee

[6] COM(2003)132 final.

mechanisms ought to be set up, such as in the context of a mutual risk fund, in order to cover, inter alia, the risks of delays or failures to complete certain sections which could jeopardise the viability of a project.

Better coordination of projects

27. The Group considers that it is necessary for coordination - not just financial, but also operational coordination - between the States concerned by projects on a single axis[8] to be strengthened and institutionalised. To that end, a coordination team under the auspices of the Community, headed by a personality recognised and accepted by all the States concerned, should be set up to spur on the achievement of projects on the major axes and to canvass private and institutional investors. In time, such teams could evolve into common management structures ensuring the coordination of the various Community interventions.

28. Superimposing national procedures relating to the assessment of the environmental and socio-economic impacts of a project has proven to be unsuitable in the case of cross-border projects. Going beyond the common assessment methods, joint procedures for trans-national enquiries ought to be developed. Consequently, the Group suggests that, for a given project, there should be the possibility of resorting to a single enquiry in the different States concerned, which could facilitate the application of recently adopted Community rules on environmental impact assessment.[9] Apart from taking better account of environmental priorities, a procedure of this kind will permit greater transparency in the choice of infrastructure and avoid the pointless and costly overlapping of procedures.

1.3. Preparing the next stages in the construction of the network

29. The priority projects selected by the Group are those which contribute most to promoting transnational traffic on the major trans-European axes. This selection procedure has made it possible to highlight a certain number of major trans-European axes. The identification of European axes characterised by major flows unavoidable for geographical or economic reasons facilitates the ordering of priorities and the establishment of consistency between the national plans. Consequently, the Group asks for this initial identification to be completed in the context of the revision of the guidelines by more detailed analyses of traffic flows in a Union of 27 countries.

30. The definition of a core network comprising these axes will constitute an indispensable working tool for further revisions of the list of priority projects. Recourse to a group of high-level experts appointed by the transport ministers has, moreover, permitted the identification of broad guidelines for the trans-European network and the incentives needed for its development. Given the strong territorial dimension and financial implications of the network, the work of a group of this kind constitutes an important prerequisite of any substantial revision of the Community guidelines.

[8] The wording “axis” is used in order to avoid confusion with the pan-European Corridors identified by the Crete and Helsinki Conference under the auspice of ECMT.

[9] Directive 2001/42/EC on the environmental assessment of certain plans and programmes.

31. For this reason, a similar group ought to be set up regularly, taking care to synchronise this exercise with the periodic revision of the Community's financial perspectives, in order to assess the progress made with the priority projects and to consider the inclusion of new projects on the list or, where necessary, the removal from the list of some projects which have been held up for too long.

32. The Group suggests that this exercise could be launched in 2010.

2. THE POLICY OF THE TRANS-EUROPEAN NETWORK SINCE MAASTRICHT

2.1. THE FIRST ACHIEVEMENTS

1. A fully integrated transport network is a prerequisite for a real freedom of movement of goods and people and for bringing together the peripheral, island or isolated areas with the central regions. A modern, interconnected and interoperable network allow, through a better use of transport, to enhance trade and the competitiveness of the European economy as a whole. Without implementing the necessary infrastructure and an appropriate regulatory framework for an efficient network management, the concepts of the internal market and the territorial cohesion of the Union will remain unfinished.

2. The inclusion in the Treaty of Maastricht of a Title for a policy on the trans-European networks gave the European Community competencies and the instruments for their development. In accordance with Article 154 of the Treaty establishing the European Community, the Community contributes to the establishment and development of trans-European networks in the sectors of transport, telecommunications and energy infrastructures. This is with a view to contributing to both the establishment of the internal market, and to economic and social cohesion. To do this it must firstly develop the interconnection and the interoperability of the national networks.

3. Under these conditions, the trans-European transport network will support the development of the economy of the European Union. People, goods and services should be able to circulate throughout the market in an effective way and at the least cost. However, in the last decades, the transport infrastructure of the Member States was still excessively oriented inwards, with the national capitals representing the nerve centres towards which the major transport routes converged. In the early 90’s, the development of the trans-European network became a political priority as it was rightly considered as a supporting tool for the single market, which, with the opening of the internal borders, became a tangible reality on 1st January 1993.

4. Establishing such a network would have become an instrument of economic integration, facilitating communication, reducing distances and making contacts easier between the peripheral and the central regions. As it is of crucial importance for the orderly functioning of the single market, the trans-European network also takes on a fundamental role in developing economic and social cohesion.

5. It soon proved necessary to “step on the gas" to promote the establishment of the trans-European transport network, as its implementation suffered from slow economic growth, which reduced the availability of funds. The Commission’s 1993 White Paper on growth, competitiveness and employment consequently evoked the idea of drawing up a list of projects of Community interest together with a number of measures aiming at mobilising public and private actors.

6. Within this framework, the role of the Union was to eliminate the financial and administrative obstacles in the development of these major and costly priority projects, of which many cross-border projects, by encouraging private investors to

play a larger part in their financing. In other words, these projects were carried out through the encouragement of partnerships between all the interested parties: public authorities, network operators, users, financial institutions and industry. This approach included the development of an action plan for each project in a form which intended to give the political impetus necessary for speeding up its implementation and financing.

7. Based on the Commission proposals contained in its White Paper, the Brussels European Council of December 1993 adopted a series of important decisions to speed up the implementation of trans-European networks (transport, but also energy and telecommunication). One of these created a special group of representatives of the Heads of State or Government chaired by Mr Christophersen. The mandate of the "Christophersen Group" was to help the Council in discharging its task in the field of transport and energy network infrastructure. The prime objective of the Group was to identify priority projects which, in the view of national representatives, were of determining importance for the establishment of the trans-European networks for transport and energy.

8. As regards transport, at its meetings in Corfu in June 1994 and in Essen in December of the same year, the European Council endorsed a list of 14 priority transport projects based on the report drawn up by the "Christophersen Group". It invited the Member States concerned to take all the measures necessary to advance these projects by in particular speeding up the administrative, regulatory and legislative procedures.

9. Subsequently, on 23 July 1996, the European Parliament and the Council adopted Decision N° 1692/96/EC on Community guidelines for the development of the trans-European transport network[10], that included a much larger list of projects of common interest.

10. This Decision[11] set 2010 as its target date for completing the network. The guidelines were intended to encourage the Member States, and if necessary the Community, according to its budgetary resources, to carry out projects of common interest aimed at ensuring the consistency, interconnection and interoperability of the trans-European transport network as well as access to this network.

11. The guidelines put in a single reference framework the plans and criteria for each mode of transport, which has made it possible to identify projects of common interest likely to be eligible for the TENs budget or under financial structural instruments. Furthermore, the Decision incorporated within its Annex III the priority projects adopted by the Essen European Council. **In fact, now, the priority projects endorsed by the Essen European Council represent only a part of the many projects of common interest.**

[10] OJ L 228 of 9.9.1996, p. 1.

[11] The Decision was amended on 22 May 2001, in order to incorporate inland ports and intermodal terminals into the plans, as well as to modify the priority project n°8 as requested by the European Council of Dublin in December 1996.

2.2. THE NECESSITY OF REFORMULATING THE COMMUNITY GUIDELINES.

1. The past decade saw not only a worrying increase in traffic congestion in urban areas, but also a new phenomenon of congestion on the major arteries of the trans-European network, increasing the number of bottlenecks. Missing links in the infrastructure, and a lack of interoperability within specific transport modes and for intermodal transport systems, are all reasons aggravating this congestion of the network. All transport modes are affected: road transport, but also railway transport – the railway themselves estimate that, on the basis of existing technologies, 20% of the railways track represent bottlenecks. Also air traffic is increasingly affected by delays. In contrast, the peripheral regions still suffer from isolation due to a lack of connections with the centre of the continent, and also congestion on the central parts of the network. The peripheral countries of the European Union are thus directly affected by the deterioration of traffic conditions in transit countries.

2. Having to cross natural barriers such as mountain ranges and sea stretches is a particular brake on the movement of goods and people. Traditionally one thinks of the Alps and the Pyrenees, but the ice which covers the north of the Baltic Sea during the winter is another example of a natural barrier which affects maritime traffic in the Nordic and Baltic countries. The construction of adapted infrastructure to cross these areas or the putting into service of specially adapted equipment (ice-breakers) is indispensable. This will require colossal investments which will often require the commitment of several Members States and very good cooperation between national administrations.

3. The phenomenon of congestion or lack of connections for the peripheral regions affects the competitiveness of companies by increasing their costs. It also has a negative impact on the environment through extra fuel consumption, as well as on the citizens' well-being due to the many side effects of transport. According to the Commission, the external costs of congestion due to road traffic alone represent approximately 0.5% of the Gross Domestic Product (GDP) in the European Union.[12]

4. This assessment becomes even more alarming when one realises that transport demand will continue to increase strongly in the future. Therefore, if no measures are taken between now and 2010 to make more rational use of the advantages of each transport mode, heavy lorry traffic alone in the Union of 15 could increase by 50% compared to its level in 1998. This phenomenon affects the Member States as well as the acceding countries, where we note a progressive deterioration of the market share of rail, with a consequent increase in road transport of almost 20% between 1990 and 1998.

5. An effective transport policy is obviously not just limited to the construction of infrastructure on the trans-European transport network. It should be noted, however, that the saturation of certain major arteries routes as well as the lack of satisfactory connections with the peripheral regions are directly caused by delays in implementing the infrastructure of the Network. As the White Paper on the European

[12] White paper on the European Transport Policy

transport policy noted[13], six years after the adoption of Decision 1692/96/EC on the Community guidelines for development of the trans-European transport network, barely 20% of the projects planned for the year 2010 have been completed. The longest delays affect the cross-border and railway projects. Of the fourteen projects adopted by the Essen European Council in 1994, only three have been completed and two have even not been started yet.

6. The current plans of the trans-European network result essentially from the juxtaposition of national plans. After enlargement, this lack of common global vision at the scale of the continent will inevitably lead to a dispersal of efforts and great difficulties in ensuring coherence between the different initiatives to plan and implement the network, at European, national or even regional level.

7. Moreover, at the request of the Member States, more than half of the capital expenditure was devoted to roads. In the new context of sustainable development, the Gothenburg European Council of June 2001 asked that, in future, stress should be laid on the development of rail, maritime and river transport. The Commission's White Paper on transport policy for 2010 also placed the re-balancing between different modes of transport at the heart of a sustainable development strategy.

8. The rebalancing of transport modes also signifies a more vigorous promotion of intermodality. It is necessary to place each project on the trans-European network in a transport chain and to find the optimal combination of existing transport modes, with a view to improving the overall performance of the system while reducing the consequences on the environment. A road project can for example have overall a positive contribution to reduce the environmental impact of transport if it improves a connection with rail or inland waterways. Rather than consider a project in isolation, one must combine at the European level the specific qualities of each transport mode.

9. Consequently, a reformulation of the current guidelines had become essential. As indicated in the Transport White Paper, the unbalanced growth of traffic and the requirements of sustainable development are forcing us to rebalance transport modes, eliminate bottlenecks, and fill in the missing links. Such an effort calls for regulated competition within the whole transport sector, for a framework favourable for the financing of the infrastructure but also for better targeting of investments on the major routes of the trans-European network.

10. We must judiciously use the different transport modes, telematics to better organise journeys and traffic, connect, in all the areas, the relevant networks of national authorities and ultimately improve transport services combining different transport modes. We must integrate higher environmental standards into infrastructure projects. The territorial aspects of transport must be considered in order to guarantee a balanced and sustainable development of all the regions of Europe by a better distribution of traffic flows. The investments are considerable but so are the gains in terms of competitiveness, employment, territorial cohesion, and reduction of negative social and environmental externalities.

[13] COM (2001) 370 - http://europa.eu.int/comm/energy_transport/en/lb_en.html.

11. A first, limited, attempt at revising the guidelines of the trans-European network of transport, was proposed by the Commission on 2 October 2001[14]. It is necessary to point out that although the Commission's proposal received the Parliament's approval on the list of new priority projects presented in Annex III[15], it has not found yet any agreement of the Council. Nonetheless, at several European Council meetings Member States renewed their request for a revision of the guidelines for the trans-European network, including new priority projects.[16]

[14] COM (2001)544; OJ C 362 of 18.12.2001, p. 205.

[15] The new priority projects presented in Annex III of the proposal were: Galileo, a high-capacity rail link across the Pyrenees, a mixed rail line from Stuttgart to Vienna, Danube river improvement between Vilshofen and Straubing, the high-speed rail interoperability on the Iberian peninsula, and the Fehmarn belt.

[16] The following European Councils made the following statements:

Göteborg, "invites the European Parliament and the Council to adopt by 2003 revised guidelines for trans-European transport networks on the basis of a forthcoming Commission proposal, with a view to giving priority, where appropriate, to infrastructure investment for public transport and for railways, inland waterways, short sea shipping, intermodal operations and effective interconnection;"

Barcelona, "requests the Council and the European Parliament to adopt, by December 2002, the revision of the guidelines and the accompanying financial rules on Trans-European Transport Networks (TEN), including new priority projects identified by the Commission, with a view to improving transport conditions with a high level of safety throughout the European Union and to reducing bottlenecks in regions such as, among others, the Alps, the Pyrenees and the Baltic Sea."

Brussels, "invites the Council, in the light of the conclusions of the Barcelona European Council and following the report of the Van Miert High Level Group, to spell out conditions and directions needed in terms of "connectivity", especially in view of enlargement, so as to make better use of and improve existing infrastructure while completing (in the next programming period) its missing links, while reducing bottlenecks in regions such as the Alps, the Pyrenees, the Massif Central and the Baltic Sea, especially related to cross-border natural barriers, encouraging investment in basic infrastructures through available EU financing instruments and joint public-private initiatives;"

3. NEW INFRASTRUCTURE: AN ESSENTIAL CONTRIBUTION FOR ENLARGEMENT

3.1. INTEGRATE THE NETWORKS OF THE NEW MEMBER STATES

1. A reformulation of the current trans-European transport network guidelines is especially necessary since we are on the verge of the largest expansion of the European Union. Ten countries are expected to join the European Union in May 2004: Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia and Slovenia. Romania and Bulgaria should join in 2007. This prospect emphasises the need for upgraded or new infrastructure on the corridors serving these countries in order to connect them effectively to the trans-European network of the 15 current Member States. There is also a need to improve the connections between these countries themselves. A new infrastructure network must therefore be developed East-West, and also North-South.

2. Adequate transport infrastructure is one of the conditions for the economic development of the acceding countries and their integration into an internal market on a continental scale, as well as for strengthening the accessibility of the peripheral regions towards the central regions. Borders will not be truly opened and people and goods will not be able to circulate freely and efficiently if the roads, railways, airports and ports of these countries are not modernised.

3. The accession negotiations revealed important needs regarding transport in the acceding countries. Approximately 20,000 km of roads and 30,000 km of railways, as well as ports and airports, will have to be built or modernised to achieve the criteria and the objectives of the Decision on the trans-European network guidelines applicable in the current Member States. The investments to be made in those countries can be estimated at about €100 billion, which is huge compared with their GDP.

4. The pan-European Conferences of the Ministers of Transport in Crete in 1994 and then in Helsinki in 1997 made it possible to identify a series of pan-European corridors crossing the Central and Eastern European countries and connecting with the network of the European Union. These corridors, whose purpose is to take up the major part of international traffic, made it possible to coordinate the interventions of the various authorities, including those of the Community that already actively support the Central and Eastern European countries through the PHARE and ISPA programmes (Instrument for structural policies for pre-accession).

3.2. INFRASTRUCTURE FOR ENLARGEMENT IS A MATTER FOR ALL

5. Raising the economies of the acceding countries to the level of those of the 15 Member States will still however require considerable investment efforts. Moreover, economic growth will itself generate unprecedented growth in the transport needs in these countries, and consequently for infrastructure as well. Since the cycle of development of an efficient transport network is relatively long, we understand that large-scale facilities must be planned and launched now in order to develop the future trans-European transport network of the broad-based Union. Furthermore we need to make up for investments that were not made for several decades because of the separation of Europe into two blocs.

6. The effects of enlargement on the trans-European transport network are not limited to those parts of it located in the future Member States. The integration of markets will be accelerated by enlargement and this will also probably lead to the generation of new traffic flows on the network of the current Member States. Some of the existing peripheral Member States will benefit from new intra-EU connections with central areas, for instance through the Baltic states or the Eastern Balkans. It is difficult to estimate today the magnitude of this phenomenon, which will depend on new territorial dynamics and the international division of labour. It is clear that the regions of the Union bordering the acceding countries will be strongly affected, as will certain major routes such as those crossing the Alps and the Pyrenees. It is therefore particularly important to keep the commitments of previous years and carry out the projects needed to complete the trans-European transport network in the current Union.

4. THE MANDATE GIVEN BY THE COMMISSION

4.1. THE COMPOSITION AND MANDATE OF THE GROUP

1. At the end of 2002, the Vice-President of the Commission, Loyola de Palacio, decided to create a High Level Group to assist the Commission in the revision of the guidelines for the trans-European network. She also wished to associate the future Member States from the outset of this large-scale exercise.

2. The Group was established under the presidency of Mr Karel van Miert, former Vice-President of the Commission with particular responsibility for transport, and comprised a representative designated by the Transport Ministers of each Member State, and, with observer status, a representative from the 12 countries whose accession to the European Union is envisaged in 2004 or 2007, and a representative of the European Investment Bank[17].

3. The primary objective of the Group was to identify, from proposals from each State, a restricted number of priority projects located on those major corridors that will carry important traffic volumes between the states of the enlarged Union. In accordance with the mandate of the Group, this list of projects should only include *"the most important infrastructure for international traffic, keeping in mind the general aims of cohesion of the European continent, modal rebalancing, interoperability and reduction of bottlenecks".* Moreover, each project should be evaluated regarding its *"conformity with the objectives of European transport policy, its Community value added and the sustainable character of its financing up to 2020".*

4.2. THE WORK PROGRAMME

4. The Group met ten times between December 2002 and June 2003. It developed a methodology and criteria for the selection of priority projects. It examined all the proposals for new projects submitted to it by the States, and the eleven unfinished projects among those adopted by the Essen European Council of 1994[18], as well as the six new projects identified by the Commission in its proposal of October 2001[19].

[17] See list of the members of the High Level Group in point 7 of the report.

[18] See Annex III to Decision 1692/96/EC.

[19] Proposal for a Decision of the European Parliament and the Council amending Decision 1692/96/EC on the Community guidelines for the development of the trans-European transport network; COM/2001/544, OJ 362 of 18/12/2001 p. 205. Proposal for a Council regulation of the European Parliament and amending Council Regulation (EC) 2236/95 determining the general rules for the granting of Community financial aid in the field of trans-European networks; COM/2001/545, OJ C 75 of 26/03/2002 p. 316.

5. For those projects that had been selected by the Essen European Council in 1994, the objective of the Group was, above all, to check the commitment of the States concerned to carry them out within a reasonable time-limit, and consequently examine the advisability of keeping them on a list of priority projects. The examination by the Group was also an occasion to update information on these projects and to identify the sections already built, in order to focus future efforts on the sections that are uncompleted. The prospect of enlargement also gave a new dimension to certain projects that had to be taken into account. Therefore some of the 'Essen projects' were extended towards the East to improve connections with the acceding countries.

6. The list of *priority projects* only represents a part of the numerous projects of the trans-European network. However their selection from a wide range of projects gives them a high profile. Receiving this 'European label' will make it possible to concentrate and coordinate the financial resources of the Community budget allocated to the trans-European networks, along with funds allocated by the states and/or regional or local authorities, and also attract private investors.

7. The definition of these priorities will also make it possible to channel the financial contributions of the cohesion and structural funds, and will be able to serve as a reference for the loan policy of the European Investment Bank. These projects display a particularly clear European interest insofar as they will facilitate exchanges between States of the enlarged Union; will improve the cohesion between countries, and will promote modal shift towards the railways and inland waterways.

8. The restricted list of priority projects established by the Group includes those large-scale projects for which all the states concerned were able to show sufficient political commitment, guaranteeing the start of work between now and 2010 and the completion of the infrastructure by 2020.

9. The Group also identified projects with an evident European interest, but where agreement on the timetable is currently lacking between the countries concerned or some other characteristics of the project remain undefined.

10. The Group hopes that this approach will give these projects the necessary high profile to facilitate coordination between the countries concerned and to carry out, where necessary with a financial intervention of the European Community, the required preliminary studies to mobilise potential investors.

11. The Group has identified some projects which contribute in particular to connections to third countries, as well as a series of projects which, although not meeting the selection criteria to be retained on a list of priority projects, are important at the national or regional level and which could, where appropriate, benefit from certain Community funds (Cohesion Fund and/or European Regional Development Fund).

12. Apart from the selection of a restricted number of priority projects, the Group also identified projects involving so-called "horizontal" priorities that contribute to improving the organisation and management of traffic. More precisely, this involves projects aiming to promote interoperability and traffic management systems for the various modes of transport.

13. In addition, the Group explored the means of facilitating and accelerating the implementation of the priorities of the trans-European network. Success in carrying out major projects of the trans-European transport network very often depends on the degree of coordination between the various authorities concerned. This is particularly the case for cross-border projects where the launch but also the implementation commonly suffer from the lack of a common approach.

14. In this context the Group has identified some measures which the Commission needs to examine in more detail with a view to reinforcing the financial part of projects of the trans-European network. Public private partnership and the coordination of different sources of investment are examples of approaches which merit deeper consideration at a technical level.

15. The Group also recommended a method, a procedure and a timetable for future updates of the list of priority projects. These updates involve the identification of new priority projects, but also the possible withdrawal from the list of projects failing to make any progress or projects whose profitability and feasibility are called into question.

5. THE NECESSITY OF A SELECTIVE APPROACH

5.1 GENERAL REMARKS

5.1.1. An insufficient and sometimes incoherent provision of infrastructure at the European level

1. Experience shows that the volume of overall traffic always, or almost always, increases more quickly than GDP and that interurban flows and, in particular, long distance flows, grow even faster. In addition, enlargement will accelerate this traffic growth, in particular for freight. At the same time, the provision of infrastructure does not keep pace because of, amongst other things, a lack of public financing and the current difficulty of mobilising private funds. This gap between transport needs and the supply of new infrastructure will lead to an impasse which will not be without negative consequences for the competitiveness of the economy of the Union.

2. The coherence of the trans-European network suffers from the actions of the past. The transport infrastructure networks in the various Member States were developed above all according to a national logic, giving priority to the development of radial routes serving major cities, thus affecting overall balance. Experience shows that it is the cross-border sections which are generally the last to be carried out on a given transport route. Furthermore, the Member States do not all show the same interest in the transport modes - alternatives to road - which sometimes leads to situations where canals or railway tunnel projects for freight are only built up to one side of the border.

3. In addition, the division of Europe after the Second World War led to underinvestment in the connections not only between the current Member States and the future Member States of Central and Eastern Europe, but also in those between the acceding countries themselves.

4. The policy of transferring a share of the growth of goods traffic by road towards railways, inland waterways, or the Motorways of the Sea will only happen if cross-border infrastructure projects and interoperability on a European scale see the light of day.

5. Infrastructure project management is becoming increasingly complex. Carrying out of major projects today takes from 10 to 15 years, or even longer in the case of the cross-border projects.

6. In addition, the implementation of cross-border projects is hindered by specific factors such as different political agendas, the lack of coordination of administrative procedures on either side of the border and the difficulty to agree on sufficient amount of public contribution to make projects bankable. The political decision-makers are sometimes inclined to sacrifice cross-border projects for the benefit of national projects.

7. It requires a long-term vision in order to avoid, as is often the case today, short-term decisions on financing infrastructure - according to the political priorities of the day. It also requires a Community vision, on the level of the enlarged Europe, for the planning of major infrastructure.

5.1.2. The foreseeable development of traffic

8. The integration of 12 new Members States between now and 2007 will greatly stimulate these countries' trade. It must be expected that, if Europe does not agree to make sufficient efforts for modal transfer and the construction of new infrastructure, certain sections of the current network will quickly arrive at complete gridlock.

9. It is still difficult to make forecasts, especially for 20 years hence. Nevertheless, the Commission's services launched a major study aiming to simulate growth scenarios for traffic in an enlarged Europe as well as identifying how the major flows were structured on a European scale.[20]

10. Although this study is not yet completed, the Group benefited from certain preliminary results. Even on the assumption that some of the proactive measures proposed in the White Paper on European transport policy were implemented, with an assumed growth of 60% of GDP and a moderate economic catch-up of eastern countries, the volume of land freight traffic would increase by 68% from 2000 to 2020 in the current Member States and by 94% in the future Member States.

Provisional results

Freight transport in billion t.km	*Current Member States*			*New Member States*		
	2000	***2020***	***%***	***2000***	***2020***	***%***
Road	848	1420	67%	114	268	135%
Rail	220	388	76%	167	273	63%
Inland waterways	145	226	56%	7	18	157%
Total	1213	2034	68%	288	559	94%

11. Without wishing to be too alarmist, the Group draws the attention of the Member States and the Community Institutions to the importance of taking, today, courageous decisions both on the common transport policy and on investment priorities for safeguarding the competitiveness of the European economy.

5.1.3. The constraint of financing

12. The estimated cost of the whole trans-European transport network agreed in 1996 in the guidelines and in 2002 in the Accession Treaties, alone, amounts to nearly €500 billion[21] for all the projects due initially to be completed by 2010, including €112 billion still to be invested for the priority projects agreed by the European Council of Essen. The work of the Group has shown that new additional needs for a time horizon of 2020, not yet identified in the guidelines, have now to be considered. Adding what needs to be completed to achieve past commitments and these new needs, we can estimate the total needs at nearly more than €600 billion until 2020.

[20] Study “Scenarios, traffic forecast and analysis of TEN corridors”, ordered by DG TREN. Figures exclude local traffic.

[21] 2003 prices, excluding traffic management and information systems and partly airports and ports.

13. The Member States, which invested on average 1.5% of the GDP in transport infrastructure during the 1980s, now invest less than 1%[22]. Acceding countries currently invest roughly 1.5% of their GDP and it seems to be quite unlikely that they could significantly increase this level without external support. Only a small part of these investments is actually devoted to infrastructure of the trans-European transport network, the lion's share being allocated by Member States to other national, regional or urban transport projects. Recent estimates[23] point out that overall investments in the trans-European transport network in the EU27 amount to less than €30 billion a year since 1996. With such a pace of investments, more than 20 years will be needed to complete the network.

5.1.4. The need for greater concentration, selectivity and coordination

14. The constraints relating to public finance inevitably require a high selectivity in identifying new priority projects of common interest. A stronger concentration of efforts must be sought on the basis of joint programming and maximising the profitability of these new infrastructure by ensuring coordinated development at European level. The effectiveness and the value added of Community action necessitates concentrating, in a selective manner, the financial support of the Community.

5.2. CRITERIA AND METHODS FOR EXAMINING THE PROJECTS

5.2.1. Take stock of progress and delays with existing priority projects

1. Although the Group could take stock of progress on a number of priority projects (see Chapter 6.1), it had to examine the reasons for delays encountered by those priority projects which will not be completed between now and 2010. Certain delays are inherent in infrastructure project management in general, such as:

   – the lack of well advanced studies when the decision to build the infrastructure is taken;

   – the existence of environmental constraints, connected for example with being in a NATURA 2000 area;

   – the legal risks, which arise from the 'NIMBY syndrome' ("not in my backyard"). Decisions taken by the Member States to build major infrastructure are increasingly frequently challenged in local courts.

2. It must also be remembered that it is the cross-border projects or the cross-border sections which in general show the biggest delays. The cross-border nature of these projects exposes them to additional causes of delay:

[22] Including transport infrastructure of the trans-European network and others, ECMT, “Investment in Transport Infrastructure 1985 – 1995”.

[23] Study TEN-Invest commissioned by DG TREN, excluding traffic management and information systems.

- firstly, sometimes there is the difficulty that Member States have to agree on a route, as in the case of the high-capacity rail crossing of the Pyrenees;

- secondly, the question of who is going to pay is particularly difficult to agree upon as the benefits are usually not in proportion to the costs incurred in each region or country crossed by the project (for instance in the case of the Brenner base tunnel of priority project No 1 of the Essen list);

- thirdly, unlike national projects, cross-border projects are likely be the focus of political decision-makers seeking advantage on the pretext that the other Member State is, or is likely to be, behind schedule;

- lastly cross-border projects suffer from having to undergo different procedures in the various Member States for prior authorisations necessary for construction of the infrastructure in question. Similarly, it is more difficult to set up a management contract for the cross-border sections.

3. The delays encountered by cross-border projects illustrate certain weaknesses of the intergovernmental method used up until now by the Member States:

   - Member States which are not concerned with the project route but which have on the other hand a direct interest in its construction as it links them to the network, are not invited to the bilateral meetings;

   - the Community is not represented at the "intergovernmental" meetings between Member States, although there is the question of common interest and the fact that the Community contributes a sometimes considerable financial share from the Cohesion Fund, from the ERDF or from the TEN budget line;

   - the delays in the construction timetables do not result in 'penalties' to the State in question, although these delays often cause a severe financial cost to another Member State which carried out its section on time, but which cannot make this section profitable in the absence of an extension of the infrastructure beyond its border.

5.2.2. The need to stick to strict criteria

4. An examination of all the priority projects selected by the Christophersen Group might give the impression that they do not have a perfect coherence. The method used and the rules of the game inherent in this type of exercise can explain this relative and occasional lack of coherence. Some of the Essen projects reflect a national planning desire which does not show any strong synergy with the remainder of the trans-European network. Others take the form of packages including many disparate projects. However, the priority projects have a role in completing major trans-European axes whose usefulness and European added value is undeniable at the level of the Community. The present Group wished to avoid the above-mentioned difficulties by following two principles :

- having a rigorous and clear methodology for choosing the priority projects;

- having in mind the concept of major trans-European axes - like that of pan-European corridor developed by the pan-European conferences on transport infrastructure among the countries of Central Europe and Eastern Europe – so as to keep in mind the need for the priority projects in an overall framework and hierarchy coherent with the trans-European network.

5. The Group arrived at a clear methodology and criteria to choose from among the candidate projects, those which can really play a key role from a European perspective.

5.2.2.1 A two stage method

6. The Group decided to work in two stages. In a first stage, the Group pre-selected the projects worthy of being examined in more detail, by eliminating those projects not meeting one of the following criteria:

   - Being on a main trans-European axis pertinent to the internal market of the enlarged Europe, taking in particular into account projects crossing natural barriers, solving congestion problems or corresponding to missing links.

   - Having a European dimension in particular by meeting a threshold of €500 million for infrastructure.

   - The existence of evidence showing potential economic viability, other socio-economic benefits (e.g. social, environmental), and firm commitments from the concerned Member States to carry out the required impact assessments with a view to completing the project within an agreed timeframe.

7. In a second stage, the Group selected the priority projects with respect to the three following qualitative criteria:

   - The European value added of the project, in terms of importance for facilitating exchanges between Member States, for instance improving interconnections and interoperability between national networks.

   - The strengthening of cohesion, either by better incorporating the future Member States into an enlarged Europe, or by connecting the main peripheral areas and the least developed regions to the rest of Europe.

   - The contribution to the sustainable development of transport while tackling the problems of safety and of environmental protection and by promoting modal transfer.

5.2.2.2 The pre-selection

8. The first pre-selection criterion refers, for the future Member States, to the pan-European corridors mentioned in Chapter 4 of this report. For the current Member States, the main trans-European axes which should have constituted the framework of a genuine core trans-European network were never formally identified and listed.

This is why, Member States were invited to indicate for each one of their proposals on which main trans-European axes the project in question was located. This approach made it possible to have very constructive and informative exchanges on the perception that the various members of the Group had of what these main trans-European axes were.

9. The second pre-selection criterion relating to the financial threshold had the role of ruling out the projects whose scale was obviously below that foreseen for this exercise.

10. Lastly, as a the third pre-selection criterion it was considered crucial to be able to rule out the projects which are not mature enough or to which the States are not ready to commit themselves.

5.2.2.3 The evaluation of the pre-selected projects

11. The first evaluation criterion relating to the European value added is without doubt the most important one. This criterion is measured either by the share of intra-Community traffic (i.e. concerning at least two Member States) in percentage terms of the total traffic on the sections concerned, or on the increases in net capacities on the route concerned, or by the number and length of networks which become interoperable.

12. The second evaluation criterion relating to the contribution of the project to cohesion directly follows the provisions of Article 154(2), of the EC Treaty. This criterion reflects population of an 'isolated' region served by the infrastructure in question, and in the number of hours saved for the peripheral regions, or the cost savings for the transportation of goods.

13. Lastly, the third evaluation criterion reflects one of the major concerns of the White Paper on transport policy to make transport more compatible with sustainable development. This objective has to measure itself by the number of passenger-kilometres or of tonnes-kilometres transferred towards more "sustainable" modes of transport, such as rail or waterways.

5.2.2.4 Comparisons with the approach of the Christophersen Group

14. For the record, we recall that the Christophersen Group devised a list of selection criteria as follows:

(i) projects had to be projects of common interest in accordance with the criteria which were meanwhile set in the Community guidelines for the development of a trans-European transport network;

(ii) they had to be of exceptional size, bearing in mind the type of project and the relative size of the Member States directly concerned;

(iii) they had to pass the economic viability test, including improvements of competitiveness and the technological performance of the Union;

(iv) they had to allow for the possibility of private financing;

(v) they were ought to be mature enough in order to be carried out quickly;

(vi) they had to avoid the public financing of infrastructure which would lead to distortions of competition contrary to the common interest;

(vii) and to respect Community legislation, in particular concerning environmental protection.

15. The Group took up most of these selection criteria, knowing that the other criteria had implicitly to be met whatever happened, and added up other criteria attempting to capture the greatest European value and reflecting new important policy objectives like sustainable development. The innovation of the Group consists in having introduced evaluation criteria beforehand, on which it will justify the inclusion or not of a project in the list of the priority projects. The evaluation criteria are not absolute instruments, but constitute above all a methodological reference to facilitate the work of the Group and to justify certain decisions.

16. It must be recalled that the Christophersen Group retained 14 priority projects from the 34 projects which had been submitted to it. For this exercise, the present Group had to examine more than one hundred projects and finally select only 19 in the list of the priority projects.

17. This is why the Group had to make use of a very selective approach, by retaining only those projects whose overall contribution to the objectives inherent in the three evaluation criteria is obviously higher than the average. The fact that a project is not adopted as a priority does not mean that it is not of interest for the Community.

18. Firstly, the list of the priority projects is intended to evolve over time. Secondly, for certain non-selected projects, the Group commits itself to recommending their being taken into account for other Community funds.

19. It is from this viewpoint that the Group decided on various lists of projects.

6. RECOMMENDATIONS OF THE GROUP

1. These recommendations go beyond a strict framework limited to physical infrastructure. Demand management, active policies on intermodality and investment targeted and coordinated on the major trans-European axes are only facets of the same problem, to ensure sustainable transport development at the level of the enlarged European Union.

2. Although a number of missing strategic links have to be built, more efficient use of the existing network is crucial. The potential of maritime transport on intra-Community routes still needs to be tapped by innovative cooperation between public authorities and the private sector to start up genuine ‘motorways of the sea’. The organisation of traffic to distribute railway capacities between freight and passenger trains, to manage the capacity of airports and of airspace, better use of rail signalling, and ultimately more integrated traffic management will also prove necessary.

3. Given the budget constraints and the change of the scale of the trans-European network after enlargement, a more coherent approach between European and national infrastructure planning will be needed. Identifying the main multimodal routes taking intra-Community traffic flows is a prerequisite to organise effective coordination of the various public authorities and industry and to target the efforts to promote a shift to rail and waterborne transport able to compete with roads mainly for long-distance services.

4. Undertaking the priority projects identified by the Group will require substantial public financing. It will also demand further efforts to adapt the legal and transport policy framework to allow both a higher participation of private capital and more efficient use of infrastructure overall.

5. The Group stresses that the implementation of these priorities must be monitored regularly at Community level and that a further revision between now and 2010 will be necessary.

6.1. CARRY OUT THE PRIORITY PROJECTS

6. The Group identified a set of new priorities, and other important projects, considered as crucial to facilitate transnational exchanges in a single internal market, and to promote intermodality leading to a 'rebalancing' of the territory of the enlarged Union.

7. The lessons of the past and of the delays to the Essen projects have to be learnt. The Group took first stock of the progress made as regards the current Essen projects (List 0).

8. After having considered 100 projects, 24 delegations agreed on a set of new priority projects which were grouped together synthetically in the report, depending on their belonging to a certain number of major traffic axes on the scale of the expanded Union. Belgium and Luxembourg did not approve the report because the upgrade of the rail link between Brussels and Luxembourg was not included in List 1. Greece also disagreed because it wanted to add the Ionian/Adriatic intermodal corridor in List 1 instead of List 3.

9. It was ensured that the new priorities in List 1 are clearly defined, have a high European value added, and are realistic as concerns financing and the possibility to start work on time. Important sections of six of the Essen projects have been integrated in these new priority projects.[24]

10. Projects identified in List 2 feature a particularly high European added value and, although for a longer-term time horizon, deserve special attention. Without prejudging the scope of Community financial instruments in the future, the Group has also identified a list of important projects for territorial cohesion contributing to the aims of economic and social cohesion (List 3).

11. It cannot be ruled out that other needs will appear between now and the next revision of the list of priority projects, nor, moreover, that it will be necessary to re-examine certain projects identified by this report (see Chapter 6.7).

12. It is advisable to make a distinction between these priorities and eligibility for Community funding. Eligibility is specific to each financial instrument and has to be considered on a case by case basis (see also Chapter 6.6). The numerous other projects not included in this report are not less important. Choices had to be made. Besides that, a certain number of other projects have simply neither the necessary scale, nor the strategic role for the Community, to develop transnational trade, to significantly contribute to territorial cohesion and to the concentration of traffic on the more environmentally friendly modes.

6.1.1. Priority projects in the process of completion (List 0)

13. Certain priority projects adopted by the European Councils of Essen and Dublin are in the process of completion. Their implementation is envisaged in the majority of cases before 2007. **The Group notes the progress achieved and recommends the**

[24] Former Essen Priority Projects N°1, 3, 4, 6, 8, 12 (see table 2 of 6.1.1)

continuation of work on these priority projects according to the agreed timetables.

14. The Group confirms their priority character. It notes in addition that certain important sections within these projects will not be finished before 2007 and that, consequently, **it is advisable to retain Community financing during the next Community budgetary perspective**. Table 1 below presents the projects which will be completely finished between now and 2007.

Table 1: Projects completely finished by 2007

Projects or sections of projects completed in 2007	*Date for start of operation*
PP2 High Speed Train Paris-Brussels-Cologne-Amsterdam-London [25]	2007
PP5 Betuwe line	2007
PP 9 Rail line Cork-Dublin-Belfast-Stranraer [26]	2001
PP 10 Malpensa airport (finished)	2001
PP11 Öresund fixed link (finished)	2000

15. Other projects are also on the way to completion. Numerous sections will be completed within the deadline initially envisaged, i.e. 2010. The progress achieved by the States concerned deserves to be noted (table 2).

Table 2: Projects of which several sections will be completed by 2010

Projects or sections completed before 2010	*Date for start of operation*
PP1 Berlin-Verona	
- Nürnberg-München	2006
- Kufstein-Innsbruck	2009
PP3 Southern TGV	
- Madrid-Barcelona	2005
- Barcelona-Figueres-Perpignan	2008
- Madrid-Vitoria-Hendaya	2010
PP 4 TGV East	
- Paris-Baudrecourt	2007
- Metz-Luxembourg	2007
- Saarbrücken-Mannheim	2007
PP 6 Lyon-Torino-Trieste	
- Torino-Venezia	2010
PP7 Greek Motorways	
- Via Egnatia	2006
- Pathe	2008
PP 8 Multimodal link Portugal/Spain rest of Europe	
- Rail line Coruña-Lisboa-Sines	2010
- Rail line Lisboa-Valladolid	2010
- Rail line Lisboa-Faro	2004
- Road Coruña-Lisboa	2003
- Road Lisboa-Valladolid	2010
- Road Seville-Lisboa	2001
PP12 Nordic triangle	
- Road and railway projects in Sweden [27]	
- Road link Helsinki-Turku	2010
- Rail line Kerava-Lahti	2006
PP13 UK/IRL/Benelux road link	2010
PP14 West Coast Main Line	2007

[25] Two main HST stations in the Netherlands, Rotterdam and Amsterdam need further financing beyond that foreseen in the project retained in the Essen List.

[26] New additional capacity enhancement of the line has been decided in 2003 and is included in List 1 as a separate project.

[27] Only some minor road and railway sections will remain to be completed between 2010 and 2015.

16. The Group observes, however, that, within the Essen projects, progress is unequal. **The sections located within the national networks have made notably more progress than the cross-border sections, which in general, except the Öresund bridge, have encountered major delays.** Consequently, essential sections of these projects will not be completed before 2010[28].

17. As regards the project N° 14 (West Coast Main Line), the Group welcomes the commitment of the UK to implement ERTMS before 2015.

6.1.2. Priority projects to start before 2010 (List 1)

18. On the basis of the proposals submitted by the Member States, the acceding countries and the Commission, the Group identified a series of projects having a very high European value added. **The countries concerned gave firm commitments to begin work on all the sections of each one of these projects at the latest in 2010 so that to make them operational at the latest in 2020.**

19. The Group considers that they constitute the priority projects for the period 2007-2020. They should consequently be identified as such in the future guidelines on the trans-European transport network, without however prejudging later revisions provided for in Chapter 6.6 of this report.

20. The majority of these projects aim to build new railway, river or road infrastructure. The geography of transport flows in Europe as well as the technological developments of the transport sector, in particular in the railways, require us to go beyond the traditional concept of infrastructure. Projects for the development of motorways of the sea, which will make it possible to cross or circumvent natural barriers such as the Alps, the Pyrenees and the Baltic Sea are therefore proposed. Technological projects aiming to improve the interoperability of the rail network, and the overall transport management such as Galileo, are also adopted.

21. The inclusion in this list of certain projects is accompanied by conditions to be fulfilled before a certain date. The Group considers that if these conditions are not met after a while, it will be advisable to transfer the projects concerned to List 2 (longer-term priority projects).

22. The Group recommends that the authorities of the countries concerned, as well as various Community Institutions, give, in particular in their investment and financing decisions, real priority to carrying out these projects in a coordinated framework.

23. These priority projects, and the corresponding sections, are indicated below (date of completion of sections between brackets).

1. Galileo (2008)

The Group considers this project as presenting a particularly high strategic interest as it will provide the European Union with an autonomous radionavigation system. The launching of a constellation of 30 satellites covering the world, supplemented with land transmitters allowing the supply of universal services, will provide an essential tool for many sectors and in first instance for the transport sector. It will improve the efficiency

[28] Some of these sections still requiring important work are included in List 1 because of their fundamental European interest.

and safety in all modes of transport, by constituting a solid technical base for positioning and the identification of all vehicles, trains, ships and aircrafts.

2. Eliminating the bottlenecks on the Rhine- Main- Danube [29]

- Rhin-Meuse (2019) with the lock of Lanaye as cross-border section
- Vilshofen – Straubing (2013)
- Wien – Bratislava (2015) cross-border section
- Palkovicovo-Mohacs (2014)
- Bottlenecks in Romania and Bulgaria (2011)

The Group observes that the Vilshofen-Straubing section constitutes a major bottleneck on the Rhine-Main-Danube line. It stresses that its upgrading should guarantee a draught of at least 2.50 metres during all seasons, in order to develop long-distance and reliable inland waterway transport, compatible with environment, from the North Sea to the Black Sea. However, the Group notes that the technical option taken by Germany for the Vilshofen-Straubing section does not ensure this level of navigability throughout the year.

3. Motorways of the Sea[30]

- Motorway of the Baltic Sea (linking the Baltic Sea Member States with central and western Member States)
- Motorway of the Sea of Western Europe (leading from the Iberian peninsula via the Atlantic Arc to the North Sea and the Irish Sea)
- Motorway of the Sea of South-East Europe (connecting the Adriatic Sea to the Ionian Sea and the Eastern Mediterranean to include Cyprus)
- Motorway of the Sea of South-West Europe (Western Mediterranean), connecting Spain, France, Italy, including Malta, and linking the Motorway of the Sea of the South-East Europe[31]

Proposals aiming at developing these motorways of the sea will have to be proposed to the Commission by at least two Member States and must respect certain conditions (see Chapter 6.2). For the Motorway of the Baltic Sea, a joint working group of the countries concerned has already agreed upon a number of transnational proposals (e.g.icebreaking, tracking and tracing of cargo). The Group also welcomes the Greek and Italian initiatives to prepare proposals fitting in the Motorway of the Sea of South-East Europe.

[29] A part of this project fits into pan-European Corridor VII.

[30] Projects to be addressed at a later stage to the Commission in order to be evaluated.

[31] Including towards the Black Sea

4. Mixed railway line Lyon-Trieste/Koper-Ljubljana-Budapest [32]

- Lyon-St Jean de Maurienne (2015)
- Mont-Cenis tunnel (2015/2017), cross-border section
- Bussoleno-Torino (2011)
- Venice-Trieste/Koper-Divaca (2015)
- Ljubljana-Budapest (2015)

As regards the first three sections, the Group classifies them in List 1 on condition that the tunnel under Mont-Cenis, the most critical cross-border section, is completed at a time horizon of 2015/2017. It invites the countries concerned to respect their commitments within the deadline agreed upon. The economics of these sections depend on a firm commitment of the countries concerned to promote a transport policy favourable to intermodality in the spirit of the Alpine Convention. The idea of new road capacities on the competing routes, even in the short and medium term, is not compatible with this project. A coherent approach as regards infrastructure charging is in addition necessary.

5. Mixed Railway line Berlin-Verona –Napoli/Milano-Bologna

- Halle/Leipzig-Nürnberg (2015)
- München-Kufstein (2015[33])
- Brenner tunnel (2015), cross-border section
- Verona-Napoli (2007)
- Milano-Bologna (2006)

The Group classifies this project in List 1 on the condition that the cross-border sections, in particular the Brenner tunnel, are completed at the time horizon of 2015. The Group invites the countries concerned to respect their commitments to carry out these sections within the agreed deadline. Like the previous project, the economics of the Brenner tunnel and its access links depend on a firm commitment of the countries concerned to promote a transport policy favourable to intermodality in the spirit of the Alpine Convention. The idea of new road capacities on the competing routes, even in the short and medium term, is not compatible with this project. A coherent approach as regards infrastructure charging is in addition necessary.

6. Mixed railway line Greek/Bulgarian border- Sofia –Budapest – Wien -Praha-Nürnberg [34]

- Greek/Bulgarian border–Kulata-Sofia-Vidin/Calafat-(Craoiva) (2015)[35]
- Curtici–Brasov–(towards Bucuresti and Constanta) (2010)
- Budapest-Wien (2010), cross-border section
- Brno-Praha-Nürnberg (2010), with Nürnberg-Praha as cross border section.

[32] Parts of this project are registered in pan-European Corridor V.

[33] Depending on the completion of the Brenner tunnel

[34] Some parts of this project are on pan-European Corridor IV.

[35] The section Vidin/Calafat to Craiova is subject to further discussion with the Commission.

The interoperability of this line on a major railway axis, including a branch connecting the Black Sea to the centre of Europe, has to be ensured by applying the Community technical specifications.

7. High Speed Railway lines, South-West

- Lisboa/Porto – Madrid (2011)
- Perpignan – Montpellier (2015)
- Montpellier - Nîmes (2010)
- Irún – Dax as the cross border section (2010)
- Dax - Bordeaux (2020)
- Bordeaux – Tours (2015)

The Group stresses the importance of the sections crossing the natural barrier of the Pyrenees, which acts as a brake on economic development (see also 6.1.3). The granting of a concession on the section between Figueres and Perpignan (in List 0), on the Mediterranean side, should be done as quickly as possible and be followed by the section between Perpignan and Nîmes as soon as possible. For the Atlantic side the Group recalls the commitments given at the European Council of Essen to develop a high-speed connection, which unfortunately will not be completed before 2020. It suggests ensuring mixed use (freight/passengers) of this railway corridor and increasing capacity for goods traffic in the short and medium term. With regard to the new connection between Lisboa/Porto and Madrid, the Group proposes classifying it in List 1 provided Spain and Portugal decide the route in time before the adoption of the revised TEN-T guidelines in particular for the cross border sections of the project.

8. Mixed railway line Gdansk-Warszawa-Brno/Zilina [36]

- Gdansk-Warszawa-Katowice (2015)
- Katowice-Brno-Breclav/Zilina-Nove Mesto n.V.(2010)

The Group considers that the implementation of this project, together with project n° 18, along a new north-south axis from the Baltic Sea, constitutes an opportunity for providing in the long term an alternative to the existing saturated north-south axes from the North Sea. The project includes access to the Port of Gdansk.

9. Mixed railway line Lyon/Genova –Basel – Duisburg - Rotterdam/Antwerp

- Lyon-Mulhouse-Mülheim (2018), with Mulhouse-Mülheim as cross-border section [37]
- Genova-Milano/Novara-Basel-Karlsruhe (2015)
- Frankfurt-Mannheim (2012)
- Duisburg-Emmerich (2009)
- "Iron Rhine" Rheidt – Antwerp (2010)

This project comprises the construction of new high-speed passenger lines, of new dedicated freight lines, and upgrades of existing lines. The construction of new high-speed lines will release capacity on the existing lines for freight. This project is proposed,

[36] This project forms part of pan-European Corridor VI.

[37] Including the so called “TGV Rhin-Rhone” minus the western branch. The section Dijon-Mülhouse (“East Branch”) included in the project will be completed in 2010.

with a view to, among others, establishing a dedicated rail freight corridor at a later stage. The good timing of the work requires close coordination of investments between all the countries concerned, including Switzerland (see Chapter 6.5).

10. Mixed railway line Paris - Strasbourg - Stuttgart –Wien –Bratislava

- Baudrecourt-Strasbourg-Stuttgart (2015) with the Kehl bridge as the cross-border section
- Stuttgart-Ulm (2012)
- München-Salzburg (2015), cross-border section
- Salzburg-Wien (2012)
- Wien-Bratislava (2010), cross-border section.

The cross-border parts of this project constitute the critical sections, in particular between France and Germany and between Germany and Austria. The Group recommends that the Member States concerned take all the measures necessary to ensure the coordination of investments and the respect of their commitments to complete work within the agreed time.

11. Interoperability of the high-speed rail network of the Iberian Peninsula

The Group proposes to place in List 1 the new high-speed lines (with European gauge) and the lines upgraded with dual gauge of the Iberian Peninsula. The Group sticks to the definition proposed by the Commission[38], with specifications described in the project fiche attached to this report. The project comprises the new high speed line between Vigo and Porto.

12. Multimodal links Ireland/UK/Continental Europe

- Strategic Road/Railway corridor linking Dublin with the North (Belfast-Larne) and South (Cork) (2010)
– Road/Railway corridor Hull-Liverpool (2015)

- Railway line Felixstowe-Nuneaton (2011)
– Railway line Crewe-Holyhead (2008)

The projects Felixstowe-Nuneaton and Crewe-Holyhead and on the road/railway corridors Hull-Liverpool, crossing the West Coast Main Line, will contribute particularly at improving the transport of freight between major British ports. In Ireland, the development of passengers and freight transport requires additional works compared to what was already achieved under Essen projects N° 9 and 13 (see List 0).

13. Rail/road bridge over the Strait of Messina (2015)

The project consists of a long mixed bridge- with a distance of 3.3 km between the two main piers - over the Strait of Messina which will connect the most populated island of the Mediterranean Sea (5 m inhabitants) to the rest of Europe. This link will constitute a landmark infrastructure for Europe with a a magnitude comparable with that of the Öresund bridge.

[38] In COM(2001)544

14. Fixed link rail/road across the Fehmarn Belt (2014)

The objective of the Fehmarn Belt is to create a fixed combined link for both railway and road and thus eliminate an important bottleneck for transport flows between Scandinavia and the Continent. The link will in particular benefit rail transport. An agreement between Germany and Denmark on the financing methods should be found in the near future so that the project could be carried out within the agreed time. The railway connections to the fixed link of the Fehmarn Belt, in Denmark from the Öresund, and in Germany from Hamburg, Hannover and Bremen needs to be considered as part of the extended project.

15. The Nordic Triangle

- Helsinki-Vaalimaa motorway (2015)
- Railway line Helsinki-Vainikkala(Russian border) (2014)

The layout of this project remains as it was when retained by the European Council of Essen. The principal sections which will be carried out between now and 2010 are however included in List 0. In Sweden some minor sections remain to be completed by 2015.

16. Multimodal connection Portugal/Spain with the rest of Europe

This project remains as it was when defined at the European Council of Dublin, except for the sections carried out before 2007 which are included in the List 0 and for the new section from Sines to Badajoz on the Spanish-Portuguese border.

17. Motorway Greek/Bulgarian border -Sofia-Nadlac (Budapest)/(Constanta) [39]

- Sofia-Kulata-Greek/Bulgarian border (2010), cross-border section
- Nadlac-Sibiu (branch towards Bucuresti and Constanta) (2007)

The project extends the Greek motorway “Pathe” (a priority project endorsed by the Essen European Council) to new Member States.

18. Motorway Gdansk –Katowice –Brno/Zilina –Wien [40]

- Gdansk-Katowice (2010)
- Katowice-Brno/Zilina (2010) cross-border section
- Brno-Wien (2009) cross-border section

The Group considers that the implementation of this project, together with project n° 8, along a new north-south axis from the Baltic Sea, constitutes an opportunity for providing in the long term an alternative to the existing saturated north-south axes from the North Sea. The project includes access to the Port of Gdansk.

[39] These two sections are part of pan-European Corridor IV.

[40] Road element of the pan-European Corridor VI.

6.1.3. Longer-term priority projects (List 2)

Other less mature projects also present a high European value added. The Group is fully aware that, due to their importance, these other projects could have appeared in List 1. This is particularly the case for the rail crossing of the Pyrenees already proposed by the Commission and accepted by the Parliament in the framework of the first revision of the Guidelines[41].

However, to its great regret, the Group was not able to obtain from all the countries concerned a commitment that construction would begin before 2010, once the alignment was precisely established, which is not yet always the case. Until an agreement is reached between the countries concerned on the alignment and/or the funding, and until the timescale for achieving these projects is confirmed, the Group recommends that they should be classified in a list of priority projects for the longer term.

The Group therefore recommends that the States concerned continue all the necessary studies, that the Commission supports them and proposes, if necessary, an adaptation of the guidelines to this end. It will be advisable to again examine these projects at the time of the preparation of the next revision (see Chapter 6.7). These longer-term priority projects are:

1. New high-capacity railway crossing of the Pyrenees

The Group draws the attention of the Member States concerned to the very rapid growth in traffic across the Pyrenees and to the fact that the development of new rail freight capacities is crucial given that land transport traffic amounts at 70 million tonnes in 1999 and will more than double by 2020. The current roads cannot absorb such an increase in traffic (+10% of yearly increase of road traffic).

In this context, taking account of the great importance of this project, an importance already identified by the Commission and recognised by the Parliament, the Group hopes that France and Spain will be able by common accord to reach an agreement in the near future permitting construction to begin before 2010, thus allowing this project to have the same status as the projects appearing in List 1.

The Group recalls that the Commission listed the improvement of the Pau-Canfranc line in its proposal to revise the Community guidelines for the development of the TEN-T as one of the stop-gap solutions while waiting for the construction of the high-capacity trans-Pyrenees line.

Given the impressive growth of the trans-Pyrenean freight traffic, the remote time horizon of such a huge project makes it necessary to increase, in a near future, the capacity on existing road connections through the Pyrenees so that the means of crossing them can be enhanced, while keeping in mind the necessity of constructing the high-capacity railway crossing as soon as possible.

[41] COM (2001) 544

2. Rail Baltica: Helsinki-Tallinn-Riga-Kaunas-Warszawa

As well as an agreement between the States concerned on the nature of work, the route and the interoperability standards, it will be advisable to ensure a good interconnection to the network of the remainder of the European Union (via the Polish network).

3. Dedicated freight railway line Gdansk-Bydgoszcz-Katowice-Zwardon

The Group recalls that Poland is currently one of the countries with the highest share of rail freight. However, given the current reform of the rail sector in Poland, the Group considers that the viability of this project can reasonably be assessed and envisaged after progress in implementing projects n°18 and n°8.

4. Inland waterway Seine-Scheldt

Given the fact that one of the concerned countries is not in the position to confirm a time horizon, the project is not classified in List 1. The Group believes that this project will allow substantial improvement of the connections between the three large waterway basins in France, in Belgium and in the Netherlands.

6.1.4. Other important projects for territorial cohesion (List 3)

The trans-European network contributes to the aim of economic and social cohesion. The economic catching-up of numerous regions, in particular in the future new Member States, will depend on good access to the major European axes, efficient interconnections, in particular good cross-border connections. Hence, the Group considered a range of important projects in this respect. Without prejudging the scope of Community financial instruments in the future, after 2006, only the most important projects could be selected by reference to the selection criteria developed by the Group. Also, projects on urban transport systems have not been retained, given their more local value; these projects are therefore not relevant in terms of trans-European dimension. The interest of the projects in this list is important in terms of facilitating exchanges between Member States, but mainly for territorial cohesion. The list is not exhaustive as the Group considered only projects initially thought to be possibly priority projects.

1. Accessibility and interconnections of networks

- Multimodal logistic centres in Slawkow (Poland) with connections to the Russian gauge rail network (2012)
- Railway line Bari–Durres-Sofia-Varna/Bourgas (Black Sea) (2020)[42]
- Railway line Napoli-Reggio Calabria – Palermo (2015)
- Road/Railway Corridor linking the West and Dublin (2010)
- Limassol port and road access (2015)
- Larnaka port and road access (2020)
- Ports of Valletta and Marsaxlokk (2012)
- Ionian/Adriatic intermodal Corridor (2015)
- Road Dover-Fishguard (2015), (except M25)

[42] Part of Corridor VIII

2. Cross-border connections

- Motorway Dresden/Nürnberg-Praha-Linz (2010)
- Railway line Praha/Linz (2010)
- Motorway Zilina - Bratislava- (Wien) (2012)
- Railway line Maribor-Graz (2015)
- Motorway (Ljubljana)-Maribor-Pince-Zamardi-(Budapest) (2012)[43]
- Road permeability through the Pyrenees (2010)[44]

[43] Parts of this project are registered in pan-European Corridor V.

[44] See comments on project N° 1 of List 2.

6.2. DEVELOP GENUINE MOTORWAYS OF THE SEA

1. Maritime transport represents more than 40% of the volume of intra-Community freight flows[45], i.e. almost on a par with road transport. But maritime transport could do more to remove lorries from the roads in congested areas. Maritime routes which better link countries isolated by natural barriers such as the Alps, the Pyrenees and the Baltic Sea, as well as island countries, should be as important as motorways or railways in the trans-European network.

6.2.1. An untapped potential

2. But a number of potential maritime routes have not taken off for many reasons such as, amongst others, the administrative burden at the customs, the lack of regularity and of punctuality and the absence of adequate facilities (logistic facilities, one-stop commercial shops, mobile equipment, infrastructure).

3. It is of the utmost importance to Europe that the most promising would-be links be supported by public aid during the start-up phase, as the White Paper on transport policy stresses it: *"These lines will not develop spontaneously. Based on proposals from the Member States, they will have to be ‘sign posted’, notably by granting European funds (from the Marco-Polo programme, Structural Funds) to encourage start-ups and give them their attractive commercial dimension*". While taking due consideration of the risks of distortion of competition, such maritime routes[46] should preferably connect ports located on the main trans-European axes, or at least significantly alleviate road traffic congestion on these axes.

4. Genuine motorways of the sea are therefore aimed at acting as a substitute for motorways on land, either to avoid saturated land corridors or to give access to countries separated from the rest of the European Union by seas. In addition to reducing the number of lorries on main roads, they could also in certain cases contribute to fostering the transport of passengers by sea since vessels can carry at the same time freight and passengers. The underlying concept thus differs from the broader one of short sea shipping which also includes coastal domestic connections and connections from mainland to islands areas[47].

6.2.2. Process proposed to launch projects

5. The Group identified in List 1 (see priority project n° 3) four maritime areas where projects could be launched. The type of vessels suited for this job should be most obviously roll-on-roll-off (roro) but load-on-load-off (lolo) could also be envisaged at a later stage, where appropriate, in connection with feedering dispatching schemes. A successful launch of new motorways of the sea, or ‘seaways’, would depend on a number of prerequisite or parallel actions, such as:

[45] White Paper on the European Transport Policy

[46] Including sea-river shipping.

[47] With the exception of the island States.

- concentrating freight on the maritime routes concerned in order to increase the potential economic viability of sea lines;
- convincing hauliers, shippers and forwarders of the benefits and merits of the maritime alternative;
- eliminating (systematic) customs checks and other administrative burdens as it is already the case at intra-Community crossings on European land motorways, or at least streamlining them, and developing electronic reporting for port authorities[48];
- providing for, where possible, appropriate facilities that should preferably be dedicated for this activity (ro-ro terminals, logistic equipment, parking places, facilities for lorry drivers) and direct access to ports (including open rail access);
- respecting competition rules;
- ensuring all year round navigability, especially in the Baltic Sea with ice-breakers.

6. One possible method for a pair of Member States could be:
   - to select their respective ports amongst the A category of the TEN-T on the basis of transparent criteria;
   - to agree on the sharing of the costs to be borne by public finance;
   - to organise a public tender for awarding a contract of public service;
   - to phase-out the operating aid within a predetermined timeframe.

7. But the Group notes that the most difficult step for Member States is to choose the ports suited for being part of a motorway of the sea. If the choice at national level proves to be too difficult, one alternative method could consist of proposing a global tender to both ports and maritime companies, leaving the choice of ports to candidate consortia.

8. Another (complementary) approach could be to finance or subsidise the accompanying actions described above while giving due consideration to avoid distorting competition and to be in compliance with state aid guidelines.

9. To launch projects in practice, the Group suggests that current and future Member States submit to the Commission proposals before 2007 in relation to the objective of creating motorways of the sea in at least one of these four maritime areas. **These projects could take the form of public-private partnerships schemes whereby financial aid from the Community and national budgets would be jointly granted through public tendering procedures.** To be eligible for Community funding, these projects should:
   - be proposed at least by two Member States;
   - concern the smallest possible number of ports (ideally two in each different Member States);
   - alleviate road traffic congestion on the main axes[49].

[48] In the field of electronic reporting a European wide system concerning all sea motorways should be developed (see Chapter 6.3)

[49] Or improve accessibility in the case of island States

10. The Group considers that **these projects should constitute priority projects, on an equal footing with land infrastructure**, and consequently they deserve a place in List 1 and a similar financing (see 6.1), even though they are not yet defined considering also that these projects maybe launched within shorter delays..

11. The Group stresses that such priority projects are not deemed to compete with the Marco Polo programme which follows a broader objective. Sea motorways should be primarily focused on complementing major land axes.

12. **On the basis of this general approach, the Group recommends to integrate as soon as possible in the TEN-T guidelines the required legal provisions to encompass Motorway of the Sea projects and allow a concrete Community support.**

6.3. BETTER MANAGE TRANSPORT

1. Infrastructures are not an end in themselves. They deliver their promises by offering high quality services only if efficiently managed, which requires, among other things, to design interoperable networks better adapted to market needs and integrated traffic management systems. The growth in transport over the last decades has led to the construction of more and more infrastructure. Such supply-driven policy can no longer be the only response to the problem of growing congestion. Building infrastructure has, furthermore, a considerable cost and, especially road, is far from being neutral in its effects on the environment, human health, the land take and the general well being of the population.

2. A high performance transport system should allow for the safe and regular provision of services, be they air, road, rail, or waterborne. To this end, the Member States of the enlarged Union must fix common objectives to optimise the use of transport infrastructure. In this respect the Commission has already underlined in its White Paper on a European Transport Policy the need to better manage and co-ordinate the different transport modes.

3. European transport suffers from an imbalance between transport modes, to the detriment of railways, more particularly in the rail freight transport, of maritime shipping and of inland waterways. In the railway sector, for example, between 1970 and 1998, the share of goods market carried by rail in Europe fell from 21% to 8.4%, even though the overall volume of goods transported rose spectacularly. International rail haulage enjoys an average speed of only 18 km/h, due in particular to the priority given to passenger trains, deterring shippers from using rail freight.

4. Even with the efforts to reverse this trend, road transport will grow substantially. Rather than building new road infrastructure, better management of transport can contribute to make this mode as efficient as possible in order to alleviate bottlenecks and environmental nuisances. In this respect, good progress has already been made in the deployment of efficient road traffic management systems, to be continued.

5. The growing imbalance between transport modes, to the detriment of railways (in particular for freight transport), maritime and inland waterways, needs to be addressed, including through better transport management. Hence, the Group stresses the need to build a genuine European rail network, fully interoperable and adapted to

customer needs by separating freight traffic and passenger traffic. Integrated management systems for air, river and maritime transport with the help of Community financial support, and removing airport capacity constraints play also a very important role.

6.3.1. Build a European rail network

6.3.1.1 Make national networks interoperable

6. The emergence of trans-European interoperable railway axes for specific market segments (e.g. high-speed and freight) should be seen as key to the success of international rail services. However, the huge diversity in signalling and in telecommunication systems constitutes a major obstacle to this goal, The current situation requires European standards for a new–generation of railway signalling and telecommunication systems to be implemented, such as the *European Rail Traffic Management System* which covers, on the one hand, the *European Train Control System* (the "signalling" part) and, on the other hand, the *GSM-Railways* (the "telecommunication" part). The Community has already adopted directives promoting technical specifications for interoperability.. These specifications for high-speed rail were adopted in 2002 and are starting to be implemented. As regards the conventional rail system, these specifications still need to be further developed by the future European Rail Agency. A coherent "*Trans-European deployment strategy*" should reconcile the different national deployment blueprints.

7. The Group is of the opinion that Community funding should support interoperability and help coordinate national approaches. Based on axes, an EU deployment plan should be elaborated in 2003 drawing on national plans. Grants would be determined on the expected effects of projects. Cost incurred by the infrastructure managers, should be given priority since investment in rolling stock equipment is in general not assigned to a specific axis.

6.3.1.2 Dedicate part of the rail network to freight

8. Major stumbling blocks to the development of European rail freight are inefficient use and technical and physical insufficiencies of the rail infrastructure. Incompatibility of slow and fast trains as well as technical and operational differences between national networks in combination with a low priority for freight trains in train path allocation and daily train path management limit the growth potential of rail freight services.

9. The Group considers that a freight-dedicated network (or with very strong priority for freight) on some major European axes in the transit countries is likely to significantly improve the quality and the effectiveness of services to an extent similar to that of the high speed train revolution. Such a network could be very efficient in terms of speed (more than 100 km/h) and of service quality (regularity), both for the traditional freight, for combined transport or for the transport of lorries by rail.

10. The Group welcomes the Commission position that such the emergence of such a dedicated network needs a very significant and encouraging subsidy rate of up to 50% of the overall costs.

11. A first step towards a more efficient European rail freight network will be to render it gradually interoperable. To that end Member States should first implement the

technical specifications for interoperability provided for in the above mentioned Community Directives (see 6.3.1.1).

12. National infrastructure managers will need to co-operate in a Community framework in order to make a better use of existing infrastructure. This mainly goes through a co-ordinated allocation of international and national train paths with a priority for international freight.

13. Last but not least, operation of the rail freight network must be redesigned to allow attractive and high-quality services at European level. A research study[50] on the attractiveness of the dedicated network shows that the traffic on the dedicated network can increase by about 25%, account for 85% of total traffic and result in time saving of 20 to 30%. Currently, the total rail freight network has a length of 140,000 km, but this survey stresses that only 22% of the network carries about 60% of the total traffic.

14. The Group recommends the creation of a permanent group gathering operators and national and European authorities. Its first mission would be to identify at the level of an enlarged European Union the rail network dedicated to freight. In a second stage, this group could evolve into the coordinating entities mentioned in Chapter 6.6.3.

6.3.2. Integrate air traffic management

15. Aviation is hampered by regular delays as a consequence of the limits of current air traffic management systems. Air transport suffers on the one hand from the fragmentation of the air traffic management services in Europe, with 29 national systems and 58 Air Traffic Control Centres developed to different standards with different systems and capabilities, and on the other hand, from the too slow implementation of new technologies.

16. The role of the Community is to ensure that the development of the future air traffic management systems is properly organised and managed at the European level to ensure that the various elements are available and implemented system-wide in line with traffic growth. The Community thus proposed solutions to these problems, through the Single Sky legislative package[51] to be adopted in 2003. The EU should achieve a ‘European system’ and not a collection of national systems, by setting up functional blocks of airspace and putting new concepts and technologies into practice.

17. To achieve the Single Sky, the integration of air traffic services would require reconfiguration of air space into a limited number of functional blocks. This opens the way to consolidation of service provision and rationalisation and infrastructure. This would imply the development by 2008 of interoperability requirements for the existing systems and a standardised ‘target’ architecture for the future European air traffic management system and the progressive implementation of this target architecture in the national systems by 2015. The Group thus shares the idea that Community financial grants for new and crucial interoperability components, such as

[50] EUFRANET, EU Framework Transport Research Programme IV

[51] COM(2001)123final/2 ; OJ C 103E, 30.4.2002, p. 1 and COM(2001)564final/2 ; OJ 103E, 30.4.2002, p. 26

for instance data processing systems or equipment, and where appropriate some ground control centres would help lead to an integrated European air traffic management system.

6.3.3. Manage river traffic

18. In order to help inland waterways' users, a pilot project called *River Information System* is currently developed in order to provide boats with:

    - Fairway information (geographical, hydrological, administrative information regarding the waterway);
    - Flash traffic information (affecting immediate navigation decisions in the actual traffic situation and geographical surroundings.);
    - Planning traffic information (voyage planning, lock and bridge planning, port and terminal planning);
    - Cargo and fleet management, tracking and tracing;
    - Information on calamity abatement;
    - Information on possible interfaces with other transport modes.

19. This project aims at minimising voyage incidents, injuries and fatalities in inland navigation and at preventing environmental hazard as well as polluting spills.

20. Up to now, Member States are implementing the system on a voluntary basis on the basis of commonly agreed standards and protocols. To ensure interoperability on Community inland waterways, the Group welcomes the intention of the Commission to propose a framework directive in a near future. It is indeed in the Community interest that Member States implement in a harmonised way on the trans-European inland waterway network, in priority on the Rhine-Danube axis.

6.3.4. Watch maritime traffic

21. European waters are at greater risk of major accidents, as confirmed by the accident statistics for the last twenty years. *Vessel traffic management and information systems* are needed to improve safety in Community waters, particularly in areas of high traffic density, of dangerous navigation or of ecological sensitivity. It would also make the transport chain more competitive, and enhance security of ports.

22. Some maritime zones in Europe are already covered by such systems run at a national or regional level. Exchanges of information, if any, between systems occur on a bilateral basis and the communication protocols have not yet been harmonised. To correct these weaknesses, the existing system should be integrated into a European *vessel traffic management and information system*. An EU Directive already determines the features of such a Community instrument: equipment tracking vessels by automatic identification systems, interoperability for exchanging information, identification of places of refuge and close surveillance of 'dangerous' ships.

23. Such an integrated system should comprise physical infrastructure, facilities for receiving vessels in places of refuge and telematic networks between Member States for exchanging maritime transport information. It should moreover resort to new technologies, such as automatic identification and tracking systems for vessels far out at sea.

24. With this objective in mind, the Community has already subsidised such systems through various financial instruments, particularly in peripheral regions such as Greece and Spain. In particular the Commission launched in January 2002 the *SafeSeaNet* project, with the objective of establishing an electronic platform for the exchange of maritime data between Member States.

25. More generally, the Group is of the view that the Community should aim through the TEN-T programme:

- to further develop infrastructure for managing maritime traffic, particularly in the zones most at risk;
- to make Member States' systems interoperable and to provide for regional vessel traffic management centres;
- to set up telematic networks for exchanging data on dangerous goods, interfacing local databases with the SafeSeaNet;
- to connect the Community database on maritime safety to other European databases (security, Schengen, customs, inland navigation, etc);
- to equip places of refuge with appropriate tools;
- to develop tools for risk analysis in connection with vessel traffic control.

26. But the improvement of the navigability and management of the maritime traffic would also hinge on the Galileo programme for developing an autonomous radionavigation system. With a future constellation of 30 satellites connected to land transmitters, Galileo will be an indispensable tool for, amongst others, developing sea motorways.

6.3.5. Remove airport capacity constraints

27. Given the expected growth in air transport the Group stresses that efforts will have to be undertaken to better manage the use of existing airport capacities. It therefore recommends to accordingly review existing rules on slots and charges and to proactively support the better functioning of rail/air intermodality.

28. The Group recognises that airports play a particular role in the European transport network. Their function as facilitators of economic growth and gateways to intra- and extra European markets for goods and passengers is vital in light of the enlargement and economic globalisation processes.

29. Currently the environmental, political, and physical restrictions on airports are such that major expansions of existing facilities, in particular the major hub airports, are difficult to implement. Therefore, there is a need for the development of additional new airport capacity in this and the next decade. Ideally such airports should have the potential to become major European connecting points.

6.4. IDENTIFY THE MAIN AXES

1. The Group noted that the trans-European network is identified in the Community guidelines and the Accession Treaties while the pan-European corridors were identified by the Crete and Helsinki pan-European Conferences.

2. The Group very rapidly agreed that an essential criteria to identify priority projects is that they should form part of one of the essential transnational axes relevant to the internal market; the criteria should take into account projects crossing natural barriers, solving congestion problems or filling in missing links.

3. The density of the existing trans-European network, made up as it is of all the national networks, and sometimes of the regional networks as well, does not however give a clear picture from a European perspective. The Community guidelines do not specify the multimodal routes between Member States which, due to geographic and economic factors, carry the heaviest traffic. Against this background, identifying priorities on the basis of a network reflecting the juxtaposition of the national networks has proved to be a delicate exercise, in particular in current Member States where no official corridors having a European dimension exist.

6.4.1. More coherent planning

4. Therefore, the Group considers that there is a need to proceed, as quickly as possible, with an exercise to identify major axes in order to facilitate the selection of trans-European network priorities in the course of future revisions. This work appears all the more urgent for several reasons:

   – It is necessary, when planning the network, to consider in parallel major infrastructure projects, the deployment of operating systems and the gradual elimination of bottlenecks, or even the management of demand, which is easier to do by axis than by taking the network as a whole.

   – An increase in intermodality, a condition of sustainable transport development, is possible only on routes with substantial long-distance traffic, these being the only ones where it is possible to compete with road transport. Concentrating this type of traffic on major axes will offer a better chance to rail freight, inland waterways, and maritime transport to be competitive[52].

   – Eliminating bottlenecks and completing missing links on the main European routes to stimulate transnational trade and providing access to every European region constitutes distinct problems with different solutions. Distinguishing these problems, and thereby clarifying responsibilities, will help differentiate between planning at European, national, and regional level, and between planning in the long and short term.

   – The coordination and follow-up of investments on the network at the level of the trans-European network has proven to be complex and is unlikely to work efficiently in the near future. However, it appears feasible to quickly set up mechanisms that provide for broad coordination and follow-up for each major axis (see chapter 6.6.3).

[52] See Chapter 6.2 on sea motorways and Chapter 6.3.2.1 on a dedicated rail freight network.

5. The Group notes that this recommendation goes in the direction of the Parliament's resolution on the White Paper which advocates giving priority in the framework of TEN-T to the development of East-West and North-South corridors[53].

6.4.2. Take into account the experience of the pan-European corridors

6. The only concrete experience in defining main European axes stems from the Ministerial pan-European Conferences in Crete (1994) and Helsinki (1997) which identified 10 pan-European corridors in Central and Eastern Countries.[54] This has proved to be a promising planning approach to coordinate investments as pan-European corridors are now widely used by the national administrations of Acceding Countries, and by the Commission itself, not only to program financial aid but also to maintain coordination at policy level.

7. Pan-European corridors form part of a different institutional framework (intergovernmental cooperation) from the trans-European network (Community framework). They have played an important role, in particular because in the early 90', there was no network clearly established like in western countries.

8. Today in the enlarged Union and the increased scope and complexity the trans-European network, the needs are different and require a different approach. The identification of trans-European axes aims at ultimately establishing a core network.

9. Many of the Member States have identified corridors on their territory when preparing national transport infrastructure plans The concept of a corridor is also increasingly used by rail operators and infrastructure managers (Magistrale Eco-fret, Belifret, etc.).

6.4.3. A task to be continued within the framework of the revision of the guidelines

10. The Group did not have the time to identify these main axes. The priorities recommended by the Group reflect, however, to a great extent some of the major transnational axes considered by the Group since it was the first criteria of the methodology to identify priority projects. The priority projects, on the basis of the proposals of the Member States, therefore make it possible to have a first idea of the likely mapping of such axes. (See Annex 4).

11. The Group requests the Commission to complete this work of identification of the main European axes which are crucial in enabling the efficient flow of the majority of goods and people within the enlarged Union, and to include them in the future guidelines.

[53] Resolution of the E.P. – in Item 43, the European Parliament asks "that the improvement and creation of south-north and East-West European corridors of large capacity in the rail and intermodal terminals sectors… be given priority under TEN-T". See also item 34.

[54] "The object of the corridors is to […] put in evidence the main transport relations in a pan-European context. They take the form of broad bands up to 100 or 200 kms wide. They have a multimodal character and do not prejude the different transport modes called upon to serve these relations (Pan European Ministerial Transport Conference, Crete, March 1994).

12. This work should rely on mapping traffic flows and a forward looking approach, while taking into account, the existing pan-European corridors. It requires an in-depth analysis of current and future traffic flows (goods and passengers) including modal split as well as the split between short and long distance transport. The group proposes to base this work on the following three main principles:

    - European axes should include land and maritime links and nodes expected to have great significance in terms of inter Member States trade. Improving the flows on these links will yield benefits not only to users at a national level but also at a European level, and facilitate exchanges between Member States.

    - European axes should take into account accessibility needs of the peripheral countries and be well interconnected with national, regional and third country networks.

    - European axes should include routes with proportionally high volumes of long-distance traffic, including long distance national traffic, since these are good targets for promoting modal rebalancing and could make it possible to improve the consistency with existing national corridors under development.

13. The Group stresses that, once these main axes have been identified, it will facilitate the future revision of the list of priority projects, but also make it possible to identify smaller projects, including projects submitted to the Group for consideration, which are nevertheless likely to improve the efficiency of these axes, as well as projects to improve the accessibility to, and interconnections with, these main axes and sea motorways.

6.5. DEVELOP LINKS WITH NEIGHBOURING COUNTRIES OF THE UNION

1. Good connections with third countries have an important role in encouraging trade between the European Community and its neighbours, and thus promoting economic development. Connections to and across Switzerland and the Western Balkans facilitate trade and mobility between the Member States. In the majority of the new Member States, such transit routes carry a large part of their foreign trade. In this context, Motorways of the Sea also have a role in creating linkages with regions outside the EU. Most of these continental connections also belong to the Pan-European Corridors as defined in the Helsinki Conference in 1997.

2. While recognising the vital role of these connections for the European Union in general, and for the countries of the periphery of the Union in particular, it must however be stressed that they involve a different logic to that of the priority projects of the trans-European transport network, which must firstly contribute to strengthen the internal market.

3. This however does not rule out the possibility that these connections, of which certain projects are identified below, could benefit from aid granted under Community financial structural instruments, for those sections located within the territory of the European Union, in particular in the new Member States, both peripheral and transit countries. Indeed, the sections in the new Member States, which are dependent on trade with third eastern countries, may also improve the transit conditions between them and the old Member States.

4. These projects could also be taken into account when negotiating transit or association agreements between the Community and the third countries concerned, bearing in mind that some of these agreements could contain a financial cooperation chapter allowing the support of feasibility studies or works on sections located outside the European Union..

5. Norway merits particular mention. Although a third country, not contributing directrly to the EU budget, it participates closely in the internal market of the European Union through the European Economic Area Agreement. This is why the connections to Norway are specified in List 1 (Nordic Triangle).

6.5.1. Switzerland: a particular case

6. The Group stresses the special situation of Switzerland. The territory of Switzerland is located in the middle of the Union in an area characterised by a very high traffic density. The agreement of 21 June 2002 between Switzerland and the European Community envisages new Alpine rail links (NLFA) in Switzerland, and improvements on the territory of the Union of the capacities of the northern and southern access routes to the NLFA to the UIC C' gauge. These access connections were naturally included in List 1, in view of the Community’s international commitments.

7. The construction of each of access tunnels to Switzerland will have to be taken into account in the implementation of the Community transport policy, in order to guarantee a coordinated vision of the development of the major traffic axes at the level of the European territory as a whole.

8. This investment policy is necessary to promote intermodality in this sensitive area. It requires close coordination of programming in the construction timetable of the tunnels and of the access routes. It requires a complete view of the flows crossing the Alps in particular after enlargement. The Group consequently recommends strengthening the systematic exchange of multilateral, detailed information on investments, for example within the framework of the joint committee, foreseen by the agreement between the EU and Switzerland.

6.5.2. The Western Balkans

9. The Balkans constitute another area of third countries located in the heart of Europe. Croatia has already submitted its application for membership of the Union in March 2003 and the strengthening of the connections with the whole area contributes to the stabilisation process. On the basis of the strategic plan established by the Commission for the development of the infrastructure in the Balkans[55], the Group identified a number connections with a high European interest, not only for the economic development and the stabilisation of the area, but also to give Member States in south-east Europe a better access to the central markets of the European Union.

10. These projects with a high European interest are above all on the *Danube*. During the war in the 1990's several bridges on the Danube in Serbia were destroyed, blocking navigation. Pontoon bridges have now been set up but they still hinder normal navigation. A construction plan for new bridges has to be set up very quickly in order to restore sufficient navigability on this part of the Danube. Other important projects are the *motorway Ljublana-Zagreb-Beograd-Nish-Skopje-Thessaloniki,* and the *motorway Budapest-Sarajevo-Ploce* to improve the access to the Adriatic Sea.

6.5.3. Eastern European countries (Russia, Belarus, Ukraine, Moldavia)

11. Several projects were identified by the Group as worth consideration to reinforce ties with Russia, Belarus and the Ukraine. The rail line (Helsinki)-Vainikkala-Saint Petersburg. Railway and road connections between the Baltic States and Russia/ Belarus, (Klaipeda-Vilnius-border with Belarus and Ventspils/Liepäja/Riga – border with Russia/Belarus; Tallin – Narva/Tartu – border with Russia). he motorway Zilina-Kosice (Ukraine); road and rail connections Berlin – Warsaw – Minsk-Moscow-Nishny Novgorod (pan-European Corridor II); road and rail connections Berlin/Dresden-Wrozlaw-Lvov-Kiev (pan-European Corridor III); road and rail connection between Budapest and Ukraine's border (pan-European Corridor V)Rail and road access to Kaliningrad. Connections to countries bordering the Black Sea.

[55] Report 'Transport and energy infrastructure in south-eastern Europe' available from http://europa.eu.int/comm/energy_transport/en/se_sum_en.html.

12. The Group recommends that the Commission assesses the EU interest in these cases, for instance within the framework of the EU-Russia Partnership and Co-operation Agreement (PCA) and in the context of EU's Northern Dimension and "Wider Europe" initiatives.

6.5.4. Mediterranean Countries

13. The European Union is on the point of enlarging with ten new Member States, of which two, Cyprus and Malta, are Mediterranean partners. There is therefore a pressing need to develop a Euro-Mediterranean-Transport Network which as much concerns North-South traffic as South-South regional traffic. In this context, special attention should be given to the connections to Turkey.

14. The Group welcomes, with interest, the Commission's Communication on this issue[56]. It notes the interest of the countries concerned to undertake, on the basis of the ongoing studies, an exercise aiming at planning such a network. This exercise will identify, in the context of the Euro-Mediterranean Conference "Infrastructure and Investments" under the Italian Presidency (December 2003), a number of transport infrastructure projects judged by all the Euro-Mediterranean partners as having major regional interest. These projects would rapidly benefit from feasibility studies in the framework of MEDA.

[56] COM (2003) … on the development of Euro-Mediterranean transport networks

6.6. FACILITATE THE IMPLEMENTATION OF THE NETWORK

6.6.1. Ensuring the necessary funding

1. The scarcity of public financing due to budgetary constraints led the Group to be selective in the establishment of priorities, in particular by spreading them over time (see Chapter 5). **It is nonetheless true that the priority projects of the trans-European network identified by the Group[57], even after great efforts at selectivity, involve investment estimated at €235 billion[58] up to 2020, this being double of that for the current projects in the Essen list.**

2. To this are added the investments which will be necessary for the longer-term projects, and other projects on the trans-European network important for the territorial cohesion as identified by this report. **However, all these priorities are only a part of the whole trans-European network.** Indeed, the Group stresses the needs of financing the construction of other elements of the trans-European network - not mentioned or specified in details in this report - of more modest size, e.g. access to the main axes, or necessary management systems for better use of the existing infrastructure. T**he cost of the whole trans-European transport network, including the projects which are not identified as priority projects in this report, is in the order of €600 billion.** In addition, the maintenance and the regeneration of existing infrastructure stock increasingly weighs on public accounts.

Cost of priority and important projects [59]

Billion €	***2004-2020***	***Of which 2004-2013***	***Of which 2014-2020***
List 0	80	80	0
List 1	142	125	17
List 2	13	3	10
List 3	22	20	2
Total	**257**	**228**	**29**

3. Figures of the above table are based on information provided by the members [and are subject of minor updates until the final publication of the report]. For simplification, the table assumes an equal spread of investments' needs over the construction periods. Due to lack of data, it excludes the cost of the horizontal priorities indicated in Chapter 6.2 and 6.3. Moreover, it should be stressed that the cost of the investments needs after 2014 does not take into account of the projects which may be added by that time.

[57] List 0, List 1 and List 2.

[58] These figures are affected by uncertainties inherent in estimating 'upstream' from the costs of major infrastructure projects. Experience suggests that they are underestimates.

[59] However, the budgetary period corresponding to the next financial perspectives is not fixed.

4. The question of the financing of the priority projects of the trans-European network, and more generally of all the transport infrastructure, consequently takes on crucial importance. The Group therefore welcomes with great interest the Commission Communication entitled *"develop the trans-European transport network: innovative financing"*[60] which takes stock of this subject. In the light of this Communication, the Group considers that measures have to be undertaken to attract more private capital in order to facilitate the carrying out of the priority projects. However, the Group stresses that at the end of the day either the tax payers or the users have to pay. It notes that the share paid by users is likely to increase in the near future as already observed in some countries in recent years.

5. Certain major infrastructures can be financed entirely by fees. Hence, the Group considers that the building of new airport capacities or significant increase of existing capacities can, as a general rule, be financed from future fees. In this respect, the Group is of the opinion that projects, such as the construction of a new airport in Berlin - while considering this latter project as having a high priority - should be done without financial aid from the Community, except for studies. The airports in the isolated and less developed regions constitute an exception and, under the structural financial instruments, should be able to benefit from aid from the Community.

6.6.1.1 Taking into account the constraint of public finance

6. Underinvestment in infrastructure characterises the past in current Member States as in the Acceding Countries. The Group considers that if this general tendency continues, it will hinder economic growth and sustainable development.

7. In addition to the significance of investment, the majority of the projects recommended by the Group present uncertainties regarding their *a posteriori* final cost and their future income. These risks, inherent in infrastructure projects, make profitability for private investors risky. Consequently, these projects cannot be carried out without at least partial public financing notably from Community financial support amongst other sources.

8. The Group stresses that the priority projects selected have strong socio-economic benefits by reducing costs (internal and external), improving the quality of transport and inducing spatial development. In addition, these projects present a particularly high European value added. They will facilitate transnational trade and will contribute to the sustainable development of transport at Community level by promoting intermodality. The Group emphasises that, unlike many sectors, investment projects in the transport sector will have a life of many decades, for the benefit of future generations.

9. **Since these projects improve the growth potential for the long term, strengthen the dynamics of the internal market, and contribute to sustainable development,**

[60] COM (2003)132

[60] Theory of endogeneous growth

they can be regarded as productive investments[61] with positive repercussions for the whole Union and its competitiveness.

10. The Group consequently recommends that the Member States take full account of these benefits when considering the necessary financing. In this respect, the Group notes, on the one hand the importance of these projects for the long term competitiveness of the Union, and the other hand, the current budgetary constraints on public finance. **The Group draws the attention of policy makers to the risk of major gaps over a long period of time between the investment needed to implement these priority projects and the current budgetary framework in which Member States and the Community have to operate.**

11. It should be noted however, that the annual investment necessary to carry out the projects in Lists 0, 1, 2 and 3 accounts for only 0.16% of the GDP of the enlarged Union, although this share may be higher for individual Member States. Nonetheless the individual priority projects are clearly defined, and therefore the related public expenditure can consequently be easily identified.

6.6.1.2 A strongly anchored principle of territoriality

12. It is the State and the regional authorities which bear the brunt of public financing and of the risks inherent in each project. Even in the case of projects co-financed by the Cohesion Fund, the States concerned remain liable for the risks of non-compliance with the project objectives and may have to reimburse the Community grants.

13. But the priority projects of the trans-European network take, by definition, transnational traffic and benefit in the first place the users of other Member States. For example, half of the traffic through the Pyrenees concerns transit flows across France. No less than 80% of the lorries using the Brenner tunnel are in transit through Austria. Transit in Germany will certainly increase. The accessibility and opening-up of certain peripheral regions are also dependent on effective connections on the territory of neighbouring transit Member States.

14. It is important to note that, exceptionally, countries take part in the financing of infrastructure projects in their neighbours. Luxembourg contributes up to €100 million in the financing of the High Speed Line between Metz and Luxembourg. The Netherlands contributes to the financing of the High Speed Train in Belgium.

15. In addition, in those countries where the internal political organisation gives regions specific powers, the increasingly active participation of certain regions can be observed in the financing of infrastructure, which allows a reduction of the contribution from the national budgets.

16. However, a decisive financial contribution remains in the majority of cases, and to a lesser extent in the countries eligible for the Cohesion Fund, at the cost of the national authorities which in addition have the responsibility for delivering the necessary administrative authorisations.

6.6.1.3 Community financial instruments to meet the challenge

17. **In general, taking into account the high stakes involved in providing a sustainable and balanced European transport system, the European value added of priority projects, and the current constraints on finance, the Group believes that substantial Community financial support is called for.**

18. **In particular, the Group considers that priority projects of exceptional importance for the single market, for example crossing natural barriers, should benefit from greater European support through the Community budget.**

19. The Community contributes to the financing of the trans-European transport network. Indeed, the Treaty confers on the Community the mandate not only to identify projects of common interest on the network, but also to give them financial support from the TEN budget or the Cohesion Fund. Council Regulation 2236/95[62], determines the general rules for the granting of Community financial aid in the field of the trans-European networks, for studies or for the carrying out work on projects of common interest.

20. This support is primarily in the form of direct subsidies, while the Regulation also makes it possible to grant loan guarantees, interest rebates, or even direct participation in venture capital funds. The Group considers that this range of possibilities should be fully implemented.

21. In parallel, the Community also takes part in the financing of these networks through structural financial instruments which concern the least developed countries and regions (Cohesion Fund and ERDF). With regard to connections inside the future Member States, the pre-adhesion structural instrument (ISPA) is made available for the development of the networks in these countries. On the whole, Community participation in the current European Union (all instruments combined but not including loans from the European Investment Bank) reaches approximately €20 billion for the period 2000-2006. By the 'leverage effect' that this aid is supposed to create, at best €100 billion could be levered over the period. **It is thus clear that the Community contribution covers only a (very) limited part of the financial needs and is largely insufficient to contribute effectively to the development of the networks.**

22. **The Group stresses the distinction between, on the one hand the priority nature of the projects identified in this report to meet the increase in intra-Community trade and mobility, and, on the other hand, eligibility for Community financing.** This report only retains a small number of projects of common interest: it concentrates on the identification of the strategic elements of the network. Certain projects of common interest should nonetheless remain eligible for Community financial instruments, such as the structural funds and the Cohesion Fund. Nevertheless, the classification in the lists of Chapter 6.1 does not prejudge, in any way, the possibility for the projects to be financed entirely by private investors.

23. On the other hand, a considerable number of projects of Lists 0, 1 and 2 will not be carried out in time without sufficient Community aid to mobilise and coordinate

[62] Amended by Regulation of the European Parliament and of the Council No 1655/99.

public and private capital. **This is, in particular, the case for the cross-border projects, and to a lesser extent for certain bottlenecks.**

24. The projects identified in List 3 are another case. Without prejudging the zoning (distribution) of future Community financial instruments such as the structural funds and the Cohesion Fund, the Group stresses that these projects are, above all, part of the logic of territorial cohesion, and that they play a decisive role for the economic integration of the countries or regions concerned by giving them access to the main axes. It is very probable that the budgetary capacity of most of the acceding Member States concerned, and the users' ability to pay charges are insufficient to finance them. Without a significant external financial contribution, in particular on the part of the Community, these projects could not be carried out within the desired time.

25. The timeframe for carrying out of the projects recommended by the Group is considerably longer than those of the budgetary perspectives for the Community. It is spread out over a period covering the perspectives fixed by Berlin and Copenhagen up to the end of 2006, those for the following period from which the preparation has just started, but also the following perspective.

€ Billion	*1993-1999*	*2000-2006* *EU 15*	*2000-2006* *EU 25*
TEN Budget	2.2	4.2	4.4
Cohesion Funds	7.6	9	12.8
ERDF *	5	6	6
ISPA	--	2.1	na
Total	14.8	21.3	23.2

** Estimate DG TREN of the share allocated to the TEN-T*

26. It is not the role of the Group to come to a conclusion about the share that the trans-European network policy should take with respect to the other Community policies within the next financial perspectives for the Community. Nor is it its role to anticipate the overall budget available at Community level.

27. **The Group emphasises that a sustainable transport policy in an enlarged Union is a prerequisite for European integration, both at the level of the citizens and at the level of the economic integration driven by the internal market and monetary union**. It is therefore important to stress that for the period 2004-2013 alone, the priority projects identified in Lists 0, 1 and 2 represent a total amount of investment of more than € 208 billion. **Without appropriate funding of the future financial instruments for the trans-European network, several of these priority projects could not be carried out in time or might even be abandoned.**

28. In this respect, the Group notes with interest the idea of the European Parliament [63] in its resolution on the White Paper on the common transport policy *"of creating within the framework of the financial perspectives a European Transport Fund, a financial instrument with an appropriate budget, applying to all the States of the Union, for all the modes of transport and for all the problems of the sector* ".

[63] Resolution of 12 February 2003, Draughtsman M.Juan de Dios Izquierdo Collado. Paragraph 82.

29. The European Investment Bank (EIB) plays an important role. It can borrow on the international markets at advantageous rates and can consequently grant loans at advantageous conditions to the projects of common interest. Since 1993, the EIB has approved loans for TEN-T projects with a total amount of €80 billion and has financed some €40 billion in public private partnerships.

30. **The Group welcomes with interest the EIB's readiness to create a new 'EIB TENs Investment Facility (TIF)' allowing the granting of long-term loans (35 years) covering up to 75% of the costs of TEN-T projects, up to a volume of €50 billion for the period 2004-2010. This facility will offer a special flexibility for maturity, grace periods, and repayment.**

31. In the framework of this facility, the EIB envisages giving priority to projects of the trans-European network contributing to regional development, cross border projects and intelligent transport systems. The Group welcomes with interest these priorities, in particular cross border projects.

32. Moreover, in the context of private finance and public-private partnerships for TENs, in addition to the existing Structured Finance Facility for higher-risk loans, the EIB could provide a special guarantee scheme for long-term investments,

33. Creating an infrastructure capital fund to provide equity and mezzanine finance with a view to boosting the equity of project companies (or other special project vehicles) and provide start-up and feasibility study finance could also be envisaged. The fund could be managed by the EIB and based on resources from the Commission, the EIB and the private sector. It would give priority to the priority projects identified in this report.

34. A 'Special Purpose Vehicle' (SPV) could buy TENs portfolio of loans from national financial institutions, securitise them and issue AAA bonds to the market. This would release new resources to be invested in TENs while ensuring capital relief for the originating financial institutions. The EIB Group could be involved in these transactions.

6.6.1.4 Greater efficiency for Community financial aid

35. Community resources are very limited, and therefore precious. We must seek the best possible management of these resources. Experience shows that, in their requests for subsidies, countries give priority to spreading them over a multiplicity of small projects. The Essen projects, although declared a priority by the Heads of State and of Government, received only 40% of the budget devoted to the trans-European network for the period 2000-2006 and slightly less than half of the budget available during the previous period. Since the projects[64] recommended by the Group present a high European value added, **the Group recommends that in future a more important share of the financial instruments available for the trans-European network be devoted to them.** This type of concentration should ideally include the structural financial instruments in the countries concerned.

[64] Including projects related to themes of Chapter 6.2 and 6.3

36. The coexistence of various financial instruments, each with their own logic, causes asymmetry in the intervention rates between the countries and regions eligible for the structural financial instruments and those eligible only for the budget of the trans-European network. Consequently, work on the corridors connecting the peripheral countries to transit countries encounters an excessive delay on the territory of the latter, being little encouraged to invest in infrastructure benefiting in the first instance their neighbours. The extra-territoriality of eligibility for the structural financial instruments or new adapted financial instruments could constitute in this respect a solution that it is advisable to examine in the case of cross-border sections of the projects on the major axes.

37. **Generally, the intervention rate of Community financing should be differentiated according to the benefits going to other countries, in particular the neighbouring countries**. Such modulation would not be contrary to the principle of territoriality of financing of infrastructure, and should benefit in the first instance the cross-border projects used by long distance transport.

38. Such cross-border connections are essential for exchanges between Member States and for the connectivity along the major trans-European axes. The "border effect" often results in lighter local traffic, which tends to reduce the profitability of the cross-border projects in comparison to those located in the middle of the national networks. As a result, the gap to be filled by public financing is greater.

39. However, in general, the national authorities show a clear reluctance to finance the cross-border sections, not only owing to the complexity of coordination between Member States to define and carry out a project, but also to budgetary arbitration to the profit of infrastructures benefiting the national priorities, without having considered the broader European interest. **It must be remembered that the majority of the cross-border sections identified in this report will only be carried out only after 2010, unlike the other sections.**

40. **The Group defends the idea that the Community could play a more active role in promoting the carrying out of cross-border connections,** and that a possible increase of the Community intervention rate under the TEN budget, as the Commission had already proposed in its proposal of 3 December 2001[65], should be carefully investigated. Contrary to what one might believe, the budgetary impact of such a development would not be exorbitant, the cost of the cross-border sections for the period 2007-2013 being somewhat lower than €15 billion.[66]

41. The Group therefore recommends the Council to reexamine the Commission proposal to amend Regulation (EC) 2236/95 on the granting of financial aid under the trans-European network, to raise this aid to 20% in the case of certain cross-border projects instead of current 10% - proposals that were approved by the European Parliament. Without prejudging the result of the codecision procedure, it is clear that this proposal may constitute a first practical step towards aid based on benefits to neighbouring countries.

[65] COM(2001)545 final.

[66] Including projects in cohesion countries and excluding sea motorways

6.6.1.5 The public-private partnership: better management of risks and costs

42. The capitalisation of the various financial markets in Europe amounts to several trillions of euros. In theory they could very easily absorb the financial needs for the completion of the trans-European transport network. The problem is not therefore the lack of private capital. The major difficulty is at the level of the division of the risk between private investors and public authorities. A clearer and more homogeneous regulatory framework in Europe would probably make it possible to encourage private investors to take a larger share of risks and to channel more private financing towards the construction of infrastructure.

43. Today, except in rare exceptions, the development of the main ports and the main airports can be self financed from the income generated by the infrastructure. However, this is not the case for land transport:

    - the railways, whose development was financed largely by private investors throughout the 19th century must compete with roads whose use is almost totally free;

    - inland waterways have suffered from a chronic lack of investment for almost two centuries;

    - heavy lorries only contribute a relatively small part of motorway tolls while the bulk of the construction costs of the infrastructure are caused by the technical and construction features that they require.

44. For land transport private investors cannot in general assure the total construction cost because of relatively - and artificially - low charges for use of the infrastructure. It is necessary therefore to make use of mixed financing.

45. These schemes[67], by means of concessions, make it possible for States to limit their financial aid to what is necessary to make up the difference between what is profitable from the point of view of society and what is financially profitable. In the case of large complex projects, in particular cross-border railway projects, these schemes are however extremely difficult and in any event, the potential contribution of the private sector is limited in view of the risks and of the very long term period of return. In any case, the Group stresses that both for railways and inland waterways, the potential of private capital is very low.

46. **Even if not providing an important share of private capital, public-private partnerships have however an essential virtue, which is to oblige greater transparency of costs and thus the public authorities to more strict management.** They oblige the States to clarify their long-term policy (regulation, infrastructure charging) and to commit themselves, contractually, to reduce the risks. A clear division of the risks between the public authorities and the private sector is

[67] The main purpose of Public Private Partnerships (PPP) is to provide public services with private sector participation and financing. When they are on a concession basis, the ownership of the infrastructure remains in the hands of the public sector, even though the concessionaire assumes its business at its own risk.

indeed essential. However those are of a very different nature (future risks inherent in the level of income[68], risks of slippage in the cost of a project at the time of its construction, exchange rate risks for the States outside the Eurozone). They are therefore particularly complex to evaluate.

47. The practice of risk assessment remains not very widespread in a sector which is traditionally in the public sphere. Decision-makers do not have the reflex to seek mixed financing solutions (public-private). This traditional stance consequently discourages the private investor. **The Group proposes that in future the major priority projects of the trans-European network are subject to an analysis of the various risks and of the private financing opportunities and suggests that the Commission examines further this issue together with the EIB.**

48. The spread of risk provides the key to successful public-private partnership. The guarantee mechanisms play an essential role in this respect. The Commission Communication on the development of the trans-European network puts forward the idea that the Community provides guarantees to concessionaires against the risk of non-completion or of delays of certain sections.[69] For instance, the company who will be awarded the concession contract to build and operate the rail line between Figueres and Perpignan would, by such a guarantee, cover the loss of revenues due to non completion of the section between Perpignan and Nîmes.

49. The Community could, as Article 103 of the EC Treaty permits, jointly grant with the Member States concerned and the European Investment Bank, loan guarantees for the financing of priority projects. These guarantees would reflect the interest and the confidence of the Union in an individual project.

50. To cover these guarantees, a 'Mutual Risk Fund' should be considered. Like insurance systems this would involve putting together the risks of a sufficient number of projects. This Mutual Risk Fund could be set up according to practices determined with the EIB and would be funded by the Member States concerned and the Community.

51. **The funding of this reserve would take account of the level of probability that the incurred limited risks materialise**. The contribution of the Community budget to this mutual fund would be financed from the budget heading TEN-T or possibly by contributions of other financial instruments, such as the structural funds and the Cohesion Funds. **The Group suggests that the Commission examines the feasibility of such new guarantee mechanisms and to assess the potential of such an approach within the framework of work on the new financial perspectives.**

52. Within the framework of the development of the motorways of the sea, the issue is not to attract private capital but to organise general interest services in compliance with competition rules. Public-private partnerships, of a much smaller scale and a different nature, are thus also necessary.

[68] In particular if priorities as regards transport policy change.

[69] The rules of monitoring of the public deficit, moreover, do not refer to the guarantees granted by States and regions.

53. Due to lack of time, the Group could not estimate the potential of private capital in financing the priority projects. On the basis of experience and forecasts made in national plans, the Group considers that, at best, between 10% and 30% of the overall amount of the priority project costs could be ensured by the private sector in the field of land transport. Of course, the share varies considerably from one project to another. It is advisable to adopt an approach on a case by case basis, to accurately measure the potential contribution of private investors. **The Group suggests that the Commission should define the framework for such an exercise.**

6.6.2. Adapt the political and legal framework

54. Public-Private Partnerships have to cope with important obstacles of a legal, economic and sometimes political nature. The Group considers it necessary to disseminate good practice and in the medium-term to update the existing legal framework in order to make them attractive for private investors in particular.

6.6.2.1 The laws related to concessions

55. The revision of the legal status of concessions has already started in a number of Member States. In the current state of Community law, concessions are not covered by the Directives on public contracts (except for the concessions which include work the making of which is subject to certain provisions of Directive 93/37). In its interpretative communication of 29 April 2000, the Commission nevertheless clarified the principles which arise from the provisions of the Treaty on fundamental freedoms, and in particular the obligations of competition and of equal treatment. The Court of Justice confirmed this interpretation, in particular in its Telaustria judgement[70].

56. On the occasion of the redrafting of the directives on public contracts[71], the Commission proposed opening new proceedings on the award of contracts, named "competitive dialogue". This procedure applies to the complex markets, and in particular when the judicial entity is not in a position to define the technical means which can meet its needs, or the legal and/or financial set up of a project. The competitive dialogue procedure allows bilateral dialogues with various candidates at an early stage. Once the awarding entity is in a position to identify the solutions likely to respond to its needs, the dialogue is closed. It is then followed of a phase of tendering and of evaluation of tenders. **The Group notes with interest such changes.**

6.6.2.2 Regulated competition of transport

57. The coherence of transport policies is of primary importance to mobilise private investors. The Group stresses therefore the importance that the application of transport policies at the level of States and the Community is coherent with this list of priorities, once adopted by the Council and Parliament. Uncoordinated infrastructure investments, not very competitive transport markets, unsuitable demand

[70] Case 324/98, Judgment of 7 December 2000.

[71] COM (2000) 275 final.

management, the lack of common standards, are factors which all directly affects the economics of the priority projects identified by the Group. The clarification of the interoperability standards, the definition of which is ongoing, applicable in the new Member States is in this respect very important.

58. The current sectoral reforms, in particular in rail transport have a key role. The opening of the rail freight market to competition, decided by the Council and Parliament, creates new market opportunities on a European scale These new rules, accompanied by a set of technical standards to ensure interoperability have still to be fully implemented. **The Group stresses that their application will improve the economics of the majority of the projects recommended in this report. The new infrastructures will not be used for empty wagons making empty return journeys as 'return loads' can be organised.**

6.6.2.3 Infrastructure Charging

59. **The Group stresses in particular the need for a stable common framework as regards infrastructure charging. Charging for an efficient use of infrastructure would make it possible to create a framework more favourable to investment, not least by allowing the infrastructure managers to cover all or part of their costs.**

60. The Group recalls that in this context the building and financing of Alpine tunnels, (and subsequently in the Pyrenees) in the proposed timeframe is only realistic if an appropriate framework allows cross-financing of new infrastructure from existing or new road tolls, or a more substantial Community intervention.

61. The Group observes that cross-financing is allowed in several Member States, as long as there is a clear functional relation, i.e. in respect of availability and quality, between the different infrastructure concerned. It notes that the European Council in Copenhagen in December 2002 has asked the Commission to present a new legislative instrument, amending Directive 1999/62 (the so-called "Eurovignette" Directive) and suggests as announced by the Commission, that such an instrument should specify the conditions of implementation of cross financing, bearing in mind the above.

6.6.3. Organise the coordination of investment

6.6.3.1 Coordination within the major European axes

62. The profitability of investment is closely linked to the sequence of putting into operation the various sections on the axis in question. Experience shows that the socio-economic profitability of major projects of the trans-European network is disappointing owing to delays in the work of other projects located on the same trans-European axes. Investments have therefore to be better synchronised along the main corridors.

63. **Closer coordination is therefore necessary between countries concerned with the same axis . For each major European axis (corridor), a coordination entity, in which the Community would take part, could be created for the duration of the priority projects located on the axis. Article 155 of the EC Treaty gives to the Commission the role of taking any useful initiatives to promote coordination**

between Member States. It would therefore be in the remit of the Commission to designate a personality, in agreement with the concerned Member States, to take charge of coordinating, stimulating cooperation, and ensuring the necessary follow-up, as well as to take measures for its functioning.

64. This is close to the idea of a ‘European Structure’, as mentioned by the Commission in its Communication entitled *"Developing the trans-European transport network"*. These entities could indeed, in the long term, evolve towards common structures in charge of promoting the projects to private and public investors, Member States directly interested in the completion of a priority project could acquire equity. Those which cannot or do not want to be directly involved in managing big projects could delegate such a task to these structures.

65. Without prejudging the future financial perspectives and the structural aid which will be available after 2006, the Group recommends that the Member States concerned prepare their transport planning and their transport programming for the next budgetary period now on the basis of the priorities identified by this report.

6.6.3.2 Transnational legal entities for major cross-border projects

66. Coordination between the various parties to a project (whether they are public or private entities) is essential, especially for the cross-border infrastructure. However, the setting up of a structure, by project, which has to manage it in the development phase and which has the responsibility for collecting the public and private capital is likely to prove particularly complex. The approval by the Council, on 8 October 2001, of the statute of the **European Company** (EC) already provides some possible solutions.

67. The European Company statute will indeed allow, from its application, in 2004, simplification and substantial economies of scale in the establishment of companies charged with managing cross-border projects. Within this framework of the ‘European Company’, (with a share capital authorised by the Member States, private companies, and the participation of the EIB), one could therefore envisage creating companies for major cross-border TEN-T projects, using for that, the structure or at least the spirit, of the joint undertaking Galileo.

6.6.4. Adapt the assessment methods to sustainable development

6.6.4.1 More homogeneous economic assessment methods

68. The socio-economic impact of a project constitutes the base of any infrastructure investment decision. The methods to calculate the costs and the benefits of infrastructure project constitute in this respect a valuable planning tool. The Group notes the great diversity of practices between Member States and between modes of transport. Not only methods vary greatly in their appraisal of the external effects, but also in criteria such as the discount rates affecting the decision-making directly. This diversity impedes clarity and the transparency of the appraisal in the case of cross-border projects. The harmonisation of these methods therefore appears desirable. **Should the Community become an important financial partner for the realisation of cross-border projects, it would be logical that the Commission proposes common evaluation methods.** Moreover, the Commission evaluates subsidy requests under the structural financial instruments, by harmonised methods

of estimating the costs and benefits. This approach constitutes a powerful vector of dissemination and of harmonisation of good practices as regards cost/benefit analysis.

69. The current practices show other limits, in particular with regard to railway infrastructures. The positive effects on the sustainable development of the railway infrastructures are felt only in the very long term and cannot be captured correctly by the traditional cost/benefits analysis. Moreover, certain Member States pay great attention to the time savings for passengers but on the other hand do not give sufficient attention to the added value in terms of new freight capacities. The current railway market is in the process of major change, in particular due to the opening of the market, forecasting traffic from past trends is no longer appropriate. Similarly the effects of transport infrastructure in all modes in terms of spatial development remain difficult to incorporate in a transparent way into the evaluation, leading to under-estimates but also to over-estimates of these effects. **The Group therefore recommends to the Commission to further support research in this area and to disseminate good practices.**

6.6.4.2 Taking sustainable development into account

70. The limiting of emission of greenhouse gases probably constitutes the greatest environmental challenge of current transport policy. The transport sector constitutes one of the main contributors among human activities to the production of these gases. The growth of emissions of carbon dioxide cannot be controlled without a strong political will to achieve a significant modal transfer towards rail and inland waterways. If this does not occur, it will be difficult to respect the commitments that the Union took under the Kyoto protocol, even with technological progress expected on the part of the motor industry in the coming decades. This is why the Group attached great importance to the criterion relating to sustainable development. **The priorities of the Group are directly in keeping with the aim set by the European Council of Göteborg to give priority to the infrastructure for intermodal transport, rail transport, maritime transport, and river transport.**

6.6.4.3 The environmental impact assessment procedures

71. The undertaking of priority projects has to be exemplary concerning the respect of the various Community directives for environmental protection, in particular Council Directive 85/337/EEC, of 27 June 1985, concerning the assessment of the effects of certain public and private projects on the environment[72] and Directive 92/43 of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora.[73] **The Group did not ignore the fact that infrastructures can bring certain harmful effects to their immediate environment. It is advisable to mitigate them as much as possible at source from the design stage (safety, noise pollution, water pollution, etc).**

72. Often the legislation concerning environmental protection is said to be one of the causes of the delays too frequently met in the carrying out of major projects. Even if taking into account environment effects may contribute to lengthening the duration of

[72] OJ L 175 of 5.7.1985, p. 40.

[73] OJ L206 of 22.7.1992, p. 7

studies and of completing a project, the Group wishes to stress that this makes it possible to achieve infrastructure of better quality and more respectful, in the end, of sustainable development. It rests with the infrastructure promoters and with the political decision-makers to anticipate these long development deadlines and to start the studies of projects upstream. Too often, studies are not sufficiently advanced when the hour of the political decision arrives. In particular, the Group considers that some of the priority projects selected would have benefited from being at a more advanced stage with their studies to meet the needs of the work of the Group.

73. To avoid delays in a later planning stage, the network managers have to incorporate the environment aspect as far upstream as possible, in particular through the requirements of Directive 2001/42/EC on strategic environmental assessments. COREPER had already proposed to the Transport Council of 25 September 2002 to ask the Commission to develop, in agreement with the Member States, methods to implement strategic environmental assessment with the objective of assuring *inter alia* appropriate coordination, and 'avoiding a multiplication of the efforts, and of achieving simplification and acceleration of the procedures for the cross-border projects and the corridors'. **The Group subscribes to this request in order to quickly lead to a common methodology for all the priority projects - and other projects of the TEN-T network - for the application of this Directive.**

6.6.4.4 Facilitate these procedures by transnational commissions of enquiry

74. The Group examined the question of going beyond harmonising procedures related to environmental protection. The Group asks in particular that the Commission reflects on the possibility of allowing a **single public consultation procedure covering several Member States** and not only in the Member State promoting the project. A "transnational" commission of enquiry would thus be set up to receive the reactions of all interested parties within the Member States concerned.

75. Such a procedure would be a tool at the disposal of the Member States. **It would be optional, in the sense that it will be applicable only if the Member States concerned by the project specify their wish to use such a procedure beforehand.** Such a procedure could moreover concern any infrastructure project in general, whether it is for transport, energy or telecommunications, beyond those located on the TEN-T.

76. In addition, the procedure will have to take as a starting point the Espoo Convention of 1991 on the environmental impact statements in a cross-border context[74]. This convention defines the principles to be followed for taking into account the cross-border effects of projects in the impact statements, whether these projects are cross-border or not and for the exchanges of information between countries concerned. The procedure envisaged in the case in point would go further than this convention by envisaging a single impact statement and impact procedure in all the Member States concerned.

77. Such a procedure would offer several advantages. It would entail a **single enquiry in the various States concerned** rather than a juxtaposition of national procedures

[74] Available on the site of the UNECE at the following address: http://www.unece.org/env/eia/eia.htm.

which inevitably are not coordinated. It would establish **the drafting of a single impact statement** for the project. Indeed, it is urgent to take account of the effects, positive or negative, at the level, not of the State promoting the project, but of all the Member States concerned with the project in question. It would make it possible to organise a **consultation, complying with directive 2001/42/EC, of all those concerned in several Member States.**

6.7. SIMPLIFY THE FUTURE REVISIONS OF THE LISTS OF PRIORITY PROJECTS

6.7.1. A necessary periodic revision

1. The list of the priority projects is not set in stone. It must evolve over time by reflecting the reality of the needs and the level of advancement of the projects. Flexibility as regards the list of priority projects remains necessary. Should some projects not start the works before the agreed date for projects in List 1, their qualification as priority projects of the trans-European network should inevitably be reconsidered. Also there are projects of very high European importance, such as those in List 2, which may become ready to go forward if for instance a political agreement between the concerned countries can be found on the alignment and the calendar.

2. The Christophersen Group had already recommended that the list of the priority projects be revised periodically. Ten years have however passed since the work of the Christophersen Group. Experience shows that ten years is too long a period between revisions. Indeed, the Commission felt the need to up-date the Essen list by making new proposals.

6.7.2. The list of the priority projects evolves

3. The Group proposes that the list of the priority projects, and therefore the guidelines on the trans-European transport network, be revised after a certain time. The life span of the guidelines and most of the priority projects exceed, by far, the duration of the Community budgetary perspectives. The Group therefore, suggests preferably synchronising such a revision with the timing of the Community's budgetary perspectives.

4. To that end a group of representatives appointed by the Transport Ministers should be set up at the very latest by 2010[75]. The recommendations of such a group should be addressed to the Commission in time to prepare a proposal for revising the guidelines and the following budgetary perspectives. It should be noted that the co-decision procedure to adopt the Community guidelines, and consequently the priority projects, takes a certain time and must be carefully accounted for in planning the process.

5. Furthermore, twelve months should be given to such a group in order to perform a more thorough analyses. The six-month period granted to the present Group has been considered too short.

6. The Group suggests that the next exercise be preceded by an analysis of the socio-economic interest and financial viability of the individually submitted projects in order to allow the group to better understand the risks associated with the various projects. In particular, the EIB should ideally be in the position to deliver an informed opinion on the financial viability of the different projects.

[75] Assuming that the next budgetary perspectives cover a 7-year period.

7. To this end, it would be appropriate that the Commission invites Member States to submit their projects at least six months before the setting-up of the group, in order to allow the Commission and EIB services to examine the projects in detail, well ahead of the work of the group. If in doubt over economic, environmental, social or technical aspects of certain projects, the secretariat of the group should be able to call upon additional independent external expertise. As regards the work of the group itself, more and updated documentation on traffic analysis with maps representing the volume of flows along the various main axes should be made available on time.

6.7.3. The bottom-up approach is no longer enough

8. In view of the integration of the trans-European transport network, the bottom up approach is no longer sufficient on its own in order to determine the priority projects. No single Member State can claim to have an overall picture of transport needs on the scale of the enlarged Union.

9. Thus, the Group suggests setting up a European Transport Observatory in charge of carrying out, on a regular basis, a traffic inventory on the main axes and establishing European reference traffic forecasts. Such an Observatory would provide the tools needed by the entities proposed in Chapter 6.6. More importantly, it would assist the Commission in fulfilling its duty from the Treaty by making proposals for the choice of the priority projects and by sounding the alarm when delays to implement projects cause, or are likely to cause, a serious malfunctioning of the internal market.

7. LIST OF MEMBERS

Chairman : Mr Karel **VAN MIERT**

Former Vice-President of the Commission and Commissioner in charge of transport

Austria
Mr Gerold **ESTERMANN**
Director of « Gesamtverkehrsmanagement, Logistik und Telematik »,
Bundesministerium für Verkehr, Innovation
und Technologie

Belgium
Mr Luc **MARECHAL**
Chef de cabinet du Ministère de la mobilité et des transports

Denmark
Mr Thomas **EGEBO**
Permanent Secretary, Ministry of Transport

Deputy :
Mr Jørn **HOLDT**
Head of International Division, Ministry of Transport

Germany
Mr Ulrich **SCHÜLLER**
Director of Grundsatzabteilung, Bundesministerium für Verkehr,
Bau- und Wohnungswesen

Deputy :
Mr Jürgen **PAPAJEWSKI**
Regierungsdirektor**,** Bundesministerium für Verkehr,
Bau- und Wohnungswesen

Spain
D. Antonio **LOPEZ -CORRAL**
Director General de Programación Economica
Ministerio de Fomento

Finland
Mr Juhani **TERVALA**
Director of infrastructures, Ministry of Transport and Communication

Deputy :
Mr Juha **PARANTAINEN**

France	Mr Claude **MARTINAND** Vice Président du Conseil Général des Ponts et Chaussées, Ministère de l'équipement, des transports, du logement, du tourisme et de la mer CGPC
Greece	Mr Yiannis **ROUBATIS** Former spokesman of government and former Member of European Parliament Deputy : Mr Christos **DIONELIS,** Advisor to the Minister of Transport
Ireland	Mr Andrew **CULLEN,** Director General, Public Transport Planning and Investments, Department of Transport
Italy	Mr Ercole **INCALZA**, Cabinet advisor to M. Lunardi Ministero delle Infrastrutture e dei Trasporti
Luxembourg	Mr Paul **SCHMIT** Commissaire du gouvernement Secrétaire général du Ministère des Transports
Netherlands	Mrs Dr. Neelie **KROES** Former Minister of Transport Deputy Drs Roel **GANS,** MMC
Portugal	Exmo Senhor Dr Romeu **REIS** Director do Gabinete para os Assuntos Europeus e Relações Externas-GAERE
Sweden	Mr Jonas **BJELFVENSTAM** State Secretary, Ministry of Industry, Employment and Communications Deputy : Mr Ulf **LUNDIN** Director, Ministry of Industry, Employment and Communications

United Kingdom

Mr Willy **RICKETT**
Director General of Transport Strategy, Roads and Local Transport

Deputy :
Mr David **Mc MILLAN**
Mr John **STEVENS**

Observers appointed by acceding countries :

Bulgaria

Mr Dimitar **ZOEV**
Director ‘Transport Policy, Infrastructure and Construction’.
Directorate of the Ministry of Transport and Communications.

Czech Republic

Mr Antonin **TESARIK**
Deputy Minister, Ministry of Transport

Deputy :
Mr Karel **STEINER**
Director of Transport Policy, International Relations and
Environment Dept., Ministry of Transport

Mr Vratislav **INDRA,**
Government Counsellor, Ministry of Transport

Cyprus

Mr Symeon **MATSIS**
Permanent Secretary, Ministry of Communication and Works

Deputy :
Mr Iacovos **PAPADOPOULOS**
Director of Administration, Ministry of Communication and Works

Estonia

Mr Anti **MOPPEL**
Head of Department of Development & Logistics,
Ministry of Economic Affairs and Communication

Hungary

Mr Zoltan **KAZATSAY**
Deputy State Secretary, Ministry of Economy and Transport.

Latvia

Mr Vigo **LEGZDINS**
State Secretary, Ministry of Transport of Latvia

Lithuania

Mr Alminas **MACIULIS**
State Secretary of the Lithuanian Ministry of Transport and Communications

Deputy :
Mr Albertas **ARUNA**
Director of Transport Investment Directorate,
Ministry of Transport and Communications,

Malta

Dr Marc **BONELLO**
Chairman Malta Maritime Authority
Ministry of Transport and Communication

Poland

Mr Sergiusz **NAJAR**
Undersecretary of State, Ministry of Infrastructure

Romania

Mr Sergiu **SECHELARIU**
State Secretary Ministry of Transport

Deputy:
Mrs Virginia **TANASE**
Director General, Ministry of Public Works, Transport and Housing

Mr William **PADINA**
Director General, Ministry of Public Works, Transport and Housing

Slovakia

Mr Branislav **OPATERNY**
State Secretary of Ministry of Transport, Posts & Telecommunication of the Slovak Republic

Deputy :
Mr Rudolf **KORONTHALY**
Director of the European Integration Unit, Ministry of Transport, Posts & Telecommunication

Slovenia

Mr Boris **ZIVEC**
State Secretary for Transport Policy, Ministry of Transport

****

European Investment Bank (EIB):

M. Ewald **NOWOTNY**
Vice-President

8. LIST OF MEETINGS

The High Level Group met in Brussels on the :

- 12 December, 2002[76]
- 10 January, 2003
- 28 January, 2003
- 14 February, 2003
- 7 March, 2003
- 31 March, 2003
- 9 April, 2003
- 30 April, 2003
- 12 – 13 May, 2003
- 20 June, 2003.

[76] Without the participation of acceding countries

COUNCIL OF
THE EUROPEAN UNION

Brussels, 29 January 2003

15917/02

POLGEN 84

COVER NOTE

from :	Presidency
to :	delegations
Subject :	**COPENHAGEN EUROPEAN COUNCIL 12 AND 13 DECEMBER 2002 PRESIDENCY CONCLUSIONS**

Delegations will find attached the revised version of the Presidency conclusions of the Copenhagen European Council (12 and 13 December 2002).

1. The European Council met in Copenhagen on 12 and 13 December 2002. The meeting was preceded by an exposé by the President of the European Parliament, Mr Pat Cox, followed by an exchange of views concerning the main items on the agenda.

2. The European Council heard a report by President Valéry Giscard d'Estaing on the progress of the Convention's proceedings. In the light of that report the European Council held an exchange of views on the development of the discussions. The Convention will present the result of its work in time for the European Council in June 2003.

I. Enlargement

3. The European Council in Copenhagen in 1993 launched an ambitious process to overcome the legacy of conflict and division in Europe. Today marks an unprecedented and historic milestone in completing this process with the conclusion of accession negotiations with Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, the Slovak Republic and Slovenia. The Union now looks forward to welcoming these States as members from 1 May 2004. This achievement testifies to the common determination of the peoples of Europe to come together in a Union that has become the driving force for peace, democracy, stability and prosperity on our continent. As fully fledged members of a Union based on solidarity, these States will play a full role in shaping the further development of the European project.

4. The Union endorses the result of these negotiations as set out in document 21000/02. The financial consequences of enlargement are set out in Annex I. The comprehensive and balanced outcome provides a solid basis for the smooth integration of ten new Member States, while safeguarding the effective functioning of the enlarged Union. The agreement reached will provide the acceding States with the necessary transitional arrangements to cope successfully with all obligations of membership. The result achieved in the accession negotiations ensures the continued functioning of the internal market as well as the various EU policies, without prejudging future reform.

5. Monitoring up to accession of the commitments undertaken will give further guidance to the acceding States in their efforts to assume responsibilities of membership and will give the necessary assurance to current Member States. The Commission will make the necessary proposals on the basis of the monitoring reports. Safeguard clauses provide for measures to deal with unforeseen developments that may arise during the first three years after accession. The European Council welcomes furthermore the commitment to continue the surveillance of progress with regard to economic, budgetary and structural policies in the candidate States within the existing economic policy coordination processes.

6. All efforts should now be directed at completing the drafting of the Accession Treaty so that it can be submitted to the Commission for its opinion and then to the European Parliament for its assent, and to the Council with a view to signing in Athens on 16 April 2003.

7. By successfully concluding the accession negotiations the Union has honoured its commitment that the ten acceding States will be able to participate in the 2004 European Parliament elections as members. The Accession Treaty will stipulate that Commissioners from the new Member States will join the current Commission as from the day of accession on 1 May 2004. After the nomination of a new President of the Commission by the European Council, the newly elected European Parliament would approve a new Commission that should take office on 1 November 2004. On the same date, the provisions contained in the Nice Treaty concerning the Commission and voting in the Council will enter into force. The necessary consultations with the European Parliament on these matters will be concluded by the end of January 2003. The above arrangements will guarantee the full participation of the new Member States in the institutional framework of the Union.

8. Finally, the new Member States will participate fully in the next Intergovernmental Conference. Without reform the Union will not fully reap the benefits of enlargement. The new Treaty will be signed after accession. This calendar shall be without prejudice to the timing of the conclusion of the IGC.

9. The current enlargement provides the basis for a Union with strong prospects for sustainable growth and an important role to play in consolidating stability, peace and democracy in Europe and beyond. In accordance with their national ratification procedures, the current and the acceding States are invited to ratify the Treaty in due time for it to enter into force on 1 May 2004.

Cyprus

10. In accordance with paragraph 3 above, as the accession negotiations have been completed with Cyprus, Cyprus will be admitted as a new Member State to the European Union. Nevertheless, the European Council confirms its strong preference for accession to the European Union by a united Cyprus. In this context it welcomes the commitment of the Greek Cypriots and the Turkish Cypriots to continue to negotiate with the objective of concluding a comprehensive settlement of the Cyprus problem by 28 February 2003 on the basis of the UNSG's proposals. The European Council believes that those proposals offer a unique opportunity to reach a settlement in the coming weeks and urges the leaders of the Greek Cypriot and Turkish Cypriot communities to seize this opportunity.

11. The Union recalls its willingness to accommodate the terms of a settlement in the Treaty of Accession in line with the principles on which the EU is founded. In case of a settlement, the Council, acting by unanimity on the basis of proposals by the Commission, shall decide upon adaptations of the terms concerning the accession of Cyprus to the EU with regard to the Turkish Cypriot community.

12. The European Council has decided that, in the absence of a settlement, the application of the acquis to the northern part of the island shall be suspended, until the Council decides unanimously otherwise, on the basis of a proposal by the Commission. Meanwhile, the Council invites the Commission, in consultation with the government of Cyprus, to consider ways of promoting economic development of the northern part of Cyprus and bringing it closer to the Union.

Bulgaria and Romania

13. The successful conclusion of accession negotiations with ten candidates lends new dynamism to the accession of Bulgaria and Romania as part of the same inclusive and irreversible enlargement process. The Union welcomes the important progress achieved by these countries, which is duly reflected in the advanced state of their accession negotiations.

14. The Union looks forward to consolidating the results achieved so far. Following the conclusions of the European Council in Brussels and depending on further progress in complying with the membership criteria, the objective is to welcome Bulgaria and Romania as members of the European Union in 2007. The Union confirms that accession negotiations with these countries will continue on the basis of the same principles that have guided the accession negotiations so far, and that each candidate country will be judged on its own merits.

15. The roadmaps put forward by the Commission provide Bulgaria and Romania with clearly identified objectives and give each country the possibility of setting the pace of its accession process. It is essential that Bulgaria and Romania seize this opportunity by stepping up their preparation, including fulfilling and implementing the commitments undertaken in the accession negotiations. In this context, the Union underlines the importance of judicial and administrative reform that will help bring forward Bulgaria and Romania's overall preparation for membership. This will ensure that the process will be successfully brought forward on the basis of the results reached so far. Future Presidencies and the Commission will make sure that the pace of accession negotiations on all remaining chapters, including chapters with financial implications, is maintained and matches the efforts of Bulgaria and Romania.

16. The Union underlines its resolve to assist Bulgaria and Romania in these efforts. The Union endorses the Commission's communication on roadmaps for Bulgaria and Romania, including the proposals for a significant increase in pre-accession assistance. The high level of funding to be made available should be used in a flexible way, targeting the priorities identified, including in key areas such as Justice and Home Affairs. Further guidance in their pre-accession work will be provided by the revised Accession Partnerships to be presented to them next year.

17. Furthermore, Bulgaria and Romania will participate in the next Intergovernmental Conference as observers.

Turkey

18. The European Council recalls its decision in 1999 in Helsinki that Turkey is a candidate State destined to join the Union on the basis of the same criteria as applied to the other candidate States. It strongly welcomes the important steps taken by Turkey towards meeting the Copenhagen criteria, in particular through the recent legislative packages and the subsequent implementation measures which cover a large number of key priorities specified in the Accession Partnership. The Union acknowledges the determination of the new Turkish government to take further steps on the path of reform and urges in particular the government to address swiftly all remaining shortcomings in the field of the political criteria, not only with regard to legislation but also in particular with regard to implementation. The Union recalls that, according to the political criteria decided in Copenhagen in 1993, membership requires that a candidate country has achieved stability of institutions guaranteeing democracy, the rule of law, human rights and respect for and protection of minorities.

19. The Union encourages Turkey to pursue energetically its reform process. If the European Council in December 2004, on the basis of a report and a recommendation from the Commission, decides that Turkey fulfils the Copenhagen political criteria, the European Union will open accession negotiations with Turkey without delay.

20. In order to assist Turkey towards EU membership, the accession strategy for Turkey shall be strengthened. The Commission is invited to submit a proposal for a revised Accession Partnership and to intensify the process of legislative scrutiny. In parallel, the EC-Turkey Customs Union should be extended and deepened. The Union will significantly increase its pre-accession financial assistance for Turkey. This assistance will from 2004 be financed under the budget heading "pre-accession expenditure".

o

o o

21. The European Union and the acceding States agreed on a joint declaration "One Europe" on the continuous, inclusive and irreversible nature of the enlargement process (see SN 369/02) which will be annexed to the final act of the Accession Treaty.

The enlarged Union and its neighbours

22. The enlargement will bring about new dynamics in the European integration. This presents an important opportunity to take forward relations with neighbouring countries based on shared political and economic values. The Union remains determined to avoid new dividing lines in Europe and to promote stability and prosperity within and beyond the new borders of the Union.

23. The European Council recalls the criteria defined at the Copenhagen European Council in June 1993 and reaffirms the European perspective of the countries of the Western Balkans in the Stabilisation and Association Process as stipulated by the European Council in Feira. The Council underlines its determination to support their efforts to move closer to the EU. The European Council welcomes the decision by the incoming Greek Presidency to organise a Summit on 21 June in Thessaloniki between EU Member States and countries of the Stabilisation and Association Process.

24. The enlargement will strengthen relations with Russia. The European Union also wishes to enhance its relations with Ukraine, Moldova, Belarus and the southern Mediterranean countries based on a long-term approach promoting democratic and economic reforms, sustainable developments and trade and is developing new initiatives for this purpose. The European Council welcomes the intention of the Commission and the Secretary-General/High Representative to bring forward proposals to that end.

25. The European Council encourages and supports the further development of cross-border and regional cooperation inter alia through enhancing transport infrastructure, including appropriate instruments, with and among neighbouring countries in order to develop the regions' potential to the full.

II. FUNCTIONING OF THE COUNCIL IN VIEW OF ENLARGEMENT

26. The European Council took note of an initial report from the Presidency on the Presidency of the Union requested at Seville.

III. EUROPEAN SECURITY AND DEFENCE POLICY

27. The European Council congratulated the Presidency and the Secretary-General/High Representative, Javier Solana, for their efforts which have enabled the comprehensive agreement reached with NATO on all outstanding permanent arrangements between the EU and NATO in full conformity with the principles agreed at previous meetings of the European Council and the decisions taken at the Nice European Council.

28. The European Council confirmed the Union's readiness to take over the military operation in FYROM as soon as possible in consultation with NATO, and invited the relevant bodies of the EU to finalise work on the overall approach to the operation, including development of military options and relevant plans.

29. The European Council also indicated the Union's willingness to lead a military operation in Bosnia following SFOR. It invited the Secretary-General/High Representative, Javier Solana, and the future Presidency to begin consultations to that end with the authorities in Bosnia and Herzegovina, the High Representative/EU Special Representative Lord Ashdown, NATO and other international players and to report to the Council in February. It requested the relevant EU bodies to make proposals on an overall approach, including the legal framework, by the same time.

30. The European Council has taken note of the declaration of the Council attached in Annex II.

IV. MIDDLE EAST/IRAQ

31. The European Council adopted the declarations in Annexes III and IV.

V. OTHER ITEMS

Maritime safety/marine pollution

32. The European Council expresses its regret and grave concerns with regard to the serious accident of the oil tanker PRESTIGE off the northwest coast of Spain. The ensuing damage to the marine and socio-economic environment and the threat to the livelihood of thousands of persons are intolerable. The European Union expresses its solidarity with the States, regions and populations that have been affected and its support and recognition of the efforts of the affected States, institutions and civil society towards the recovery of the polluted areas.

33. The European Council recalls its conclusions in Nice in December 2000 concerning the ERIKA measures and acknowledges the determined efforts in the European Community and the International Maritime Organisation (IMO) since the ERIKA accident to enhance maritime safety and pollution prevention. The Union is determined to take all necessary measures to avoid a repetition of similar catastrophes and welcomes the rapid responses by the Council and the Commission. The Union will also continue to play a leading role in international efforts in pursuit of this objective, in particular within the IMO. The conclusions of the Transport Council on 6 December 2002 and the Environment Council on 9 December 2002 should be implemented in all their aspects without delay.

34. The European Council welcomes the action undertaken by the Commission to confront the economic, social and environmental consequences derived from the wreck of the Prestige, in the framework of the present financial perspective and its intention to examine the need for further specific measures. Amongst these measures, questions relating to liability and the corresponding sanctions will also be examined.

On the basis of a report by the Commission, the European Council will address these issues at its forthcoming March meeting.

Alpine transit

35. According to the conclusions of the European Council in Laeken, the European Council requests the Council to adopt, before the end of this year, a regulation on the interim solution for the transit of heavy goods vehicles through Austria 2004-2006. The European Commission shall present a proposal for a new Eurovignette directive not later than the first half of 2003.

Melk Agreement

36. The European Council took note with satisfaction of the Melk Agreement between Austria and the Czech Republic and expects its comprehensive implementation.

Specific situations in agriculture in current Member States

37. The European Council has been asked by Portugal to take action pursuant to the conclusions of the Berlin European Council on 24 and 25 March 1999 on the specificity of Portuguese agriculture.

The European Council noted that Portugal considers that a specific problem, arising from the way the CAP currently applies to Portuguese agriculture, still exists. To this end the Commission is invited to present a report analysing the situation. The Commission is also invited to consider the situation in other parts of the Union where similar specific problems may exist.

Reports and communications for the European Council

38. The European Council took note of the report on reports and communications submitted to it (15530/02).

ANNEX I

BUDGETARY AND FINANCIAL ISSUES

The Union endorses the result of the negotiations which have determined expenditure requirements resulting from the accession of new Member States respecting the ceilings for enlargement-related expenditure set out for the years 2004-2006 by the European Council in Berlin.

The European Council invites the Commission to take into account this expenditure in its proposal to adjust the financial perspective, to be adopted by the European Parliament and the Council in accordance with paragraph 25 of the Interinstitutional Agreement of 6 May 1999 on budgetary discipline and improvement of the budgetary procedure.

Based on the accession of 10 new Member States by 1 May 2004, the maximum appropriations for commitments for agriculture, structural operations, internal policies and administration for the new Member States should be the amounts now determined as a result of the negotiations at this European Council, as set out in the following table:

Maximum enlargement-related appropriations for commitments (EUR mio. 1999 prices) 2004-2006 (for 10 new Member States)

	2004	**2005**	**2006**
Heading 1 Agriculture	1.897	3.747	4.147
Of which:			
1a - Common Agricultural Policy	327	2.032	2.322
1b - Rural development	1.570	1.715	1.825
Heading 2 Structural actions after capping	6.070	6.907	8.770
Of which:			
Structural Fund	3.453	4.755	5.948
Cohesion Fund	2.617	2.152	2.822
Heading 3 Internal policies and additional transitional expenditure	1.457	1.428	1.372
Of which:			
Existing policies	846	881	916
Transitional nuclear safety measures	125	125	125
Transitional institution building measures	200	120	60
Transitional Schengen measures	286	302	271
Heading 5 Administration	503	558	612
Total maximum appropriations for commitments (Headings 1, 2, 3 and 5)	9.927	12.640	14.901

This is without prejudice to the EU 25 ceiling for category 1a for 2007-13 set out in the Decision of the Representatives of the Governments of the Member States, meeting within the Council on 14 November 2002, concerning the conclusions of the European Council meeting in Brussels on 24 and 25 October 2002.

The European Council considers that appropriate adjustments to the EU 15 financial perspective ceilings for the period 2004-2006 to take account of the expenditure requirements relating to enlargement should not − for existing headings − exceed the above amounts.

In addition, a new temporary heading X for a special lump-sum cash-flow facility and for temporary budgetary compensation for the years 2004 to 2006 should be created within the Berlin ceilings for enlargement-related expenditure. The total amounts now determined as a result of negotiations are as follows:

Heading X (special cash-flow facility and temporary budgetary compensation) 2004-2006 (for 10 new Member States)			**(EUR mio. 1999 prices)**
	2004	**2005**	**2006**
Special cash-flow facility	1.011	744	644
Temporary budgetary compensation	262	429	296
Total	1.273	1.173	940

However, the corresponding ceiling for appropriations for payments for the enlarged Union for the years 2004-2006 should be unchanged compared to the corresponding ceiling set out in Table A of the Berlin conclusions. The European Council recalls paragraph 21 of the Interinstitutional Agreement of 6 May 1999 which sets out the need to maintain an appropriate relationship between commitments and payments.

In accordance with the Own Resources Decision of 29 September 2000, the new Member States will fully contribute to the financing of the EU expenditure as from the first day of accession, since the own resources acquis will apply to the new Member States as from accession.

Regarding the ring-fencing of expenditure, the European Council recalls paragraph 21 of the Interinstitutional Agreement of 6 May 1999.

The general effort towards budgetary discipline laid down by the European Council in Berlin should be continued in the period beginning in 2007.

ANNEX II

DECLARATION OF THE COUNCIL MEETING IN COPENHAGEN ON 12 DECEMBER 2002

The Council notes the following:

1. As things stand at present, the "Berlin plus" arrangements and the implementation thereof will apply only to those EU Member States which are also either NATO members or parties to the "Partnership for Peace", and which have consequently concluded bilateral security agreements with NATO.

2. Paragraph 1 above shall not affect the rights and obligations of EU States in their capacity as EU Members. Consequently, in the absence of any specific provision in the Treaty or in a Protocol annexed thereto (particular case of Denmark), all EU Member States will participate fully in defining and implementing the Union's CFSP, which shall cover all matters relating to the Union's security, including the progressive framing of a common defence policy.

3. The fact that, as things stand at present, Cyprus and Malta will not take part in EU military operations conducted using NATO assets once they have become members of the EU will not, within the limits of the EU Security Regulations, affect the right of their representatives to participate and vote in EU institutions and bodies, including COPS, with regard to decisions which do not concern the implementation of such operations.

   Likewise, their right to receive EU classified information, within the limits of the EU Security Regulations, shall not be affected, provided the EU classified information does not contain or refer to any classified NATO information.

ANNEX III

EUROPEAN COUNCIL DECLARATION ON THE MIDDLE EAST

Peace in the Middle East is an imperative. The European Council calls upon the Israeli and Palestinian people to break the endless cycle of violence. It reiterates its strong and unequivocal condemnation of all acts of terrorism. Suicide attacks do irreparable damage to the Palestinian cause. The European Union supports the efforts of those Palestinians seeking to take forward the reform process and to bring an end to the violence. It appeals to Israel to facilitate those efforts. While recognising Israel's legitimate security concerns the European Council calls upon Israel to stop excessive use of force and extra-judicial killings, which do not bring security to the Israeli population.

Violence and confrontation must give way to negotiations and compromise. The international community, including the parties, share a common vision of two States, Israel and an independent, viable, sovereign, and democratic Palestine, living side by side in peace and security on the basis of the 1967 borders. All efforts should now be directed at translating this vision into reality.

As a result the European Council attaches the highest priority to the adoption on 20 December this year by the Middle East Quartet of a joint road-map with clear timelines for the establishment of a Palestinian State by 2005. The implementation of the road-map must be based on parallel progress in the security, political and economic fields and should be closely monitored by the Quartet.

In this context, the European Council is alarmed at the continuing illegal settlement activities, which threaten to render the two-State solution physically impossible to implement. The expansion of settlements and related construction, as widely documented including by the European Union's Settlements Watch, violates international law, inflames an already volatile situation, and reinforces the fear of Palestinians that Israel is not genuinely committed to ending the occupation. It is an obstacle to peace. The European Council urges the Government of Israel to reverse its settlement policy and as a first step immediately apply a full and effective freeze on all settlement activities. It calls for an end to further land confiscation for the construction of the so-called security fence.

Decisive steps must be taken to reverse the sharply deteriorating humanitarian situation in the West Bank and Gaza, which is making life increasingly intolerable for ordinary Palestinians and fuelling extremism. Humanitarian access and the security of humanitarian personnel and their installations must be guaranteed.

With the aim of supporting the reforms in the Palestinian territories, the EU will continue its budgetary support to the Palestinian Authority with clear objectives and conditions. The EU calls on other international donors to join this commitment also with a view to coherent efforts for reconstruction. Israel for its part must resume the monthly transfers of Palestinian tax revenues.

The European Union is determined to continue the work with its partners in the Quartet to assist Israelis and Palestinians alike to move towards reconciliation, negotiations and a final, just and peaceful settlement to the conflict.

ANNEX IV

EUROPEAN COUNCIL DECLARATION ON IRAQ

The European Council underlines its full and unequivocal support for Security Council Resolution 1441 of 8 November 2002. The goal of the European Union remains the disarmament of Iraq's weapons of mass destruction in accordance with the relevant UN Security Council Resolutions. It is now up to Iraq to seize this final opportunity to comply with its international obligations.

The European Council notes Iraq's acceptance of Resolution 1441 and that it has, as required, submitted a declaration on its programmes to develop weapons of mass destruction and related products.

The EU will continue to give its full support to the efforts of the UN to ensure full and immediate compliance by Iraq with Resolution 1441. The role of the Security Council in maintaining international peace and security must be respected.

The European Council expresses its full support for the inspection operations of UNMOVIC and IAEA headed by Dr Blix and Dr El-Baradei. The European Council stresses that the weapons inspectors should be allowed to proceed with their important task without interference using the full range of tools available to them under Resolution 1441. The EU looks forward to their assessment of the Iraqi declaration.

COMMISSION OF THE EUROPEAN COMMUNITIES

Brussels, 21.5.2003
COM(2003) 283 final

COMMUNICATION FROM THE COMMISSION TO THE COUNCIL AND THE EUROPEAN PARLIAMENT

Public finances in EMU – 2003

{SEC (2003) 571 }

COMMUNICATION FROM THE COMMISSION TO THE COUNCIL AND THE EUROPEAN PARLIAMENT

Public finances in EMU – 2003[1].

The most difficult period for budgetary policies since the launch of the euro

2002 and the early part of 2003 has been a difficult period both in terms of actual budgetary developments and as regards the implementation of the EU framework for fiscal surveillance. The nominal deficit for the euro area as a whole increased from 1.6% of GDP in 2001 to 2.2% in 2002 and, according to the latest Commission forecast, it is projected to rise to 2.5% of GDP in 2003. This aggregate outcome is the result of striking contrasts in the performance across Member States. By the end of 2002, only six EU countries, including four euro area countries (accounting for some 18% of euro area output) had achieved budget positions (both in nominal and cyclically adjusted terms) that met the 'close to balance or in surplus' requirement of the Stability and Growth Pact, whereas two euro area countries (accounting for half of the euro area output) had deficits above the 3% of GDP reference value.

The Portuguese authorities succeeded in reducing the nominal deficit from 4.1% of GDP in 2001 to 2.8% in 2002, although very significant challenges remain if the deficit is to remain below 3% of GDP in 2003 as much of this improvement is due to one-off measures which have only led to a transitory improvement in the budget balance. A deficit of 3.6% of GDP in 2002 has resulted in Germany being placed in an excessive deficit position: while the authorities are taking measures aimed at reducing the cyclically-adjusted budget deficit, only a very limited improvement in nominal terms is expected in 2003 as growth conditions deteriorate. Despite clear evidence of budgetary slippage emerging in early 2002, the French authorities did not take corrective measures and a deficit of 3.1% of GDP occurred in 2002 resulting in the excessive deficit procedure being activated. An even higher deficit of 3. 7% of GDP is forecast by the Commission services for 2003 on the basis of current policies. Large deficits remain in Italy (2.3% of GDP in 2002 and in 2003) and by 2004 is projected to rise above the 3% of GDP reference value[2]: budgetary consolidation efforts in Italy continue to rely on one-off measures rather than on reforms of a structural nature needed to ensure a permanent improvement in the budget balance. Deficits have also re-emerged in 2002 in countries that already had reached balanced budget positions, notably Austria (0.6% of GDP), the Netherlands (1.1%) and the UK (1.3%).

Higher nominal deficits are only partly due to the economic cycle

At first sight, these developments compare relatively favourably with previous economic downturns when deficits reached much higher levels and debt ratios entered rapidly increasing trajectories. In addition, governments have not pursued fine-tuning policies and while fiscal policies were slightly looser, monetary conditions have eased thanks mainly to low real interest rates.

[1] See also the report by the Commission services on “Public Finances in EMU 2003”, SEC ……..

[2] European Commission Spring 2003 forecast, 2004 figures are based on the assumption of no policy change.

However, a closer consideration of underlying budgetary trends reveals that the deterioration in nominal deficits also results from high and rising cyclically-adjusted deficits in several countries. This indicates a discretionary loosening of the fiscal stance by some Member States over the past two years, brought about by a combination of unfunded tax cuts, discretionary expenditure increases and failures as regards budgetary execution. While the outcome of the euro area in 2002 was unchanged compared to 2001, it should be noted that the cyclically-adjusted budget balance for 2001 has recently been revised upwards to 2.1% of GDP from 1.5% of GDP, implying that the deterioration in the underlying budget balance in that year was considerably worse than earlier estimates showed: moreover, the cyclically-adjusted budget balance includes the impact of one-off budgetary measures which only have a transitory effect on budget positions. The deterioration has been particularly pronounced in Germany (where the CAB increased to 3.2% of GDP in 2002) and France (to 3.3%). In Italy, it remains high at 2.1% of GDP.

In a medium-term perspective, the latest updates of the stability and convergence programmes contain a target by most Member States to reach budget positions of 'close to balance or in surplus' by 2005 or 2006. However, it should be noted that the medium-term targets of Member States are based on growth assumptions, which in light of developments in recent months now appear to be optimistic. In countries where large cyclically adjusted deficits remain, the time frame for reaching the ‘close to balance or in surplus’ objective has been pushed back to 2006 or 2007: even this date will only be met if additional consolidation measures are undertaken.

Commission proposals to strengthen the co-ordination of budgetary policies

The deterioration in budget positions has placed considerable stress on the EU’s framework for fiscal surveillance and three Member States have been placed in excessive deficit positions. In response to these developments, and in line with a mandate from the Barcelona European Council conclusions, the Commission adopted a Communication on strengthening the co-ordination of budgetary policies.[3] It identified a number of shortcomings with the implementation of the SGP in the first four years of EMU and outlined a strategy based on Member States reassuming political ownership of the Pact. *Inter alia,* it called for more account to be taken of underlying economic conditions when assessing budgetary positions, an interpretation of compliance with SGP requirements that would (depending on country specific circumstances) cater for the budgetary impact of reforms that enhance growth and employment, increasing the emphasis placed on the sustainability of public finances and outstanding debt positions, and improving the implementation of the SGP including stricter and more timely recourse to the existing enforcement instruments. At the same time the Commission adopted proposals to improve the governance of budgetary statistics which provide the foundations for effective surveillance.

The European Council of March 2003 endorsed key conclusions of the ECOFIN Council

The Spring European Council of March 2003, endorsed a report of the (ECOFIN) Council which shared many of the Commission’s proposals on strengthening the co-ordination of budgetary policies. It confirmed that the achievement of a budget position of 'close to balance or in surplus' is in the economic self-interest of Member States both individually and collectively. In the short run, it provides room for the automatic stabilisers to operate freely and cushion the effect of economic shocks; in the medium-run it creates room for budgetary manoeuvre to either cut taxes or divert expenditures to more productive items such as

[3] Communication from the Commission “Strengthening the co-ordination of budgetary policies”, COM (2002)668 final of 27 November 2002.

investment and R&D; in the long-run, compliance will help Member States meet the budgetary costs of ageing population while securing adequate and accessible pensions and health care.

In addition to re-stating their commitment to the goal of the SGP, the Council agreed that compliance with the 'close to balance or in surplus’ requirement should be assessed in cyclically-adjusted terms with due account taken of one-off budgetary measures which only have a transitory impact on budget positions. For euro-area countries, agreement was reached that Member States with deficits should achieve an annual improvement in the cyclically-adjusted budget deficit of at least 0.5% of GDP until the 'close to balance or in surplus' requirement is reached. It underlined the need for automatic stabilisers to operate symmetrically over the economic cycle and the particular importance of avoiding a pro-cyclical loosening of fiscal policies in good times. The Council also confirmed the importance of running down public debt at a satisfactory pace towards the 60% of GDP reference value and that the existing provisions of the Treaty (i.e. the debt criterion of the excessive deficit procedure) can contribute to achieving this goal.

An opportunity to ensure consistent and transparent budgetary strategies

To ensure that the agreement of the European Council represents a real progress towards a consistent and transparent implementation of SGP, it is essential that the policy guidelines endorsed by the European Council, and the specific budgetary commitments given by Member States in their updated stability and convergence programme, are respected.

To this end, policies adopted at national level need to respect the budgetary goals agreed at EU level In doing so, budgetary consolidation strategies need to be designed in a way that tackle, and not exacerbate structural weaknesses leading to slow growth and missed employment opportunities. This requires careful design as regards the balance between measures on the revenue and expenditure side, and choices on the composition of public expenditures. Contrary to what is often argued, the existing framework for budgetary surveillance can simultaneously achieve a consistent approach that balances the need for budgetary consolidation, re-igniting the recovery and strengthening growth potential.

Significant advances have been made in the framework for budgetary surveillance

This year’s report on *Public finances in EMU –2003* highlights three areas where substantial progress has been made in the framework for budgetary surveillance over the past year: (i) the integration of candidate countries into the EU’s fiscal surveillance framework, (ii) an increased focus on the sustainability of public finances, and (iii), an improvement in the governance of budgetary statistics. These advances show that tangible progress can be made to the benefit of Member States and the EU as whole when there is a political will to do so. It also shows that framework for budgetary surveillance is capable of evolving in light of growing experience and new policy challenges.

Integrating acceding and candidate countries into the EU's fiscal surveillance framework

With ten countries set to join the EU in 2004, a major policy challenge is to prepare for their integration into the EU economic policy framework, in particular for budgetary surveillance. A key requirement has been to develop reliable government accounts and economic forecasts on a par with existing EU countries. At the same time, the EU surveillance of budgetary developments needs to develop so that appropriate account is taken of the important structural and institutional changes underway in accession countries. These are partly due to the completion of the transition from a command to a market economy and partly due to the additional effects which EU membership will entail (associated with the need to upgrade public infrastructure and the commitment to implement the *acquis communautaire*).

Clear strides have been taken in recent years, although budgetary data are still neither fully comparable across countries nor completely in line with EU definitions. Data reported by the candidate countries and forecasts prepared by the Commission services indicate that budgetary developments are closely mirroring those in the EU, with nominal and cyclically adjusted budget deficits in 2002 rising in most countries. Looking ahead to 2003 and 2004, the Commission forecast of Spring 2003 envisages an improvement in the budgetary balances of nine countries, with marked deficit reductions forecasted in Hungary, Slovakia and Turkey, and to a more limited extent in Malta. However, very limited improvements in budget balances are projected in the Czech Republic, Poland and Cyprus.

An important step to integrate the candidate countries into the existing surveillance process was completed in November 2002, when the second set of Pre-accession Economic Programmes (PEPs) submitted by candidate countries were examined. The annual programmes outline the medium-term policy framework, including public finance objectives and structural reform priorities, and moreover provide an opportunity for candidate countries to develop their institutional and analytical capacity. The 2002 updates revealed an improved effort to develop a consistent and credible medium-term macroeconomic framework, although further analytical capacity building is called for.

The sustainability of public finances received increased prominence in the assessment of sustainability and convergence programmes.

Progress has also been made as regards placing increased emphasis on the sustainability of public finances in the SGP as requested by the 2001 Stockholm European Council. For the second time, an assessment of the sustainability of public finances was carried out on the basis of budgetary targets and measures announced in the 2002 updates to stability and convergence programmes leading to firm policy conclusions by the Council. The policy conclusions, which are based on quantitative indicators and long-run budgetary projections prepared by the Economic Policy Committee and national authorities, are worrying.

Even assuming all Member States achieve the budget targets for 2006 set down in their stability or convergence programmes, there is a risk of unsustainable public finances emerging in about half of EU Member States, especially Belgium, Germany, Greece, Spain, France, Italy, Austria and Portugal. To ensure sustainable public finances, Member States with deficits first need to achieve and sustain the SGP goal of budget positions of 'close to balance or in surplus'. Furthermore, preliminary estimates by the Commission show that an additional permanent budgetary adjustment of between 1 and 2 percentage points of GDP is needed in Member States where the sustainability of public finances is a concern. To close this financing gap, governments should try to avoid raising taxes (especially on labour), and concentrate efforts on reducing (in terms of ratio to GDP) age-related expenditure by reforming of pension and health care systems and/or reducing non-age related primary spending while increasing employment rates and fostering growth.

Progress has been made on the governance of budgetary statistics

The quality of economic statistics is crucial to ensure an adequate understanding of the economic situation and effective policy making. Budgetary statistics are the foundation of the EU fiscal surveillance tools and their quality has improved considerably over the last decade. Government accounts are now more reliable, complete, transparent and detailed, and are published in a much more timely fashion than when the excessive deficit procedure was set up. However, some weaknesses remain: in several countries, data on government deficit and debt ratios are not yet as reliable as they should be and are subject to large revisions. Furthermore, the government accounts of several Member States are not fully transparent, and there have been problems in terms of their timely submission. These concerns are clearly amplified with the perspective of enlargement.

To address outstanding challenges, the (ECOFIN) Council recently agreed to implement a code of best practice.[4] From the Member States' side, this involves increasing the transparency of government accounts in particular for the lower government subsectors, the strict respect of deadlines, an overall increase in the data quality, but also a clarification of the independence statute of the national statistical offices as the main compilers of government data. The Commission (Eurostat) is aiming at reinforcing its ability to scrutinise the Member States' government accounts in more detail, and accelerating the decision making process for deciding upon the recording of government transactions. The new steps to compile quarterly budgetary statistics is a major challenge for statisticians, but also for economists, policy-makers and budgetary policy analysts that will need to interpret quarterly data with due care, since these will necessarily be more volatile and perhaps less transparent than annual data.

The Commission role in upgrading the analysis of economic and budgetary policies

In its Communication on strengthening the co-ordination of budgetary policies, the Commission committed itself to upgrading the analysis of economic and budgetary policies. To this end, a number of detailed studies are contained in the report *Public finances in EMU – 2003* as follows:

- firstly, the report examines the impact of budgetary consolidation on growth. It considers whether the assertion that budgetary consolidation has a negative impact on output is always valid, or whether fiscal consolidations in EMU under certain conditions can have a positive effect on output;

- secondly, and as part of the effort to focus on the quality of public finances, the report analyses public investment. It examines the reasons why public investment as share of GDP has fallen in recent decades and whether this is in part due the process of budgetary consolidation and the development of fiscal rules at EU level. It also analyses the link between public investment and productivity, and considers the merits and feasibility of developing specific provisions for public investment within the EU's framework for budgetary surveillance; and,

- a third chapter examines various aspects of the challenge facing national authorities in ensuring sound public finances. It reviews the experience of Member States in using expenditures rules as an instrument to better manage public finances and improve their quality. In addition, the chapter examines how the allocation of public finance functions

[4] Conclusions of the 2485th Council meeting, Economic and Financial Affairs, Brussels 18 February 2003.

across different levels of governments influences the capacity of Member States to fulfil their budgetary commitments at EU level. This analysis is a good example of the role of the Commission in undertaking comparative cross-country analyses that enable Member States to learn from the experiences and best practices of other countries.

Is fiscal consolidation always contractionary?

While there is a broad consensus among both academics and policy-makers on the need for fiscal discipline to ensure the smooth functioning of EMU and provide conditions conducive to growth and employment creation, concerns have been expressed that budgetary consolidation could have a negative effect on output in the short run. This issue is relevant given the need for several Member States to reduce large cyclically-adjusted budget deficits, especially against the current background of slow economic growth.

An empirical analysis of the experiences of EU Member States, however, demonstrates that roughly half of the episodes of fiscal consolidation undertaken in the past three decades have been accompanied by an acceleration in economic growth. These findings appear to be consistent with theories that identify a positive impact of budgetary consolidation on consumer expectations of lower taxes in the future inducing them to raise their consumption plans, and/or on business expectations of higher profitability enabling them to raise investment. Confidence factors may play a more prominent role in the future in light of large unfunded pension liabilities.

Simulations using the QUEST model confirm that if appropriately designed, budgetary consolidation can contribute significantly to the goal of Lisbon strategy in terms of raising output and employment in the medium-term. Budgetary consolidation have a slight contractionary effect on output in the short run, depending on the composition of the budgetary adjustment. However, budgetary consolidation has a positive impact on output in the medium-run if it takes place in the form of expenditure retrenchment rather than tax increases. Moreover, the effect of budgetary consolidation on output could be reinforced, and even positive, in the short-run if fiscal consolidation is combined with structural reform of factor and product markets and accompanied with an accommodating monetary stance. Indeed, budgetary consolidation often acts as a catalyst for structural reforms.

Public investment

Public investment as a share of GDP has fallen in most industrialised countries in recent decades. It has been claimed that the budgetary requirements of the Treaty and SGP result in public investment expenditures being at excessively low levels, and that a sustained growth in public investment expenditures would improve the EU's growth potential. However, an analysis shows that the decline in public investment rates is a long-run tendency that started already in the 1970's, and affected all industrialised countries and not just EU Member States. Declining levels of public investment as a share of GDP have been attributed to factors such as increased levels of economic development (with developed countries already having a high stock of physical capital and the emphasis switching towards investment in human capital[5]) and the changing boundaries between public and private investment (in part linked to the process of privatisation). Some of the decline in public investment levels appears to be related to efforts to consolidate public finances, which was necessary irrespective of EMU. A careful analysis of the data, however, fails to show any clear-cut link between change in investment

[5] Communication from the Commission *'Investing efficiently in education and training: an imperative for Europe*", COM(2002)779

ratios and the provisions of the EU's framework for fiscal surveillance. Indeed public investment expenditures in many Member States have stopped falling after the beginning of monetary union.

Public investment can make an important contribution to meet the output and employment goals of the Lisbon strategy. However, in considering the links between public investment and growth, it is important to focus on net as opposed to gross investment levels (i.e. taking account of the depreciation of the existing capital stock) and also the interaction between trends in public and private investment level. Existing studies reveal that public investment has a positive impact on output and productivity, although the results are not very strong. This is explained by the fact that only a fraction of public investment expenditures are devoted to projects which aim at directly raising productivity (e.g. investment in transport infrastructure), whereas a significant proportion of public investment is devoted to projects that pursue other objectives such as environmental protection or redistribution across regions, which have an indirect contribution to productivity .

The important role of public investment is recognised in the existing framework for budgetary surveillance: for example, Member States are required to specify planned public investment levels in their annual updates to stability and convergence programmes and the BEPGs frequently recommend that an increased share of public expenditures be devoted to productive items. In brief, the budget balance requirements of Treaty and SGP are compatible with a high share of public spending being devoted to public investment. The recent Commission Communication on strengthening the co-ordination of budgetary polices sought to cater for the budgetary impact of large investment projects while at the same time respecting the commitment to sound and sustainable public finances[6].

Several calls have been made to introduce a so-called golden rule into the SGP, which would allow governments to borrow to finance investment. However, there are strong theoretical and practical arguments against its introduction, especially in a framework of multilateral surveillance such as the SGP. First, a golden rule based on a national accounts system could lead to a bias in expenditure decisions in favour of physical capital and against spending on human capital (education, training) or other productive items (health care, R&D) which also contribute to growth and employment. Secondly, if applied to gross investment, depending on the specific design and implementation of the reform, the adoption of a golden rule into the SGP framework may imply substantially higher deficits, thus compromising the objective of sustainability of public finances. Finally, the relevant concept for the application of the golden rule would be net investment. However, it is not always possible to compute reliable, comparable and timely data on this type of investment.

There is a growing practice of financing public purpose investment projects through public-private partnerships (PPPs). A large share of the PPPs in the EU finance infrastructure and supplement public investment.[7] The main implication for public finances of choosing PPPs as opposed to traditional public investment is in fact that of converting up-front fixed expenditures into a stream of future obligations. This practice has a sound microeconomic rationale in that it can lead to increased efficiency without compromising public objectives. It is important however to avoid recourse to PPPs where this is solely motivated by a desire to bypass budgetary constraints. by putting capital spending outside government budgets. This

[6] The Council has shown some flexibility in interpreting compliance with the "close to balance or in surplus" requirement to reflect significant planned increases in public investment programmes.

[7] Also see Communication from the Commission "*Developing the trans-European transport network: innovative funding solutions : interoperatibility of electronic toll collection systems*", COM(2003)132 of 24 April 2003.

could lead to PPP projects which entail higher overall costs, which would not be in line with the objective of sustainable public finances. Efforts are also required to ensure transparency in national accounts.

Efforts at national level to meet EU budgetary requirements: expenditure rules and fiscal relations across different levels of governments

Many Member States in recent years have introduced expenditure rules as a means to improve the management of their public finances, mostly in the form of *ex-ante* targets rather than binding legal obligations. National expenditure rules can enable Member States to meet the budget balance requirements of the Treaty and SGP by helping them to better control expenditure items that are subject to overruns. The specific design and the strength of the enforcement mechanisms are key to their effectiveness. Depending on their design, they can also contribute to other policy objectives such as avoiding a pro-cyclical loosening of fiscal policy in good times, and improving the quality of the composition of public spending.

There is a great deal of variety in the design of expenditure rules across EU Member States, as regards the the types of expenditure covered by a rule, the time frame involved and the robustness of surveillance and enforcement mechanisms. Preliminary empirical analysis indicates that the existing expenditure rules have not had a visible impact on trends in public spending. However, judging compliance with expenditure rules is difficult as in many cases they cover several years and are subject to revisions. In some countries, expenditure rules are not ambitious enough and adherence with them is easily reached: in other cases, the rule has been adjusted or abandoned if it is perceived as being too ambitious. Overall, even a relatively weak expenditure rule can provide useful guidance and signals to actors involved in the budgetary process.

The Treaty and SGP requirements are defined in terms of the budget balance of the general government (i.e. central and local/state governments and social security), although the specific budget targets in stability and convergence programmes are set by the central government. The challenge in meeting EU budgetary requirements is therefore affected by the way in which Member States allocate fiscal functions (both revenues and expenditures) across different levels of government. This is especially the case in federal countries and the Member States where local authorities have considerable budgetary autonomy. The contribution of sub-central authorities to the overall budget position is changing in a number of countries in light of efforts to devolve certain public functions to regional/local authorities.

The direct contribution of lower levels of government to the general government deficit is generally limited since all Member States apply restrictions to local government borrowing: the exception is Germany, where net borrowing by local and state governments accounts for nearly half of the general government budget deficit in 2002. However, it should be borne in mind that *de facto* central government often have to bear the cost of financing difficulties that emerge at sub-central level. To help comply with the EU's fiscal rules, the federal Member States and Italy and Spain have recently introduced arrangements that aim at co-ordinating the budgetary position across levels of government (usually referred to as national stability pacts). More experience with the implementation of these arrangements is needed before conclusions can be drawn on their effectiveness in contributing to the objectives of the EU fiscal framework. *A priori*, a strong legal base and enforcement mechanism would be expected to contribute to the credibility and effectiveness of the arrangements.

The process of decentralising responsibility for some policies raises a second issue in the context of EMU, namely the operation of automatic stabilisers. Experience shows that in general systems are designed to shield sub-national governments from cyclical variations. However, empirical evidence for the US and Germany suggests some degree of pro-cyclical behaviour at the level of the States. Further research would be useful to analyse the possible interaction between fiscal decentralisation and automatic stabilisation and to identify the best practices to reconcile the process of decentralisation with ensuring sound and sustainable public finances

18/2004 - 11 February 2004

New decision of Eurostat on deficit and debt

Treatment of public-private partnerships

Eurostat, the Statistical Office of the European Communities, has taken a decision on the accounting treatment in national accounts of contracts undertaken by government units in the framework of partnerships with non-government units. The decision specifies the impact on government deficit/surplus and debt. It results from work undertaken in 2003 in cooperation with experts from European countries and different international bodies.

The decision is in line with the European System of Accounts (ESA95), and is consistent with the opinion of the Committee on Monetary, Financial and Balance of Payments Statistics (CMFB), as described in the annex.

Eurostat recommends that the assets involved in a public-private partnership should be classified as non-government assets, and therefore recorded off balance sheet for government, if both of the following conditions are met:

1. the private partner bears the construction risk, and
2. the private partner bears at least one of either availability or demand risk.

If the construction risk is borne by government, or if the private partner bears only the construction risk and no other risks, the assets are classified as government assets. This has important consequences for government finances, both for the deficit and the debt. The initial capital expenditure relating to the assets will be recorded as government fixed capital formation, with a negative impact on government deficit/surplus. As a counterpart of this government expenditure, government debt will increase in the form of an “imputed loan” from the partner, which is part of the “Maastricht debt” concept. The regular payments made by government to the partner will have an impact on government deficit/surplus only for the part relating to purchases of services and “imputed interest”.

Why is Eurostat taking this decision now?

Public partnerships with private units have been observed for a long time in EU Member States. Such arrangements take various forms, including concessions which normally do not raise difficulties as regards their treatment in national accounts. Recently however, new kinds of arrangements have been made in a few Member States, and a significant increase in these arrangements is expected for various reasons such as efforts to increase efficiency of public expenditure and to improve the quality of public services. Moreover, the European Growth Initiative, approved by the European Council in December 2003, sets as one of its objectives to promote the use of such partnerships, notably in order to develop growth-related infrastructures.

As the Statistical Authority of the Commission, Eurostat does not examine the motives, rationale and efficiency of these partnerships, but has to provide clear guidance on their treatment in national accounts, as regards their impact on data for the general government sector. Furthermore, an important part of Eurostat’s mission is to ensure homogeneity of government statistics in all Member States, including the 10 Acceding Countries, under ESA95, such that deficit and debt figures are fully comparable.

Which partnerships does this decision cover?

The decision will apply to long-term contracts in areas of activity where government normally has a strong involvement. These contracts often (but not always) correspond to what is referred to as “Public-private partnerships”, concluded with one or several partners, directly or through a special entity set up on purpose, and possessing expertise in the content of the contract over its lifetime. An important feature is that the contract mentions both the output of some specifically-designed assets, needing an initial capital expenditure, and the delivery of agreed services, requiring the use of these assets and according to given quality and volume standards. This decision applies only in cases where government is the main purchaser of the services supplied by the partner, whether the demand originates directly from government itself or from third party users (as seen notably for health and education services, and the use of some transport infrastructures).

What is the key issue relating to public-private partnerships as regards their treatment in national accounts?

The key issue is the advance classification of the assets involved in the partnership contract - either as government assets or recorded in the balance sheet of the partner. In national accounts, the assets involved in a public-private partnership can be considered as non-government assets only if there is strong evidence that the partner is bearing most of the risk attached to the specific partnership. Therefore, this analysis of risks borne by the contractual parties is the core element of the assessment of a partnership project, as regards classification of the assets involved in the contract, in order to ensure the correct accounting of the impact on the government deficit of public-private partnerships.

However, this assessment does not consider risks that are not closely related to the asset and can be fully separated from the main contract, as is the case where part of the contract might be periodically renegotiated, and subject to performance and penalty payments that do not significantly depend on the condition of the main assets.

What is the Eurostat analysis of risk in partnerships?

Many risks may be observed in practice in such arrangements. The wording used may be in addition diverse and confusing. This is why, for the purpose of this decision, Eurostat has selected three main categories of “generic” risks. Therefore, “bearing a risk” for one party means that this party bears the majority of the risk.

A first category is “construction risk” covering notably events like late delivery, non-respect of specified standards, additional costs, technical deficiency, and external negative effects. Government’s obligation to start making regular payments to a partner without taking into account the effective state of the assets would be evidence that government bears the majority of the construction risks.

A second category is “availability risk” where the responsibility of the partner is quite obvious. It may not be in a position to deliver the volume that was contractually agreed or to meet safety or public certification standards relating to the provision of services to final users, as specified in the contract. It also applies where the partner does not meet the required quality standards relating to the delivery of the service, as stated in the contract, and resulting from an evident lack of “performance” of the partner. Government will be assumed not to bear such risk if it is entitled to reduce significantly (as a kind of penalty) its periodic payments, like any “normal customer” could require in a commercial contract. Government payments must depend on the effective degree of availability supplied by the partner during a given period of time. Application of the penalties where the partner is defaulting on its service obligations should be automatic and should also have a significant effect on the partner’s revenue/profit, and must not be purely "cosmetic" or symbolic.

A third category is “demand risk” covering variability of demand (higher or lower than expected when the contract was signed) irrespective of the behaviour (management) of the private partner. This risk should only cover a shift of demand not resulting from inadequate or low quality of the services provided by the partner or any action that changes the quantity/quality of services provided. Instead, it should result from other factors, such as the business cycle, new market trends, direct competition or technological obsolescence. Government will be assumed to bear the risk where it is obliged to ensure a given level of payment to the partner independently of the effective level of demand expressed by the final user, rendering irrelevant the fluctuations in level of demand on the partner’s profitability. However, this statement does not apply where the shift in demand results from an obvious government action, such as decisions of units of general government (and thus not just the unit(s) directly involved in the contract) that represent a significant policy change, or the development of directly competing infrastructure built under government mandate.

How will the decision be implemented in practice?

The analysis of the risks in such partnerships will be carried out in all Member States and Acceding Countries (as this decision is applicable for the next notification on 1 March 2004), under the responsibility of the National Statistical Offices.

Eurostat is of the opinion that information about such risks can easily be obtained by statisticians and that the burden of the different risks is generally identifiable in the contracts. Eurostat is also of the opinion that the assessment of risk according to the process described above would allow for a straightforward classification of the assets either “on” or “off” government balance sheet in most cases.

However, it may happen in some cases that the risk analysis, as mentioned above, might not give clear conclusions (for instance if at least for two categories the share in risk may be estimated as balanced or based on very fragile hypotheses). In these cases, some additional elements in a partnership contract should also be taken into consideration. Apart from an analysis of the nature of the partners (notably in specific cases where the partner is a public corporation), the importance of government financing, the effect of government guarantees or provisions relating to the final allocation of the assets could be in some cases appropriate supplementary criteria.

In this respect, if the assets remain the property of the partner at the end of the project, and if they still have a significant economic value, then it is normally classified on the partner's balance sheet. This also includes contracts where government has merely an option to buy the asset at the current market value. On the other hand, if government has a firm obligation to acquire the assets at the end of the contract at a pre-determined price that does not reflect the economic value of the assets at that time (such as expected on the basis of conservative hypothesis at the time the contract was signed), or has paid for the right to acquire the assets throughout the contract through regular payments that were higher than they would have been without that right, then there can be a reason to record the assets as government assets if the other tests do not give a clear answer.

Finally, Eurostat considers that this decision is not in contradiction with the usual business approach to such issues. In any case, specific and complex borderline cases should be closely examined according to the agreed procedure, including at a first stage the assistance of Eurostat.

CMFB opinion
on the treatment in national accounts of assets related to “public-private partnerships” contracts

The CMFB Chairman, with the assistance of the Executive Body, invited the CMFB Members on 23 December 2003 to give an opinion on the above-mentioned subject. Fourteen (14) national statistical institutes and thirteen (13) national central banks from the Member States returned the questionnaire. A total of twenty-seven (27) national institutions thus participated in the consultation. The ECB also provided a reply.

The result of the consultation was the following:

On the question: *Do you agree that PPP assets should be considered as non-government assets if there is strong evidence that the non-government partner bears most of the risk, according to the assessment of risks proposed in the guidance note?*

Twenty-six **(26)** national institutions responded **Yes**, among which three **(3)** asked for minor corrections to the numerical examples and three **(3)** requested clarifications on some parts of the guidance note. One **(1)** national institution answered **No**.

Accordingly, the CMFB endorses the guidance note of 23 December 2003 relating to the classification of assets in the context of "Public-Private Partnerships". The CMFB recommends that the suggested clarifications should be incorporated in a revised version of the ESA 95 Manual on Government Debt and Deficit, in so far as they do not change the substance.

In addition to this opinion, a document summarising the replies and all the original answers from the CMFB Members have been transmitted to Eurostat and will be kept in the records of the CMFB secretariat.

PPP Global Summit – The 6th Annual Government-Industry Forum on Public Private-Partnership

Copenhagen, 17 November 2005

Introduction

Ladies and Gentlemen,

It is a pleasure to be here with you today, to talk about PPPs – Public-Private Partnerships. From my point of view the timing of this conference could not be better: Two days ago, the Commission adopted a Communication on PPPs and Community Law on Public Procurement and Concessions. This Communication sets out the Commission's views on future policy to make public authorities choose their private partners for PPPs on a more competitive basis than is done today.

Now is an opportunity to inform you of the main content of this Communication which will be the subject of a press conference in Brussels later this morning.

Background

As far as I am concerned, in the field of public procurement there is enormous untapped potential across Europe, not least in some of the Member States that are struggling most with their public sector deficits.

Improved public procurement practices and procedures and more effective and timely enforcement of existing rules are, I hope, going to have a major role to play in coming years in terms of contributing to the resolution of public sector financing problems that will inevitably become more acute as demographics shift in a direction that makes higher State dependency levels inevitable.

I am currently giving thought to how – aside from planned legislative and communication initiatives – we might be able to “get more bang for our buck” on the public procurement side – by, for example, speedier and more rigorous enforcement procedures. I am also looking to ensure we are applying the appropriate resources in the public procurement enforcement and policy areas where significant further added value may be had.

Public Private Partnerships have, as you know, been developed in several areas of the public sector and are widely used within the EU, in particular in transport, public health, public safety, waste management and water distribution. In times of tight public budgets their importance for the European Economy can hardly be underestimated.

For new Member states whose economies are not well developed, value for money in public procurement is key – especially for key infrastructure projects that are vital for sustained economic development.

But in the more advanced economies, maintaining a state of the art infrastructure is also key to sustaining competitive advantage.

For Germany alone, between now and 2010, investment of the order of 700 billion is needed for maintenance and renovation of the transport infrastructure and for municipal construction. The contribution PPPs can make in this context becomes apparent when we consider that in the UK up to 20% of public financing is provided by PPPs.

Value for money in the context of PPPs can obviously best be achieved if private partners are chosen on the basis of fair competition. Widescale public consultation – launched by a Green Paper adopted by the Commission in April 2004 – showed, however, that fair competition is not guaranteed throughout the Community at present.

The reported reasons for the dissatisfaction of stakeholders with the status quo are manifold and certainly not limited to areas where the European Community has the final say. Some issues raised in this context – and certainly not the least important ones – do, however, concern my area of responsibility. Stakeholders participating in the discussion argued that the regulatory framework at EU level governing the choice of private partners for PPPs is incomplete or lacks clarity.

I can give you concrete examples of the issues at stake.

Concessions

Take the case of a public authority in a Member State looking for a company to maintain and operate a motorway. In practice, the company doing this job is usually interested in the right to exploit the service provided – in the case of motorways we are talking about the revenues from the tolls levied for using the motorway – rather than in direct payment from the contracting authority to the private party. As you know, such contracts where the contractor bears much of the operational and financial risk inherent in the management and use of the facility are called "concessions".

At present, a public authority is obliged only to apply the broad principles of the EC Treaty, specifically, transparency, non discrimination and proportionality when awarding a service concession – whether for operating a road, a prison, a waste management facility, or a hospital. These general principles leave, however, many questions open when it comes to awarding service concessions. Similarly, the award of works concessions, granted for building infrastructure or other public facilities, is basically governed by the EC Treaty principles. Only a few detailed provisions of secondary Community legislation exist for works concessions.

I wasn't surprised that in the course of the PPP Green Paper consultation many stakeholders complained about the lack of legal certainty as regards the rules applicable to the choice of private parties for concessions.

Respondents highlighted major difficulties faced when disputing the legality of allegedly discriminatory award decisions before national courts on the basis of general EC Treaty principles. They argued, with good justification, that these principles are not detailed enough to effectively assist parties discriminated against. Thus, to obtain legal certainty in this area in particular, practitioners have asked for a clear, self contained set of rules which govern the award of PPP concessions.

Other respondents highlighted the need for a clearer line to be drawn between concessions and other public contracts. A potential lack of clarity is unacceptable as under current law quite different legal rules apply depending on whether a PPP is a concession or a public contract: As I said, the award of concessions is mainly governed by EC Treaty principles. In contrast, public contracts are subject to the detailed rules of the public procurement directives.

The uncertainty as to what set of rules apply to the award of a given PPP can clearly become an obstacle to effective competition in the area of concessions. This can limit the potential for private project financing in times of tight public budgets. The estimated investment to upgrade the infrastructure within the ten new Member States to the standard of infrastructure in the EU 15 is about 500 billion euros. So it is hardly surprising that in the consultation these new Member States in particular expressed their interest in a stable and clearer Community framework for the award of concessions. In the absence of Community rules, some of them have launched national legislative procedures on this issue.

The fact that this has simply added to the existing patchwork quilt of applicable rules is not particularly helpful in terms of developing a coherent framework in the context of an integrated internal market in this area.

So it is clear – and has been confirmed by the PPP consultation that a legislative initiative at EC level is required. This should provide a stable legal framework for the establishment of PPPs.

I intend, however, to intervene and propose legislative measures in this area only when I am absolutely certain that this will be the best way to achieve our policy objectives. We will thus look more closely into the costs and benefits of such binding initiatives as well as alternative measures to address the problems at stake. Based on the results of this Impact Assessment – probably at the end of next year – we will decide whether or not the balance between benefits and costs justifies a legislative initiative on the award of concessions.

Institutionalised PPPs

I will give you another practical example of the problems we are facing in the context of PPPs and public procurement law.

In one particular case, a municipality decided to establish a public company to take care of a waste management scheme which had been performed up to then by the municipality's own departments. This public company obtained the contract without a competitive tendering procedure. At that stage of the procedure this direct award appeared to be legitimate: it could be argued that the municipality wanted to do the job through its wholly owned public company quasi in-house – thus as if its own departments did the job.

However, this “outsourcing” to the public company was not the end of the story. A few months after the establishment of the public company and the direct award of the task of waste management to that public company, a private undertaking bought 49% of the shares of this initially 100% public company. This private undertaking thus became responsible for waste management operations within the geographical area of the municipality.

Is this type of procedure, which does not involve a competitive award procedure, the magic formula for outsourcing public tasks? I don't think so. I believe this way of organising the performance of services of general interest does not conform to EC law and I am content that the European Court of Justice shared our view – I am in fact describing one case of the municipality of Mödling in Austria, which was decided by the European Court of Justice just a few days ago.

Against this background, one question to emerge from consultation on the PPP Green Paper was whether and how the Commission could clarify the application of EC public procurement rules to the described outsourcing of public tasks, which involves the creation of public service undertakings held jointly by both a public and a private partner. These arrangements are referred to as "Institutionalised PPPs".

A clear majority of stakeholders participating in the PPP Green Paper consultation are not satisfied with the current practice of creating Institutionalised PPPs. It is too cosy an arrangement. The consultation indicated, however, that legislation is not the preferred way of moving forward in this area. There appears to be a general view that the Commission should provide clarity by means of a non-legislative interpretative document and they want this as a matter of urgency.

They have signalled to the Commission that public authorities are reluctant to enter into innovative PPPs involving the establishment of mixed capital companies, in order to avoid the risk of establishing companies which might turn out to be non-compliant with EC law later on. Those of you who are familiar with the legislative process at EC level will understand that a relatively quick response to the problems at hand could be provided by an interpretative document of this kind rather than by way of fully-fledged legislation. In most Member States the establishment of public-private entities to perform services of general economic interest is a rather new and innovative concept. A non-binding initiative in this area should provide the required guidance without stifling innovation but would also leave space for a legislative initiative further down the road.

Some final remarks

To conclude, consultation on the PPP Green Paper has highlighted various problems in applying EC public procurement law to the choice of private partners for PPPs. Many of these problems result from uncertainty about what rules are applicable. We are aware that such uncertainties might be an obstacle to the development of the PPPs we need for the private financing of infrastructure and services of general interest. There is, however, no one size fits all solution to the problems in question. A legislative initiative is likely to be necessary for the award of concessions, while non-binding guidance might be sufficient to clarify what rules apply in other areas, such as the establishment of Institutionalised PPPs.

Ladies and Gentlemen, developing or clarifying EC rules in this area is obviously not a goal in itself. The prime objective of any Community initiative in this area is to provide the public and the private side with legal certainty to facilitate a framework within which PPPs can work most efficiently.

I have little doubt that as economic pressures intensify and as pressures on Member State governments intensify in terms of containing their spiralling public sector deficits and delivering value for money to the taxpayer, public pressure for efficient and innovative solutions towards the procurement of public services will also intensify. It is a very unusual citizen who likes paying taxes. But there can be no citizen who enjoys paying a huge chunk of his hard earned money every month to a government that fails to use it efficiently or to deliver the best services and infrastructure at the most economical cost. That’s why good public procurement policy is important – economically and politically. That’s why too I am determined to make progress in this area. I am not satisfied with the status quo. I have had my spotlight more intensely on other areas of my portfolio over the past year but now I intend shining it a little more intensely on public procurement - not least on fast, vigorous, and effective enforcement of the powers we already have. Maybe I will tread on a few toes in the process. But as I said last week in a different context, I didn’t come to Brussels to tiptoe around in my slippers.

Thank you very much for your attention and may I wish you success with the rest of the conference.

IP/05/1440

Brussels, 17 November 2005

Public procurement: Commission proposes clarification of EU rules on public-private partnerships

The European Commission has published a Communication with new policy options on Public-Private Partnerships (PPPs). The Communication follows a major public consultation which was launched by the PPP Green Paper in April 2004 (IP/04/593). The Commission will clarify how EU rules should apply to the choice of private partners in "institutionalised PPPs", which are public-service undertakings held jointly by both a public and a private partner. The Commission will also assess whether to propose a legislative initiative on concessions, to clarify both the term 'concessions' and the rules applicable to their award.

Internal Market and Services Commissioner Charlie McCreevy said: *"PPPs are vital to investment in Europe's infrastructure and public services. But to reap the full benefits of these partnerships and ensure value for money for taxpayers, we need transparency and fair competition in the selection of private partners. The goal towards which we strive is to provide transparent and non-discriminatory conditions that will enable private entities to contribute to setting up infrastructures and provide services throughout the EU in a way that delivers best value for taxpayers. We have now listened to all the views expressed during the consultation, which show a strong demand for further Commission action."*

A key aim of the 2004 consultation was to find out how the rules and principles work in practice and to see if they are clear enough and if they suit the challenges and characteristics of PPPs. The options are presented with a view to ensuring effective competition for PPPs without unduly limiting the flexibility needed to design innovative and often complex projects.

Institutionalised PPPs

Many respondents to the PPP Green Paper asked how EU rules should apply to the choice of private partners in "institutionalised PPPs" (IPPPs), which are public-service undertakings held jointly by both a public and a private partner. Overall, it appears at present that an Interpretative Communication would be better suited to this demand than fully-fledged legislation. This Interpretative Communication should be published during 2006.

Concessions

A clear majority of participants in the consultation supported an EU initiative, legislative or non-legislative, on concessions, in order to clarify both the term 'concessions' and the rules applicable to their award. Having carefully considered all arguments and the factual information provided by stakeholders it appears that a legislative initiative is at present the preferable option.

However, the final decision on whether or not to take such a measure, and on its concrete shape, depends on further in-depth analysis, including an Impact Assessment, which will be carried out in 2006.

Background

Public-private partnerships (PPPs) are forms of cooperation between public authorities and businesses, which aim to carry out infrastructure projects or providing services for the public. These arrangements which typically involve complex legal and financial arrangements involving private operators and public authorities have been developed in several areas of the public sector and are widely used within the EU, in particular in transport, public health, public safety, waste management and water distribution.

4.5. Assessing the results and evaluating performance 18

4.6. Reviewing sectoral policies 19

4.7. Reflecting our internal policies in our international trade policy 20

4.8. Promoting services of general interest in development co-operation 21

ANNEX

1. INTRODUCTION

In recent years, the role of the European Union in shaping the future of services of general interest[1] has been at the centre of the debate on the European model of society. Recognising the crucial importance of well-functioning, accessible, affordable and high-quality services of general interest for the quality of life of European citizens, the environment and the competitiveness of European enterprises, the European Commission adopted a Green Paper on services of general interest,[2] which launched a broad public consultation on how best to promote the provision of high-quality services of general interest in the European Union. The Green Paper invited comments on the overall role of the European Union in defining the public service objectives pursued by services of general interest and on the way these services are organised, financed and evaluated.

The debate launched by the Green Paper met with considerable interest and was welcomed by many interested parties. The Commission received close to 300 contributions from a wide variety of respondents, including many of the Member States[3]. Commission staff have prepared a Report on the public consultation which analyses the contributions submitted and provides background material to the present White Paper[4].

In line with the request made by the European Parliament in its Resolution on the Green Paper of 14 January 2004[5], the Commission draws its conclusions from the debate in the present White Paper.

The European Economic and Social Committee[6] and the Committee of the Regions[7] have also discussed the issues raised by the Green Paper and given their views.

In addition, services of general interest were also the subject of intense debate within the Convention on the future of Europe.

Finally, the Court of Justice has also examined various questions related to services of general economic interest, in particular with regard to their financing, and handed down a landmark decision on public service compensation[8].

The debate has revealed considerable differences of views and perspectives. Nevertheless, a consensus seems to have emerged on the need to ensure the harmonious combination of market mechanisms and public service missions.

[8] Judgment of 24 July 2003 in the case C-280/00 Altmark Trans

Services of general interest and the context in which they are provided, including the European Union itself, are constantly evolving and will continue to evolve. By submitting this White Paper, the Commission does not intend to conclude the debate that has developed at European level. Its aim is to make a contribution to the ongoing discussion and to take it further by defining the Union's role and a framework that allows these services to function properly.

The White Paper sets out the Commission's approach in developing a positive role for the European Union in fostering the development of high-quality services of general interest and presents the main elements of a strategy aimed at ensuring that all citizens and enterprises in the Union have access to high-quality and affordable services. The document focuses on just some of the key issues of the debate as it would be impossible to address all the issues raised during the public consultation. More specific issues will be addressed in the context of the relevant policies.

2. A SHARED RESPONSIBILITY OF PUBLIC AUTHORITY IN THE UNION

The public discussion on the Green Paper has shown that there is broad agreement on the importance of high-quality services of general interest for European societies. The division of tasks and powers between the Union and the Member States leads to a shared responsibility of the Union and the public authorities in the Member States but detailed definition of services to be provided and delivery of those services remain the responsibility of the Member States..

2.1. An essential component of the European model

The debate on the Green Paper has strongly confirmed the importance of services of general interest as one of the pillars of the European model of society. In spite of sometimes substantial differences in the views and perspectives of the various participants in the debate, the consultation has shown a broad consensus on the need to ensure the provision of high-quality and affordable services of general interest to all citizens and enterprises in the European Union. It has also confirmed the existence of a common concept of services of general interest in the Union. This concept reflects Community values and goals and is based on a set of common elements, including: universal service, continuity, quality of service, affordability, as well as user and consumer protection.

In the Union, services of general interest remain essential for ensuring social and territorial cohesion and for the competitiveness of the European economy. Citizens and businesses rightly expect to have access to affordable high-quality services of general interest throughout the European Union. For the citizens of the Union, this access is an essential component of European citizenship and necessary in order to allow them to fully enjoy their fundamental rights. For enterprises, the availability of high-quality services of general interest is an indispensable prerequisite for a competitive business environment. The provision of high quality, accessible and affordable services of general interest meeting the needs of consumers and enterprises is therefore an important element contributing to reach the strategic goal of the Union "to become the most competitive and dynamic knowledge-based economy in the world capable of sustainable economic growth with more and better jobs and greater social cohesion[9]".

As the Commission highlighted in the Green Paper, services of general interest have helped to achieve the Union's objectives in a large number of Community policies. At the same time, Community policies have significantly contributed to improving the quality, choice and efficiency of a number of services of general interest.

In line with the principles set out in Article 16 of the Treaty[10] and in Article 36 of the Charter of Fundamental Rights,[11] the Commission is committed to taking full account of the specific role of services of general interest in the policies and activities falling within its sphere of competence. It will aim to ensure that the European Union continues to make a positive contribution to the development of services of general interest as part of the European model, while respecting the diversity of traditions, structures and situations that exists in the Member States. In line with the principles of better regulation[12], the prior assessment of the impact of major initiatives[13] as well as the regular evaluation of the relevant Community policies will assist in achieving this objective.

At this crucial point in the development of the Union, particular attention will have to be paid to developments in the new Member States and to their specific needs resulting in particular from the transformation of their economies during the last two decades.

2.2. A responsibility for public authorities

While the provision of services of general interest can be organised in cooperation with the private sector or be entrusted to private or public undertakings, the definition of public service obligations and missions remains a task for the public authorities at the relevant level. The relevant public authorities are also responsible for market regulation and for ensuring that operators accomplish the public service missions entrusted to them.

It was stressed in the consultation on the Green Paper that within the framework of a competitive internal market the relevant public authorities must retain the powers to ensure that defined public policy objectives are effectively being achieved and that democratic choices are respected, including with regard to the level of quality and the resulting costs. It is necessary for the relevant public authorities to have adequate instruments and expertise at their disposal. The existing sector-specific Community

[9] Lisbon European Council of 23 and 24 March 2000, Presidency conclusions, paragraph 5. See http://europa.eu.int/comm/lisbon_strategy/intro_en.html for detail

[10] Article 16 reads: "*Without prejudice to Articles 73, 86 and 87, and given the place occupied by services of general economic interest in the shared values of the Union as well as their role in promoting social and territorial cohesion, the Community and the Member States, each within their respective powers and within the scope of application of this Treaty, shall take care that such services operate on the basis of principles and conditions which enable them to fulfil their missions*"

[11] Article 36 reads: "*The Union recognises and respects access to services of general economic interest as provided for in national laws and practices, in accordance with the Treaty establishing the European Community, in order to promote the social and territorial cohesion of the Union*"

[12] European Governance: Better lawmaking, Communication from the Commission, COM(2002) 275 final, 5.6.2002

[13] Commission Communication on Impact Assessment, COM(2002) 276, 5.6.2002

rules provide for specific legal instruments and powers that allow the authorities of the Member States to enforce public policy objectives. Above all, Member States should pay attention to the increasingly complex tasks of the regulatory authorities and provide them with all necessary instruments and resources.

2.3. A shared responsibility of the Union and its Member States

In its Green Paper, the Commission already stated that the Treaty provides the Community with a whole range of means to ensure that users have access to high-quality and affordable services of general interest in the European Union. Nevertheless, it is primarily for the relevant national, regional and local authorities to define, organise, finance and monitor services of general interest.

This shared responsibility is the concept underlying the provision of Article 16 of the EC Treaty that confers responsibility upon the Community and the Member States to ensure, each within their respective powers, that their policies enable operators of services of general economic interest to fulfil their missions. The right of the Member States to assign specific public service obligations to economic operators and to ensure compliance is also implicitly recognised in Article 86(2) of the EC Treaty[14].

In the debate on the Green Paper there was broad agreement that it was not necessary to bestow the Community with additional powers in the area of services of general interest. In principle, the Commission agrees with this analysis. It is of the opinion that the powers currently conferred on the Community with regard to services of general interest are appropriate and sufficient in order to ensure that well-functioning services can be maintained and developed throughout the Union.

At the same time, the Commission welcomes the amendment of the provisions of the current Article 16 EC Treaty as proposed by the European Convention in Article III-6 of the draft Constitutional Treaty. Article III-6 reads:

"Without prejudice to Articles III-55, III-56 and III-136, and given the place occupied by services of general economic interest as services to which all in the Union attribute value as well as their role in promoting social and territorial cohesion, the Union and the Member States, each within their respective powers and within the scope of application of the Constitution, shall take care that such services operate on the basis of principles and conditions, in particular economic and financial, which enable them to fulfil their missions. European laws shall define these principles and conditions."

Once the Constitutional Treaty has entered into force, this provision will provide an additional legal basis for Community action in the field of services of general economic interest, within the powers of the Union and within the scope of application of the Constitution.

[14] Article 86 (2) provides: "*Undertakings entrusted with the operation of services of general economic interest ... shall be subject to the rules contained in this Treaty, in particular to the rules on competition, insofar as the application of such rules does not obstruct the performance, in law or in fact, of the particular tasks assigned to them. The development of trade must not be affected to such an extent as would be contrary to the interests of the Community*"

3. Guiding principles of the Commission's approach

The Commission's approach is based on a number of principles which are reflected in the Community's sectoral policies and can be clarified on the basis of the results of the debate on the Green Paper:

3.1. Enabling public authorities to operate close to the citizens

In the consultation it was highlighted that services of general interest should be organised and regulated as closely as possible to the citizens and that the principle of subsidiarity must be strictly respected.

The Commission respects the essential role of the Member States and of regional and local authorities in the area of services of general interest. This role is reflected in the Community's policies on services of general interest, which are based on various degrees of action and the use of different instruments in line with the principle of subsidiarity.

As in the past, the Commission intends, whenever required, to make proposals for sector-specific regulation only in areas that, like the large network industries, have a clear Europe-wide dimension and present a strong case for defining a European concept of general interest. Such Community regulation defines, as a general rule, only a regulatory framework that can be implemented and specified by the Member States, taking into account country-specific situations.

3.2. Achieving public service objectives within competitive open markets

On the basis of the consultation, the Commission remains of the view that the objectives of an open and competitive internal market and of developing high-quality, accessible and affordable services of general interest are compatible. Indeed, the creation of an internal market has significantly contributed to an improvement in efficiency, making a number of services of general interest more affordable. In addition, it has led to an increase in choice of services offered, as it is particularly visible in the telecommunications and transport sectors[15].

However, in certain situations, the achievement of a national public policy objective may need to be co-ordinated with certain Community objectives. At the level of the Treaty, these situations are addressed by Article 86(2), which provides that services of general economic interest are not subject to the application of Treaty rules to the extent that this is necessary to allow them to fulfil their general interest mission. This means that, under the EC Treaty and subject to the conditions set out in Article 86(2), the effective performance of a general interest task prevails, in case of tension, over the application of Treaty rules[16]. Thus, missions are protected rather than the way they are fulfilled. The Treaty provision therefore allows the reconciliation of the pursuit and achievement of public policy objectives with the competitive objectives

[15] A detailed assessment will be provided in the forthcoming Commission staff working document "Evolution of the performance of network industries providing services of general interest – Report 2004"

[16] The application of Article 86(2) is explained in detail in the Commission Communication on Services of general interest in Europe, OJ C 17, 19.1.2001, p. 4

of the European Union as a whole, in particular the need to ensure a level playing field for all providers and the best use of public money.

3.3. *Ensuring cohesion and universal access*

The access of all citizens and enterprises to affordable high-quality services of general interest throughout the territory of the Member States is essential for the promotion of social and territorial cohesion in the European Union, including the reduction of handicaps caused by the lack of accessibility of the outermost regions. The Commission is committed to promoting and improving an effective universal access to services of general interest across all its policies.

In this context, universal service is a key concept the Community has developed in order to ensure effective accessibility of essential services[17]. It establishes the right of everyone to access certain services considered as essential and imposes obligations on service providers to offer defined services according to specified conditions, including complete territorial coverage and at an affordable price. Universal service is a dynamic and flexible concept and has proven to be an effective safety net provision for those who could otherwise not buy essential services for themselves. It can be redefined periodically in order to be adapted to the social, economic and technological environment. The concept allows common principles to be defined at Community level and the implementation of these principles to be left to the Member States, thus making it possible to take account of specific situations in each country, in line with the principle of subsidiarity.

In the framework of its structural policies the Community helps to prevent vulnerable social groups or regions from being excluded from access to essential services[18]. The structural funds can be used to co-finance investments in network infrastructures, subject to certain criteria[19]. In addition, the Commission's policy in the area of trans-European networks is improving access to transport, energy and communications networks in the more remote areas and will assist in linking the new Member States with the infrastructure of the Fifteen, thus maintaining a high level of quality, security and safety. In its European Growth Initiative, the Commission has set out an ambitious programme for the implementation of priority cross-border projects in the area of transport, energy and broadband communications networks[20].

3.4. *Maintaining a high level of quality, security and safety*

The public consultation highlighted that it was crucial to ensure high levels of quality, security and safety. The Commission agrees that all citizens and users should be provided with services of general interest of a high quality. Also, the physical safety of consumers and users, of all persons involved in the production and provision of these services, and of the general public must be guaranteed, including

[17] See Green Paper on services of general interest, COM(2003) 270, 21.5.2003, paragraphs 50 to 54

[18] A new partnership for cohesion, Third report on economic and social cohesion, COM(2004) 107, 18.2.2004

[19] See for instance, Commission Staff Working Paper : Guidelines on Criteria and Modalities of Implementation of Structural Funds in Support of Electronic Communications, SEC(2003) 895

[20] Communication from the Commission, A European Initiative for Growth, Investing in Networks and Knowledge for Growth and Jobs, Final Report to the European Council, 11.11.2003, COM(2003) 690 final

the protection against possible threats such as terrorist attacks and environmental catastrophes. Furthermore, the security of service provision, and in particular the security of supply, constitutes an essential requirement which needs to be reflected when defining service missions. The conditions under which services are supplied also have to provide operators with sufficient incentives to maintain adequate levels of long-term investment. Quality and security of supply entail an economic cost to society which should be sufficiently and transparently balanced against expected benefits.

In line with the Union's policy on sustainable development, due consideration has to be taken also of the role of services of general interest for the protection of the environment and of the specific characteristics of services of general interest directly related to the environmental field, such as the water and waste sectors.

The Commission takes full account of these requirements and will ensure that Community policies contribute to and facilitate maintaining quality, safety and security standards. It will monitor progress in particular in its regular evaluations and sectoral reports.

3.5. Ensuring consumer and user rights

The consultation on the Green Paper has shown that there is broad agreement that the provision of services of general interest must be organised in such a way that a high level of consumer and user rights is ensured. The Commission intends to base its policies on the principles identified in the Green Paper and in the Commission Communication on services of general interest in Europe of September 2000[21].

These include in particular the access to services, including to cross-border services, throughout the territory of the Union and for all groups of the population, affordability of services, including special schemes for persons with low income, physical safety, security and reliability, continuity, high quality, choice, transparency and access to information from providers and regulators.

The implementation of these principles generally requires the existence of independent regulators with clearly defined powers and duties. These include powers of sanction (means to monitor the transposition and enforcement of universal service provisions) and should include provisions for the representation and active participation of consumers and users in the definition and the evaluation of services, the availability of appropriate redress and compensation mechanisms and the existence of an evolutionary clause allowing requirements to be adapted in accordance with changing user and consumer needs and concerns, and with changes in the economic and technological environment. Regulators should also monitor market developments and provide data for evaluation purposes.

3.6. Monitoring and evaluating the performance

On the basis of the public consultation, the Commission remains convinced that systematic evaluation and monitoring is a vital instrument for maintaining and developing high-quality, accessible, affordable and efficient services of general

[21] COM(2000) 580, 20.9.2000, OJ C 17, 19.1.2001. See in particular paragraphs 8 to 13

interest in the European Union. The Commission recognises the particular responsibility of the Community institutions, with the help of data provided at national level, in the evaluation of services that are subject to a sector-specific regulatory framework established by the Community. However, an evaluation at Community level could be also considered in other areas if it can be established in specific cases that such an evaluation would create added value.

In line with the prevailing view expressed in the public consultation, the Commission considers that any evaluation should be multi-dimensional and cover all relevant legal, economic, social and environmental aspects. In any case, any evaluation will have to take due account of the specific characteristics of the sector evaluated and of the different situations that exist in the different Member States and their regions. It should be based on the periodic provision of comparable data by Member States and/or national regulators.

3.7. Respecting diversity of services and situations

The consultation has also highlighted the differences between various services of general interest and the different needs and preferences of users and consumers resulting from different economic, social, geographical or cultural situations. In addition, it was stressed that the personal nature of many social and health services leads to requirements that are significantly different from those in the network industries. As regards broadcasting, the importance of public service broadcasting for the democratic, social and cultural needs of each society must be taken into consideration[22]. The Commission supports these views.

Any Community policy in the area of services of general interest must take due account of the diversity that characterises different services of general interest and the situations in which they are provided. However, this does not mean that it is not necessary to ensure the consistency of the Community's approach across different sectors or that the development of common concepts that can be applied in several sectors cannot be useful.

In this context, it should be noted that the Commission proposal for a Directive on services in the Internal Market[23] only covers services that correspond to an economic activity. It does not cover non-economic services of general interest but only services of general economic interest. Furthermore, in this proposal, certain activities which may be considered by Member States as services of general economic interest are excluded from the scope of the proposal such as transport or are subject to derogations from the country of origin principle, such as postal services and electricity, gas and water distribution services. More important, the proposal does neither require the Member States to open up services of general economic interest to competition nor does it interfere with the way they are financed or organised.

3.8. Increasing transparency

The principle of transparency is a key concept for the development and implementation of public policies regarding services of general interest. It ensures

[22] See also the Protocol on the system of public broadcasting in the Member States annexed to the EC Treaty by the Treaty of Amsterdam

[23] COM(2004) 2, 13.1.2004

that public authorities can exercise their responsibilities and that democratic choices can be made and are respected. The principle should apply to all aspects of the delivery process and cover the definition of public service missions, the organisation, financing and regulation of services, as well as their production and evaluation, including complaint-handling mechanisms.

The application of Community law has already contributed to improving the transparency of the provision of services of general interest in the Union. The Commission is committed to working towards further increasing the transparency of service provision in all its policies relating to services of general interest. Member States should also guarantee full transparency in the implementation of Community legislation and in other relevant national provisions.

3.9. Providing legal certainty

In the consultation on the Green Paper the point was made that in certain areas the application of Community rules to services of general interest was not sufficiently clear. The application of state aid rules to the financing of services of general interest and the rules on procurement and service concessions were frequently highlighted specifically. Also, the situation of social and health services was mentioned.

The Commission is aware that the application of Community law to services of general interest might raise complex issues. It will therefore make a continuous effort to improve legal certainty regarding the application of Community law to the provision of services of general interest, without prejudice to the case law of the European Court of Justice and the Court of First Instance. As set out below, it has already accomplished the modernisation of the existing public procurement rules and launched initiatives in the area of state aid and with regard to public-private partnerships[24].

4. NEW ORIENTATIONS FOR A COHERENT POLICY

4.1. Respecting diversity in a coherent framework

One of the key questions raised by the Green Paper concerned the need for a framework directive on services of general interest. The views expressed on the subject in the public consultation remained divided, a number of Member States and the European Parliament being sceptical on the issue. As a result, it remained doubtful whether a framework directive would be the most appropriate way forward at this stage. Furthermore, in the consultation, the added value of a horizontal framework as compared to the sector-specific approach followed so far has not been demonstrated.

The Commission therefore considers appropriate not to proceed to submitting a proposal at this point in time but to re-examine the issue at a later stage. As part of this examination, the Commission would subject any legislative proposals to a prior

[24] See sections 4.2 and 4.3 below

extended impact assessment of its economic, social and environmental implications [25].

As regards the calendar for such re-examination account may also be taken of the fact that the future entry into force of the Constitutional Treaty and of the proposed Article III-6 of the Constitution will bring another possible legal basis that would complement those already existing. The Commission considers appropriate to re-examine the issue once the Constitutional Treaty is in force.

For the time being, the Commission will, as a general rule, pursue and develop its sectoral approach by proposing, where necessary and appropriate, sector-specific rules that allow account to be taken of the specific requirements and situations in each sector. However, without prejudice to existing sector-specific Community rules, a horizontal approach will be considered with regard to a number of specific issues, such as consumers' interests, the monitoring and evaluation of services of general interest, the application of state aid rules to financial compensation or the use of structural funds for the support of services of general interest.

While the need for a framework instrument was an issue of considerable controversy, the necessity of ensuring the consistency and coherence of Community measures in the area of services of general interest was widely recognised in the public consultation. At the same time, it was stressed that it was essential for Community policies to respect and take account of the different characteristics of different services and of the diverse realities in the Member States.

The Commission will step up its efforts to ensure full consistency of the Community's policies in the area of services of general interest and will look at full coherence of its sectoral policies with regard to its general approach during the forthcoming reviews of the sectors concerned[26].

In addition, the Commission will review the situation of services of general interest in the European Union and the need for any horizontal measures in 2005. It intends to submit a report on its findings to the European Parliament, to the Council, to the European Economic and Social Committee and to the Committee of the Regions before the end of 2005.

The Commission

- **will re-examine the feasibility of and the need for a framework law for services of general interest on the entry into force of the Constitutional Treaty,**
- **will launch a review of the situation of services of general interest and submit a report before the end of 2005.**

The Member States

- **should pursue the modernisation of services of general interest at their level in order to ensure that all citizens have access to quality services adapted to their needs and requirements.**

[25] Commission Communication on Impact assessment, COM(2002) 276 final, 5.6.2002

[26] See Annex 2

4.2. Clarifying and simplifying the legal framework for the compensation of public service obligations

There are in particular two areas – financing and awarding of contracts - where the Member States' discretion to define and design the missions of services of general interest usually interact with Community law. The present section deals with financing. The issue of public procurement will be addressed in section 4.3.

The principle of the Member States' autonomy to make policy choices regarding services of general economic interest equally applies with regard to financing the latter. Indeed, Member States enjoy a wide margin of discretion when deciding whether and in what way to finance the provision of services of general economic interest. The financing mechanisms applied by Member States include direct financial support through the State budget, special or exclusive rights, contributions by market participants, tariff averaging and solidarity-based financing. As a general rule, Member States can choose which financing mechanism is used. In the absence of Community harmonisation, the main limit to this discretion is the requirement that such financing mechanism must not distort competition within the common market. It is for the Commission, as the guardian of the Treaty, to ensure that this rule is respected to the benefit of taxpayers and the economy at large.

However, the practical application of this rule is at times a complex matter. It has not always been clear, for example, under what conditions compensation for services of general economic interest would actually constitute state aid. Likewise, once the existence of state aid was established there might have been some uncertainty as to the conditions under which such aid could be considered compatible with the common market. And finally, the obligation under the Treaty to formally inform the Commission about plans to grant or alter aid creates an administrative burden which may be out of proportion for relatively modest amounts of aid.

The public consultation has confirmed the demand for greater legal certainty and predictability when it comes to the application of the state aid rules to public service compensation. This call was particularly strong at local level, concerning local services. It is true that the Court of Justice has recently set out a number of conditions under which compensation for services of general economic interest does not constitute state aid[27]. But the need for increased legal certainty remains and it is for the Commission to bring about such certainty to the greatest extent possible. Therefore, the Commission proposes a number of initiatives.

The first proposed measure is a Commission decision that considers relatively small-scale public funding to undertakings entrusted with the operation of services of general economic interest to be compatible with the common market under certain conditions. Likewise, such funding should also be exempt from the obligation of prior notification, as long as it is proportionate to the actual costs of the services, and certain thresholds are not exceeded. The Commission proposes the same for funding of services of general economic interest provided by hospitals and social housing, irrespective of the amounts involved.

[27] Judgment of 24 July 2003 in the case C-280/00 Altmark Trans and judgment of 24 November 2003 in joined cases C-34/01 to 38/01 Enirisorse SpA

In essence, the Commission hereby seeks to exempt compensation to local providers of services of general economic interest from the obligation of prior notification. Once the thresholds are set in the light of the results of the currently ongoing consultation process, legal certainty for relatively small-scale public funding will be significantly increased.

In addition, the Commission also proposes to increase legal certainty for compensation for services of general economic interest which exceeds the above-mentioned thresholds – and thus will have to be notified to the Commission - by means of a Community framework that sets out the criteria for assessment of such compensation for services of general economic interest.

Furthermore, the Commission intends to amend Directive 80/723/EEC on the transparency of financial relations between Member States and public undertakings. The amendment will specify that the directive is applicable to public service compensations, whatever the legal qualification of these under Article 87 of the Treaty. Both the Commission decision and the Community framework will not be applicable to the transport sector[28].

Finally, the Commission plans to further clarify the conditions under which compensation can constitute state aid following the recent case law of the Court of Justice. As requested in a number of comments received in the public consultation on the Green Paper, this will also include a further clarification of the distinction between economic and non-economic activities[29].

Taken together, those measures that are elaborated on the basis of extensive consultations with interested parties are likely to ensure legal certainty and predictability for both operators and authorities to the greatest extent possible. The Commission will, moreover, continue its pragmatic approach when assessing compensation for public service obligations in order to ensure that high-quality, accessible and affordable services of general interest continue to be provided close to the citizens while respecting common basic rules.

[28] The decision may be applicable to certain maritime links to islands, on which annual traffic does not exceed a defined threshold

[29] For more detail see the Commission Communication on services of general interest in Europe, OJ C 17, 19.1.2001, p. 4 (paragraphs 28 to 30) and the Green Paper on services of general interest, COM(2003) 270, 21.5.2003, paragraphs 43 to 45

The Commission

- **will adopt a Decision on the application of Article 86 of the Treaty to state aid in the form of public service compensation granted to certain undertakings entrusted with the operation of services of general economic interest by July 2005,**
- **will adopt a Community framework for state aid in the form of public service compensation by July 2005,**
- **will adopt an amendment of Directive 80/723/EEC on the transparency of financial relations between Member States and public undertakings by July 2005,**
- **will further clarify under which conditions public service compensations may constitute state aid within the meaning of Article 87 (1) by July 2005.**

The Member States

- **should assist the Commission in applying the new legal framework, in particular by clearly defining public service obligations and by applying transparent rules on compensation.**

4.3. Providing a clear and transparent framework for the selection of undertakings entrusted with a service of general interest

In principle, Member States have a wide margin to decide how to organise services of general interest. In the absence of Community harmonisation, the relevant public authorities in the Member States are in principle free to decide whether to provide a service of general interest themselves or whether to entrust its provision to another (public or private) entity[30]. However, providers of services of general economic interest, including in-house service providers, are undertakings and therefore subject to the competition rules of the Treaty[31]. In practice, Member States increasingly use public-private schemes, including design-build-finance-operate contracts, concessions and the creation of mixed-economy companies to ensure the delivery of infrastructure projects or services of general interest.

In the public consultation, calls were made for clarity on a number of questions relating to the Community rules applicable to such schemes, and in particular on the scope and substance of the Community rules that public authorities may have to respect when they entrust a public service mission to another entity.

In order to clarify the rules applicable, the Community has undertaken an effort of simplification and clarification of the public procurement directives[32]. The new directives, adopted by the European Parliament and the Council last March, are due to be transposed by all Member States by January 2006 and should make it easier, for

[30] As regards local inland transport, the Commission has proposed legislation that would require Member States to use public service concessions. Cf. Amended proposal for a Regulation of the European Parliament and of the Council on action by Member States concerning public service requirements and the award of public service contracts in passenger transport by rail, road and inland waterway, OJ C 151 E, 25.6.2002, p. 146

[31] For detail see Green Paper on services of general interest, COM(2003) 270, 21.5.2003, paragraphs 79 to 83

[32] Directive 2004/18 of 31 March 2004 on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts and Directive 2004/17 of 31 March 2004 coordinating the procurement procedures of entities operating in the water, energy, transport and postal services sectors, OJ L 134, 30.4.2004, p. 1 and p. 114

all awarding authorities concerned, to comply with their obligations of transparency under the EC Treaty.

Furthermore, in order to establish whether Community legislation should be proposed in particular on the transparent award of service concessions by public authorities, and other forms of cooperation between the public and the private sector, the Commission has recently adopted a Green Paper on public-private partnerships in the European Union[33]. This Green Paper launches a broad consultation on the procurement aspects of public-private partnerships.

The Commission

- **will conduct a public consultation on the Green Paper on the procurement aspects of public-private partnerships ,**
- **will submit, where appropriate, on the basis of the results of the public consultation, proposals before the end of 2004.**

The Member States

- **should ensure that the national frameworks for the award of public service contracts are based on transparent and non-discriminatory rules.**

4.4. Recognising fully the general interest in social and health services

The Green Paper on services of general interest raised a considerable interest from interested parties in the area of social services, including health services, long term care, social security, employment services, and social housing. Social services of general interest have a specific role to play as an integral part of the European model of society. Based on the principle of solidarity, social and health services of general interest are person-centred and ensure that citizens can effectively enjoy their fundamental rights and a high level of social protection, and they strengthen social and territorial cohesion. Their provision, development and modernisation is fully in line with the achievement of the objectives set at the Lisbon European Council of March 2000, and in particular with the goal of achieving a positive link between economic, social and employment policies. The public consultation has shown that providers of social services are ready to engage in a modernisation process in order to better respond to changing needs of European citizens. However, they also expressed a need for greater clarity and predictability necessary to ensure a smooth evolution of social services, including health services.

While in principle the definition of the missions and objectives of social and health services is a competence of the Member States, Community rules may have an impact on the instruments for their delivery and financing. A clear recognition of the distinction between missions and instruments should help to create more clarity with a view to the modernisation of these services in a context of evolving user needs while preserving their specific nature in terms of the particular requirements of, amongst others, solidarity, voluntary service and the inclusion of vulnerable groups of people. Clarifying this distinction will in particular assist Member States which use market-based systems to deliver social and health services to anticipate the possible impact of EU competition law on them. It will of course remain a matter of

[33] Green Paper on public-private partnerships and on Community law on public contracts and concessions, COM(2004) 327, 30.4.2004

political choice for Member States whether to use such systems or to provide services directly via tax funded state agencies.

The Commission is of the view that it is useful to develop a systematic approach in order to identify and recognise the specific characteristics of social and health services of general interest and to clarify the framework in which they operate and can be modernised. This approach will be set out in a Communication on social services of general interest, including health services, to be adopted in the course of 2005.

This Communication will take stock of the Community policies that are related to the provision of social and health services of general interest. It will also describe the ways social and health services are organised and function in the Member States. This description will be prepared in close co-operation with the Member States[34] and with organisations from civil society.

The Communication would also set out, in line with the Commission's general principles on evaluation, a mechanism for a regular assessment and evaluation of the national frameworks for the provision of social services of general interest. The existing open methods of coordination in the field of social inclusion and social protection could be used to this effect. The Commission has recently proposed an open method of coordination in the field of health care and long term care which would usefully contribute to the exchange of best practices in the field of health services and support the reforms undertaken in the field[35].

The Commission is currently also working on the follow-up to the high-level reflection process on patient mobility and health care developments and has adopted a Communication in April 2004[36] which recalls the principles of the case law of the European Court of Justice and sets out a range of initiatives on subjects such as sharing spare capacity and cooperating on cross-border care identifying and networking European centres of reference and coordinating assessment of new health technologies. The accompanying Decision establishes a new High Level Group to facilitate cooperation among Member States in this area.

The Commission

- **will submit a Communication on social and health services of general interest in the course of 2005.**
- **will facilitate cooperation among Member States on health services and medical care in order to contribute to ensuring a high level of health protection throughout the Union.**

Member States

- **should improve cooperation on health services and medical care in order to ensure a high level of health protection throughout the Union.**

[34] In particular with the Social Protection Committee and the newly established « High level group on health services and medical care »

[35] Communication of the Commission on Modernising social protection for the development of high-quality, accessible and sustainable health care and long-term care: support fro the national strategies using the "open method of coordination", COM(2004) 304, 20.4.2004

[36] Communication from the Commission, Follow-up to the high-level reflection process on patient mobility and health care developments in the European Union, COM(2004) 301, 20.4.2004

4.5. Assessing the results and evaluating performance

The public consultation has confirmed the Commission's view that the evaluation of performance at Community as well as at national level is crucial for ensuring the development of high-quality, accessible and affordable services of general interest in a constantly evolving environment. Moreover, there was broad agreement among contributors that such evaluation should be based not only on criteria of economic efficiency but also on broader social, economic and environmental criteria.

In recent years, the Commission has indeed increased its evaluation efforts in the area of services of general interest. With regard to network industries, the Commission's evaluation strategy covers both sectoral and horizontal evaluations on a regular basis and involves the other European Union institutions and bodies as well as interested parties[37]. Given that the Commission started to perform horizontal evaluations in 2001, and will submit in 2004 its first horizontal evaluation report that is fully based on the methodology presented in 2002, it appears appropriate to gather more experience with this process before reflecting on additional evaluation mechanisms.

At the same time, there is room for improving the involvement of all parties concerned. The Commission will therefore consider how to amend the current methodology and procedures so as to ensure that all interested parties, including public authorities, consumers, users, providers and employees, are fully involved. It will also examine the need for any amendments with regard to assessing the impact of liberalisation on citizens, enterprises and employees.

Better integration should be considered between the current evaluation efforts specifically focusing on services of general interest and the Commission's more wide-ranging reporting tools. This would ensure a broader and more comprehensive approach to evaluating services of general interest and could thus generate genuine added value without increasing reporting requirements and statistics for the Community, Member States, undertakings and indeed citizens themselves.

In this context the link between, on the one hand, the above-mentioned sectoral and horizontal evaluations and, on the other, the "Implementation Package" – consisting of the Broad Economic Policy Guidelines Implementation Report, the Joint Employment Report and the Implementation Report on the Internal Market Strategy and submitted together with the Report to the Spring European Council is important and should be maintained.

In addition, the evaluation of services of general interest could usefully be integrated into the analysis made regularly by the Commission of several Community policies. This could be relevant in particular in the area of social and health services.

On the basis of its experience with the application of its amended methodology, the Commission will review its evaluation mechanisms, including their scope, when evaluating its approach in 2006 as provided for in its Communication of 18 June 2002. This review will also look into the need for additional measures aiming at

[37] For details see Communication from the Commission: A Methodological Note for the Horizontal Evaluation of Services of General Economic Interest, COM(2002)331 final, 18.6.2002

improving the availability and quality of data, the exchange of information and best practices, and the participation of interested parties.

The Commission

- **will submit its first horizontal evaluation on services of general interest on the basis of its evaluation methodology in 2004,**
- **will review its evaluation mechanisms for services of general interest in 2006.**

Member States

- **should assist the Commission in the development and application of evaluation mechanisms,**
- **should consider the development of evaluation instruments at national, regional and local level, where appropriate.**

4.6. Reviewing sectoral policies

Currently, sector-specific regulation at Community level covers essentially the big network industries such as telecommunications, postal services, transport and energy, which have a clear trans-European dimension. In the Commission's view, the public consultation has confirmed this approach. As far as the water sector is concerned, the Commission will publish before the end of the year the results of the assessment it has undertaken[38].

The public consultation has confirmed the relevance and importance of the set of obligations on which current sector-specific Community legislation is based and which are set out in the Green Paper (universal service, continuity, quality of service, affordability, user and consumer protection, safety and security, access and interconnectivity). Where appropriate, on the basis of the sectoral reviews foreseen, the Commission will propose to adapt these obligations.

Concerning media pluralism, the public consultation highlighted that, in the light of the differences that exist across the Member States, the issue should be left to the Member States at this point in time. The Commission concurs and concludes that at present it would not be appropriate to submit a Community initiative on pluralism. At the same time, the Commission will continue to closely monitor the situation.

As regards the institutional framework for regulation, the need for closer co-operation between the Commission and the national regulatory authorities was frequently highlighted. The Commission intends to encourage the creation and development of close co-operation between regulators in the framework of the existing networks of regulatory authorities[39]. Where appropriate, the Commission will make proposals with a view to strengthening the legal framework for this co-operation.

The Commission will take account of the positions set out above as well as any other results of the public consultation on the Green Paper in the reviews that are foreseen for the different sectors.

[38] Internal market strategy, Priorities 2003 - 2006, COM(2003)238, 7.5.2003

[39] See points 53 – 59 of the Annex to the Green Paper on services of general interest for details

The Commission

- **will encourage the co-operation of national regulatory authorities on the basis of networks of regulators,**
- **will take into account the results of the public consultation on the Green Paper in the reviews already foreseen for the different sectors, in particular:**
  - **the review of the scope of universal service in electronic communications by July 2005**
  - **the review of the electronic communications package by July 2006**
  - **the review of the postal services directive by the end of 2006**
  - **the review of the internal market for electricity by 1 January 2006**
  - **the review of the internal market for gas by 1 January 2006**
  - **the review of the "Television without frontiers" directive at the beginning of 2005**
  - **the assessment of the water sector by the end of 2004.**

(For more details see the non-exhaustive table in the Annex).

Member States

- **should ensure that existing sector-specific legislation is fully transposed and applied,**
- **should provide national regulatory authorities with all necessary instruments and resources.**
- **should assist the Commission in encouraging closer co-operation within the framework of networks of regulators.**

4.7. Reflecting our internal policies in our international trade policy

As the Commission has pointed out in the Green Paper, the Community commitments made in the context of the World Trade Organisation (WTO) or in the context of bilateral agreements, have been fully consistent with the internal market rules applying to these services and have not, to date, led to problems for the organisation, provision and financing of services of general interest in practice. The same applies to new commitments being offered in the framework of present negotiations.

The public consultation has shown that there is widespread desire to ensure the continued consistency between the internal Community regulatory framework and the obligations accepted by the Community and its Member States in the framework of international trade arrangements, in particular the WTO. There is a strong expectation that international trade agreements should not go beyond the positions agreed within the European Union.

In driving the Community's trade policy, the Commission is fully committed to ensure such consistency and counts on the support of the Member States and the European Parliament in this respect. To that effect, the Commission will continue to make full use of the institutional framework provided for by the Treaty (Articles 133 and 300) and to involve the European Parliament in the formulation of trade policy no matter its limited powers under that framework, while looking forward to the desired improvement of those powers under the draft Constitutional Treaty. The Commission will also continue to maintain a regular dialogue with civil society and to ensure the maximum degree of transparency in trade negotiations, of which the publication of the Community's initial offer in the present GATS negotiations is an example.

The Commission

- **will continue to ensure that the positions taken by the Community in international trade negotiations are fully consistent with the EU's internal regulatory framework regarding services of general interest.**

The Member States

- **should work with the Commission in order to ensure that internal policy positions are fully reflected in our trade policy.**

4.8. Promoting services of general interest in development co-operation

In the consultation on the Green Paper, the essential importance of basic services of general interest for the development of the poorest countries was widely recognised. It was highlighted that the absence of investment was a major obstacle to improving these services in the poorest countries. In line with the recommendations set out in the Commission Communication on the reform of state-owned enterprises in developing countries[40] the Commission intends to continue to assist in the creation of a sound regulatory and institutional framework in the developing countries as a key prerequisite for the promotion of investment in and access to finance for basic services of general interest.

The EU Initiatives on Water and Energy, launched at the World Summit on Sustainable Development have the objective to contribute to the achievement of the Millennium Development Goals through the provision of modern and affordable services to the poor. The initiatives involve Member States and stakeholders from civil society and the private sector, and is developed through a continued dialogue, based on the key principle of ownership, with partners in Africa and other regions, to initiate activities at national and regional levels. Both the Water and the Energy Initiative aim at institutional capacity building, cross-sectoral planning and market development, by means of targeted technical co-operation and an extended cooperation with financial institutions.

The Commission

- **will assist developing countries in creating a sound regulatory and institutional framework as a key prerequisite for the promotion of investment in and access to finance for basic services of general interest.**

[40] The Reform of State-Owned Enterprises in Developing Countries with focus on public utilities: The Need to Assess All the Options, Communication from the Commission, COM(2003) 326, 3.6.2003

ANNEX 1 Definition of Terms[41]

Terminological differences, semantic confusion and different traditions in the Member States have led to many misunderstandings in the discussion at European level. In the Member States different terms and definitions are used in the context of services of general interest, thus reflecting different historical, economic, cultural and political developments. Community terminology tries to take account of these differences.

Services of general interest

The term «*services of general interest*» cannot be found in the Treaty itself. It is derived in Community practice from the term «services of general economic interest», which is used in the Treaty. It is broader than the term «services of general economic interest» and covers both market and non-market services which the public authorities class as being of general interest and subject to specific public service obligations.

Services of general economic interest

The term «*services of general economic interest*» is used in Articles 16 and 86(2) of the Treaty. It is not defined in the Treaty or in secondary legislation. However, in Community practice there is broad agreement that the term refers to services of an economic nature which the Member States or the Community subject to specific public service obligations by virtue of a general interest criterion. The concept of services of general economic interest thus covers in particular certain services provided by the big network industries such as transport, postal services, energy and communications. However, the term also extends to any other economic activity subject to public service obligations.

Like the Green Paper, the White Paper focuses mainly, but not exclusively, on issues related to «services of general economic interest», as the Treaty itself focuses mainly on economic activities. The term «services of general interest» is used in the White Paper only where the text also refers to non-economic services or where it is not necessary to specify the economic or non-economic nature of the services concerned.

Public service

The terms «service of general interest» and «service of general economic interest» must not be confused with the term «*public service*». This term is less precise. It can have different meanings and can therefore lead to confusion. The term sometimes refers to the fact that a service is offered to the general public, it sometimes highlights that a service has been assigned a specific role in the public interest, and it sometimes refers to the ownership or status of the entity providing the service[42]. Therefore, this term will not be used in the White Paper.

[41] These definitions are based on the definitions used in the Green Paper on services of general interest, COM(2003)270, 21.5.2004

[42] There is often confusion between the term «public service» and the term «public sector». The term «public sector» covers all public administrations together with all enterprises controlled by public authorities

Public service obligations

The term «*public service obligations*» is used in the White Paper. It refers to specific requirements that are imposed by public authorities on the provider of the service in order to ensure that certain public interest objectives are met, for instance, in the matter of air, rail and road transport and energy. These obligations can be applied at Community, national or regional level.

Public undertaking

The term «*public undertaking*» is normally also used to define the ownership of the service provider. The Treaty provides for strict neutrality. It is irrelevant under Community law whether providers of services of general interest are public or private; they are subject to the same rights and obligations.

ANNEX 2: Main Results of the Public Consultation [43]

1. Importance of Services of general interest

- There is a broad consensus on the essential importance of services of general interest for European societies. It is also generally accepted that these services should be provided in a way that puts users first.

- No agreement exists concerning the relationship between services of general interest and market principles.

2. The role of the European Union

- While views differ on the need to amend the Treaty, there is broad agreement that the Community should not be given additional powers in the area of services of general interest.

- The responsibilities of the Community and the Member States seem to be clear. However, there are calls for the clarification of Community rules in some areas.

- Broad agreement exists that sector-specific regulation must not be extended to all services. However, for some services (water, waste, local public transport) diverging views are expressed as to whether a specific regulatory framework is desirable at Community level. The need to take account of specificities of sectors such as health is highlighted.

- There is a large consensus that there is no need for the creation of European regulatory authorities at this stage. Networks of national regulators co-ordinated at European level seem to be the preferred option.

3. Sector-specific legislation and general legal framework

- The views on the need for a general legislative framework remain divided. However, there is agreement on the continued need for sector-specific legislation.

- Many contributions highlight the benefits of existing sectoral policies. Others point out that liberalisation has had negative social and economic consequences.

4. Services of general economic interest and non-economic services

- Many contributors feel that the distinction is important. However, a number of contributions call for other criteria beyond the economic – non-economic distinction in order to create more legal certainty.

- While there is some interest in further clarification of the situation of organisations providing social services under Community law and in protecting non-economic services of general interest as part of the European social model, there is broad agreement that the Community should not be given additional powers in the area of non-economic services.

[43] The following points are based on the Commission Staff Working Paper, Report on the public consultation on the Green Paper on services of general interest, SEC (2004) 326, 15.3.2004

5. A common set of obligations

- Views are divided on the need and feasibility of establishing a common set of obligations at Community level. While some contributions stress the need to establish public service obligations sector-by-sector, other comments argue that a common concept is appropriate and necessary.

- There seems to be a broad consensus that regulation at Community level should establish principles and objectives, while Member States should be able to implement and specify the rules in line with the specific situations and needs existing at national and regional level.

- There is no agreement on the effective implementation of requirements in Community legislation or on the impact of these requirements on social and territorial cohesion. It is suggested that it is too early to form an opinion and that a more detailed assessment is necessary.

- Different views exist regarding the need to introduce additional obligations at Community level and the need to extend existing requirements to other services of general interest.

6. Sector-specific obligations

- There seems to be little support for the introduction at Community level of additional sector-specific obligations at this stage. However, it is suggested that the situation should be closely monitored with regard to the different sectors, in particular with regard to security of supply. There are also some calls for an improvement of access and interconnectivity in some sectors.

- No agreement exists with regard to the opening of the water sector at Community level.

- There is broad agreement that no specific Community measures should be taken on media pluralism at this stage and that the protection of pluralism should be left to the Member States.

7. Definition of obligations and choice of organisation

- Some contributions highlight problems resulting from the application, as perceived by respondents, of Community law, in particular in the areas of procurement and state aid. There is a call for clarification of the rules on concessions and public-private partnerships. Some comments also refer to situations where an obstacle to the completion of the internal market is created at national level.

- The comments largely agree that further harmonisation of public service obligations at Community level is not desirable.

- Many contributions express an interest in a flexible and non-bureaucratic exchange of best practice and benchmarking as regards the organisation of services of general interest.

8. Financing of services of general interest

- There is a firm call for clarification and simplification of the rules applying to the financing of services of general interest, in particular as regards state aid. The recent judgment of the ECJ in the Altmark case is seen as positive but not as sufficient.

- There is also a broad consensus that Member States must remain free to determine the most appropriate way of financing a service of general interest, provided competition is not unduly distorted.

9. The evaluation of services of general interest

- While there are different views on the ***overall*** importance of evaluation, there is a broad consensus that evaluation should be comprehensive and take account of political, social, economic and environmental criteria.

- No agreement exists as to the range of services to be subject to an evaluation or as regards the necessary procedural and institutional arrangements.

10. The international dimension

- There is a clear request to ensure that the positions taken by the Community in international trade negotiations are fully consistent with the EU's internal regulatory framework.

- A number of comments also call for more information and transparency as regards international trade negotiations.

- The crucial importance of basic essential services for the development of the poorest countries is widely recognised. Access to finance and the attraction of foreign investment are identified as the main problem.

ANNEX 3: OVERVIEW OF IMPORTANT SECTORAL REVIEWS

Electronic communications

- Review of the *e*Europe action plan by June 2004
- Review of the provisions on Cable TV networks of Commission Directive 2002/77/EC by the end of 2004
- Review of the scope of universal service under the Universal Service Directive 2002/22/EC by July 2005
- Review of the electronic communications package by July 2006

Postal Services

- Report on the application of the postal directive before the end of 2004, and then every two years
- Report by the end of 2006 based on a prospective study on the impact on universal service of full accomplishment of the internal postal market in 2009. Proposal confirming, if appropriate, the date of 2009 for full accomplishment of the internal postal market or determining any other step in the light of the study's conclusions

Electricity

- Annual Reports on the application of Directive 2003/54/EC, including every second year a report on public service obligations
- Detailed progress report on the creation of the internal market for electricity by 1 January 2006. Proposals to EP and Council, where appropriate, to guarantee high public service standards
- Report on the implementation of Regulation 1228/2003 on network access for crossborder exchanges in electricity by July 2006
- Proposals to EP and Council, where appropriate, to ensure full and effective independence of distribution system operators before 1 July 2007. When necessary, these proposals will also address issues of market dominance, market concentration and predatory or anti-competitive behaviour

Gas

- Annual Reports on the application of Directive 2003/55/EC, including every second year a report on public service obligations
- Detailed progress report on the creation of the internal market for gas by 1 January 2006. Proposals to EP and Council, where appropriate, to guarantee high public service standards
- Proposals to EP and Council, where appropriate, to ensure full and effective independence of distribution system operators before 1 July 2007. When necessary, these proposals will also address issues of market dominance, market concentration and predatory or anti-competitive behaviour

Water

- Presentation by the Commission of the results of its assessment of the water sector by the end of 2004

Transport

- 2004: Adoption by EP and Council of the second railways package currently in conciliation
- Adoption by EP and Council of the third railways package before the end of 2004
- Adoption by EP and Council of the proposed regulation on public service requirements and the award of public service contracts in passenger transport by rail, road, and inland waterway before the end of 2004

Broadcasting

- Report on the application of the “Television without frontiers” directive, if appropriate, accompanied by legislative proposals at the beginning of 2005

COMMISSION OF THE EUROPEAN COMMUNITIES

Brussels, 15.3.2004

COMMISSION STAFF WORKING PAPER

REPORT ON THE PUBLIC CONSULTATION ON THE GREEN PAPER ON SERVICES OF GENERAL INTEREST

COMMISSION STAFF WORKING PAPER

REPORT ON THE PUBLIC CONSULTATION ON THE GREEN PAPER ON SERVICES OF GENERAL INTEREST

TABLE OF CONTENTS

1. Introduction 4

2. The Consultation Procedure 5

3. Some General Observations on the Comments Received 6

3.1. A varied response reflecting a broad spectrum of interests and views 6

3.1.1. Contributions from all over Europe, many from Belgium, France, Germany, Austria 6

3.1.2. Contributions from a broad range of categories of respondents 7

3.2. The Green Paper was well received in general, but some remain sceptical 8

4. The main results of the public consultation 9

4.1. Consensus on the importance of services of general interest, but from different perspectives 9

4.2. The role of the Union in the area of services of general interest 9

4.2.1. Some calls for the inclusion of an objective in the Treaty, but no additional powers . 9

4.2.2. An interest in clarification of Community rules 10

4.2.3. No need to extend sector-specific regulation in general, but debate on some cases.. 10

4.2.4. No need for a European Regulator for now 11

4.3. Sector-specific legislation and general legal framework 12

4.3.1. The need for a framework instrument remains controversial 12

4.3.2. A few inconsistencies and diverging views on the impact of existing regulation 13

4.4. The distinction between economic and non-economic services 14

4.4.1. The importance of the distinction and its dynamic character are widely recognised 14

4.4.2. Calls for a wider definition of non-economic services 15

4.4.3. An interest in clarification of the situation of organisations providing social services15

4.4.4. Non-economic services: broad rejection of additional Community powers, but also calls for their protection as part of the European social model 16

4.5. A Common Set of Obligations 16

4.5.1. Diverging views on the utility of a common set of public service obligations 16

4.5.2. Some suggestions for the scope of public service obligations 17
4.5.3. Scepticism as regards the extension of requirements to other services 17
4.5.4. No detailed regulation at Community level 18
4.5.5. Call for an assessment of implementation and impact on cohesion........................... 18
4.6. Sector-specific obligations 20
4.6.1. In general, no need for additional sector-specific obligations, but some proposals .. 20
4.6.2. Little support for a Community initiative on media pluralism at this stage............... 21
4.7. Definition of Obligations and Choice of Organisation 22
4.7.1. Some concerns, in particular with regard to procurement and state aid 22
4.7.2. Some examples for obstacles to the internal market created at national level........... 23
4.7.3. No support for further harmonisation of public service obligations 23
4.7.4. A broad interest in a flexible exchange of best practice regarding the organisation of services 23
4.8. Financing... 24
4.8.1. A widespread request to clarify the rules on financing... 24
4.8.2. A call in support of the freedom of Member States to determine the mode of financing... 25
4.8.3. Different views on cream-skimming... 26
4.9. Evaluation 26
4.9.1. Diverging views on the scope of evaluation at Community level 26
4.9.2. Diverging views on procedural and institutional arrangements................................ 27
4.9.3. Evaluation should be multi-dimensional... 27

4.10.2. Development Co-operation Policy: basic public services are essential..................... 30
Annex 1: Summary Table of All Questions submitted for Discussion 32
Annex 2: List of Contributors 35

1. INTRODUCTION

On 21 May 2003, the Commission adopted a Green Paper on services of general interest.[1] In publishing this Green Paper, the Commission's aim was to stimulate a discussion on the promotion of the provision of high-quality public services in the European Union. The Green Paper therefore launched a broad public consultation on the overall role of the Union in defining the objectives of general interest pursued by those services and on the way they are organised, financed and evaluated. Thus, for the first time, the Commission initiated a full open review of its policies relating to services of general interest.

In line with the Commission's general principles and standards for the consultation of interested parties,[2] this report describes the consultation procedure and analyses the 281 contributions received in the public consultation.

The objective of the report is to reflect the wide range and diversity of ideas, opinions and suggestions made in the contributions received. Without claiming to be exhaustive, the report tries to identify, as objectively as possible, the main trends, views and concerns arising from the contributions. In order to ensure full transparency, the report is complemented by the publication on the Internet of the full text of the contributions received. This allows interested parties to examine the responses to the consultation in full detail.[3] Specific comments will also be taken into account in any Commission initiatives following from the Green Paper process.

The report is structured as follows: This introduction (1.) is followed by a short description of the consultation procedure (2.). A third section sets out some general observations on the contributions received. A fourth section summarises the positions set out in the comments. The structure of this section is based on the topics addressed by the questions put forward in the Green Paper. These questions are annexed to the report. A further Annex contains an alphabetic list of all contributors to the public consultation.

The document draws on a preliminary analysis of the contributions received which was prepared by a network of correspondents in all interested Directorates-General and Services of the Commission.

It should be noted that the purpose of this document is to report on the public consultation. It does not aim to draw political conclusions from the consultation process as such. Such conclusions are drawn in the follow-up to the Green Paper process, that the Commission will present in line with the request made by the European Parliament,[4] for which this report provides background material.

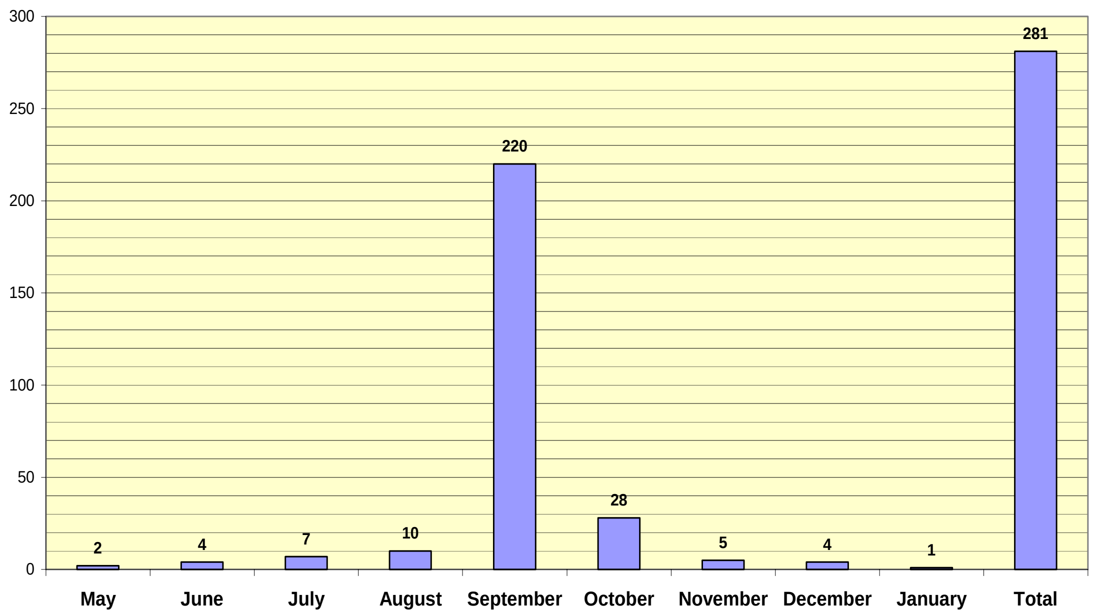
[4] European Parliament Resolution on the Green Paper on services of general interest, 14.01.2004 (T5-0018/2004)

2. THE CONSULTATION PROCEDURE

In order to structure the debate, the Green Paper of 21 May 2003 submitted thirty questions for public consultation[5] and invited all interested parties to submit any comments by 15 September 2003. This meant that the official consultation period was almost four months in length and considerably exceeded the minimum duration of eight weeks that the Commission established as a minimum standard for this type of consultation.[6]

Nevertheless, given the complexity of the issues addressed by the Green Paper, the Commission received a number of requests for an extension of the deadline for comments. Although the Commission did not agree to a formal extension of the consultation period, it informed interested parties that comments received after the deadline would also, as far as possible, be taken into account. In practice, the majority of comments received were sent towards the end of the consultation period or after the official consultation deadline. This report takes account of all comments received until the end of January 2004.

Monthly total of contributions to the Green Paper on Services of General Interest
May 2003 - January 2004



In order to facilitate the consultation, the Green Paper was made available, together with a number of relevant background documents, in eleven languages on a website created specifically for this purpose.[7]

Comments could be submitted in all Community languages, either by mail or e-mail to a dedicated mailbox. Respondents were invited to mention, where applicable, the numbers of the questions they were referring to in their responses.

[5] Cf. Annex 1

[6] Cf. COM(2002) 704, 11.12.2002

[7] http://europa.eu.int/comm/secretariat_general/services_general_interest/index_en.htm

For the information of interested parties, the Commission has placed the contributions received on the Green Paper website, provided the senders concerned explicitly agreed to their publication.[8] In practice, almost all contributors agreed to their responses being published on the Commission's website. Only 8 respondents did not agree to the publication of their comments. Most of them explicitly refused to give their agreement to a publication, while some did not reply to the Commission's repeated requests. In addition, one author of a contribution explicitly requested that his identity not be disclosed. This contribution was placed on the website as an anonymous comment.

In parallel to the public consultation, the Council had an exchange of views on the Green Paper in different Working Groups. The European Parliament,[9] the European Economic and Social Committee[10] and the Committee of the Regions[11] have also examined the Green Paper and given their views.

In addition, the Economic and Monetary Affairs Committee of the European Parliament held a public conference "A positive perspective for the future of services of general interest in Europe" on 11 June 2003.[12] The Belgian and French governments organised a seminar in Paris on 21 November 2003 with experts from current and new Member States on national experiences in the field of services of general interest.

The Commission has actively followed the work in these different forums. In addition, the Commission had numerous bilateral and multilateral meetings with interested parties on the issues covered by the Green Paper.

While all this work and all the information received is taken into account in the preparation of the follow-up, this report focuses only on the analysis of the written contributions received in response to the public consultation on the Green Paper.

3. Some General Observations on the Comments Received

3.1. A varied response reflecting a broad spectrum of interests and views

In total, 281 contributions were received in response to the Green Paper. They represent a broad spectrum of different organisations and views and reflect the diversity of structures, traditions and interests that characterise services of general interest in the European Union. However, while the Green Paper touches upon a wide number of issues, not all contributions address each issue raised in the Green Paper.

3.1.1. Contributions from all over Europe, many from Belgium, France, Germany, Austria

The Commission received responses from organisations from all current Member States except for Luxembourg. Contributions were also sent by organisations from

[8] Cf. footnote 3

[10] Opinion on the Green Paper on Services of General Interest, CESE 1607/2003, 11.12.2003

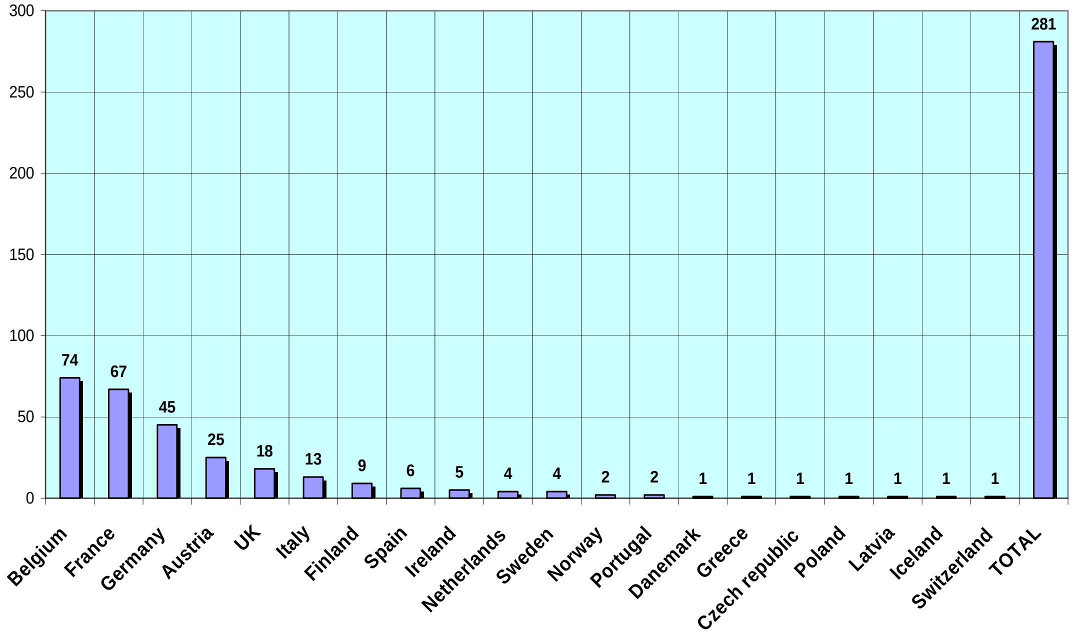
[11] Opinion of the Committee of the Regions of 20 November 2003 on the Green Paper on services of general interest, CdR 149/2003 final

[12] http://www.europarl.eu.int/hearings/20030611/econ/default.htm

three new Member States: Poland, Latvia and the Czech Republic. In addition, contributions were received from organisations in Switzerland, Norway and Iceland. The weak participation of organisations from the new Member States is regrettable. However, it should not be interpreted as an indication that services of general interest are not a highly important issue for these countries.

The distribution of the comments according to their geographical origin is as follows[13]:

Total of contributions to the Green Paper on Services of General Interest according their origin



The strong representation of organisations from Belgium, France, Germany and Austria is to be noted. It reflects the considerable interest taken in the subject in these countries. The high number of contributions of Belgian origin can in part be explained by the fact that many European organisations have their headquarters in Belgium.

3.1.2. *Contributions from a broad range of categories of respondents*

A broad variety of types of organisations have replied to the public consultation:

- national governments,
- a national Parliament,
- local and regional authorities and their associations,
- providers of local services,
- providers of social and health services, and social organisations,
- providers in network industries (transport, postal services, telecommunications, electricity, gas),

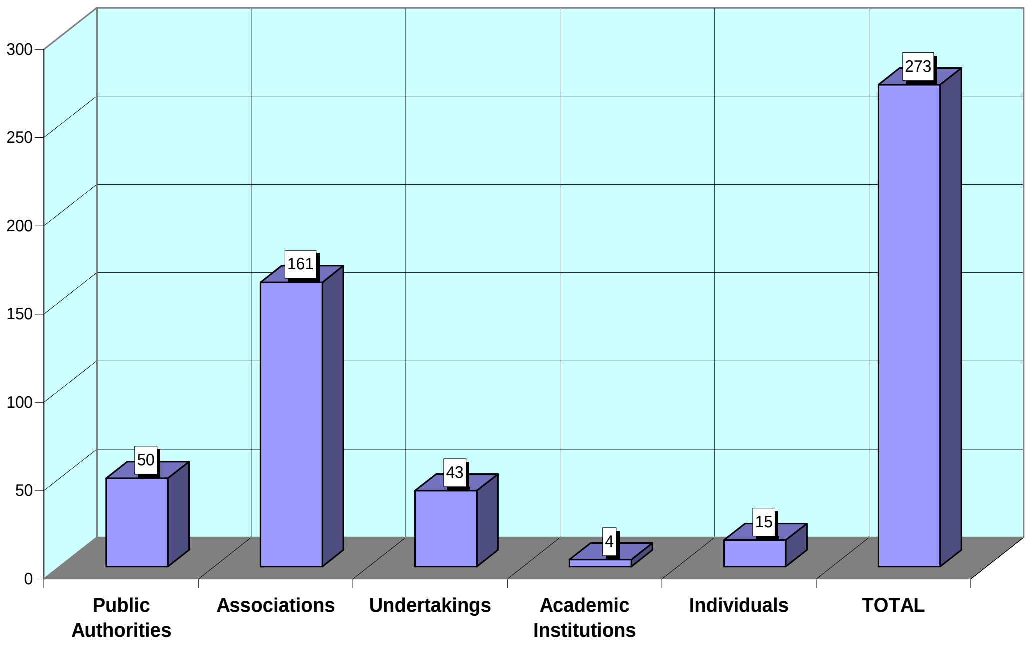
[13] Seat or principal residence of the contributor. The high number of contributions of Belgian origin can in part be explained by the fact that many European organisations have their office in Belgium. However, it is sometimes difficult to distinguish between European organisations and organisations of a more limited scope.

- a provider of financial services,
- companies and organisations from the media sector,
- trade unions and associations of trade unions,
- user and consumer organisations and agencies,
- churches,
- industry associations,
- political parties,
- academic organisations.

Comments were also received from private individuals, one of them submitting a recent doctoral dissertation on public services as a contribution.

Many of the contributions are very substantial and some are accompanied by additional background material. The breadth and the depth of the contributions received lead the Commission to believe that the different aspects and arguments relevant to the debate are well covered by the responses.

Contributions to the Green Paper on Services of General Interest published on the Website



3.2. The Green Paper was well received in general, but some remain sceptical

The public debate launched by the Green Paper was welcomed in general. The issues raised and the questions submitted were found to be relevant. Only exceptionally was the Commission’s intention to launch an open debate doubted, or the questions criticised. Some comments stated that the presentation by the Green Paper of the results of liberalisation in the network industries was too positive and did not sufficiently reflect the problems arising from market opening. A few comments claimed the Green Paper had too strong an internal market and competition focus.

The inclusion of economic as well as non-economic services of general interest in the scope of the Green Paper was widely approved. However, it was noted that the main focus of the document was on the big network industries. Also, the differences between economic and non-economic services, as well as between social services and health services, on the one hand, and network industries, on the other, are highlighted. It is stressed that any Community policy has to take due account of these differences. One organisation notes with satisfaction that the private insurance sector is not dealt with in the Green Paper.

4. THE MAIN RESULTS OF THE PUBLIC CONSULTATION

4.1. Consensus on the importance of services of general interest, but from different perspectives

Many contributions started with a statement on the role of services of general interest in general or of specific services that contributors take a specific interest in. The contributions agree that services of general interest are of essential importance for citizens and businesses in Europe and that well-functioning services of general interest are crucial for Europe's societies and economies. Some contributions also stress the importance of these services for democracy. There is also a broad consensus that services of general interest should be provided in a way that best serves the interest of users.

However, while some contributions plead for a stronger protection of services of general interest against market mechanisms and for the recognition of a separate role for these services, others stress the beneficial impact that market opening can have on the delivery of services. It is pointed out that these services should be treated as an exception to market principles.

Table 1: Importance of Services of general interest

- **There is a broad consensus on the essential importance of services of general interest for European societies. It is also generally accepted that these services should be provided in a way that puts users first.**

- **No agreement exists concerning the relationship between services of general interest and market principles.**

4.2. The role of the Union in the area of services of general interest

4.2.1. Some calls for the inclusion of an objective in the Treaty, but no additional powers

There is no consensus on the need for an amendment of the Treaty. Some comments call for the inclusion of services of general interest in the objectives of the Treaty in order to clarify the role of these services. Some contributions also welcome the amendment of Article 16 of the EC Treaty in Article III-6 of the Convention text. In some comments it is suggested that Articles 16 or 86 should be amended so as to allow for wider exemptions for services of general interest from the application of competition and internal market rules. It is also proposed that a legal base be introduced in the Treaty that would allow the European Union to legislate in the area of non-economic services. One contribution proposes extending Article 86(3) to recommendations.

Conversely, a number of comments argue that the current Treaty framework is appropriate, if properly implemented, and that there is no need for a Treaty amendment. It is argued that the recognition of services of general interest in Articles

16 and 86 is sufficient and delivers satisfactory results. It is stressed that a “social market economy” is already mentioned as an objective in Article I-3 of the Convention text and that any insertion of an additional objective on services of general interest is superfluous. It is also argued that the last sentence of Article III-6 of the Convention draft Constitutional Treaty providing a legal basis for legislation on services of general economic interest should be deleted. This provision is seen as unnecessary and as incompatible with the principle of subsidiarity.

Despite these differences, the contributions largely agree that there is no need to confer additional powers in the area of services of general interest to the Union. Many of the comments suggesting Treaty amendments stress that these amendments must not lead to an extension of the powers of the Community. It is highlighted that any amendments should strengthen subsidiarity and the freedom of Member States to define, organise and finance services of general interest at national, regional or local level. However, some contributions are not opposed or are even favourable to the idea of giving additional legal powers to the Community in the area of services of general interest.

4.2.2. *An interest in clarification of Community rules*

The contributions do not suggest that there is confusion about the responsibilities of Member State and Community levels. However, there is some interest in clarification of the application of Community rules to services of general interest in general, including the application of the concept of “effect on trade between Member States” and the distinction between economic and non-economic services. It is suggested that this clarification could be made in a framework directive or in a communication. Other contributions do not see the need for any clarification and fear that a clarification would be counter-productive.

In addition, there are strong calls from different categories of respondents to clarify the application of competition rules, and in particular state aid rules, to the provision of services of general interest. These are dealt with in section 4.8. below.

4.2.3. *No need to extend sector-specific regulation in general, but debate on some cases*

Many contributions state that the creation of specific regulatory frameworks for other sectors than the large network industries is not necessary. It is explicitly mentioned that no Community framework should be established for social services, for social protection and for public service television and radio. Moreover, specificities of sectors such as health should be recognised and taken into account in any wider discussion of services of general interest.

No agreement exists concerning water, waste and local public transport services. While some contributions call for the creation of a specific regulatory framework for these services, other comments, in particular from the local level, explicitly object to the establishment of a Community regulatory framework or call for an exemption of these services from the application of internal market and competition rules.

Health services, social assistance, education, banking and insurance services, and electronic commerce are also mentioned. One contribution from the financial services industry argues that “post-market” financial services should be regulated as services of general interest at Community level.

4.2.4. *No need for a European Regulator for now*

As regards the institutional framework, there is a broad consensus that it would not be appropriate to establish European regulatory authorities at this stage. It is stressed that services should be regulated as close as possible to the markets and that a European regulator could not take sufficient account of specific situations in the Member States. It is also highlighted that the creation of European regulators would not be in line with recent developments in Community law, such as the adoption of the electronic communications package and the modernisation of the application of competition rules. Only a few comments suggest that the establishment of a European regulator may be feasible in areas such as financial services or energy. Some contributions also suggest the creation of European observatories in areas such as the evaluation of services of general interest. It is also proposed that the subject merits further study.

A vast majority of contributions agree that for the network industries the creation and development of European networks of regulators is the most appropriate form of co-operation. A number of comments suggest that co-operation in the existing networks should be reinforced and that the Commission should be given a stronger co-ordination role. It is also proposed that the Council should regularly monitor the situation in different sectors.

The need to increase transparency requirements and to harmonise information obligations for regulated undertakings is mentioned.

The importance of respecting the principle of subsidiarity and the need to maintain the distinction between the big network industries and local services in any regulatory framework is also highlighted. It is also stressed that regulation should involve all parties concerned and that it has to be based on democratic decisions.

Furthermore, it is suggested that the principle established in the field of electronic communications according to which ex ante regulation is only necessary where competition law remedies are not sufficient should be extended to other services.

Table 2: The role of the European Union

- **While different views are taken on the need to amend the Treaty, there is broad agreement that the Community should not be given additional powers in the area of services of general interest.**

- **The responsibilities of the Community and Member States levels seem to be clear. However, there are calls for the clarification of Community rules in some areas.**

- **A broad agreement exists that sector-specific regulation must not be extended to all services. However, for some services (water, waste, local public transport) diverging views are expressed as towhether a specific regulatory framework is desirable at Community level. The need to take account of specificities of sectors such as health is highlighted.**

- **There is a large consensus that there is no need for the creation of European regulatory authorities at this stage. Networks of national regulators co-ordinated at European level seem to be the preferred option.**

4.3. Sector-specific legislation and general legal framework

4.3.1. The need for a framework instrument remains controversial

The views on the need for a general legal framework for services of general interest have not converged during the debate so far and remain divided. Both views, in favour and against, are strongly expressed by many contributors.

4.3.1.1 Comments in favour

Many comments are favourable to the introduction of a general legal framework. Some of the contributors supporting the establishment of a framework instrument see it as a tool to promote consistency and to clarify and consolidate the rules applicable to services of general interest and the respective responsibilities of the Community and the Member States. It is suggested that the framework should cover issues, such as the definition of general principles regarding the provision of services of general interest (access, universal service, transparency, affordability, non-discrimination, continuity, etc.), the funding of these services, their organisation and regulation, their evaluation, and the role of the Member States, including the regional and local levels, and the Community. It is also suggested that the framework should include provisions on cost calculation and rules on granting special or exclusive rights for the provision of a service of general interest. The added value of such a framework is seen in increasing consistency and legal certainty and in strengthening the principle of subsidiarity. Also the political and symbolic value of such an instrument is highlighted as a key element of the European social model. It is stressed that a framework instrument would give the European Union a pro-active role in the area of services of general interest.

Many contributors expect from a framework instrument that, in addition to clarification and consolidation of the current principles, it will restrict the application of competition and internal market rules to services of general interest and thus lead to a different balance between market and public service principles. It is proposed that a framework directive should lay down exemptions from internal market and competition law.

Some of the comments suggest that a framework instrument should cover only services of general economic interest, others are of the view that all services of general interest should be covered. It is also proposed that a framework directive should only apply to services that are not subject to a specific regulatory framework at Community level.

With regard to the instrument to be chosen, most contributions in favour of a framework instrument would support a legally binding instrument, in particular a directive. However, some contributions suggest the use of non-binding instruments ("soft law"), such as a Commission communication or a recommendation. It is also proposed that different instruments, binding and non-binding, could be used depending on the issue to be addressed. One organisation suggests establishing a "soft law" framework first and proposing legislation later.

Some comments suggest that a framework instrument should be based on Article III-6 of the draft Constitutional Treaty prepared by the Convention.

A number of comments stress that a framework directive must not lead to increased powers at Community level. One contribution states that it is broadly in favour of a framework instrument, provided consumer rights are protected.

No contribution suggests that a general framework could replace existing sector-specific legislation but a number of comments suggest that a framework directive must not affect the sector-specific legislation in place. One organisation, generally in favour of a framework instrument, states that following the decision of the Court in the "Altmark" case there is no longer any urgent need for a framework instrument.

4.3.1.2. Comments against

Many comments are opposed to the introduction of a general framework on the basis of a legislative instrument. It is argued that the current legislation based on a sector-specific approach has proven to be successful and that there is no need for a general framework. Articles 16 and 86(2) of the Treaty were sufficient. The different characteristics of the services covered would only allow for very general provisions that had to be complemented by sector-specific rules. A framework directive would be too abstract and too philosophical. The interaction between a framework instrument and the existing sector-specific regulation would be unclear and could lead to more legal uncertainty. The regulatory framework would become more complicated and less transparent. A framework directive could result in additional burdens and costs. It is pointed out that different sectors are at different stages of liberalisation, which will make it difficult to establish a general framework. There was a risk of conflict between the establishment of a framework directive and the sectoral legislative agendas. It is also feared that a framework directive would be tantamount to a step backward in the most liberalised sectors. Political compromises reached on sector-specific legislation could be put in danger. One comment argues that there is no legal base for a framework directive. It is also argued that a framework directive would deviate from the Lisbon strategy.

Some comments state that broadcasting should not be covered by a framework directive. For the electronic communications sector it is argued that a framework directive would undermine the flexibility provided by the current sectoral regulation which ensures a move towards the full application of general competition law. It is also argued that the electronic communications legislative framework is exhaustive, thus not leaving any room for the application of a framework directive. Comments from industry also cast doubts on the compatibility of the general considerations in the Green Paper on universal service, quality of service and evaluation with developments in the telecommunications sector.

It is suggested that clarification may be necessary regarding health and social services, e.g. in the form of a communication. One contribution proposes the establishment of a specific directive for complementary health insurance.

4.3.2. A few inconsistencies and diverging views on the impact of existing regulation

As regards the existing sector-specific regulation, many contributions point out that no inconsistencies have been experienced. It is stressed that the existing differences between rules for individual sectors reflect different situations in different sectors. A point that is frequently made is that different degrees of market opening in Member States and uneven implementation of Community law create problems.

With regard to transport, the point is made that differences in the regulation of different transport sectors can create difficulties. The liberalisation of road transport led to problems in the railway sector. It is also suggested that the legislation for maritime transport does not take account of certain specific contexts.

It is also argued that various pieces of Community data protection legislation are not fully coherent.

It is mentioned that universal service obligations exist only for some services and that the objectives for different services of general interest are not identical.

As regards Directive 93/38/EEC, it is suggested that the impact of the directive on the sectors covered (energy, water, transport) is different due to the differences of these sectors.

It is stated that, in some cases, a more technology-neutral approach could have avoided inconsistencies. For example, the distance-selling directive applies to value added services provided via voice telephony and the e-commerce directive applies to value-added services offered on the Internet.

The positive impact of the Community's existing sectoral policies is stressed in a number of contributions. One contribution argues that sector-specific regulation has worked well but has created a feeling of legal uncertainty and confusion. Others point to remaining monopolistic structures, the creation of oligopolies and price increases and suggest that there are also other negative social and economic consequences of the Community's liberalisation policies. It is mentioned that for consumers comparisons of different service offerings are sometimes difficult because of a lack transparency. The uncertainty relating to the calculation of the cost of providing a universal service is stressed.

Table 3: Sector-specific legislation and general legal framework

- **The views on the need for a general legislative framework remain divided. However, there is an agreement on the continued need for sector-specific legislation.**

- **Many contributions highlight the benefits of existing sectoral policies. Others point out that liberalisation had negative social and economic consequences.**

4.4. The distinction between economic and non-economic services

4.4.1. The importance of the distinction and its dynamic character are widely recognised

In general, contributors consider the distinction made in Community law between economic and non-economic services to be important and relevant. Only a few contributions argue that this distinction is outdated or unnecessary and no longer appropriate. A number of comments stress that the distinction is not clear and call for greater legal certainty. It is highlighted that some sectors provide both economic and non-economic services. Some comments underline that the Member States should have a role in deciding on the nature of a service. Also, the importance of the nature of downstream activities for the qualification of upstream activities is highlighted.

The fact that the borderline between economic and non-economic activities is dynamic and evolving over time is widely accepted. Consequently, many contributors agree that a definitive list of activities that are to be considered non-economic cannot be established. However, some comments suggest that a list of examples could be useful to clarify the distinction. A number of comments call for the establishment of a list of abstract criteria that could be used to determine whether a service is of an economic or a non-economic nature. A communication is suggested as the appropriate instrument. It is also proposed that the distinction could be clarified in a framework directive. Others are of the view that the development of the distinction should be left to the Court.

A few comments propose the establishment of a negative list of all services that are not subject to competition and internal market rules. This list should include services such as public local transport, water supply, waste water, waste management, social services, health services, education, culture, and services provided by not-for-profit organisations. Other comments stress that services such as waste water and health are of an economic nature.

4.4.2. Calls for a wider definition of non-economic services

A number of comments, in particular from the social sector, from the local and regional levels and from trade unions, suggest that the market-based distinction between economic and non-economic services is too narrow. It is proposed that broader criteria, such as social and environmental objectives, participation of volunteers or lack of profit-orientation, should be used to establish whether a service is of an economic nature or not. Some comments argue that the activities of not-for-profit organisations or of organisations that re-invest all profits in public service activities should be considered to be non-economic. It is also suggested in comments from the local level that most universal public services are of a non-economic nature.

However, other comments, in particular from industry, stress that the current functional definition based on the nature of the activity is appropriate and should be maintained. The existence of a potential market for a given activity should be the sole criterion. The status of an organisation must not be taken into account.

4.4.3. An interest in clarification of the situation of organisations providing social services

A number of replies, including many from the social and health sector, suggest that it would be useful if the situation of non-for-profit organisations and of organisations performing largely social functions was further clarified. Reference is made to legislative as well as to non-legislative instruments. It is suggested that the specific role of providers of social services should be explicitly recognised. The importance is highlighted of ensuring that the provision of social services by not-for-profit organisations remains possible in the future. Other contributions however, also from the social sector, insist on the need to focus on the nature of the services and not on the nature of the provider.

One industry association opposes any further clarification of the status of these organisations, arguing that the status of an organisation is irrelevant under Community law and that it is only the nature of the service provided that was important.

4.4.4. *Non-economic services: broad rejection of additional Community powers, but also calls for their protection as part of the European social model*

There is a broad agreement among contributors that the Community should not be given additional powers in the area of non-economic services. The Member States should be responsible for these services, in line with the principle of subsidiarity. Many comments suggest that the role of the Community should be limited to facilitating the exchange of experience and good practices, and benchmarking. The method of open co-ordination is mentioned as an appropriate instrument.

However, some comments request that the Community should protect non-economic services of general interest as part of the European social model. A few comments refer to the establishment of common basic standards at Community level. Some contributions propose that non-economic services should be covered by a framework directive.[14] It is stressed that consumer rights must be protected regarding non-economic services as well.

It is also suggested that the Community should take better account of non-economic services in its policies, e.g. regarding cohesion, social inclusion, and health.

Table 4: Services of general economic interest and non-economic services

- **Many contributors feel that the distinction is important. However, a number of contributions call for other criteria beyond the distinction economic – non-economic in order to create more legal certainty.**

- **While there is some interest in further clarification of the situation of organisations providing social services under Community law and in protecting non-economic services of general interest as part of the European social model, there is a broad agreement that the Community should not be given additional powers in the area of non-economic services.**

4.5. A Common Set of Obligations

4.5.1. *Diverging views on the utility of a common set of public service obligations*

The differences in the views regarding the need for a general Community framework are also reflected in the responses concerning a common set of public service obligations. A number of contributions explicitly contest the possibility or the need to establish a common set of obligations at Community level. Public service obligations should reflect the specific characteristics of the different sectors and should be established sector-by-sector. A common set of obligations would be too general and create an unnecessary administrative burden. It is argued that there is no convincing case for a common set of obligations and that the concepts of universal service and affordability, for instance, do not even fit all sectors of the network industries, such as the railways. The electronic communications reform package is cited as an example of successful sector-specific regulation. It is also stated that common elements exist but that these elements have to find a different expression for each sector and that for a common concept it is difficult to go beyond very general statements.

[14] See 4.2.1.1. above

A number of other contributions argue that the definition of a common set of obligations is appropriate and necessary. Many of those contributions argue for an extension of the common set of obligations. They generally establish a link with their support for a framework directive where this common set of obligations could be promoted. One contribution focuses on the concept of universal service as being the most relevant from a consumer's perspective.It is also suggested that a common concept is only possible for the large network industries. One contribution suggests referring to public service “missions“ rather than to public service “obligations”, as the former is a more comprehensive and more positive term.

4.5.2. Some suggestions for the scope of public service obligations

A number of contributions state that in addition to the requirements mentioned in the Green Paper no further obligations should be introduced. It is argued that additional requirements would increase the costs of providing the service and that the importance of public service obligations for achieving cohesion objectives is overstated. The Community should allow for some degree of regulatory competition between Member States. The proper transposition and application of the existing requirements should be given priority.

Other contributions suggest additional elements. The principle of adaptability of services of general interest is mentioned as a separate item in several contributions. Also, the principles of sustainable development and environmental protection are mentioned repeatedly. Other elements that are suggested include access, transparency, democratic control and evaluation, social cohesion, solidarity, consumer participation, infrastructure provision, country planning, non-distortion of competition, employment, user and employee participation, gender aspects, data protection and privacy, payment options, redress and complaint mechanisms, incentives for investment and quality improvements, neutrality of ownership, fair pricing, efficiency, accountability, security and safety, pluralism, interconnectivity, competitive tendering, diversity and choice, territorial coverage, education and training, and subsidiarity. The principle of cost-recovery (for the water sector) and the “polluter pays”-principle are also mentioned.

4.5.3. Scepticism as regards the extension of requirements to other services

Many contributions do not, at this stage, see any need for an extension of the requirements defined in Community sector-specific regulation and detailed in the Green Paper to other services of general interest. In this context, some contributions highlight the specific characteristics of broadcasting and of health and social services. A number of contributions stress that an extension could only be considered on a case-by-case basis and after careful assessment. The use of non-binding guidelines and the open method of co-operation is also considered.

However, some contributions are favourable to the extension of the common set of obligations to all or at least some other services of general interest. Banking and financial services, water and sewage services, town cleaning, Internet access, accommodation and social services are specifically mentioned. It is also argued that the requirements should be extended to all sectors that have been liberalised. It is also suggested that the public service obligations set out in the Green Paper should be extended to the distribution of medicines and to emergency services in general.

One contribution proposes including the provision of geographical information. It is also proposed that universal service should be introduced in the railways sector.

Conversely, some contributions stress that these requirements should not be extended to the water sector. With regard to gas, it is stressed that the concept of universal service cannot be applied to this sector. It is also highlighted that the concept of affordability is not suitable for the energy sector.

As regards non-economic services, the view prevails that the set of requirements applying to the network industries should not cover these services. It is stressed that these services should remain under the responsibility of local and regional authorities. However, there are also some contributions that promote an extension of such requirements or general principles to all or at least some non-economic services of general interest.

4.5.4. No detailed regulation at Community level

There is broad agreement that Community regulation should be confined to establishing principles and objectives and that Member States should have the power to implement these principles in line with the specific needs and characteristics that exist at national or regional level. The need to respect the principle of subsidiarity is highlighted in several contributions. In particular, it is argued that the organisation, financing and control of services of general interest should be left to the Member States. A number of contributions argue that a Community regulatory framework should be established only for sectors that are liberalised at Community level. Along the same lines, it is stated that Community regulation should remain limited to the network industries. The specific responsibility of the Community for the functioning of the internal market and for undistorted competition is underlined. It is stressed that, as a general rule, regulation should remain as closely as possible to the citizen. However, it is also recognised that with the completion of the internal market the need for regulation at Community level may increase.

Some contributions are in favour of an increase in regulation at Community level. The Community should facilitate the harmonisation of public service requirements in the Union. It should take on the responsibility for ensuring social and territorial cohesion. It is highlighted that the Community should strengthen the guarantees established at national level with regard to services of general interest. It is also argued that all aspects relating to human dignity should be regulated at Community level.

Several contributions also call for clarification of the respective roles of the Community and national levels.

4.5.5. Call for an assessment of implementation and impact on cohesion

There is no agreement regarding the effective implementation of public service requirements set out in Community law and their impact on social and territorial cohesion. A number of contributions argue that the requirements have not yet been effectively implemented and that cohesion goals have not yet been achieved. In particular, there is criticism that the existing requirements are too focused on the introduction of competition and have not improved access to services. Other respondents claim that requirements have been properly implemented and that the cohesion objectives have been attained. However, a significant number of contributions considers that it is too early to form an opinion and that a more detailed assessment of the implementation of public service obligations and their implementation is necessary. It is suggested that Community regulation has had an uneven impact and that the actual record varies from one Member State to another.

Several contributions refer to specific problems. It is argued that the current requirements fail to address problems resulting from obscure tariff practices and from concentration and bankruptcy of providers in the telecommunications sector. It is stated that in the gas and electricity sectors problems of price increases and security of supply have occurred. It is claimed that energy liberalisation had a negative impact on employment, on the electricity grids, on the development of renewable energy sources, on energy savings measures and on a coherent Community energy policy. It is also stressed that post offices were closed. It is claimed that where Community law defines only minimum standards or Member States have a wide margin for the application of requirements, implementation has led to distortions of competition and to a “race to the bottom” in which operators facing high standards in their home market have a competitive disadvantage. With regard to universal service, it is maintained that the current Community provisions do not provide sufficient financial incentive for providers to ensure universal service. There is criticism that the concept of affordability is not specified at Community level and that the concept is translated into a mere cost-orientation of tariffs without taking other (social) parameters into account. It is argued that the Community provisions on sea transport security are not properly applied. Inconsistency in the regulation of data protection in different Community law instruments is also referred to. The importance of taking account of the specific needs of the outermost regions is highlighted.

Table 5: A common set of obligations

- **Views are divided on the need and feasibility of establishing a common set of obligations at Community level. While some contributions stress the need to establish public service obligations sector-by-sector, other comments argue that a common concept is appropriate and necessary.**

- **There seems to be a broad consensus that regulation at Community level should establish principles and objectives, while Member States should be able to implement and specify the rules in line with the specific situations and needs existing at national and regional level.**

- **There is no agreement on the effective implementation of requirements in Community legislation or on the impact of these requirements on social and territorial cohesion. It is suggested that it is too early to form an opinion and that a more detailed assessment is necessary.**

- **Different views exist regarding the need to introduce additional obligations at Community level and regarding the need to extend existing requirements to other services of general interest.**

4.6. Sector-specific obligations

4.6.1. In general, no need for additional sector-specific obligations, but some proposals

Many comments do not see a need at this stage for introducing additional sector-specific public service obligations.

As regards supply security the energy sector is identified as the sector for which the issue is most relevant. However, it is also argued that other network industries or all infrastructure-based services could raise security of supply concerns. Telecommunications, postal services, transport, water, heating, broadcasting services and the supply of medicines are specifically mentioned. It is suggested that in the future security of supply could also become relevant for health, education, social and cultural services. Conversely, it is argued that the concept of security of supply does not fit for health and social services. Some contributions express the concern that liberalisation could have a negative effect on the security of supply. The need to ensure long-term investment in infrastructure-based services is highlighted as a key issue. It is also argued that security of supply should become an integral part of the universal service concept. Also, the interdependency of the security of supply of different services of general interest is underlined. For the electricity sector, it is maintained that supply security must be complemented by the aspects of continuity of production and the smooth functioning of the grid. However, there is broad agreement that currently no additional initiatives are required at Community level. One contribution stresses that security of supply should best be ensured closest to the citizen. It is argued that Community measures must not lead to a centrally defined energy mix. The need to continuously assess the situation of different sectors with regard to supply security is mentioned. Some contributions call for additional Community measures in the field of supply security. One contribution mentions that the issue is not appropriately addressed in the Water Framework Directive.

As regards access and interconnectivity, the view also seems to prevail that no specific Community initiatives have to be taken at this stage. For the telecommunications sector, the debate focuses on clarifying some issues related to the implementation of the current framework and some expressed views in favour of the extension of universal service to broadband and mobile telephony. However, it is also argued that access needs to be improved in general. Trans-European networks should be developed. It is argued that border regions deserve particular attention. Some contributions stress the need to ensure and improve access and interconnectivity in the railway sector. The need to improve trans-border trade in gas and water and trans-border interconnectivity in the electricity sector is also highlighted. Measures should be taken to prevent conflicts in cases where a public operator from one Member State acquires control over a private operator from another Member State. The interoperability of transport networks and the integration of transport systems should be stimulated.

No agreement exists with regard to water. While the view is taken that access to water networks should be opened, other contributions argue that the concepts of access and interconnectivity cannot apply to the water sector.

Furthermore, one contribution suggests encouraging the harmonisation of tariffs across the Union. It is also suggested that obligations relating to crisis or emergency situations should be developed. One contribution proposes additional measures ensuring user and employee safety, technical safety as well as sustainable development and environment protection. It is suggested that cost-covering prices be introduced for water supply and a specific framework for waste. The establishment of an annual minimum investment standard is also proposed.

4.6.2. Little support for a Community initiative on media pluralism at this stage

The crucial importance of protecting media pluralism is widely recognised and the inclusion of Article 11(2) of the Charter of Fundamental Rights in the draft Constitutional Treaty established by the Convention is welcomed in several contributions. Some comments stress the importance of public broadcasters, other contributions underline the importance of private broadcasting for pluralism. The link between cultural diversity and media pluralism is highlighted. Some contributors are of the view that it would be better not to place a debate on media pluralism in the context of a discussion on services of general interest. One comment suggests that the issue should be addressed in more detail in a separate consultation.

On the substance, there is broad agreement that at this stage measures should not be taken at Community level and that the protection of the pluralism of the media should be left to the Member States. It is argued that media markets are essentially national in nature and that the diversity of situations in the different Member States could best be addressed at national level. Several contributions suggest that the aspect of pluralism is more strongly taken into account in the application of Community competition and state aid rules.

There are also some comments that call for an initiative at Community level. It is argued that pluralism is not always ensured by Member States. Several comments are in favour of a legislative measure such as a Directive. In particular, it is suggested that the issue of pluralism be addressed in the forthcoming revision of the Television without Frontiers Directive. It is proposed that a legal base should be created to implement Article 11(2) of the Charter. It is also suggested that an independent observatory be created for media pluralism.

Table 6: Sector-specific obligations

- **There seems to be little support for the introduction at Community level of additional sector-specific obligations at this stage. However, it is suggested that the situation should be closely monitored with regard to the different sectors, in particular with regard to security of supply. There are also some calls for an improvement of access and interconnectivity in some sectors.**

- **No agreement exists with regard to the opening of the water sector at Community level.**

- **There is broad agreement that no specific Community measures should be taken on media pluralism at this stage and that the protection of pluralism should be left to the Member States.**

4.7. Definition of Obligations and Choice of Organisation

4.7.1. Some concerns, in particular with regard to procurement and state aid

A number of comments stress that the application of Community law has led to problems with regard to the organisation of services of general interest and the definition of public service obligations. In this context, some contributions refer to negative consequences of Community liberalisation policies. It is suggested that the Member States' freedom to organise services of general interest should be explicitly recognised. However, the main concerns appear to result from the application, as perceived by respondents, of the Community rules with regard to public procurement, concessions and state aid. It is argued that the rules on tendering and state aid for services of general interest are unclear. Some contributions, coming in particular from the public sector mention that public procurement rules are too rigid and may impose an excessive burden on administration. Other contributions, in particular from the private sector, argue that award procedures for public services are not yet fully competitive and transparent, and that this creates an obstacel to the internal market. Many contributions ask for clarification, in particular as regards the "in-house" concept or the rules on concessions and public-private-partnerships. It is proposed that the procurement directives be revised so as to allow public authorities to take better account of issues such as environmental and social concerns. One contribution claims that in practice all cases requiring state notification cause problems because they prolong procedures. In addition, a number of specific issues and cases are mentioned. These include:

- the ECJ judgment in case C-519/99 of March 2002 concerning second homes in Austria,
- the prohibition by the ECJ of reduced entrance fees for museums in favour of the local population,
- the suspension of a system of aid to social housing in Sweden pending a state aid decision by the Commission,
- the refusal of an authorisation by a regional administration for a subsidy in favour of a local abattoir because of concerns with regard to its compatibility with Community state aid rules,
- the restrictions on the freedom of choice of organisation contained in the Commission proposal for a regulation on public services obligations in local public transport,
- the degradation of international rail services as a consequence of Community legislation,
- the obstruction to efficient provision of services through the envisaged reform of Regulation 1191/69,
- the restrictions resulting from the energy directives of the freedom of the Member States to organise their electricity sectors,
- the use of volunteers by social organisations, which could be considered a problem under the competition rules,
- the abolition in Austria of tax advantages for the purchase of goods manufactured by handicapped persons for reasons of distortion of competition,
- Community pre-accession funding which in practice was not available for projects involving private companies,
- the absence of Community legislation defining a level playing field for private and public companies.

Conversely, there are also many comments that stress that the application of Community law has not led to undue restriction of the organisation of services of general interest and the definition of public service obligations at national level.

4.7.2. *Some examples for obstacles to the internal market created at national level*

Some comments also mention situations where an obstacle to the completion of the internal market is created at national level. These examples include:

- contract award procedures that are not competitive and transparent,
- concerns of private broadcasters regarding a possible non-compliance by Member States with their obligation to define precisely the public service mission of public service broadcasters,
- tax discrimination in favour of public undertakings in a Member State,
- the obstacle to the export of waste from private households,
- the restrictive interpretation by national authorities of the concept of recovery in the area of waste management,
- access to the insurance and credit sectors,
- the distortion of competition through national compensation schemes for public service obligations,
- the limitation of the scope of economic activities of local authorities in national legislation,
- the bottlenecks created in the transport of goods by the priority given to passenger rail transport in one Member State,
- the distortion of competition through differences in the taxation systems of the different Member States,
- the implications of the introduction of environmental requirements for the transmission and transport of electricity.

4.7.3. *No support for further harmonisation of public service obligations*

There is broad agreement among contributors that in general any further harmonisation of public service obligations is not desirable. The importance of the principle of subsidiarity is frequently stressed in this context.

Only a few comments argue in favour of further harmonisation. One contribution supports progressive further harmonisation on the basis of regular evaluation reports. The areas of emergency services and geographical information are specifically mentioned. One contribution argues that the Community should establish maximum levels for public service obligations in order to prevent distortions of competition. Furthermore, it is proposed that the taxation of services of general interest in the Member States should be harmonised. Private broadcastersalso suggested that the Commission should publish a list of definitions of public service missions for broadcasters in the Member States.

4.7.4. *A broad interest in a flexible exchange of best practice regarding the organisation of services*

There is a strong interest in an exchange of best practice and in benchmarking concerning the organisation of services. It is stressed that the diverse forms of organisation to be found in the Member States suggest that much can be gained from comparisons. However, it is underlined that the creation of an additional burden and the duplication of processes must be avoided. Many contributions stress that new processes should not be institutionalised and refer to the possibility of using existing forums and procedures. Several contributions mention the application of the Open Method of Co-ordination. It is also suggested that the place for an exchange of best practice would be an observatory for the evaluation of services of general interest. Many contributions call for the involvement of all interested parties in the process. Some comments highlight the need to take due account of regional and sectoral differences. It is stressed that the process must not lead to the establishment of standards.

Only a few comments oppose an enhanced exchange of practice on the basis that additional comparisons are not necessary. Some contributions are reluctant in particular to support benchmarking in the area.

Table 7: Definition of obligations and choice of organisation

- **Some contributions highlight problems resulting from the application, as perceived by respondents, of Community law, in particular in the areas of procurement and state aid. There is a call for clarification of the rules on concessions and public-private-partnerships. Some comments also refer to situations where an obstacle to the completion of the internal market is created at national level.**

- **The comments largely agree that further harmonisation of public service obligations at Community level is not desirable.**

- **Many contributions express an interest in a flexible and non-bureaucratic exchange of best practice and benchmarking as regards the organisation of services of general interest.**

4.8. Financing

4.8.1. A widespread request to clarify the rules on financing

A perceived legal uncertainty regarding the rules applying to the financing of services of general interest, and in particular the application of state aid rules, is a key issue in the comments received. Many contributions from all categoreis of respondents request clarification of these rules. The need for clarification is highlighted by a range of different categories of respondents. The call for more legal certainty is made for services of general interest in general but it is particularly strong at the local level and concerning local services. Some contributions also refer to the burden of state aid procedures and call for simplification. Many contributions explicitly comment on the ECJ judgment in the Altmark case, which is seen as positive but not as sufficient to ensure legal clarity. It is expected that the conditions set out by the Court will be clarified and specified. Clarification of the methods of cost calculation (transparency, parameters) and of the nature of public service obligations that are compensated is referred to specifically.

Whilst the call for more legal certainty is widespread, no specific views seem to prevail on the instrument to be chosen. Some comments propose the adoption of a block exemption or advocate the approach proposed by the Commission in its Report to the Laeken European Council. Others are in favour of different instruments, such as an amendment of the Treaty, “a legal framework”, “guidelines”, “derogations”, or “a negative list”. There are also a number of comments that explicitly call for a non-legislative clarification of the state aid rules. A number of contributions seem to confuse the issue of a framework directive with the issue of clarifying the state aid rules. Many organisations in favour of a framework directive expect the directive to set out the conditions under which services of general interest can be financed. A number of them refer explicitly to state aid and competition and possible exemptions as issues that should be covered in a framework directive.

Some comments, in particular from industry associations, stress the need for continued strict application of competition and state aid rules. According to these comments, the existing framework is sufficient and no additional clarification is necessary. These contributions seem to suggest that clarification would imply more lenient application of the rules. As regards the broadcasting sector, several contributions call for full application of the transparency directive. One contribution calls on the Commission to ensure equal, non-discriminatory and transparent discounts for airport fees.

While some contributions state that problems regarding the application of state aid rules have not occurred, other contributions mention cases where the application of state aid rules as perceived by respondents has led to problems. In addition to the examples mentioned under 4.7.1, these cases include:

- the creation of a municipal funding association in a Member State,
- the operation of a public ferry service in a sparsely populated region,
- the envisaged revision of Regulation 1107/70, which could lead to an additional administrative burden,
- territorial coverage in the areas of mobile telephony and broadband services,
- restrictions resulting from structural separation (unbundling) and obligations to tender.

4.8.2. *A call in support of the freedom of Member States to determine the mode of financing*

There is broad agreement that the Member States freedom to determine the mode of financing of a service of general interest must be preserved. It appears from a number of contributions that in practice there is no single ideal financing mode that would suit all situations and services. It is argued that Member States are in the best position to choose the appropriate mode of financing taking into account the diversity of situations and services. The flexibility of Member States must be preserved. However, it is stressed that the choices made must not distort competition. The need for a Community legislative instrument on concessions and public-private partnerships should be examined.

It is also highlighted that Community rules must not impede tariff averaging for services in the Member States. There is also mention that the direct financing of public broadcasting through the state budget would be unconstitutional in one Member State. It is noted that an obligation to tender restricts the freedom of choice of public authorities and it is requested not to impose at Community level public tendering for all services that require financial support. However, the view is also taken that compensation should in general be based on a tendering procedure. Furthermore, it is stressed that the Community should not introduce a general principle of affordability for all services. Several contributions call for the principle of cost recovery to be fully applied in the water sector.

With regard to solidarity-based financing, there is broad agreement that clarification at Community level is not required at this stage. Most contributions argue that this area should be left to the Member States for reasons of subsidiarity. However, it is also stressed that solidarity-based financing schemes in the Member States must not prevent the opening of insurance markets as set out in Community directives. Only a few comments suggest that further clarification at Community level is desirable, in particular with a view to increasing the possibilities of solidarity-based financing. The possibility of an evaluation of good practices at Community level is also mentioned.

Furthermore, it is suggested that the Community should develop co-financing instruments.

4.8.3. Different views on cream-skimming

There are different views expressed in the comments on cream-skimming. A number of comments argue that the problem is widespread, especially in liberalised sectors. It is stressed that cream-skimming always leads to results that are inefficient and against the general interest. The transport sector is specifically mentioned in a number of contributions. However, other comments, in particular from industry, take the view that cream-skimming is essentially not a problem in practice. It is argued that the problem cannot occur in fully liberalised sectors. One contribution states that cream-skimming cannot per se be seen as negative.

Other comments argue that cream-skimming can have negative effects in particular in cases of tariff averaging and internal cross-subsidisation between profitable and loss-making services. Problems that can arise in less populated regions are also referred to. It is argued that where selective market entry occurs, the provision of universal service must be carefully monitored.

Table 8: Financing of services of general interest

- **There is a firm call for clarification and simplification of the rules applying to the financing of services of general interest, in particular as regards state aid. The recent judgment of the ECJ in the Altmark case is seen as positive but not as sufficient.**

- **There is also a broad consensus that Member States must remain free to determine the most appropriate way of financing a service of general interest, provided competition is not unduly distorted.**

4.9. Evaluation

Regarding the evaluation of services of general interest, it is to be noted that different contributions attach a different degree of importance to the subject. Whilst for some contributors evaluation is a very important or even an essential issue, others seem to attach little or no importance to the question.

4.9.1. Diverging views on the scope of evaluation at Community level

A number of comments state that the evaluation currently performed at Community level, on a sectoral basis for different network industries and horizontally in the framework of the Cardiff process, is sufficient. Some comments argue that evaluation at Community level should be limited to services for which a specific Community legislative framework exists, which have a trans-border dimension or to which the Method of Open Co-ordination is applied. Other comments, however, suggest that all services of general interest or all services of general economic interest should be evaluated at Community level.

A number of contributors stress that the evaluation is primarily a task for the authority that has defined and organised a service of general interest. Evaluation should be performed in general by national, regional and local authorities. In particular, local services should be evaluated by local administrations. Broadcasters underline that broadcasting should not be evaluated at Community level. It is stressed that an evaluation at Community level is only meaningful if the situations in the Member States are sufficiently similar.

It is also suggested that the performance of a service of general interest in the Member States is evaluated before proposals for market opening are made at Community level.

4.9.2. *Diverging views on procedural and institutional arrangements*

Some comments suggest that common principles or criteria should be established at Community level but that the evaluation should be left to the relevant authorities in the Member States. Other contributors are of the opinion that the Commission should perform evaluations at Community level. A number of comments, however, doubt that the Commission is in a position to evaluate the performance of services of general interest objectively and support the idea of the creation of an independent European observatory for the evaluation of services of general interest. There are some proposals for this observatory to be attached to the European Parliament. The idea of a European network of evaluation bodies is also suggested.

While many contributions suggest that a horizontal evaluation of services of general interest is desirable, it is also argued that only a sectoral evaluation is useful.

It is proposed that Community provisions on evaluation should be set out in a framework directive.

4.9.3. *Evaluation should be multi-dimensional*

The is broad agreement among contributors that, where services of general interest are evaluated, this evaluation should not only be based on criteria of short-term economic efficiency and competition but also on broader political, social, economic and environmental criteria. The Commission Communication of 2002 on an evaluation methodology[15] is seen as appropriate in some contributions, whereas other comments suggest that a broader and more comprehensive approach is required.

A number of contributions suggest that the performance of services of general interest should be evaluated in particular against the public service obligations imposed on the provider.

[15] COM(2002) 321

4.9.4. *Other comments*

As regards user involvement, user surveys and the involvement of consumer organisations are frequently referred to as the most appropriate instruments. Appropriate complaint mechanisms are also mentioned. Various cases of users and citizens committees involved in evaluation processes are highlighted as good practice. Eurobarometers are referred to as useful instruments by some, while others believe that they are not an appropriate tool.

Several comments stress the need for a pluralistic evaluation. It is proposed that social partners should also be involved in the evaluation process.

The need to discuss the results of the evaluation with all stakeholders is also mentioned.

A number of comments suggest that the relevant data are already largely available. Others stress the need to impose information obligations on the providers of services of general interest. Some contributors, in particular from the industry, are opposed to binding obligations. It is stressed that the burden for operators should not be increased. It is also suggested that EUROSTAT could have a role in providing the necessary data.

The need to create common data standards or common indicators at Community level is stressed in some comments. However, the difficulty of establishing useful indicator systems is also mentioned.

For health and social services, it is argued that evaluation standards do not yet exist and that the criteria applied for the evaluation of the network industries cannot be applied in the health and social sectors. Any standards established would need to respect the values of the European social model, such as health objectives of universality, equity and solidarity.

Table 9: The evaluation of services of general interest

- **While there are different views on the overall importance of evaluation, there is a broad consensus that evaluation should be comprehensive and take account of political, social, economic and environmental criteria.**

- **No agreement exists as to the range of services to be subject to an evaluation or as regards the necessary procedural and institutional arrangements.**

4.10. The international dimension

4.10.1. *Trade Policy: a call for consistency and more transparency*

Concerning trade policy, the need to ensure the consistency between the internal EU regulatory framework and any international obligations is forcefully highlighted. International trade agreements should not go beyond what has been discussed and agreed within the European Union. Conversely, it is also stressed that the internal framework must comply with WTO obligations.

As regards negotiations in the WTO framework, a number of organisations call for an improvement of the information flow and for more transparency regarding the development of the negotiations.

Some comments from industry underline that EU industries expect the Community to negotiate further market opening in the framework of the WTO negotiations in order to create new business opportunities for EU companies. Other comments suggest that the Community should not accept any further market opening within the WTO framework before the effects of the liberalisation processes already underway have been evaluated. It is also proposed that additional commitments should be made conditional upon an effective liberalisation in third countries.

A number of comments highlight the need to protect public services in international trade negotiations and to guarantee that the EU and the Member States maintain the capacity to define a regulatory and institutional framework ensuring that providers of services of general interest effectively fulfil the public service missions entrusted to them. The non-discriminatory regulation of services of general interest and the imposition of public service obligations should remain possible. Some comments go further and suggest reviewing the GATS agreement in order to improve the protection of services of general interest.

More specifically, representatives of the local and regional levels argue that international trade agreements must not interfere with decisions of local and regional authorities regarding services of general interest. International trade negotiations should strengthen local democracy and local self-administration. They must not lead to the liberalisation of public services provided by local authorities.

Several comments suggest that an exception for all services of general interest should be negotiated within the WTO framework. It is also proposed that non-economic services should not be covered. Other contributions maintain that certain services, such as water, waste water, health, education and social services should be exempted from WTO obligations. However, it is also argued that the inclusion of water supply and distribution in the scope of the GATS would have little impact, as governments remained free to decide how to organise water supply and distribution under their jurisdiction.

As regards broadcasting and audio-visual services, the view is expressed that these services should remain excluded from the scope of the GATS and could better be dealt with in a separate international convention on cultural diversity. Conversely, it is argued that cultural services should not be isolated from other services.

A number of contributions make the point that the Community approach on services of general interest in the context of international trade negotiations should be further clarified. It is also pointed out that the WTO terminology and the terminology used in Community internal legislation are not identical. It is proposed that a definition of public services be included in a framework directive that could also be used in the WTO context.

Further comments refer to the need to ensure that in international trade negotiations investors in newly privatised undertakings are protected against sudden shifts of government policies and the specific requirements of certain services of general interest sectors, such as postal services, electronic communications, public transport or public health, are taken into account.

4.10.2. Development Co-operation Policy: basic public services are essential

The comments widely recognise the essential importance of basic services of general interest for the development of the poorest countries. However, while several contributions welcome the inclusion of development co-operation in the scope of the Green Paper, there is also the view that the Green Paper should not have covered this matter since it would have been better to deal with it in a separate debate.

A number of comments point out that the needs of the citizens of the poorest countries and their specific living conditions should serve as the starting point for defining a development strategy. Some contributions refer to the need for close co-operation with the local decision-makers in the developing countries and for the involvement of users in the management of services. The possibility of transferring know-how from EU industries to developing countries is highlighted. Some contributions however warn that solutions from EU Member States may not be adapted to the specific situations in developing countries. Europe should promote its model of society and the same principles should apply to services of general interest in the European Union and in developing countries. However, it is also suggested that standards cannot always be the same and must be adjusted to the specific requirements of these countries.

Access to finance and the attraction of private foreign investment are identified as the main problem. In this context, the importance of market opening, the creation of a stable political, economic and regulatory environment, regional integration and the need to protect investment are mentioned. The need to strengthen the private sector in developing countries is highlighted but a number of comments warn that privatisation should not be forced as it may not always be the most appropriate solution. EU trade policy should not counteract the development of services of general interest in developing countries. Many contributions stress that Public-Private Partnerships are a particularly useful instrument and should be facilitated and encouraged. The support of multi-donor initiatives, such as the Public Private Infrastructure Advisory Facility (PPIAF), are mentioned as a means to encourage private sector investment.

The particular importance of some sectors, such as water, energy, public transport, and geographical data is highlighted. Contributions from the broadcasting sector suggest that an international instrument could assist in supporting pluralism in developing countries.

A number of comments mention that co-ordination and co-operation within the European Union should be improved. Some suggest that more financial support should be given or that the provision of services of general interest should be improved in the developing countries. It is also suggested that financing should be better targeted. Several comments mention the need to review the relevant procedures of the European Union. There is also reference to the need for a reform of the Common Agricultural Policy in order to allow the developing countries to compete.

Several contributions suggest including provisions on development co-operation in a framework directive.

The Commission Communication of 3 June 2003 on the reform of public utilities in developing countries is mentioned as providing a good basis for further discussion.[16]

Table 10: The international dimension

- **There is a clear request to ensure that the positions taken by the Community in international trade negotiations are fully consistent with the EU's internal regulatory framework.**

- **A number of comments also call for more information and transparency as regards international trade negotiations.**

- **The crucial importance of basic essential services for the development of the poorest countries is widely recognised. Access to finance and the attraction of foreign investment are identified as the main problem.**

[16] The Reform of State-Owned Enterprises in Developing Countries with focus on public utilities: The Need to Assess All the Options, Communication from the Commission, COM(2003) 326, 3.6.2003

ANNEX 1: SUMMARY TABLE OF ALL QUESTIONS SUBMITTED FOR DISCUSSION

What kind of subsidiarity?

(1) Should the development of high-quality services of general interest be included in the objectives of the Community? Should the Community be given additional legal powers in the area of services of general economic and non-economic interest?

(2) Is there a need for clarifying how responsibilities are shared between the Community level and administrations in the Member States? Is there a need for clarifying the concept of services without effect on trade between Member States? If so, how should this be done?

(3) Are there services (other than the large network industries) for which a Community regulatory framework should be established?

(4) Should the institutional framework be improved? How could this be done? What should be the respective roles of competition and regulatory authorities? Is there a case for a European regulator for each regulated industry or for Europe-wide structured networks of national regulators?

Sector-specific legislation and general legal framework

(5) Is a general Community framework for services of general interest desirable? What would be its added value compared to existing sectoral legislation? Which sectors and which issues and rights should be covered? Which instrument should be used (e.g. directive, regulation, recommendation, communication, guidelines, inter-institutional agreement)?

(6) What has been the impact of sector-specific regulation so far? Has it led to any incoherence?

Economic and non-economic services

(7) Is it necessary to further specify the criteria used to determine whether a service is of an economic or a non-economic nature? Should the situation of non-for-profit organisations and of organisations performing largely social functions be further clarified?

(8) What should be the Community's role regarding non-economic services of general interest?

A common set of obligations

(9) Are there other requirements that should be included in a common concept of services of general interest? How effective are the existing requirements in terms of achieving the objectives of social and territorial cohesion?

(10) Should all or some of these requirements be extended to services to which they currently do not apply?

(11) What aspects of the regulation of these requirements should be dealt with at Community level and which aspects left to the Member States?

(12) Have these requirements been effectively implemented in the areas where they apply?

(13) Should some or all of these requirements also be applied to services of general interest of a non-economic nature?

Sector-specific Obligations

(14) Which types of services of general interest could give rise to security of supply concerns? Should the Community take additional measures?

(15) Should additional measures be taken at Community level to improve network access and interconnectivity? In which areas? What measures should be envisaged, in particular with regard to cross-border services?

(16) Which other sector-specific public service obligations should be taken into consideration?

(17) Should the possibility to take concrete measures in order to protect pluralism be re-considered at Community level? What measures could be envisaged?

Definition of Obligations and Choice of Organisation

(18) Are you aware of any cases in which Community rules have unduly restricted the way services of general interest are organised or public service obligations are defined at national, regional or local level? Are you aware of any cases in which the way services of general interest are organised or public service obligations are defined at national, regional or local level constitutes a disproportionate obstacle to the completion of the internal market?

(19) Should service-specific public service obligations be harmonised further at Community level? For which services?

(20) Should there be an enhanced exchange of best practice and benchmarking on questions concerning the organisation of services of general interest across the Union? Who should be involved and which sectors should be addressed?

Financing

(21) Are you aware of any cases in which Community law, and in particular the application of State aid rules, has impeded the financing of services of general interest or led to inefficient choices?

(22) Should a specific way of financing be preferred from the point of view of transparency, accountability, efficiency, redistributive effects or competition? If so, should the Community take appropriate measures?

(23) Are there sectors and/or circumstances in which market entry in the form of «cream-skimming» may be inefficient and contrary to the public interest?

(24) Should the consequences and criteria of solidarity-based financing be clarified at Community level?

Evaluation

(25) How should the evaluation of the performance of services of general interest be organised at Community level? Which institutional arrangements should be chosen?

(26) Which aspects should be covered by Community evaluation processes? What should be the criteria for Community evaluations? Which services of general interest should be included in an evaluation at Community level?

(27) How could citizens be involved in the evaluation? Are there examples of good practice?

(28) How can we improve the quality of data for evaluations? In particular, to what extent should operators be compelled to release data?

Trade Policy

(29) Is there any specific development at European Community internal level that deserves particular attention when dealing with services of general interest in international trade negotiations? Please specify.

Development Co-operation

(30) How can the Community best support and promote investment in the essential services needed in developing countries in the framework of its development co-operation policy?

ANNEX

Public service obligations and instruments of Community policy in the area of services of general economic interest 35

INTRODUCTION

1. The European Union is at a turning point in its history. It is preparing itself for an unprecedented wave of enlargement and, at the same time, within the context of the Convention, for a redefinition of its tasks and how its institutions operate under a new constitutional Treaty. It has also launched a development strategy based on the synergy between economic and social reforms with the added dimensions of sustainability and the environment.

2. In this context, *services of general interest* play an increasing role. They are a part of the values shared by all European societies and form an essential element of the European model of society. Their role is essential for increasing quality of life for all citizens and for overcoming social exclusion and isolation. Given their weight in the economy and their importance for the production of other goods and services, the efficiency and quality of these services is a factor for competitiveness and greater cohesion, in particular in terms of attracting investment in less-favoured regions. The efficient and non-discriminatory provision of services of general interest is also a condition for the smooth functioning of the Single Market and for further economic intergration in the European Union. Furthermore, these services are a pillar of European citizenship, forming some of the rights enjoyed by European citizens and providing an opportunity for dialogue with public authorities within the context of good governance.

3. In the perspective of the accession of the new Member States, the guarantee of efficient and high-quality services of general interest and in particular the development of the network industries and their interconnection are essential to facilitate integration, to increase citizens' well-being and to help individuals to make effective use of their fundamental rights. Also, several new Member States have over the last decade gone through the transition towards a market economy and their citizens must be assured as to the importance the Union attaches to everyone's access to services of general interest.

4. Services of general interest are at the core of the political debate. Indeed, they touch on the central question of the role public authorities play in a market economy, in ensuring, on the one hand, the smooth functioning of the market and compliance with the rules of the game by all actors and, on the other hand, safeguarding the general interest, in particular the satisfaction of citizens' essential needs and the preservation of public goods where the market fails.

5. In the early years of the Communities, the objective of economic integration led to concentrating efforts on the removal of barriers to trade between Member States. In particular, since the second half of the 1980s a number of sectors in which mainly, or at least also, services of general economic interest are provided,have gradually been opened up to competition. This has been the case with telecommunications, postal services, transport and energy. Liberalisation stimulated the modernisation, interconnection and integration of these sectors. It increased the number of competitors and led to price reductions, especially in those sectors and countries that liberalised earlier. Although there is as yet insufficient evidence to assess the long-term impact of the opening to competition of services of general interest, there is, based on the available information, no evidence supporting the thesis that liberalisation has had a negative impact on their overall performance, at least as far

as affordability and the provision of universal service are concerned. The Community has always promoted "controlled" liberalisation, i.e. gradual opening-up of the market accompanied by measures to protect the general interest, in particular through the concept of universal service to guarantee access for everyone, whatever the economic, social or geographical situation, to a service of a specified quality at an affordable price. In this context, it has given special attention to ensuring adequate standards for cross-border services that cannot be adequately regulated only at national level.

6. Initial fears that market opening would have a negative impact on employment levels or on the provision of services of general economic interest have so far proved unfounded. Market opening has generally made services more affordable. For consumers in the lowest income brackets, for example, the percentage of personal income needed to buy a standard basket of telephone calls or a standard volume of electricity consumption has fallen in most Member States between 1996 and 2002. The impact of market opening on net employment has also been broadly positive. Job losses, particularly amongst former monopolies, have been more than compensated for by the creation of new jobs thanks to market growth. Overall, the liberalisation of the network industries is estimated to have led to the creation of nearly one million jobs across the European Union[1].

7. In spite of these results, certain misapprehensions have been expressed after the first steps towards liberalisation. The Commission has repeatedly tried to clarify the relevant Community policies. In a first horizontal communication of 1996,[2] it explained the interplay for the citizens' benefit between Community measures in the areas of competition and free circulation and public service tasks. This communication also suggests adding the promotion of services of general interest to the objectives of the Treaty. It was updated in 2000[3] with a view to increasing the legal certainty for operators as regards the application of competition and internal market rules to their activities. In 2001, these two communications were complemented by a Report to the Laeken European Council[4]. This report responds to concerns with regard to the economic viability of operators entrusted with public service tasks. It highlights the guarantees offered by Article 86 (2) of the Treaty,[5] Community action and the responsibility of the Member States, in particular as regards the definition of public service obligations. In addition, the Commission has made efforts to better assess the performance of the industries providing services of general interest by carrying out sectoral and horizontal evaluations.

8. In the meantime, the debate has evolved and its emphasis has shifted. The Treaty of Amsterdam recognises the place of services of general economic interest among the

[1] The Internal Market – Ten Years without Frontiers, SEC(2002) 1417, 7.1.2003

[2] «Services of general interest in Europe», OJ C 281, 26.9.1996, p.3

[3] «Services of general interest in Europe», OJ C 17, 19.1.2001, p.4

[4] COM(2001) 598 final, 17.10.2001

[5] Article 86 (2) provides: «*Undertakings entrusted with the operation of services of general economic interest ... shall be subject to the rules contained in this Treaty, in particular to the rules on competition, insofar as the application of such rules does not obstruct the performance, in law or in fact, of the particular tasks assigned to them. The development of trade must not be affected to such an extent as would be contrary to the interests of the Community*»

shared values of the Union[6]. It also assigns the Community and the Member States, «each within their respective powers», responsibility for the smooth functioning of these services. In the "Protocol on the system of public broadcasting" it highlights that public broadcasting in the Member States is directly related to the democratic, social and cultural needs of each society and to the need to preserve media pluralism. In addition, the Union recognises and secures citizens' right of access to services of general economic interest in the Charter of Fundamental Rights[7]. These new provisions are important elements in the development of the process of European integration: from the economic sphere towards broader issues relating to the European model of society, to the concept of European citizenship and to the relations between every individual in the Union and the public authorities. They also raise the question of the means for their effective implementation. The Commission believes that these questions deserve a broader and more structured debate. Naturally, this debate will take into account and be inspired by work in progress – regarding, for example, the Union's values and objectives, the question of competencies or the principles of subsidiarity and proportionality - within the European Convention and in the forthcoming intergovernmental conference.

9. The uncertainties and concerns of citizens remain in evidence and require a response. The European Parliament suggested the Commission should present a proposal for a framework directive on services of general interest and the Council also asked the Commission to look into this question[8].

10. The reality of services of general interest which include services of both general economic and non-economic interest, is complex and constantly evolving. It covers a broad range of different types of activities, from certain activities in the big network industries (energy, postal services, transport, and telecommunications) to health, education and social services, of different dimensions, from European or even global to purely local, and of different natures, market or non-market. The organisation of these services varies according to cultural traditions, the history and geographical conditions of each Member State and the characteristics of the activity concerned, in particular technological development.

11. The European Union respects this diversity and the roles of national, regional and local authorities in ensuring the well-being of their citizens and in guaranteeing democratic choices regarding, among other things, the level of service quality. This diversity explains the various degrees of Community action and the use of different instruments. The Union also has its own role to play as part of its exclusive

[6] The Treaty provides in its Article 16 : «*Without prejudice to Articles 73, 86 and 87, and given the place occupied by services of general economic interest in the shared values of the Union as well as their role in promoting social and territorial cohesion, the Community and the Member States, each within their respective powers and within the scope of application of this Treaty, shall take care that such services operate on the basis of principles and conditions which enable them to fulfil their missions*»

[7] Article 36 of the Charter provides: «*The Union recognises and respects access to services of general economic interest as provided for in national law and practices, in accordance with the Treaty establishing the European Community, in order to promote the social and territorial cohesion of the Union*»

[8] See also the Presidency conclusions of the Barcelona European Council, 15 and 16 March 2002, para. 42 and of the Brussels European Council, 20 and 21 March 2003, para. 26

competencies. Moreover, throughout the European Union services of general interest raise a number of questions and issues that are common to different services and different competent authorities.

12. The debate that this Green Paper intends to launch raises questions with regard to

- the scope of possible Community action that implements the Treaty in full respect of the principle of subsidiarity,
- the principles that could be included in a possible framework directive or another general instrument concerning services of general interest and the added value of such an instrument,
- the definition of good governance in the area of organisation, regulation, financing and evaluation of services of general interest in order to ensure greater competitiveness of the economy and efficient and equitable access of all persons to high-quality services that are satisfying their needs,
- any measures that could contribute to increasing legal certainty and to ensuring a coherent and harmonious link between the objective of maintaining high-quality services of general interest and rigorous application of competition and internal market rules.

13. The Green Paper consists of five main parts plus an introduction and an operational conclusion. The first part outlines the background, the second part discusses the scope of Community action in the area of services of general interest, the third part provides a number of elements for a possible common concept of services of general economic interest, on the basis of existing sector-specific legislation, the fourth part looks at issues related to the way services of general interest are organised, financed and evaluated, and the fifth part addresses the international dimension of services of general interest. The Green Paper is accompanied by an annex which sets out public service obligations in more detail, as derived from existing sector-specific legislation and the policy instruments available to ensure compliance with these obligations.

14. The Green Paper raises a number of questions on which the Commission seeks comments from interested parties. A summary table of all the questions is attached to this document.

1. BACKGROUND

1.1. Definitions and terminology

15. Terminological differences, semantic confusion and different traditions in the Member States have led to many misunderstandings in the discussion at European level. In the Member States different terms and definitions are used in the context of services of general interest, thus reflecting different historical, economic, cultural and political developments. Community terminology tries to take account of these differences.

16. The term «*services of general interest*» cannot be found in the Treaty itself. It is derived in Community practice from the term «services of general economic interest», which is used in the Treaty. It is broader than the term «services of general

economic interest» and covers both market and non-market services which the public authorities class as being of general interest and subject to specific public service obligations.

17. The term «*services of general economic interest*» is used in Articles 16 and 86(2) of the Treaty. It is not defined in the Treaty or in secondary legislation. However, in Community practice there is broad agreement that the term refers to services of an economic nature which the Member States or the Community subject to specific public service obligations by virtue of a general interest criterion. The concept of services of general economic interest thus covers in particular certain services provided by the big network industries such as transport, postal services, energy and communications. However, the term also extends to any other economic activity subject to public service obligations.

18. The Green Paper focuses mainly, but not exclusively, on issues related to «services of general economic interest», as the Treaty itself focuses mainly on economic activities. The term «services of general interest» is used in the Green Paper only where the text also refers to non-economic services or where it is not necessary to specify the economic or non-economic nature of the services concerned.

19. The terms «service of general interest» and «service of general economic interest» must not be confused with the term «*public service*». This term is less precise. It can have different meanings and can therefore lead to confusion. The term sometimes refers to the fact that a service is offered to the general public, it sometimes highlights that a service has been assigned a specific role in the public interest, and it sometimes refers to the ownership or status of the entity providing the service[9] Therefore, this term will not be used in this Green Paper.

20. The term «*public service obligations*» is used in this Green Paper. It refers to specific requirements that are imposed by public authorities on the provider of the service in order to ensure that certain public interest objectives are met, for instance, in the matter of air, rail and road transport and energy. These obligations can be applied at Community, national or regional level.

21. The term «*public undertaking*» is normally also used to define the ownership of the service provider. The Treaty provides for strict neutrality. It is irrelevant under Community law whether providers of services of general interest are public or private; they are subject to the same rights and obligations.

1.2. An evolving and crucial role for public authorities

22. The market usually ensures optimum allocation of resources for the benefit of society at large. However, some services of general interest are not fully satisfied by markets alone because their market price is too high for consumers with low purchasing power or because the cost of providing these services could not be covered by market price. Therefore, it has always been the core responsibility of public authorities to ensure that such basic collective and qualitative needs are satisfied and that services

[9] There is often confusion between the term «public service» and the term «public sector». The term «public sector» covers all public administrations together with all enterprises controlled by public authorities

of general interest are preserved wherever market forces cannot achieve this. To date, the crucial importance of this responsibility has not changed.

23. However, what has changed is the way in which public authorities fulfil their obligations towards the citizens. Indeed, the role of public authorities in the context of services of general interest is constantly adapting to economic, technological and social developments. In Europe, a number of services of general interest have traditionally been provided by public authorities themselves. Nowadays, public authorities increasingly entrust the provision of such services to public or private undertakings or to public-private partnerships (PPPs)[10] and limit themselves to defining public objectives, monitoring, regulating and, where necessary, financing those services.

24. This development should not mean that public authorities renounce their responsibility to ensure that objectives of general interest are implemented. By means of appropriate regulatory instruments public authorities should have the capability to shape national, regional or local policies in the area of services of general interest and to ensure their implementation. However, this development from self-provision towards the provision through separate entities has made the organisation, the cost and financing of these services more transparent. This is reflected in a broader debate and in stronger democratic control of the ways in which services of general interest are provided and financed. This increased transparency also reduces the possibility to use financing mechanisms to limit competition on these markets.

25. In the European Union, the creation of the internal market has accelerated this process. At the same time, the changing role of public authorities regarding the provision of services of general interest has also influenced the development of Community policies.

26. The process of European integration has never called into question the primary responsibility or the capability of public authorities for making the necessary political choices regarding the regulation of market activities. The Commission intends to reaffirm this responsibility by stimulating a European debate on the political choices to be made concerning services of general interest at European level. The results of this debate will form the basis for future Community policies in this field.

2. THE SCOPE OF COMMUNITY ACTION

27. As regards the scope of Community action, three main issues are addressed in this section:

[10] The Commission intends to publish a Green Paper on public procurement and Public-Private-Partnerships in the second semester of 2003. In its Communication “Developing the trans-European transport network: innovative funding solutions and interoperability of electronic toll collection systems”, COM(2003) 132final, 23.4.2003, the Commission examined PPPs in the light of the need to find funding solutions for the development of the transport network

- How, in the light of the principle of subsidiarity, should responsibilities in the area of services of general interest be shared between the Community and the Member States, including regional and local administrations?

- Should Community action be based on an essentially sector-specific approach or should a general framework be created?

- How is the scope of Community action affected by the distinction between economic and non-economic services?

2.1. What kind of subsidiarity?

28. In the area of services of general interest the division of tasks and powers between the Community and the Member States is complex and sometimes leads to misapprehension and frustration on the part of consumers, users and operators.

29. The Treaty does not mention the functioning of services of general interest as a Community objective and does not assign specific positive powers to the Community in the area of services of general interest. To date, except for a sector-specific reference in the title on transport,[11] these services are referred to in two provisions of the Treaty:

- Article 16 confers responsibility upon the Community and the Member States to ensure, each within their respective sphere of competencies, that their policies enable services of general economic interest to fulfil their missions. It spells out a principle of the Treaty although it does not provide the Community with specific means of action.

- Article 86(2) implicitly recognises the right of the Member States to assign specific public service obligations to economic operators. It sets out a fundamental principle ensuring that services of general economic interest can continue to be provided and developed in the common market. Providers of services of general interest are exempted from application of the Treaty rules only to the extent that this is strictly necessary to allow them to fulfil their general interest mission. Therefore, in the event of conflict, the fulfilment of a public service mission can effectively prevail over the application of Community rules, including internal market and competition rules, subject to the conditions foreseen in Article 86 (2)[12]. Thus, the Treaty protects the effective performance of a general interest task but not necessarily the provider as such.

30. Furthermore, according to the Charter of Fundamental Rights of the European Union, the Union recognises and respects access to services of general economic interest, in order to promote the social and territorial cohesion of the Union.[13]

31. It is primarily for the competent national, regional and local authorities to define, organise, finance and monitor services of general interest. The Community for its

[11] See Article 73 of the Treaty

[12] In its Communcation on Services of general interest in Europe of 2000 the Commission explained the three principles that underlie the application of this provisions, i.e. the principles of neutrality, freedom to define and proportionality

[13] See Article 36 of the Charter of Fundamental Rights

part has competencies in areas that are also relevant for services of general interest, such as: the internal market, competition and State aid, free movement, social policy, transport, environment, health, consumer policy, trans-European networks, industry, economic and social cohesion, research, trade and development co-operation, and taxation. The competencies and responsibilities conferred by the Treaty provide the Community with a whole range of means of action to ensure that every person in the European Union has access to high-quality services of general interest.

Services of general interest linked to the function of welfare and social protection are clearly a matter of national, regional and local responsibilities. Nevertheless, there is a recognised role for the Community in promoting co-operation and co-ordination in these areas. A particular concern for the Commission is promoting the co-operation by Member States in matters related to the modernisation of social protection systems.

32. Three categories of services of general interest can be distinguished as regards the need and intensity of Community action and the role of the Member States:

(1) Services of general economic interest provided by large network industries

Since the 1980s the Community has pursued the gradual opening of the markets for large network industries such as telecommunications, postal services, electricity, gas and transport in which services of general economic interest can be provided. At the same time, the Community has adopted a comprehensive regulatory framework for these services which specifies public service obligations at European level and includes aspects such as universal service, consumer and user rights and health and safety concerns. These industries have a clear Community-wide dimension and present a strong case for developing a concept of European general interest. This is also recognised in Title XV of the Treaty, which gives the Community specific responsibility for trans-European networks in the areas of transport, telecommunications and energy infrastructure, with the dual objective of improving the smooth functioning of the internal market and strengthening social and economic cohesion.

(2) Other services of general economic interest

Other services of general economic interest, such as waste management, water supply or public service broadcasting, are not subject to a comprehensive regulatory regime at Community level. In general, the provision and organisation of these services are subject to internal market, competition and State aid rules provided that these services can affect trade between Member States. In addition, specific Community rules, such as environmental legislation, may apply to certain aspects of the provision of these services.

For the disposal of waste (e.g. landfill), for example, provisions in Community waste legislation establish the "principle of proximity"[14]. According to this principle, waste should be disposed of as near as possible to the place it was generated.

[14] See in particular Council Directive 75/442/EEC on waste, OJ L 194, 25.7.1975, p. 47, and Council Regulation (EEC) 259/93 on shipment of waste, OJ L 30, 6.2.1993, p. 1

As regards television broadcasting, the regulatory regime is co-ordinated at Community level by the "Television without Frontiers Directive",[15] in particular in respect of events of major importance for society, promotion of European works and independent production, advertising and protection of minors. Because of the importance of public service broadcasting for the democratic, social and cultural needs of each society a specific Protocol on the systems of public broadcasting in the Member States has been annexed to the Amsterdam Treaty. In its communication on "Principles and guidelines for the Community's audio-visual policy in the digital age"[16], the Commission sets out regulatory principles concerning public service broadcasting. The Commission has further explained its approach in a Communication of 17 October 2001 on the application of the state aid rules to public service broadcasting[17]. It takes into account in particular the fact that the audio-visual landscape in the European Community is characterised by a dual system comprising public and private broadcasters.

(3) Non-economic services and services without effect on trade

Services of general interest of a non-economic nature and services without effect on trade between Member States are not subject to specific Community rules, nor are they covered by the internal market, competition and State aid rules of the Treaty. However, they are covered by those Community rules that also apply to non-economic activities and to activities that have no effect on intra-Community trade, such as the basic principle of non-discrimination.

33. Thus, the Community has developed a policy on services of general interest based on various degrees of action and on the use of different instruments. However, on the one hand, the creation of a sector-specific framework at Community level does not in itself guarantee that every individual has access to efficient and high-quality services throughout the European Union. It is up to the competent authorities in the Member States to specify and complement the Community rules on public service obligations and to monitor their implementation. On the other hand, the Commission can take specific direct measures to enforce Community rules in the areas of competition and State aid. This could give the impression of an imbalance in Community action that could ultimately affect its credibility.

34. Community legislation on network industries has taken account of the importance of public administrations of the Member States in the implementation of legislation in the area of services of general interest by requiring the creation of independent regulatory authorities. Community legislation leaves the detailed institutional

[15] Council Directive 89/552/EEC of 9 October 1989 on the co-ordination of certain provisions laid down by law, regulation or administrative action in Member States concerning the pursuit of television broadcasting activities, OJ L 298, 17.10.1989, p.23

[16] COM(1999) 657, 14.12.1999

[17] OJ C 320, 15.11.2001, p. 5. In this Communication, the Commission recognises the particular role of public service broadcasting in the promotion of democratic, social and cultural needs of each society, as acknowledged by the Protocol to the Amsterdam Treaty. Member States are competent for the definition and choice of funding of the public service and are free to define as public service remit a braod programme spectrum that may include, for instance, entertainment and sports events. The Commission retains a duty to check for abusive practices and absence of overcompensation according to the specific criteria laid down in the Communication

arrangements regarding the regulatory authority to the discretion of Member States. It can thus be an existing body or the Ministry responsible for the sector, a solution adopted by a limited number of Member States. This solution has proven to be problematic in terms of the independence of the national regulatory authority in some instances where Member States also retain ownership or control over companies active in the sector concerned. The importance and ongoing, complex and evolving nature of the regulatory tasks involved often requires the expertise and independence of a sector-specific regulatory body[18]. Such a regulator is important to complement the action of competition authorities in terms of objectives, sectoral expertise, and timing and continuity of the intervention. In particular, specific regulatory bodies have a major role to play to ensure the provision of services of general interest, to put in place the conditions for fair competition, to prevent disruptions of service or supply, and to ensure an adequate level of consumer protection. Nearly all Member States have set up such a body for the sectors concerned. However, even where a sector-specific regulatory authority exists, the government – i.e. the competent Ministry – often retains responsibility for certain regulatory decisions.

35. Furthermore, Community legislation and practice encourages co-operation and exchanges of best practice among regulatory authorities in the Member States and between them and the Commission. Whilst the creation of national regulatory authorities is to a large extent a reality, the creation of European regulators for services of general interest or the deepening of co-operation between regulators of each Member State (e.g. structured networks) has not yet been widely discussed and could raise questions. Among the objectives are the necessity to obtain a degree of consistency of national regulatory approaches to avoid distortions stemming from different approaches that could have an impact on the good functioning of the internal market as well as the need to improve the operation of these services.

36. The following questions are submitted for discussion:

(1) Should the development of high-quality services of general interest be included in the objectives of the Community? Should the Community be given additional legal powers in the area of services of general economic and non-economic interest?

(2) Is there a need for clarifying how responsibilities are shared between the Community level and administrations in the Member States? Is there a need for clarifying the concept of services without effect on trade between Member States? If so, how should this be done?

(3) Are there services (other than the large network industries mentioned in para. 32) for which a Community regulatory framework should be established?

(4) Should the institutional framework be improved? How could this be done? What should be the respective roles of competition and regulatory authorities? Is there a case for a European regulator for each regulated industry or for Europe-wide structured networks of national regulators?

[18] A definition of a sector-specific regulatory authority is contained in Commission Decision 2002/627/EC of 29 July 2002 establishing the European Regulators Group for Electronic Communications Networks and Services, OJ L 200/38, 30.7.2002: «*For the purpose of this Decision: 'relevant national regulatory authority' means the public authority established in each Member State to oversee the day-to-day interpretation and application of the provisions of the Directives relating to electronic communications networks and services as defined in the Framework Directive*»

2.2. Sector-specific legislation and general legal framework

37. Up to now, the Community has adopted legislation on services of general interest on a sectoral basis. Thus, a comprehensive body of sector-specific legislation has been developed for different network industries such as electronic communications, postal services, gas and electricity, and transport, in which services of general economic interest can be provided. In the light of the experience gained, the question was raised whether a common European framework should be developed in order to ensure coherent implementation of the principles underlying Article 16 of the Treaty at Community level. In this context, the Commission made a commitment to the Laeken European Council to find the best instrument to ensure the development of high-quality services of general interest in the European Union, in strict coherence with all Community policies.

38. A general instrument could set out, clarify and consolidate the objectives and principles common to all or several types of services of general interest in fields of Community competence. Such an instrument could provide the basis for further sectoral legislation, which could implement the objectives set out in the framework instrument, thus simplifying and consolidating the internal market in this field.

39. Consolidation of the Community "*acquis*" could be based on common elements of existing sector-specific legislation and would help to ensure overall consistency of approach across different services of general interest sectors. It could also have important symbolic value in that it would clearly demonstrate the Community's approach as well as the existence of a Community concept of services of general interest. Furthermore, consolidation could help the new Member States to develop their regulatory strategies in this area.

40. However, such an approach would also have its limitations in that a framework instrument setting out common objectives and principles would be general in nature, as it would have to be based on the common denominator of different services with very different characteristics. If current levels of protection were to be maintained, it would still have to be complemented by sector-specific legislation laying down more detailed provisions which take into account the specific characteristics of different services of general interest. Moreover, Article 16 does not provide a legal base for the adoption of a specific instrument. Other Treaty provisions could serve as a legal basis, depending on the content of the instrument. For example, Article 95 could be used, but a framework instrument based on this provision would have to be limited to services of general *economic* interest having an effect on intra-Community trade. This would mean that many important sectors would be excluded from the scope of the instrument because of their non-economic nature or because of their limited effect on trade. If Community legislation such sectors is considered desirable, an amendment of the Treaty might be the best way of providing an appropriate legal basis.

41. As regards its legal form, consolidation of common objectives and principles could be set out in a legislative instrument (i.e. in a directive or in a regulation) or in a non-legislative instrument (recommendation, communication, guidelines, inter-institutional agreement). Apart from their different legal effects, the various

instruments also differ from the point of view of the degree of involvement of the different Community institutions in the adoption procedure[19].

42. The following questions are submitted for discussion:

(5) Is a general Community framework for services of general interest desirable? What would be its added value compared to existing sectoral legislation? Which sectors and which issues and rights should be covered? Which instrument should be used (e.g. directive, regulation, recommendation, communication, guidelines, inter-institutional agreement)?

(6) What has been the impact of sector-specific regulation so far? Has it led to any incoherence?

2.3. ECONOMIC AND NON-ECONOMIC SERVICES

43. The distinction between services of an economic nature and services of a non-economic nature is important because they are not subject to the same rules of the Treaty. For instance, provisions such as the principle of non-discrimination and the principle of free movement of persons apply with regard to the access to all kind of services. The public procurement rules apply to the goods, services or works acquired by public entities with a view to providing both services of economic and non-economic nature. However, the freedom to provide services, the right of establishment, the competition and State aid rules of the Treaty only apply to economic activities. Also, Article 16 of the Treaty and Article 36 of the Charter of Fundamental Rights refer only to services of general *economic* interest.

44. As regards the distinction between services of an economic nature and services of a non-economic nature, any activity consisting in offering goods and services on a given market is an economic activity[20]. Thus, economic and non-economic services can co-exist within the same sector and sometimes even be provided by the same organisation. Furthermore, while there may be no market for the provision of particular services to the public, there may nevertheless be an upstream market where undertakings contract with the public authorities to provide these services. The internal market, competition and state aid rules apply to such upstream markets.

45. The range of services that can be provided on a given market is subject to technological, economic and societal change and has evolved over time. As a consequence, the distinction between economic and non-economic activities has been dynamic and evolving, and in recent decades more and more activities have become of economic relevance. For an increasing number of services, this distinction has become blurred. In its Communication of 2000, the Commission set out a number of examples of non-economic activities[21]. These examples concern in particular matters which are intrinsically prerogatives of the State, services such as

[19] In this context it should be noted that the Union's legal instruments are the subject of discussions within the European Convention. Indeed, Articles 24 to 28 of the Preliminary Draft Constitutional Treaty set out the proposed range of legal instruments

[20] Judgment of the Court of Justice in joint cases C-180-184/98 *Pavel Pavlov and Others v Stichting Pensioenfonds Medische Specialisten* [2000] ECR I-6451

[21] OJ C 17, 19.1.2001, p. 4 (Nos 28-30)

national education and compulsory basic social security schemes, and a number of activities conducted by organisations performing largely social functions, which are not meant to engage in industrial or commercial activity. Given that the distinction is not static in time, the Commission stressed in its Report to the Laeken European Council that it would neither be feasible nor desirable to provide a definitive *a priori* list of all services of general interest that are to be considered «non-economic»[22].

46. Although the evolving and dynamic character of this distinction has not created problems in Commission practice so far, it has raised concerns, in particular among providers of non-economic services who ask for more legal certainty regarding their regulatory environment.

47. Furthermore, the future of non-economic services of general interest, whether they are related to prerogatives of the State or linked to such sensitive sectors as culture, education, health or social services, raises issues on a European scale, such as the content of the European model of society. The active role of charities, voluntary organisations and humanitarian organisations explains in part the importance that European citizens attach to these issues.

48. The following questions are submitted for discussion:

(7) Is it necessary to further specify the criteria used to determine whether a service is of an economic or a non-economic nature? Should the situation of non-for-profit organisations and of organisations performing largely social functions be further clarified?

(8) What should be the Community's role regarding non-economic services of general interest?

3. TOWARDS A COMMUNITY CONCEPT OF SERVICES OF GENERAL INTEREST?

49. It is probably neither desirable nor possible to develop a single comprehensive European definition of the content of services of general interest. However, existing Community legislation on services of general economic interest contains a number of common elements that can be drawn on to define a useful Community concept of services of general economic interest. These elements include in particular: universal service, continuity, quality of service, affordability, as well as user and consumer protection. These common elements identify Community values and goals. They have been transposed into obligations in the respective legislations and aim to ensure objectives such as economic efficiency, social or territorial cohesion and safety and security for all citizens. They can also be complemented by more specific obligations depending on the characteristics of the sector concerned. Developed in particular for certain network industries they could also be relevant for social services.

[22] COM(2001)598, 17.10.2001 (No 30)

3.1. A common set of obligations

3.1.1 Universal service

50. The concept of universal service refers to a set of general interest requirements ensuring that certain services are made available at a specified quality to all consumers and users throughout the territory of a Member State, independently of geographical location, and, in the light of specific national conditions, at an affordable price[23]. It has been developed specifically for some of the network industries (e.g. telecommunications, electricity, and postal services). The concept establishes the right for every citizen to access certain services considered as essential and imposes obligations on industries to provide a defined service at specified conditions, including complete territorial coverage. In a liberalised market environment, a universal service obligation guarantees that everybody has access to the service at an affordable price and that the service quality is maintained and, where necessary, improved.

51. Universal service is a dynamic concept. It ensures that general interest requirements can take account of political, social, economic and technological developments and it allows these requirements, where necessary, to be regularly adjusted to the citizens' evolving needs.

52. It is also a flexible concept that is fully compatible with the principle of subsidiarity. Where the basic principles of universal service are defined at Community level, the implementation of these principles can be left to the Member States, thus allowing different traditions and specific national or regional circumstances to be taken into account. Furthermore, the concept of universal service can apply to different market structures and can therefore be used to regulate services in different stages of liberalisation and market opening.

53. During the last two decades, the concept of universal service has developed into a major and indispensable pillar of the Community's policy on services of general economic interest. It has allowed public interest requirements to be addressed in various domains, such as economic efficiency, technological progress, environmental protection, transparency and accountability, consumer rights and specific measures regarding disability, age or education. The concept has also contributed to reducing the levels of disparity in living conditions and opportunities in the Member States.

54. Implementation of the principle of universal service is a complex and demanding task for national regulators which in many cases have only been recently created and whose experience is therefore necessarily still limited. At Community level, rights of access to services are defined in different directives, but the Community institutions alone cannot ensure that these rights are fully granted in practice. There is a risk that these rights as set out in Community legislation remain theoretical, even where they are formally transposed in national legislation.

[23] Cf. Article 3(1) of Directive 2002/22/EC of the European Parliament and of the Council of 7 March 2002 on universal service and users' rights relating to electronic communications networks and services (Universal Service Directive), OJ L 108, 24.4.2002, p. 51

3.1.2 Continuity

55. A number of services of general interest are characterised by a continuity requirement, i.e. the provider of the service is obliged to ensure that the service is provided without interruption. As regards some services, uninterrupted provision may already be in the commercial interest of the provider and it might therefore not be necessary to impose a legal continuity requirement on the operator. At national level, the continuity requirement needs to be reconciled with the employees' right to strike and with the requirement to respect the rule of law.

56. The requirement of ensuring a continuous service is not consistently addressed in sector-specific Community legislation. In some cases, sector-specific Community legislation explicitly sets out a continuity obligation[24]. In other cases, sector-specific regulation does not contain a continuity requirement, but it explicitly authorises Member States to impose such an obligation on service providers[25].

3.1.3 Quality of service

57. The definition, monitoring and enforcement of quality requirements by public authorities have become key elements in the regulation of services of general interest.

58. In the sectors that have been liberalised the Community did not rely on market forces alone to maintain and develop the quality of services. Whilst in general it is for the Member States to define quality levels for services of general interest, in some cases, quality standards are defined in Community legislation. They include, for instance, safety regulations, the correctness and transparency of billing, territorial coverage, and protection against disconnection. In other cases, Member States are authorised or required to set quality standards. Furthermore, in some cases Member States are required to monitor and enforce compliance with quality standards and to ensure publication of information on quality standards and actual performance by operators. The most developed regulation of quality at Community level can be found in the legislation on postal services and on electronic communications services.

59. In addition, the Commission has developed non-regulatory measures to promote quality in services of general economic interest – including financial instruments, voluntary European standards, and exchanges of good practice. For instance, in the

[24] For instance, Article 3(1) of the postal directive (97/67/EC) obliges Member States to "*ensure the permanent provision of a postal service*." Cf. Directive 97/67/EC of the European Parliament and of the Council of 15 December 1997 on common rules for the development of the internal market of Community postal services and the improvement of quality of service, OJ L 15 , 21.1.1998, p. 14

[25] Article 3(2) of the electricity directive provides that "*Member States may impose on undertakings operating in the electricity sector, in the general economic interest, public service obligations which may relate to security, including ... regularity... of supplies... . Such obligations must be clearly defined, transparent, non-discriminatory and verifiable; they, and any revision thereof, shall be published and notified to the Commission by Member States without delay.*" Cf. Directive 96/92/EC of the European Parliament and of the Council of 19 December 1996 concerning common rules for the internal market in electricity, OJ L 27, 30.1.1997, p. 20

electricity and gas sectors, the Community promotes voluntary co-operation between regulators.

3.1.4. *Affordability*

60. The concept of affordability was developed in the context of the regulation of telecommunications services. Subsequently, it was also introduced into the regulation of postal services.[26] It requires a service of general economic interest to be offered at an affordable price in order to be accessible for everybody. Application of the principle of affordability helps to achieve economic and social cohesion within the Member States.

61. The sector-specific legislation in place does not specify the criteria for determining affordable prices. These criteria must be defined by the Member States. Relevant criteria could be linked, for example, to the penetration rate or to the price of a basket of basic services related to the disposable income of specific categories of customers. Particular attention should be paid to the needs and capacities of vulnerable and marginalised groups. Finally, once an affordable level has been set, the Member States should ensure that this level is effectively offered, by putting in place a price control mechanism (price cap, geographical averaging) and/or by distributing subsidies to the persons concerned.

3.1.5. *User and consumer protection*

62. In services of general interest, horizontal consumer protection rules apply as they do in other sectors of the economy. In addition, because of the particular economic and social importance of these services, specific measures have been adopted in sectoral Community legislation to address the specific concerns and needs of consumers and businesses, including their right to have access to high-quality international services[27]. Consumer and user rights are set out in sector-specific legislation on electronic communications, postal services, energy (electricity, gas), transport and broadcasting. The Commission's consumer policy strategy 2002-2006[28] has identified services of general interest as one of the policy areas where action is needed to ensure a high common level of consumer protection.

63. The Commission Communication on services of general interest of September 2000[29] sets out a number of principles that can help to define consumers' and users' requirements for those services. These principles include good quality of service, high levels of health protection and physical safety of services, transparency (e.g. on tariffs, contracts, choice and financing of providers), choice of service, choice of supplier, effective competition between suppliers, existence of regulatory bodies, availability of redress mechanisms, representation and active participation of consumers and users in the definition and evaluation of services and choice of forms of payment. The Communication highlighted that a guarantee of universal access, continuity, high quality and affordability constitute key elements of a consumer

[26] In the context of the proposed amendment of the electricity and gas directive the broader concept of "reasonable pricing" is being dicussed

[27] For example, in air transport, this includes measures against over-booking and a compensation scheme for denied boarding

[28] COM(2002) 208; OJ C 137, 8.6.2002, p. 2

[29] OJ C 17, 19.1.2001, p. 4

policy in the area of services of general economic interest. It also stressed the need to address citizens' concerns that are of a wider nature, such as a high level of environment protection, specific needs of certain categories of the population, such as the handicapped and those on low incomes and complete territorial coverage of essential services in remote or inaccessible areas.

64. The following questions are submitted for discussion:

(9) Are there other requirements that should be included in a common concept of services of general interest? How effective are the existing requirements in terms of achieving the objectives of social and territorial cohesion?

(10) Should all or some of these requirements be extended to services to which they currently do not apply?

(11) What aspects of the regulation of these requirements should be dealt with at Community level and which aspects left to the Member States?

(12) Have these requirements been effectively implemented in the areas where they apply?

(13) Should some or all of these requirements also be applied to services of general interest of a non-economic nature?

3.2. Further specific obligations

65. A number of sector-specific related obligations that are in the general interest could add to a common set of public service obligations. These obligations include safety and security, security of supply, network access and interconnectivity, and media pluralism.

66. Safety and Security

In a world that is rapidly and dramatically changing, citizens in the European Union need to feel, and be, safe and secure. This is becoming increasingly important following a number of events. In particular after 11 September 2001, safety and security has even come on stage as a priority for Europe as a whole. Various other events have recently underlined this concern.[30] One of the basics of the European model of society is therefore security and safety.

Safety and security refer to a common set of objectives that exist in almost all Member States. Notably, the idea is to prevent prejudices to or attacks against society. They can take on different forms. Typically, these objectives have been pursued in Europe by means of services of general interest. Traditionally they have been carried out under the umbrella of the State and without always pursuing commercial objectives.

Lately, the Commission is committed to increasing the level of security as well as adopting a more European approach in certain fields, for instance in transport and

[30] Sinking of the Petrol vessel "Prestige" and the recent SARS

energy. It is worth mentioning the Commission’s Communication on “*the repercussions of the terrorist attacks in the United States or the air transport industry*”[31], its proposals after the various major maritime accidents along the European coasts[32] or the recent nuclear package towards a Community approach to nuclear safety[33]. These texts underline various objectives to be pursued by Europe as a whole. Major impetus has been given and the levels of safety and security should thus be increased. The reasons for this new approach are widespread and various. For example, problems usually exceed national frontiers, international conventions and rules do not usually have binding force, and Member States are sometimes confronted with the limitations imposed by Community rules.

67. *Security of supply*

A high level of service quality implies that a sustainable provision of the services is ensured in the long term. In general, the development of the internal market has generated a considerable increase in the level of security of supply of products and services, to the extent that the markets concerned are functioning competitively. However, in some cases of services of general interest public intervention may be necessary to improve the security of supply, in particular in order address the risk of long-term underinvestment in infrastructure and to guarantee the availability of sufficient capacity.

68. In the energy sector, the issue of supply security has been the subject of a broad public debate at Community level on the basis of a Green Paper the Commission published in 2001[34]. The Green Paper aims to initiate a debate with a view to defining a long-term strategy for energy supply security that is geared to ensuring the uninterrupted physical availability of energy products on the market, at a price which is affordable for consumers and users, while taking account of both environmental concerns and sustainable development. The Commission reported on the results of the public debate in a communication in June 2002[35]. On the basis of this consultation, the Commission concluded in its Report that it was necessary to increase the co-ordination of measures ensuring security of supply in the field of energy. As a follow-up, the Commission submitted, in September 2002, two proposals for directives, which will help to improve the security of supply of petroleum products and natural gas in the European Union[36].

[31] Dated 10.10.2003

[32] In addition to the most recent proposals following the Prestige accident, see also the proposals put forward by the European Commission after the sinking of the Erika vessel in 1999: COM (2000) 142 and COM (2000) 802

[33] Adopted on the 6 November 2002. See in particular the Communication on nuclear safety (COM 2002) 605 final

[34] Towards a European strategy for the security of Energy supply, Green Paper, COM(2000)769, 29.11.2000

[35] Final Report on the Green Paper "Towards a European strategy for the security of Energy supply", COM(2002)321, 29.6.2002

[36] Proposal for a Directive of the European Parliament and of the Council concerning the alignment of measures with regard to security of supply for petroleum products, OJ C 331 E, 31.12.2002, p. 249; and Proposal for a Directive of the European Parliament and of the Council concerning measures to safeguard security of natural gas supply, OJ C 331 E, 31.12.2002, p. 262

69. Some services of general interest outside the energy sector may also give rise to supply security concerns Yet Community secondary legislation generally does not address the issue. It may therefore be useful to consider whether there are other sectors in which the issue of supply security should be raised specifically. However, any assessment should take into account that specific additional measures aimed at increasing the security of supply usually entail an additional economic cost and could reduce competition. Any action proposed to increase security of supply therefore needs to ensure that the ensuing cost is not greater than the expected benefits[37].

70. *Network access and interconnectivity*

Where there is effective competition, market mechanisms may ensure the provision of affordable services of an adequate quality, thus greatly reducing the need for regulatory intervention. Where services of general economic interest are provided on the basis of networks with universal coverage, the incumbent undertaking enjoys a substantial competitive advantage, mainly due to substantial sunk costs involved in establishing and maintaining alternative networks. In cases where competitors can only operate as service providers, access to the incumbent network is indispensable for market entry.However, even in sectors where competitors do have the right to deploy their own network infrastructure network access may be necessary for competitors to be able to compete with the incumbent on downstream markets. If third party access to existing networks at fair and non-discriminatory conditions was not possible, *de facto* monopolies or at least the incentive for the incumbent to discriminate in the access terms, thus distorting competition downstream, would be maintained. Therefore, in order to meet competition policy and internal market objectives, thereby offering customers more choice, higher quality and lower prices, sector-specific Community legislation for the sectors liberalised at Community level harmonises and regulates the access to network infrastructures.

71. The Community has adopted different regulatory strategies for different network industries and services of general interest. This is because these industries are indeed different and at different stages of the liberalisation process. They differ notably in their profitability, their production structure, their capital intensity, their methods of service delivery, and their demand structure. In some sectors, the incumbent operator can remain vertically integrated, but must grant network access to allow market entry by competitors. In telecommunications, public operators have an obligation to negotiate interconnection their networks. In addition, competitors have the right to use the incumbent’s infrastructure. This is also the current system in electricity and gas. In the postal sector, new entrants have established networks for the distribution of parcels without requesting access to the incumbent’s infrastructure. Where an obligation to grant access exists, the pricing of access has proven to be the crucial regulatory issue.

72. Experience shows that there is probably no single ideal approach to the regulation of network access. Choices must take account of the characteristics of each industry. For this reason, the Community has so far pursued a sector-specific approach in regulating access in the network industries. However, consideration could be given to

[37] Cf. Commission Staff Working Paper, Security of supply, The current situation at European Union level, SEC(2002)243, 28.2.2002

whether useful lessons could be learned from a cross-sectoral comparison of regulatory strategies and techniques.

73. *Media pluralism*

Measures to ensure media pluralism typically limit maximum holdings in media companies and prevent cumulative control or participation in several media companies at the same time. Their aim is to protect the freedom of expression and to ensure that the media reflect a spectrum of views and opinions that characterise a democratic society.

74. It should first be noted that the protection of media pluralism is primarily a task for the Member States. At present, secondary Community legislation does not contain any provisions directly aiming to safeguard the pluralism of the media. However, Community law allows the application of national safeguards with regard to media pluralism. The purpose of existing Community law instruments is to ensure a certain economic balance between market operators: these instruments, therefore affect the media sector as an area of economic activity and not – or at least only very indirectly - as a means of delivering information to the citizen. Back in December 1992, the Commission published a Green Paper[38] designed to launch public debate on the need for Community action in this field. The debate did not allow clear operational conclusions to be drawn and no formal initiative was taken by the Commission. Ten years later, given the progressing concentration of the media sector and the proliferation of electronic media, the protection of media pluralism remains an important issue[39]. Views are sought as to whether the Commission should re-examine the need for Community action in this field in more detail.

75. The following questions are submitted for discussion:

(14) Which types of services of general interest could give rise to security of supply concerns? Should the Community take additional measures?

(15) Should additional measures be taken at Community level to improve network access and interconnectivity? In which areas? What measures should be envisaged, in particular with regard to cross-border services?

(16) Which other sector-specific public service obligations should be taken into consideration?

(17) Should the possibility to take concrete measures in order to protect pluralism be re-considered at Community level? What measures could be envisaged?

[38] Pluralism and Media Concentration in the Internal Market, An Assessment of the need for Community action, Commission Green Paper, COM(92)480, 23.12.1992

[39] See also the specific Protocol on the system of public broadcasting in the Member States annexed to the EC Treaty by the Treaty of Amsterdam

4. GOOD GOVERNANCE: ORGANISATION, FINANCING AND EVALUATION

76. As regards the intervention of public authorities in the Member States in the provision of services of general interest, three aspects can be highlighted to provide greater clarity:

- definition and enforcement of obligations and choice of organisation,
- financing of services of general interest,
- evaluation of services of general interest.

4.1. Definition of obligations and choice of organisation

77. As stated above, the national, regional and local authorities of each Member State are in principle free to define what they consider to be a service of general interest. This freedom to define also includes the freedom to impose obligations on the providers of such services, provided that these obligations are in conformity with Community rules. In the absence of specific Community legislation, it is therefore in principle for the Member States to define requirements such as universal service obligations, territorial coverage requirements, quality and safety standards, user and consumer rights, and environmental requirements.

78. Only in the case of the big network industries has the Community harmonised provisions on public service obligations and defined common requirements in specific Community legislation. This is the case, for instance, in the electronic communications and postal sectors. However, where such harmonised obligations exist, Member States are also responsible for their specification and implementation in line with the specific characteristics of the sector. In general, sector-specific harmonisation of public service obligations does not prevent Member States from imposing more far-reaching or additional obligations compatible with Community law, unless otherwise provided for in the harmonisation measures[40]. In electronic communications, such additional obligations cannot be financed from within the sector.

79. Also, as regards the organisation of the provision of a service of general economic interest, Member States are free to decide how the service is operated, provided, however, that Community rules are observed. In any event the degree of market opening and competition in a certain service of general economic interest will be decided by the relevant Community rules on the internal market and on competition. As far as the participation of the state in the provision of services of general interest is concerned, it is for the public authorities to decide whether they provide these services directly through their own administration or whether they entrust the service to a third party (public or private entity)[41].

[40] For instance, the postal directive obliges Member States to ensure a minimum of five daily deliveries to end users per week. Member States could impose a higher number of deliveries or specify the delivery requirement further

[41] As regards local inland transport, the Commission has proposed legislation that would require Member States to use public service concessions. Cf. Amended proposal for a Regulation of the European Parliament and of the Council on action by Member States concerning public

80. However, providers of services of general economic interest, including in-house service providers, are undertakings and therefore subject to the competition provisions of the Treaty. Decisions to award special or exclusive rights to in-house service providers, or to favour them in other ways, , can amount to an infringement of the Treaty, despite the partial protection offered by Article 86. Case law shows that this is true, in particular, where the public service requirements to be fulfilled by the service provider are not properly specified;[42] where the service provider is manifestly unable to meet the demand;[43] or where there is an alternative way of fulfilling the requirements that would have a less detrimental effect on competition[44].

81. Where a public authority of a Member State chooses to entrust the provision of a service of general interest to a third party, selection of the provider must respect certain rules and principles in order to ensure a level playing field for all providers, public or private, that are potentially capable of providing that service. This will ensure that these services are provided under the economically most advantageous conditions available on the market. Within the framework of these rules and principles, public authorities remain free to define the characteristics of the service to be provided, including any conditions regarding the quality of the service, in order to pursue its public policy objectives. Two situations can be distinguished:

- If the act by which public authorities entrust the provision of a service of general economic interest to a third party is a public service or works contract, as defined by the procurement directives or a works concession, as defined by Directive 93/37/EEC,[45] it must comply with the procedural requirements defined by the relevant procurement directive, provided it reaches or exceeds a threshold defined in the relevant directive and is not excluded from its scope.

- If the act by which public authorities entrust a third party with the provision of a service of general economic interest is not covered by the procurement directives, such act must nevertheless comply with the principles that derive directly from the EC Treaty, and in particular the provisions relating to the freedom to provide services and the freedom of establishment. This is the case for instance of public contracts or work concessions falling below the thresholds, of service concessions (i.e. contracts stipulating that the consideration for the service provider consists, at least in part, in the right to exploit the service) or of unilateral acts assigning the right to provide a service of general economic interest. These rules and principles include equal treatment, transparency, proportionality, mutual recognition and the protection of the rights of individuals[46].

82. In the area of environmental services, in particular as concerns waste management, public authorities may grant exclusive rights to organisations created by producers for the recycling of certain wastes. Such organisations are subject to the competition

service requirements and the award of public service contracts in passenger transport by rail, road and inland waterway, OJ C 151 E, 25.6.2002, p. 246

[42] See the Court's judgment in *Silver Line Reisebüro* (C-66/86, judgment of 11.4.89)

[43] See the Court's judgment in *Höfner* (C-41/90, judgment of 23.4.91)

[44] See the Court's judgment in *Vlaamse Televisie Maatschappij* (T-266/97, judgment of 8.7.99)

[45] Independently of the definition used in national law

[46] Cf. the Commission Interpretative Communication on Concessions under Community Law, OJ C 121, 29.4.2000, p. 2

rules. They are often created in the context of innovative approaches to ensure prevention and recycling of waste, e.g. the application of «producer responsibility». This involves the attribution of financial responsibility for waste management to the producers of the products at the origin of the waste.

83. Thus, public authorities in each Member State retain considerable freedom to define and enforce public service obligations and to organise the provision of services of general interest. On the one hand, this allows Member States to define policies that take into account specific national, regional or local circumstances. For example, remote or sparsely populated areas may have to be treated differently from central or densely populated areas. On the other hand, the absence of specific legislation can lead to legal uncertainty and and market distortions[47]. At European level, different forms of co-operation between national regulators have developed in an attempt to improve consistency of policies across Member States, but a European regulatory authority does not exist for any service[48]. A broader process of exchange of best practice and experience involving not only regulators but also other interested parties could also be useful. The Commission believes that a broad debate is necessary on these points.

84. The following questions are submitted for discussion:

(18) Are you aware of any cases in which Community rules have unduly restricted the way services of general interest are organised or public service obligations are defined at national, regional or local level? Are you aware of any cases in which the way services of general interest are organised or public service obligations are defined at national, regional or local level constitutes a disproportionate obstacle to the completion of the internal market?

(19) Should service-specific public service obligations be harmonised in more detail at Community level? For which services?

(20) Should there be an enhanced exchange of best practice and benchmarking on questions concerning the organisation of services of general interest across the Union? Who should be involved and which sectors should be addressed?

[47] For instance, in the water sector the absence of specific, relevant regulation has led to very different industry structures across Member States. Cf. WRC/Ecologic, Study on the Application of the Competition Rules to the Water Sector in the European Community, December 2002, available at:
http://europa.eu.int/comm/competition/publications/studies/water_sector_report.pdf
However, while commercial aspects are addressed, the Water Framework Directive 2000/60/EC, OJ L 327, 22.12.2000, p. 1, sets out some transparency rules for water services. Article 9 of the Directive deals with pricing policies and requires Member States in particular to take account of the principle of recovery of costs, including environmental and resource costs, and of the polluter pays principle

[48] See Annex for more detail

4.2. FINANCING OF SERVICES OF GENERAL INTEREST

85. Many services of general interest cannot be viably provided on the basis of market mechanisms alone and specific arrangements are necessary in order to ensure the financial equilibrium of the provider. For instance, universal access or full geographical coverage may not be offered by the market itself. Currently, it is for the Member States to ensure the financing of services of general interest and to calculate the extra cost of the provision of such services. In some cases, the Community may contribute by way of co-financing to the funding of specific projects, e.g. through its structural funds or its TEN programmes.

86. Depending on historical traditions and the specific characteristics of the services concerned, Member States apply different mechanisms in order to ensure the financial equilibrium of providers of services of general interest. The financing mechanisms applied by the Member States include:

- Direct financial support through the State budget (e.g. subsidies or other financial advantages such as tax reductions).

- Special or exclusive rights (e.g. a legal monopoly).

- Contributions by market participants (e.g. a universal service fund).

- Tariff averaging (e.g. a uniform country-wide tariff in spite of considerable differences in the cost of provision of the service).

- Solidarity-based financing (e.g. social security contributions).

87. Whilst different forms of financing continue to co-exist, a clear trend has developed in recent decades: Member States have increasingly withdrawn exclusive rights for the provision of services of general interest and opened markets to new entrants. This has made it necessary to resort to other forms of financial support, such as the creation of specific funds financed by market participants or direct public funding through the budget, the least distorting way of funding[49]. These forms of financing have made the cost of providing services of general interest and the underlying political choices more transparent and fed the political debate on these services.

88. As a general rule, Member States can choose which system they apply to finance their services of general interest. They have only to ensure that the mechanism chosen does not distort unduly the functioning of the internal market. In particular, Member States can grant public service compensations which are necessary for the functioning of the service of general economic interest. State aid rules only prohibit over-compensation. In order to increase legal certainty and transparency in the application of state aid rules to services of general interest the Commission announced in its Report to the Laeken European Council its intention to establish a Community framework for state aid granted for services of general eonomic interest, and then, if and to the extent justified by the experiencegained with the application of this framework, adopt a block exemption regulation in the area of services of general

[49] See Liberalisation of Network Industries, Economic implications and main policy issues, European Economy No. 4, 1999

economic interest. Work on guidelines on the application of state aid rules to services of general economic interest is currently underway[50].

89. In some cases, sector-specific legislation lays down specific rules for the financing of the extra cost of public service obligations. For *electronic communications*, sector-specific regulation requires Member States to withdraw all special or exclusive rights, but it provides for the possibility of creating a fund to cover the extra cost of providing a universal service on the basis of contributions from market participants[51]. As regards the *postal service*, the postal directive allows a defined postal monopoly to be maintained and a universal service fund to be created for the purposes of financing the postal service[52]. In *air transport*, Member States can grant a temporary exclusive licence on the basis of an open tender in order to ensure a regular service on certain routes for which the market does not offer an adequate service[53]. In *public transport*, the Community has laid down rules for the calculation of compensation[54].

90. Internal market, competition and State aid rules aim to ensure that any financial support granted to providers of services of general economic interest does not distort competition and the functioning of the internal market. Also, the sector-specific legislation in place seeks only to ensure that the financing mechanisms put in place by the Member States are least distortive of competition and facilitate market entry. As a consequence, Community legislation allows in particular for selective market entry.

91. Other relevant criteria for selecting a financing mechanism, such as its efficiency or its redistributive effects, are currently not taken into account in Community legislation. Neither have the effects of the selected mechanism on the long-term investment of providers of services and infrastructure and on security of supply been specifically considered.

92. At this stage, the Commission considers it appropriate to launch a debate on whether these criteria could lead to the conclusion that specific financing mechanisms should be preferred and whether the Community should take measures in favour of specific financing mechanisms.

93. The following questions are submitted for discussion:

[50] Report on the state-of-play in the work on the guidelines for state aid and services of general economic interest, 13.12.2002

[51] Article 13 of Directive 2002/22/EC of the European Parliament and of the Council of 7 March 2002 on universal service and users' rights relating to electronic communications networks and services (Universal Service Directive), OJ L 108, 24.4.2002, p. 51

[52] Articles 7 and 9(4) of Directive 97/67/EC of the European Parliament and of the Council of 15 December 1997 on common rules for the development of the internal market of Community postal services and the improvement of quality of service, OJ L 15 , 21.1.1998, p.14, as amended by EP and Council Directive 2002/39/EC, OJ L 176, 5.7.2002, p. 21

[53] Article 4 of Council Regulation (EEC) No 2408/92 of 23 July 1992 on access for Community air carriers to intra-Community air routes, OJ L 240, 24.8.1992, p. 8

[54] Council Regulation (EEC) No 1169/69 of 26 June 1969 on action by the Member States concerning the obligations inherent in the concept of a public service in transport by rail, road and inland waterway, OJ L 156, 28.6.1969, p. 1 as last amended by Council Regulation (EEC) 1893/91, OJ L 169, 29.6.1991, p. 1

(21) Are you aware of any cases in which Community law, and in particular the application of State aid rules, has impeded the financing of services of general interest or led to inefficient choices?

(22) Should a specific way of financing be preferred from the point of view of transparency, accountability, efficiency, redistributive effects or competition? If so, should the Community take appropriate measures?

(23) Are there sectors and/or circumstances in which market entry in the form of «cream-skimming» may be inefficient and contrary to the public interest?

(24) Should the consequences and criteria of solidarity-based financing be clarified at Community level?

4.3. Evaluation of services of general interest

94. The changing regulatory and technological environment as well as the growing impact of Community policies on services of general interest has highlighted the need for a proper evaluation of the performance of these services at Community as well as at national level. The evaluation of these services of general interest is important because of the significance of these services for the economy as a whole and for everyone's quality of life. It is necessary in order to monitor whether the general interest tasks assigned by public authorities to the providers of such services are effectively achieved. A comprehensive evaluation increases transparency and provides the basis for better policy choices and an informed democratic debate. It allows to assess both the economic efficiency of a service and the effective achievement of other public policy objectives pursued by public authorities. At Community level the evaluation of services of general economic interest is essential to ensure that objectives of social and terrotorial cohesion and of environment protection are attained. Performance evaluation can also assist in exchanging best practices across borders and between economic sectors. It is a central element of good European governance[55].

95. In recent years, the Commission has increased its evaluation efforts in the area of services of general interest and developed an evaluation strategy that is based on three strands of assessments:[56]

- The Commission conducts regular evaluations of the network industries that have been liberalised at Community level (sectoral evaluation).

- In addition, the Commission started in 2001 to perform an annual cross-sectoral evaluation of the network industries (horizontal evaluation).

[55] Commission White Paper on European Governance, COM(2001)428, 25.7.2001; Report to the Laeken European Council, COM(2001)598, 17.10.2001

[56] Report to the Laeken European Council, COM(2001)598, 17.10.2001; Communication from the Commission: A Methodological Note for the Horizontal Evaluation of Services of General Economic Interest, COM(2002)331 final, 18.6.2002

- Thirdly, the Commission carries out regular consumer satisfaction surveys in the area of services of general economic interest (e.g. Eurobarometer opinion polls and qualitative surveys).

96. The evaluation of services of general interest is a complex task. A comprehensive evaluation must be multidisciplinary and multidimensional and include political, economic, social and environmental aspects, including externalities. It should also take account of the interests and views of all interested parties. It is important to know what users and consumers (including vulnerable and marginalised groups), social partners and other parties consider a good performance for these services and their expectations for the future. For these reasons, this Green Paper aims at opening a discussion on the criteria that, in the view of interested parties, should be used for evaluation purposes. In the context of its horizontal evaluation, the Commission has submitted a methodology for the evaluation of services of general interest[57]. It has stressed the need to gradually develop and improve its regular horizontal evaluations over the coming years. The huge disparity in data availability and data quality is a main stumbling block for a comprehensive evaluation and ways to improve data quality and availability should be examined[58].

97. At Community level, the Commission produces evaluation reports on the performance of network industries providing services of general economic interest. It submits its results to the European Parliament, the Council, the European Economic and Social Committee, the Committee of the Regions and to all interested parties, with a view to informing the widest possible audience. However, the Commission's resources available for evaluation are limited, and the Commission cannot present a consolidated view representing all the, often diverging, views of the different interested parties. It should therefore be discussed how the evaluation should be performed at Community level and how responsibilities should be shared.

98. Furthermore, performance evaluation at Community level is currently limited essentially to the network industries covered by sector-specific Community legislation. Other sectors are not included in the Commission's evaluation strategy. It could be considered whether there is a need to extend Community evaluation beyond its current scope without infringing the principle of subsidiarity.

99. The following questions are submitted for discussion:

(25) How should the evaluation of the performance of services of general interest be organised at Community level? Which institutional arrangements should be chosen?

(26) Which aspects should be covered by Community evaluation processes? What should be the criteria for Community evaluations? Which services of general interest should be included in an evaluation at Community level?

(27) How could citizens be involved in the evaluation? Are there examples of good practice?

(28) How can we improve the quality of data for evaluations? In particular, to what extent should operators be compelled to release data?

[57] Communication from the Commission: A Methodological Note for the Horizontal Evaluation of Services of General Economic Interest, COM(2002)331 final, 18.6.2002

[58] See Annex for detail

5. SERVICES OF GENERAL INTEREST AND THE CHALLENGE OF GLOBALISATION

5.1. Trade policy

100. International trade agreements, within the framework of the World Trade Organisation (WTO) and often at a bilateral level, include provisions with regard to services that are not provided in the exercise of governmental authority (i.e. that are supplied on a commercial basis or in competition with one or more service suppliers). Such provisions concern the exchange of services and the conditions under which service suppliers can operate in foreign markets. Under the General Agreement on Trade in Services (GATS) each member freely determines the service sectors that it is prepared to open to foreign service providers (the so-called "bottom-up-approach") and under what conditions. Furthermore, the GATS explicitly recognises the WTO members' sovereign right to regulate economic and non-economic activities within their terrotory in pursuance of public policy objectives. With regard to the services covered by these agreements, each contracting party maintains the right to determine the specific obligations that can be imposed on the operators. Members fully retain the possibility of excluding from its GATS commitments sectors where it believes an opening to competition could threaten for example the availability, quality and affordability of such services. Thus, members can maintain the service as a (public or private) monopoly. The negotiations in the WTO framework has no direct or indirect influence on the decisions of Member States to privatise certain undertakings.

101. In this context, the European Community has freely decided to undertake binding commitments in respect of certain services of general interest already open to competition within the internal market. Through these commitments, foreign services suppliers are granted market access to the European Community under the same, or sometimes more restrictive, conditions as any European service supplier. Commitments undertaken in the WTO multilateral context (GATS commitments) or in a bilateral context have so far had no impact on the way in which services of general interest are regulated in Community law. They have also had no impact on the way in which they are financed. Indeed, the most far-reaching obligations in this respect have been assumed at bilateral level and are limited to territorial extension of the Community State aid regime.

102. Further negotiations in the areas of liberalisation of trade in services, as well as on disciplines on subsidies related to trade in services, are under way within the context of the Doha Development Agenda. The European Community is also negotiating bilateral trade agreements in the services sector. In this context, as in the past, the European Community approaches services of general interest with a view to ensuring full coherence with the level of liberalisation and with the regulation that applies within the internal market.

103. The following question is submitted for discussion:

(29) Is there any specific development at European Community internal level that deserves particular attention when dealing with services of general interest in international trade negotiations? Please specify.

5.2. Development and co-operation policy

104. The main objective of the European Community's development policy is the reduction of poverty in the developing countries. Ensuring access to a minimum level of services of general interest is an essential prerequisite for achieving this goal, since services of general interest not only satisfy some of the basic human needs, they also provide an indispensable platform for developing the economy of the poorest countries.

105. Private investment in services of general interest can help to improve the provision of essential services in these countries. However, market opening and privatisation in developing countries can also give rise to legitimate concerns about governance and regulation. Therefore, any reform should take account of the need for an adequate regulatory and institutional framework and be based on a comprehensive assessment of its impact on economic growth, employment, service delivery, equitable access, environmental conditions and the national budget.

106. The following question is submitted for discussion:

(30) How can the Community best support and promote investment in the essential services needed in developing countries in the framework of its development co-operation policy?

6. Operational Conclusion

107. The Commission invites all interested parties to comment on the questions set out in this Green Paper. Replies and any additional comments can be sent by mail to the following address:

European Commission
Green Paper on Services of General Interest Consultation
BREY 7/342
B-1049 Brussels

or by email to the following address:

SGI-Consultation@cec.eu.int

Comments should be sent to the Commission by **15 September 2003** at the latest. Replies and comments should mention the number of the questions they are referring to. For the information of interested parties, the Secretariat-General of the Commission will put contributions received electronically, together with the sender's contact data, on the Green Paper website

http://europa.eu.int/comm/secretariat_general/services_general_interest/

provided the senders concerned have explicitly agreed to their publication.

108. Basing itself *inter alia* on the contributions received, the Commission intends to draw conclusions in the autumn and, where appropriate, submit concrete initiatives as a follow-up.

Summary Table of All Questions submitted for Discussion

What kind of subsidiarity?

(1) Should the development of high-quality services of general interest be included in the objectives of the Community? Should the Community be given additional legal powers in the area of services of general economic and non-economic interest?

(2) Is there a need for clarifying how responsibilities are shared between the Community level and administrations in the Member States? Is there a need for clarifying the concept of services without effect on trade between Member States? If so, how should this be done?

(3) Are there services (other than the large network industries mentioned in para. 32) for which a Community regulatory framework should be established?

(4) Should the institutional framework be improved? How could this be done? What should be the respective roles of competition and regulatory authorities? Is there a case for a European regulator for each regulated industry or for Europe-wide structured networks of national regulators?

Sector-specific legislation and general legal framework

(5) Is a general Community framework for services of general interest desirable? What would be its added value compared to existing sectoral legislation? Which sectors and which issues and rights should be covered? Which instrument should be used (e.g. directive, regulation, recommendation, communication, guidelines, inter-institutional agreement)?

(6) What has been the impact of sector-specific regulation so far? Has it led to any incoherence?

Economic and non-economic services

(7) Is it necessary to further specify the criteria used to determine whether a service is of an economic or a non-economic nature? Should the situation of non-for-profit organisations and of organisations performing largely social functions be further clarified?

(8) What should be the Community's role regarding non-economic services of general interest?

A common set of obligations

(9) Are there other requirements that should be included in a common concept of services of general interest? How effective are the existing requirements effective in terms of achieving the objectives of social and territorial cohesion?

(10) Should all or some of these requirements be extended to services to which they currently do not apply?

(11) What aspects of the regulation of these requirements should be dealt with at Community level and which aspects left to the Member States?

(12) Have these requirements been effectively implemented in the areas where they apply?

(13) Should some or all of these requirements also be applied to services of general interest of a non-economic nature?

Sector-specific Obligations

(14) Which types of services of general interest could give rise to security of supply concerns? Should the Community take additional measures?

(15) Should additional measures be taken at Community level to improve network access and interconnectivity? In which areas? What measures should be envisaged, in particular with regard to cross-border services?

(16) Which other sector-specific public service obligations should be taken into consideration?

(17) Should the possibility to take concrete measures in order to protect pluralism be re-considered at Community level? What measures could be envisaged?

Definition of Obligations and Choice of Organisation

(18) Are you aware of any cases in which Community rules have unduly restricted the way services of general interest are organised or public service obligations are defined at national, regional or local level? Are you aware of any cases in which the way services of general interest are organised or public service obligations are defined at national, regional or local level constitutes a disproportionate obstacle to the completion of the internal market?

(19) Should service-specific public service obligations be harmonised further at Community level? For which services?

(20) Should there be an enhanced exchange of best practice and benchmarking on questions concerning the organisation of services of general interest across the Union? Who should be involved and which sectors should be addressed?

Financing

(21) Are you aware of any cases in which Community law, and in particular the application of State aid rules, has impeded the financing of services of general interest or led to inefficient choices?

(22) Should a specific way of financing be preferred from the point of view of transparency, accountability, efficiency, redistributive effects or competition? If so, should the Community take appropriate measures?

(23) Are there sectors and/or circumstances in which market entry in the form of «cream-skimming» may be inefficient and contrary to the public interest?

(24) Should the consequences and criteria of solidarity-based financing be clarified at Community level?

Evaluation

(25) How should the evaluation of the performance of services of general interest be organised at Community level? Which institutional arrangements should be chosen?

(26) Which aspects should be covered by Community evaluation processes? What should be the criteria for Community evaluations? Which services of general interest should be included in an evaluation at Community level?

(27) How could citizens be involved in the evaluation? Are there examples of good practice?

(28) How can we improve the quality of data for evaluations? In particular, to what extent should operators be compelled to release data?

Trade Policy

(29) Is there any specific development at European Community internal level that deserves particular attention when dealing with services of general interest in international trade negotiations? Please specify.

Development Co-operation

(30) How can the Community best support and promote investment in the essential services needed in developing countries in the framework of its development co-operation policy?

ANNEX
Public service obligations and instruments of Community policy in the area of services of general economic interest

This Annex examines, in more detail, a set of public service obligations that can be derived from existing sector-specific Community legislation and that can characterise a Community concept of services of general economic interest (Section I). It also discusses, in more detail, the policy instruments available in order to ensure that these public service obligations are complied with and that the public interest objectives pursued with these obligations are effectively achieved (Section II).

I. PUBLIC SERVICE OBLIGATIONS IN COMMUNITY LEGISLATION

1. Existing Community legislation on services of general economic interest is sector-specific. However, it contains a number of common elements that can be drawn on to define a Community concept of services of general economic interest. These elements include in particular: universal service, continuity, quality of service, affordability, as well as user and consumer protection (see point 1 below). These common elements identify Community values and objectives. They have been transposed into obligations in the pertinent legislations. They can also be complemented by more specific obligations depending on the characteristics of the sector concerned (see point 2 below).

1. A common set of obligations

1.1 Universal service

2. The concept of universal service refers to a set of general interest requirements ensuring that certain services are made available at a specified quality to all consumers and users throughout the territory of a Member State, independently of geographical location, and, in the light of specific national conditions, at an affordable price[1]. It has been developed specifically for some of the network industries (e.g. telecommunications, electricity, postal services). The concept establishes the right of everyone to access certain services considered as essential and imposes obligations on industries to provide a defined service at specified conditions, including complete territorial coverage. In a liberalised environment a universal service obligation guarantees that all persons within the European Union have access to the service at an affordable price and that the service quality is maintained and, where necessary, improved.

3. Universal service is a dynamic concept. It ensures that general interest requirements can take account of political, social, economic, and technological developments and it allows, where necessary, for regular adjustment of these requirements to the evolving needs of users and consumers.

[1] Cf. Article 3(1) of Directive 2002/22/EC of the European Parliament and of the Council of 7 March 2002 on universal service and users' rights relating to electronic communications networks and services (Universal Service Directive), OJ L 108, 24.4.2002, p. 51

4. It is also a flexible concept that is fully compatible with the principle of subsidiarity. Where the basic principles of universal service are defined at Community level, the implementation of these principles can be left to the Member States, thus allowing account to be taken of different traditions and specific national or regional circumstances. Furthermore, the concept of universal service can apply to different market structures and can therefore be used to regulate services in different stages of market opening.

5. The concept of universal service refers to the content of the service and its method of provision. The content of the service is defined in a dynamic way. Its definition covers the scope of the services, and their characteristics in term of price (which should be affordable) and quality (which should be satisfactory). As regards the method of provision, a Member State does not have to intervene or take additional measures if it finds that the provision of universal service is ensured by the mere functioning of the market, i.e. affordable commercial offers are available for everyone. However, if Member States find that the market alone does not ensure the provision of universal service, Community law allows Member States to designate one or more universal service providers and possibly compensate the net cost of providing universal service in order to minimise market distortion.

6. Existing sector-specific directives defining universal service contain a number of common elements: a set of universal service requirements, principles on the selection of the universal service provider, rules on the compensation of the cost of provision of universal service, the right of Member States to introduce additional requirements, plus rules on an independent regulator[2].

7. Existing secondary legislation is based on the following principles. If Member States find that market mechanisms alone are not sufficient to provide a universal service, they should intervene to ensure that it is provided. Any intervention should be objective, transparent, non-discriminatory and proportionate. It should entail no distortion of competition, in the sense that it must not create discrimination between undertakings active on the same relevant market, and it should minimise market distortion, in the sense that the service should be provided in the most cost-effective manner and any compensation should be recovered by contributions that are spread as broadly as possible. These principles will ensure that public intervention is transparent and efficient, thereby increasing the rule of law (democratic dimension) and overall welfare (economic dimension).

8. Furthermore, in order to ensure the effectiveness of universal service, the rules on universal service should be complemented by a number of user and consumer rights. These include physical access regardless of disability or age, transparency and full information on tariffs, terms and conditions of contracts, quality performance indicators and customer satisfaction indexes, complaint handling and dispute settlement mechanisms.

[2] Cf. Directive 2002/22/EC, OJ L 108, 24.4.2002, p. 51; Directive 97/67/EC of the European Parliament and of the Council of 15 December 1997 on common rules for the development of the internal market of Community postal services and the improvement of quality of service, OJ L 15 , 21.1.1998, p. 14; Amended Proposal for a Directive of the European Parliament and of the Council amending Directives 92/96/EC and 98/30/EC concerning rules for the internal markets in electricity and natural gas, OJ C 227 E, 24.9.2002, p. 393

9. Universal service requirements may entail a substantial cost. When considering whether such obligations should be maintained or extended, it is therefore important to consider the alternative uses to which the resources concerned could be put.

10. During the last two decades, the concept of universal service has developed into a major and indispensable pillar of the Community's policy on services of general economic interest. It has allowed public interest requirements to be addressed regarding in particular economic efficiency, technological progress, environmental protection, transparency and accountability, consumer and user rights, and specific measures regarding disability, age or education. Also, the concept has proven to be fully in line with the principle of subsidiarity. Furthermore, application of the concept can be based on extended participation of interested parties (e.g. industry, small and medium-sized enterprises, consumers, and other representative social groups). This process may include periodic evaluation of subsequent developments.

1.2 Continuity

11. A number of services of general interest are characterised by a continuity requirement, i.e. the provider of the service is obliged to ensure that the service is provided without interruption. Continuity is sometimes not seen as an independent requirement, but defined as part of a universal service obligation. As regards some services, uninterrupted provision may already be in the commercial interest of the provider and it might therefore not be necessary to impose a legal continuity requirement on the operator. At national level, the continuity requirement obviously needs to be reconciled with employees' right to strike and with the requirement to respect the rule of law.

12. The requirement of ensuring a continuous service is not consistently addressed in sector-specific Community legislation. In some cases, sector-specific Community legislation explicitly sets out a continuity obligation. For instance, Article3 (1) of the postal directive (97/67/EC) obliges Member States to «*ensure the permanent provision of a postal service*»[3]. In other cases, sector-specific regulation does not contain a continuity requirement, but it explicitly authorises Member States to impose such an obligation on service providers. Art. 3(2) of the electricity directive[4] provides that «*Member States may impose on undertakings operating in the electricity sector, in the general economic interest, public service obligations which may relate to security, including ... regularity... of supplies... . Such obligations must be clearly defined, transparent, non-discriminatory and verifiable; they, and any revision thereof, shall be published and notified to the Commission by Member States without delay...*».

1.3. Quality of service

13. The definition, monitoring and enforcement of quality requirements by public authorities has become a key element in the regulation of services of general interest. Achieving a socially acceptable level of service quality often justifies public service

[3] Directive 97/67/EC of the European Parliament and of the Council of 15 December 1997 on common rules for the development of the internal market of Community postal services and the improvement of quality of service, OJ L 15 , 21.1.1998, p. 14

[4] Directive 96/92/EC of the European Parliament and of the Council of 19 December 1996 concerning common rules for the internal market in electricity, *OJ L 27, 30.1.1997, p. 20*

obligations. In some cases, quality is seen as being so important that it is the rationale behind the provision of the public service obligation and it is the subject of close supervision and regulation. In areas in which the provision of a service is entrusted to a third party, the establishment of quality standards by public authorities is often indispensable in order to ensure that public policy objectives are met. Also where services are provided by public administrations the definition and monitoring of quality requirements may help to increase transparency and accountability. There is, however, no agreement on a general definition of quality, except that user and consumer protection and safety should be part of it. Environmental protection and sustainable development are also being taken increasingly into account when defining service quality criteria. Qualitative objectives will vary across sectors, depending on their characteristics.

14. In the sectors which were opened to competition at Community level, the Community did not rely on market forces alone to maintain and develop the quality of services. In some cases, quality standards are defined in Community legislation. They include, for instance, safety regulations, the correctness and transparency of billing, territorial coverage, and protection against disconnection. In other cases, Member States are authorised or required to set quality standards. In some cases, Member States are also required to monitor and enforce compliance with quality standards and to ensure the publication of information on quality standards and actual performance of operators. The most developed regulation of quality at Community level can be found in the legislation on postal services and on electronic communications services.

15. In addition, the Commission has developed non-regulatory measures to promote quality in services of general economic interest – including financial instruments, voluntary European standards, and exchange of good practice. For instance, in the electricity and gas sectors, the Community promotes voluntary co-operation between regulators.

16. In discussing the question of quality of service, it is important to bear in mind that there is a trade-off between the quality and the cost of a service. It would be inefficient, for example, for a public authority to impose a costly obligation to provide a very high quality of service when consumers and users would prefer a lower but satisfactory quality at a lower price. Furthermore, the imposition of quality standards might be unnecessary in markets where there is effective competition, provided that consumers and users are able to make an informed choice between competing service providers. This emphasises the role for regulators in ensuring that adequate and accurate information is available to users and consumers.

1.4 Affordability

17. The concept of affordability was developed within the regulation of telecommunications services. Subsequently, it was also introduced into the regulation of postal services. It requires a service of general economic interest to be offered at an affordable price in order to be accessible for all persons. Application of the principle of affordability helps to achieve economic and social cohesion in the European Union.

18. Affordability should not be confused with, and does not necessarily equate to, cost orientation. Indeed, the best the market could offer is a price oriented towards cost.

But if this cost is not judged to be affordable, the State may choose to step in ensure that everybody has affordable access. In some cases, affordability can imply that a service is offered free to everyone or to specific groups of persons. Member States may, in the light of national conditions, require that designated undertakings provide tariff options or packages to persons that depart from those provided under normal commercial conditions, in particular to ensure that those on low incomes or with special social needs are not prevented from accessing or using a service[5]. The concept of affordability appears to be narrower than the concept of "reasonable prices" that is currently discussed in the context of the proposed amendment of the internal market directives for gas and electricity. While affordability is a criterion that takes account mainly of the customer perspective, the principle of "reasonable pricing" suggests to take account also of other elements.

19. The sector-specific legislation in place does not specify the criteria for determining affordable prices, leaving it to the Member States to verify whether prices are affordable. Some of the criteria for determining affordability must be defined by the Member States. These criteria could be linked, for example, to the penetration rate or to the price of a basket of basic services related to the disposable income of specific categories of customers. Finally, once the affordable level has been set, the Member States should ensure that this level is effectively offered, by putting in place a price control mechanism («price cap», geographical averaging) and/or by distributing subsidies to the consumers and users concerned.

20. Therefore, it might be considered whether this concept should be developed further at Community level. Furthermore, it could be discussed whether the concept should be extended to other services of general economic interest.

1.5 User and consumer protection

21. EU consumer policy is an integral part of the political approach underpinning the European model of society. Its overarching aim is to ensure that the internal market delivers progressively better outcomes for consumers and that market failures to the detriment of consumers are remedied. This includes ensuring the market transparency and the fairness of commercial practices. In services of general interest, horizontal user and consumer protection rules apply as they do in other sectors of the economy. In addition, because of the particular economic and social importance of these services, specific measures have been adopted in sectoral Community legislation to address the specific concerns and needs of consumers and businesses. Consumer and user rights are set out in sector-specific legislation on electronic communications, postal services, energy (electricity, gas), transport and broadcasting.

22. The Commission Communication of September 2000[6] sets out a number of principles that can help to define the requirements of citizens for services of general economic interest. These principles include good quality of service, high levels of health protection and physical safety of services, transparency (e.g. on tariffs, contracts, choice and financing of providers), choice of service, choice of supplier, effective competition between suppliers, existence of regulatory bodies, availability

[5] See Article 9(2) of Directive 2002/22/EC

[6] OJ C 17, 19.1.2001, p. 4

of redress mechanisms, representation and active participation of users and consumers in the definition of services, and choice of forms of payment.

23. The Communication highlighted that a guarantee of universal access, continuity, high quality and affordability form key elements of a consumer policy in the area of services of general economic interest. It also stressed the need to address citizens' concerns that are of a wider nature, such as a high level of environment protection; specific needs of certain categories of the population, such as the handicapped and those on low incomes; and complete territorial coverage of essential services in remote or inaccessible areas.

24. In addition, services of general interest should be covered by the following user/consumer rights and principles:

- *Transparency and full information*: This must include clear and comparable information on tariffs; terms and conditions of contracts; complaint handling; and dispute settlement mechanisms.

- *Health and Safety*: This includes the need to guarantee the highest level possible of health protection and the physical safety of services.

- *Independent regulation*: Regulatory bodies that are independent of industry, with adequate resources, powers of sanction, and clear duties with regard to the protection of user and consumer interests.

- *Representation and active participation*: Provisions should be made to allow for the systematic consultation of consumer representatives to give consumers a voice in decision making.

- *Redress*: Fast and affordable complaint-handling systems and alternative dispute resolution mechanisms.

25. On the basis of the user and consumer protection principles that were identified in the Communication, a set of rights for users and consumers as regards a service of general interest could be based on the following principles:

- access (complete geographical coverage, including cross-border access, access for persons with reduced mobility and for the disabled);

- affordability (including special schemes for low income people);

- safety (safe and reliable service, high level of public health);

- quality (including reliability and continuity of services and compensation mechanisms in case of shortfalls);

- choice (widest possible choice of services and, where appropriate, choice of supplier and effective competition between suppliers, right of switching suppliers);

- full transparency and information from providers (e.g. on tariffs, bills, terms and conditions of contracts);

- right of access to the information collected by regulators (data on service quality, choice and financing of providers, complaint handling);

- security and reliability (continuous and reliable services, including protection against disconnection);

- fairness (fair and genuine competition);

- independent regulation (with adequate powers of sanction, clear duties);

- representation and active participation of consumers and users (in the definition of services, choice of forms of payment);

- redress (availability of complaint handling and dispute settlement mechanisms, compensation schemes);

- evolutionary clause (user/consumer rights are evolutionary, in accordance with changing user/consumer concerns and changes in the environment: economy, law, technology);

- equal access and treatment for users and consumers when using cross-border services within Member States.

2. Further specific obligations

2.1. Security of supply

26. The need to ensure continuous and sustainable provision of services of general economic interest calls for security of supply. In general, the development of the internal market has generated a considerable increase in the level of security of supply of products and services, to the extent that the markets concerned are functioning competitively.

27. In the energy sector, in particular, the issue of supply security has been the subject of a broad public debate at Community level, based on a Green Paper that the Commission published in 2001[7]. The Green Paper aims to initiate a debate with a view to defining a long-term strategy for energy supply security that is geared to ensuring the uninterrupted physical availability of energy products on the market, at a price which is affordable for consumers and users, while taking account of both environmental concerns and sustainable development. The Commission reported on the results of the public debate in a communication in June 2002[8]. On the basis of the consultation, the Commission concluded in its Report that it was necessary to improve the co-ordination of measures to ensure security of supply in the field of energy. As a follow-up, the Commission submitted, in September 2002, two

[7] Towards a European strategy for the security of Energy supply, Green Paper, COM(2000) 769, 29.11.2000

[8] Final Report on the Green Paper «Towards a European strategy for the security of Energy supply», COM(2002) 321, 29.6.2002

proposals for directives which will help to improve the security of supply of petroleum products and of natural gas in the European Union[9].

28. Some services of general interest outside the energy sector may also give rise to supply security concerns, e.g. because of the risk of long-term underinvestment in infrastructure or capacity. Yet, Community secondary legislation generally does not address the issue. In the telecommunications sector the Commission has proposed a comprehensive strategy to ensure the security of electronic communications networks[10]. It may be useful to consider whether there are other sectors in which the issue of supply security should be raised specifically. However, any assessment should take into account that specific additional measures aimed at increasing the security of supply usually entail an additional economic cost. For any action proposed to increase security of supply therefore needs to ensure that the ensuing cost is not greater than the expected benefits[11].

2.2. Network access and interconnectivity

29. In cases of natural monopolies with significant sunk costs, increasing returns of scale and decreasing average cost, market entry is particularly difficult. Such services are typically provided by means of stable and long-life technologies. In such cases, the mere application of common rules (e.g. competition or public procurement rules) may prove insufficient and thus needs to be complemented by more intense and continuous sector-specific oversight (regulation), the minimum scope of which is in many cases specified in Community legislation.

30. A number of the industries concerned are network industries in which fair access – in particular for new entrants - to existing networks, e.g. electricity grids, telecommunication networks or rails, will often be a prerequisite to operating successfully in downstream markets[12]. The Community has addressed the issue of access in four main ways:

(1) Retaining a vertically integrated incumbent with an exclusive right to operate services. This was the standard form of organisation of these industries at the time the Community came into being. In most network industries it has now been prohibited through specific Community legislation. It is currently not forbidden for water; for bus/metro/light rail; and for residual parts of the electricity, gas and postal industries. In bus/metro/light rail there are no plans for public authorities to be obliged to separate the operation of infrastructure from the provision of passenger services, and public authorities will be able to continue to grant exclusive rights to operators, provided such rights are awarded following competition.

[9] Proposal for a Directive of the EP and of the Council concerning the alignment of measures with regard to security of supply for petroleum products, OJ C 331 E , 31.12.2002, p. 249; proposal for a Directive of the EP and of the Council concerning measures to safeguard security of natural gas supply, OJ C 331 E , 31.12.2002, p. 262

[10] COM(2001) 298

[11] Cf. Commission Staff Working Paper, Security of supply, The current situation at European Union level, SEC(2002) 243, 28.2.2002

[12] Furthermore, many markets of services of general interest were only recently opened to competition and the incumbent providers often maintain a dominant position in their national market for a certain period of time. A certain degree of regulatory oversight and control is thus necessary to avoid abuse of market power

(2) Retaining a vertically integrated incumbent, which must open its infrastructure to competitors. Community law obliges incumbents to give competitors access to the local loop in the telecommunications sector, to the electricity grid and to gas pipelines (both at transmission and distribution level) in energy markets, and to national rail networks for international services.

(3) Enabling vertically integrated competitors to create their own duplicate infrastructure. This approach has been applied in telecommunications, postal services, aviation [and broadcasting][13].

(4) Separating the functions of operator and infrastructure manager. This is the approach chosen so far for access to the electricity network and in rail[14]. The Commission has now also proposed the same for gas and this proposal has been endorsed by the Energy Council.

31. There is clearly no single ideal approach to the regulation of network industries. Choices depend on the characteristics of each industry. The table below shows how Community regulation approaches access regulation differently according to the specificities of the industries concerned and the stage of the liberalisation process.

	Electricity and gas	**National rail**	**Bus/metro /light rail**	**Air**	**Telecoms (fixed line)**	**Telecoms (mobile telephony)**	**Post**
Do competitors create competing infrastructure networks?	Minimal in practice	No	In a few places	Yes	Yes, but limited to to certain MS	Yes	Yes
Can infrastructure managers also be operators?	No (new Directives will require legal separation)	No (independent allocation and charging function required by Community law)	Yes	Yes	Yes	Yes	Yes
Is there Community secondary legislation preventing Member States awarding a single operator an exclusive right?	Yes (non-households by 2004, all customers by 2007)	Yes (freight) No (domestic passen-ger)	No (exception: internat-ional bus services)	Yes, except on certain routes where public service obligations are	Yes	Yes	Yes/NO (weight/price limit applies)

[13] In other sectors this is not a technically or economically attractive option

[14] The infrastructure manager and operator can be part of the same legal entity, but the process of allocating capacity on the network and charging for its use have to be performed by a body which is legally, organisationally and managerially independendent of any railway undertaking (Cf. Directive No 2001/14/EC, OJ L 75, 15.3.2001, p. 29)

				imposed			
If there are exclusive rights, how are operators usually selected?	Historical operator	Historical operator (Commission wants change)	Historical operator (Commission wants change)	By open competition	n.a.	n.a.	Historical operator
If there are no exclusive rights, are there capacity limits to the volume of services provided by operators?	Yes, in the case of congested networks	Yes	n.a.	Yes	No	Yes	No
If so, how is capacity allocated?	unbundled transmission system operator with rules on congestion management for electricity	Independent infrastructure manager/allocation body	n.a.	Grandfather rights; informal market mechanisms; slot coordinators	n.a.	Beauty contests Spectrum auctions Administrative allocation	n.a.
What do infrastructure managers charge?	Cost recovery	Incremental cost (narrow definition) + State subsidy	No third party access	Cost recovery	Cost according to national methodology plus mark-up	Service providers charged on a "retail minus basis" (retail price minus a certain profit margin)	For cross-border services, charges must be cost-related
Do public authorities get involved in new infrastructure development?	Normally regulated	Regulated and subsidised	Regulated and subsidised	Commercially driven	Commercially driven	Commercially driven	Commercially driven outside the reserved area

32. In cases of low sunk costs, the degree of public intervention can be lower. Short-term contracts can be awarded to a single provider and quality evaluation by the customers will be taken into account for assessing the provider's performance.

33. Implementation of each of the above-mentioned approaches may be constrained by the public procurement directives or the general rules of the Treaty. The transparent and non-discriminatory selection (whether by tender procedure or not) of the single provider – who will benefit from exclusive/special rights - ensures that the highest quality is delivered at the lowest net extra cost.

2.3 Requirements aiming to ensure media pluralism

34. Since the mid-1980s Member states have introduced legislation regarding media ownership. The legislation put in place typically limits maximum holdings in media companies and prevents cumulative control or participation in several media companies at the same time. The objective of these legislative measures is to protect freedom of expression and to ensure that the media reflect a spectrum of views and opinions that characterise a democratic society.

35. Whilst the protection of media pluralism is primarily a task for the Member States, it is for the Community to take due account of this objective within the framework of its policies. Currently, secondary Community legislation does not contain any provisions directly aiming to safeguard the pluralism of the media. However, Community law allows the application of national safeguards with regard to media pluralism. This is highlighted, for example, in Art. 21(3) of the Merger Regulation, which explicitly provides for the possibility of applying national measures protecting the plurality of the media alongside Community merger rules or in Article 8 of the Framework Directive on electronic communications[15] which provides that national regulatory authorities may contribute to media pluralism.

36. Back in December 1992, the Commission published a Green Paper[16] designed to launch a public debate on the need for Community action in this field. The options considered in the Commission Green Paper included taking no action, proposing a recommendation to enhance transparency and proposing Community legislation harmonising national restrictions on media ownership. The debate did not allow clear operational conclusions to be drawn and no formal specific initiative was taken by the Commission.

37. Ten years later, given the progressing concentration of the media sector and the proliferation of electronic media, the protection of media pluralism remains an issue, including within the context of the Amsterdam Protocol on public broadcasting[17]. Views are sought as to whether the Commission should re-examine the need for Community action in this field in more detail.

II. POLICY INSTRUMENTS

1. Organisation of regulatory intervention

1.1. Community regulation and National Regulatory Authorities (NRA)

38. Community and Member States' primary and secondary legislation contains the basic rules applicable to markets of services of general interest. However, in order to ensure that the objectives of regulation are achieved it would be insufficient to rely

[15] Directive 2002/21/EC of the European Parliament and of the Council of 7 March 2002 on a common regulatory framework for electronic communications networks and services (Framework Directive), OJ L 108, 24.4.2002, p. 33

[16] Pluralism and Media Concentration in the Internal Market, An Assessment of the need for Community action, Commission Green Paper, COM(92) 480, 23.12.1992

[17] Cf. the Protocol on the system of public broadcasting in the Member States annexed to the EC Treaty by the Treaty of Amsterdam

exclusively on the application and usual mechanism of enforcement of legislation. Furthermore, Community legislation may oblige Member States to designate one or several «national regulatory authorities» to be responsible for carrying out these regulatory tasks. Such provisions exist for electronic communications, postal services, railway and aviation. For electricity and gas, the Commission suggested, in its proposal of March 2001 and its amended proposals of June 2002, an obligation on Member States to «*designate one or more competent bodies as national regulatory authorities*». As regards the services that are not covered by a comprehensive regulatory regime at Community level, some Member States , such as the United Kingdom, have decided to create a regulatory authority in the field of water (OFWAT).

39. The detailed institutional arrangements regarding the national regulatory authority required in the relevant Community legislation are left to the discretion of Member States. It can thus be an existing body or the ministry responsible for the sector, an approach adopted by a number of Member States. However, this approach has proven to be problematic in terms of the independence of the national regulatory authority in some instances where Member States also retain ownership or control over companies active in the sector concerned. The communications framework directive requires in such cases «*effective structural separation of the regulatory function from activities associated with ownership or control*». The designation of a Ministry as the predominant regulatory authority in charge of all regulatory decisions remains the exception. The importance as well as ongoing and complex nature of the regulatory tasks involved often requires the expertise and independence of a sector-specific regulatory body[18]. Nearly all Member States have set up such a body for the sectors concerned, including electricity and gas, for which current Community legislation does not yet require the designation of a national regulatory authority.

40. It should, however, be noted that even where a sector-specific regulatory authority exists, the government – i.e. the competent Ministry – often retains responsibility for certain regulatory decisions. A situation where the sector-specific regulator is responsible for all regulatory issues is currently the exception. Such regulators are most prevalent in communications and, to a lesser extent, in energy or post, whilst in aviation and railways responsibilities are usually shared between the ministry and the civil aviation or railway agencies. In the water sector, OFWAT in the UK has the power to regulate prices and the level of service to be provided, whilst the water agencies in France could be considered as environmental regulators, given that they collect environmental charges.

41. The key characteristic of a sector-specific regulator is its independence from market operators in the sector concerned. This requirement is essential to avoid conflicts of

[18] A definition of a sector-specific regulatory authority is contained in Commission Decision 2002/627/EC of 29 July 2002 establishing the European Regulators Group for Electronic Communications Networks and Services, OJ L 200/38, 30.7.2002: «*For the purpose of this Decision: 'relevant national regulatory authority' means the public authority established in each Member State to oversee the day-to-day interpretation and applications of the provisions of the Directives relating to electronic communications networks and services as defined in the Framework Directive*»

interest and to ensure the impartiality of the regulator[19] and is therefore stipulated in Community legislation whenever the designation of a national regulatory authority is mandatory. More specific rules are in place in Member States to ensure this independence, e.g. regulator staff are not permitted to hold shares of companies in the sector.

42. Sector-specific regulators also have a high degree of independence from the government. In most cases, the government appoints the Head and the members of the regulatory authority and determines its general policy objectives[20]. However, regulatory authorities are normally not subject to instructions from the government on individual decisions; furthermore, members of the authority could be specifically required to have a good knowledge of the rules applicable to the sector. This increases the impartiality of the regulator and enhances the continuity of regulatory approaches. Some regulatory authorities finance their budgets through autonomous sources of income, as opposed to the general budget administered by the government, which enhances their independence.

43. It is important to note that independence does not mean lack of accountability for performance. Regulators usually have to report regularly to government and/or parliament and, most importantly, the parties concerned can appeal against their decisions in court. On the other hand, appeal possibilities must be proportional. If decisions of the regulator become mired in years of controversy before they become effective, the objective of regulation will not be achieved. Therefore, in a number of cases appeals against decisions of the regulator have no suspensive effect.

44. Before taking decisions, regulators need to consult with interested parties and the public, in order to ensure that all relevant aspects are taken into account. Equally important, regulators are required to consult and co-ordinate their work with other public authorities, such as competition authorities and consumer protection bodies, to ensure compatibility and consistency of decisions taken.

45. In order to carry out their tasks effectively, regulators often rely on information which only regulated undertakings can provide. Therefore, regulators usually have the power to require from undertakings, within a time limit, any information necessary for the task in question. In the case of commercially sensitive information, regulators have to respect the rules on business confidentiality. In order to regulate network access tariffs, for instance, the regulator needs to have reliable and comprehensive information on the costs incurred by the network operators.

46. The powers and responsibilities of regulators in the Member States vary between sectors and in the legislation of the Member States, including the division of tasks between the sector regulator and the competent ministry. This division of tasks is largely influenced by national legal and administrative traditions prevailing in the Member States. Some core responsibilities are, however, shared by nearly all regulators of the sectors concerned. Regulation of the terms and conditions of access to existing networks and regulation of retail prices, in order to exclude abuses of

[19] Cf. ECJ, Case C-202/88, France v Commission [1991] ECR I-1223, para 51, 52; Case C-91/94, Thierry Tranchant [1995] ECR I-3911, para. 18, 19

[20] In some cases, such as in electronic communications, overall policy goals and objectives of the «national regulatory authority» are specified in Community legislation

dominant positions in the market, are probably the most prominent examples. In this respect regulators supplement the activities of competition authorities: whilst the latter apply general competition law to a specific sector by taking measures ex-post, i.e. after the abuse has taken place, a regulator typically intervenes ex-ante by setting rules intended to reduce the risk of the occurrence of abuses from the outset[21].

47. Usually, the legislative act in question defines the obligations related to the provision of universal service. However, regulators often play an important role in further defining and implementing such rules. For instance, where a universal service provider receives compensation for providing the service, the general rules of the cost calculation and the financing mechanism are usually defined by Parliament or the competent Ministry. The implementation of these rules is left to the regulator.

48. An important element of the universal service concept is affordability of prices for final users and consumers. Where necessary to achieve this objective, price regulation measures are applied by regulators. Since the market should in principle determine the price, such regulation usually takes the form of maximum prices, which exist in many Member States, for instance for electricity. Price regulation may, however also take the form of minimum prices, in order to prevent predatory behaviour by dominant players (e.g. in communications).

49. Particularly important from a consumer or user perspective is the role regulators often play in developing and implementing binding standards of security and quality of service. These are important in terms of meeting expectations with regard, inter alia, to access choice, transparency (including on price), affordability, quality, safety, security and reliability. Adequate redress mechanisms for consumers and users are essential where operators fail to meet standards in this respect.

50. Licensing is an important tool to ensure compliance with binding standards. If a market operator does not meet the standards set by the regulator – and specified in the licence granted to market operators – regulators can withdraw the licence. Other means to ensure compliance with rules include the imposition of penalties.

51. Consumers and users must have the possibility to file complaints, for instance, in the event of non-compliance of an operator with the kind of standards outlined above. Such complaints are usually handled by the regulator and in many cases legislation obliges regulators to take a decision rapidly (i.e. within a certain time limit).

52. Some regulatory authorities are also active in systematically providing market information to consumers,[22] whilst in most cases this task is carried out by consumer

[21] It should be noted that the responsibilities of competition and regulatory authorities usually overlap to an extent. Inappropriate pricing may be incompatible with the rules set by the regulator and at the same time constitute an abuse of dominant position within the meaning of competition law. It is important, therefore, that the respective roles of regulators and competition authorities are clear in practice. In general, it can be said that the regulator applies sector-specific rules, which will often obviate the need for intervention by the competition authority. On the other hand, it is for the competition authority to intervene when the regulator does not have the power to ensure that horizontal competition rules are respected or fails to take action

[22] For instance, the energy regulator in the UK and Denmark; in communications, Community legislation stipulates that regulators must encourage the provision of information to consumers

organisations. Apart from the above-mentioned core responsibilities of regulators, many Member States entrust them with further tasks, for instance, in energy the implementation of social and environmental policy[23] and long-term planing on security of electricity and gas supply[24]. These additional tasks are usually determined by specific national circumstances. The reason for transferring such tasks to the regulators is in many cases their technical expertise and knowledge of the sector.

1.2 Institutional co-operation arrangements at Community level

53. Sector-specific regulators are set up by Member States and regulate the national market of the sector concerned. However, national markets form part of the internal Community market and regulatory decisions taken by national regulators often impact on cross-border transactions. Therefore, a degree of consistency of national regulatory approaches is necessary to avoid distortions stemming from different approaches that could have an impact on the smooth functioning of the internal market. In railways and communications, Community legislation contains a provision obliging regulators expressly to co-ordinate their decision-making principles[25].

54. Currently, a number of organisational arrangements aimed at encouraging regulatory consistency exist for the sectors concerned.

European associations have been established for a number of sectors, which bring together regulators from the Member States and often third countries. Examples include:

- The Council of European Energy Regulators (*CEER*) acts as a focal point for contacts between regulators and the European Commission's Directorate-General for Energy and Transport. It maintains close working relations with regulatory authorities in North America and EU candidate countries. The work of the CEER has focused on issues linked to cross-border transactions and it plays an active part in the Florence Regulatory Process and the Madrid Regulatory Process (see below).

- The European Committee for Postal Regulation (*CERP*) is composed of representatives from the CEPT (European Conference of Postal and Telecommunications Administrations) countries' postal regulatory authorities, including EU and candidate countries, EFTA and others like Albania or the Russian Federation. The CERP discusses regulatory and operational postal issues and facilitates contacts with the relevant bodies, in order to develop a common approach that can lead, where appropriate, to proposals and recommendations.

- The Joint Aviation Authorities (*JAAs*) is the umbrella organisation for national civil aviation agencies. It has developed common safety, regulatory standards and

in order to enable customer choice (Articles 21 and 22 of the universal service directive (2002/22/EC))

[23] For instance, in the UK and Sweden

[24] For instance, in Belgium

[25] Article 31 of Directive EC/2001/14 and Art. 7(2) of the Communications Framework Directive

procedures for most areas of civil aviation. These standards are non-binding, unless transformed into either EU or national legislation.

55. A unique form of co-ordination and co-operation between national regulators exists in the field of electricity and gas. In order to build consensus between all parties on issues relating to cross-border transactions in the gas and electricity sectors, two regulatory forums, the *Madrid Forum* and the *Florence Forum*, were created. These forums, which are chaired by the Commission, bring together the national energy regulators and high-level representatives of the Member States, industry and consumers. The decisions taken by the forums are not formally binding, but they are taken with the understanding that national regulators will implement them at the national level[26]. The limits of the two forums have, however, increasingly become apparent, in particular when it comes to taking decisions on controversial issues. Therefore, in March 2001 the Commission proposed a regulation on cross-border exchanges of electricity providing for a comitology procedure on issues which have been discussed within the context of the Florence Forum.

56. European groups of regulators

Recently a new organisational form of involvement of national regulators at Community level has developed in the form of European groups of regulators which aim to reinforce and formalise the role of sector-specific regulatory authorities at EU level. Unlike Comitology committees, such groups must be composed of the national regulators in the sector concerned. This concept was, for instance, discussed in detail in the «Lamfalussy report» on the future legislative and regulatory process for the European securities market, with a view to developing a new and more effective form of regulation. As regards services of general economic interest, a «European group of regulators» was recently created by Commission decision[27] for electronic communications. Its aims are: (a) to advise and assist the Commission in consolidating the internal market for electronic communications networks and services; (b) to provide an interface between national regulatory authorities and the Commission; and (c) to assist in ensuring consistent application of the regulatory framework in all Member States.

57. For electricity and gas, the Commission has suggested in its amended proposals for the completion of the internal energy market, in response to a proposal made by the European Parliament, that such a group of electricity and gas regulators should be set up.

58. Comitology

In most of the sectors concerned, Community legislation provides for Comitology procedures to define the details of implementation of the rules contained in the basic Community legislation. The common pattern under such procedures is that the Commission adopts decisions after consultation of either an advisory or a regulatory committee made up of representatives of Member States. Issues dealt with are often

[26] For more detail on the Florence and Madrid Forum see http://europa.eu.int/comm/energy/en/elec_single_market/florence/index_en.html; http://europa.eu.int/comm/energy/en/gas_single_market/madrid.html

[27] OJ L 200, 30.7.2002, p. 38

those which are particularly relevant for cross-border transactions, such as, for instance, quality standards for cross-border postal services or railway interoperability. Comitology Committees exist for communications, postal services, railways and aviation. It should be noted that it is for the Member States to determine how they are represented in these Committees and, therefore, participation of the sector-specific regulatory authority is not guaranteed. However, in practice, in most cases where regulators exist they are kept involved in the procedure by Member States. For electricity, the Commission proposes in its proposals to complete the internal energy market a comitology procedure for issues relevant to the cross-border transmission of electricity.

1.3 Is there a need for European regulators?

59. A European regulatory authority does not exist at the moment for any of the sectors concerned. However, the idea of setting up such a body at European level has been discussed for certain sectors for some time, in particular in communications[28]. In aviation, for example, the Council decided recently, on the basis of a Commission proposal, to set up a European Aviation Safety Agency (EASA). This agency will assist the Commission in adopting common standards on air transport safety and environmental protection issues under a comitology procedure. It will also be responsible for the airworthiness and environmental certification of aeronautical products designed or used in the Member States. This task has until now been carried out by the national aviation authorities. In this (limited) respect the new agency could be considered a European regulator. In railways, the Commission proposed, in its 2nd railway package of January 2002 setting up a European Railway Agency. This agency would not, however, have a direct regulatory role. That said, in certain areas the Agency would have an advisory role which is comparable to the role of the «European group of regulators» in communications.

2. Financing of services of general interest

60. While for a significant number of services of general economic interest market mechanisms alone may ensure their viability, some services of general interest need specific financing schemes in order to maintain a financial equilibrium.

61. In general, Community law does not impose a specific form of financing of services of general interest and it is for the Member States to decide how these services are financed. Yet, whatever financing scheme is applied, this scheme must comply with the competition and State aid rules as well as with the internal market rules of the Treaty. In any event, the Treaty allows providers of services of general economic interest to be compensated for the extra cost of fulfilling a public service mission. Any compensation that exceeds what is necessary to discharge the public service task is, as a matter of principle, not compatible with the Treaty.

62. Financing schemes can take different forms, such as direct financing through the State budget, contributions made by market participants, the granting of special or

[28] See the two independent studies undertaken for the Commission: Eurostrategies/Cullen International, *The possible added value of a European Regulatory Authority for telecommunications*, Dec. 1999; Nera & Denton Hall, *Issues associated with the creation of a European Regulatory authority for telecommunications*, March 1997

exclusive rights, tariff averaging or, in the case of non-market social services, solidarity-based financing.

(a) *Direct compensation through a Member State's budget*

One form of providing financial support to services of general interest consists in direct compensation through a Member State's budget. This compensation can take the form of direct payments to the provider of the service or of other financial advantages, such as tax exemptions, that reduce the Member State's budget revenues. In some cases, direct compensation by a Member State can be complemented by Community funding based on the principle of co-financing, e.g. through structural funds.

Direct compensation shares the burden of financing a public service task among all tax payers. This form of financing does not create a barrier to entry. It is subject to parliamentary control in the Member States as part of the budgetary procedure.

(b) *Contributions by market participants*

Member States may also decide that the net costs of the provision of a service of general interest should be recovered from those the service is provided to by means of levies on undertakings. This possibility is explicitly provided for in Community legislation on telecommunications and on postal services.

In this case, Member States should ensure that that the method of allocation among undertakings is based on objective and non-discriminatory criteria and is in accordance with the principle of proportionality. This principle should not prevent Member States from exempting new entrants that have not yet achieved any significant market presence. Any funding mechanism should ensure that market participants only contribute to the financing of universal service and not to other activities which are not directly linked to the provision of the universal service obligations. The mechanism should in all cases comply with the principles of Community law, especially, in the case of sharing mechanisms, the principles of non-discrimination and proportionality.

The net cost of universal service obligations may be shared between all or certain specified classes of undertakings. National regulatory authorities should satisfy themselves that those undertakings benefiting from funding provide sufficiently detailed information on the specific costs requiring such funding in order to justify their request. There are incentives for designated operators to raise the assessed net cost of public service obligations. Therefore, Member States should ensure effective transparency and control of amounts charged to finance universal service obligations.

In addition, Directive 2002/22/EC on universal service in electronic communications provides that Member States' schemes for the costing and financing of universal service obligations must be communicated to the Commission for verification of compatibility with the Treaty. Furthermore, recital 21 of this directive provides that "any funding mechanism should ensure that consumers and users in one Member State do not contribute to universal service costs in another Member State, for example when making calls from one Member State to another."

(c) *Special and exclusive rights*

In some cases, Member States grant special or exclusive rights in order to ensure the financial viability of a provider of a service of general economic interest. The granting of such rights is not *per se* incompatible with the Treaty. The Court of Justice ruled[29] that Article 86(2) of the Treaty «*permits the Member States to confer on undertakings to which they entrust the operation of services of general economic interest exclusive rights which may hinder the application of the rules of the Treaty on competition insofar as restrictions on competition, or even the exclusion of all competition, by other economic operators are necessary to ensure the performance of the particular tasks assigned to the undertakings possessed of the exclusive rights*». However, Member States must ensure that such rights are compatible with internal market rules and do not amount to abuse of a dominant position within the meaning of Article 82 by the operator concerned. Generally speaking, exclusive or special rights may limit competition on certain markets only insofar as they are necessary for performing the particular public service task.

In addition, Member States' freedom to grant special or exclusive rights to providers of services of general interest can also be restricted in sector-specific Community legislation[30].

(d) *Tariff averaging*

For some services, such as certain telecommunications or postal services, Member States require that a universal service is provided at a uniform tariff throughout the whole territory of the Member State. In these cases the tariff is based on an average of the cost of providing the services, which can be differ appreciably, e.g. depending on whether the services are provided in a densely populated area or in a remote rural area. In general, and subject to control of abuse by the Commission, tariff averaging is compatible with Community law provided it is imposed by a Member State for reasons of territorial and social cohesion and it meets the conditions set out in Article 86(2) of the Treaty[31] .

(e) *Solidarity-based financing and compulsory membership*

Because of its importance this form of financing is mentioned here, although it only concerns support for services of general interest of a non-economic nature. Basic social security systems in the Member States are generally based on schemes that pursue a social objective and embody the principle of solidarity. They are intended to provide cover for all persons to whom they apply against risks such as sickness, old age, death and invalidity, regardless of their financial status and their state of health at the time of affiliation. The principle of solidarity, for instance, in health insurance schemes, can be embodied in the fact that the scheme is financed by contributions

[29] ECJ Case 320/91, judgment of 17 May 1993, Corbeau, [1993] I-2533 (point 14)

[30] Cf. Article 2(1) of Commission Directive 2002/77/EC of 16 September 2002 on competition in the markets for electronic communications networks and services, OJ . L 249, 17.9.2002, p. 21; Article 7(1) of Directive 97/67/EC of the European Parliament and of the Council of 15 December 1997 on common rules for the development of the internal market of Community postal services and the improvement of quality of service, OJ L 15, 21.1.1998, p. 14

[31] ECJ Case 320/91, judgment of 19 May 1993, Corbeau, [1993] ECR I-2533 (point 15)

proportional to the occupational income of the persons making them, whereas the benefits are based on the needs of thosewho receive them. In this case, solidarity entails the redistribution of income between those who are better off and those who, in view of their resources and state of health, would be deprived of the necessary social cover. It also mitigates market failures associated with health insurance linked to economies of scale, risk selction an moral hazard. In old-age insurance schemes, solidarity can be embodied in the fact that the contributions paid by active workers serve to finance the pensions of retired workers. It is also reflected by the grant of pension rights where no contributions have been made and of pension rights that are not proportional to the contributions paid. Finally, there can be solidarity between the various social security schemes, in that those in surplus contribute to the financing of those with structural financial difficulties. Such social security schemes are based on a system of compulsory contribution, which is indispensable for application of the principle of solidarity and the financial equilibrium of those schemes. Furthermore, the management of such schemes is generally subject to comprehensive control by the State.

According to the case law of the Court of Justice, organisations entrusted with the provision of such activities that are based on the principle of national solidarity and are entirely non-profit-making fulfil an exclusively social function. These organisations do not engage in an economic activity and are not to be considered undertakings within the meaning of Community law[32]. Nevertheless, it could be considered whether the criteria and the consequences of solidarity-based financing of social security schemes should be clarified at Community level.

63. Internal market, competition and State aid rules aim to ensure that financial support granted to services of general interest does not distort competition and the functioning of the internal market. Also, the sector-specific legislation in place seeks only to ensure that the financing mechanisms put in place by the Member States are least distortive of competition and facilitate market entry. Other relevant criteria for choosing a financing mechanism, such as efficiency, accountability or its redistributive effects, are not taken into account. At this stage, the Commission considers it appropriate to launch a debate on whether these criteria could lead to the conclusion that specific financing mechanisms should be preferred and whether the Community should take measures in favour of specific financing mechanisms.

3. Evaluation of services of general interest

64. Evaluating services of general interest is intrinsically linked to evaluating the performance of the industries providing these services. This performance rests on delivering quantitative and qualitative benefits to users and consumers, and consequently on increasing their satisfaction. Evaluating the performance of these sectors to ensure that objectives of economic, social and territorial cohesion and environment protection are attained is an essential task at Community level. From a purely economic perspective, the evaluation of services of general interest is important because the sectors providing these services account for a substantial part of EU GDP and prices in these industries have an influence on costs in other sectors.

[32] ECJ joint Cases 159/91 and 160/91, judgment of 17 February 1993, Poucet and Pistre, [1993] ECR I-637 (points 18, 19); Case C-218/00, judgment of 22 January 2002 Cisal di Battistello Venanzio & C. Sas ./. INAIL [2002] ECR I-691 (point 44)

Evaluating network industries providing services of general economic interest at this particular time is also justified by the fact that these sectors are currently undergoing major structural reforms due to regulatory, technological, social and economic changes. Nevertheless, the evaluation of performance should be undertaken in all industries providing services of general interest, whether they are subject to structural changes or not. Evaluation is also essential because the information it provides is an important input for broad-based political discussions and informed regulation of the sectors. Finally, evaluation is justified in terms of good governance. Evaluation provides evidence, judgment and information for policy conception, adaptation and accountability. For all these reasons, the Commission considers that it is important to assess services of general interest and has defined a strategy in this respect.

3.1 A three pillar-approach

65. As already stated in the 2000 Communication on services of general interest in Europe, "*the Community involvement with services of general interest goes beyond developing the Single Market, including providing for instruments to ensure standards of quality, the co-ordination of regulators and the evaluation of operations. (...) Such contributions are meant to enhance, and by no means replace, the national, regional and local roles in their respective fields"*[33]. Guided by these principles, the European Commission carries out regular evaluations of the performance of industries providing services of general economic interest. This evaluation is based on three pillars.

66. The Commission has made «horizontal assessments» part of its strategy for efficient evaluation of services of general economic interest. In December 2001, the Commission presented a first horizontal assessment[34] annexed to the «Report on the functioning of product and capital markets»[35]. It provided a baseline for future horizontal monitoring and regular evaluation of these services, as requested by the Council. In line with the Council's invitation to present a methodology for the evaluation of services of general interest, the Communication «A Methodological Note for the Horizontal Evaluation of Services of General Economic Interest"[36] defined a methodology to be applied by the Commission in future horizontal evaluations. The Commission will produce annual reports presenting the results of the horizontal evaluation of services of general economic interest. The reports will consist of three main parts: an analysis of structural changes and market performance, the results of the ongoing consumer consultation process, and a cross-sectoral review of horizontal topics. Initially, horizontal evaluations will cover the sectors, in the Member States, of air transport, local and regional public transport, electricity, gas, postal services, railway transport, and telecommunications.

[33] COM(2000) 580, p. 23-24

[34] Market performance of network industries providing services of general interest: a first horizontal assessment, SEC(2001) 1998

[35] COM(2001) 736 final

[36] COM(2002) 331 final

67. Alongside horizontal assessments, the European Commission pursues sectoral assessments of industries providing services of general economic interest[37]. Indeed, the economic, technical, and regulatory frameworks differ across industries, so that some issues are industry-specific and cannot be fully addressed in horizontal assessments. In addition, these sectoral assessments are suitable instruments for monitoring the transposition of directives and effective application of the rules as transposed into national law, as well as for obtaining a comparison of sectoral regulation. This gives the Commission a basis for guiding the Member States on future regulation and for discussing best sectoral practices. It also provides a clear picture of possible failures to comply with EU laws.

68. Evaluation of the performance of services of general interest would not be comprehensive if it failed to take into account the opinion of the various interested parties (all users/consumers, operators, regulators, social partners, public authorities, etc.) concerned in these services. The views of interested parties are taken into account in the assessment by the Commission and provide guidance for future policy action. Specifically, consumer satisfaction with regard to services of general interest is surveyed by Eurobarometer opinion polls and qualitative surveys[38].

3.2 Scope of the evaluation

69. In the current environment of structural and regulatory change, the evaluation process should take four questions into consideration.

(a) Do the structural changes occurring in the industries providing services of general interest lead to benefits to users and consumers in terms of lower prices and better services?

Liberalising industries providing services of general economic interest should foster competition and therefore increase choice, and should force companies to rationalise production and to offer better and innovative services at lower prices. These multiple benefits should increase welfare, provided appropriate measures are taken to safeguard consumer and user rights. However, the benefits of market opening can only be transmitted to users and consumers if appropriate regulation and competitive conditions are in place. The evaluation of services of general economic interest is important to detect evidence of possible shortcomings in the transmission of these benefits and their possible capture by certain economic operators. This objective is consistent with the Commission’s general initiative to improve governance and the quality of regulation in the European Union.

(b) How are access and quality evolving with regard to the provision of services of general interest?

Market performance includes the quality and the affordability of the service provided. With market opening, there is a potential risk that a competitive environment could put pressures on prices at the expense of the quality of these services or at the cost of an unequal distribution of benefits among users and

[37] See the examples from the telecommunications, postal, energy and transport sectors in the Commission Report on services of general interest, COM(2001) 598, 17.10.2001, p. 15

[38] http://europa.eu.int/comm/consumers/cons_int/serv_gen/cons_satisf/index_en.html

consumers. Therefore, the evaluation should take particular account of the interaction between different infrastructure networks, as well as the objectives of both economic efficiency, consumer and user protection and economic, social and territorial cohesion. In this context, an essential aspect to be considered is the degree of accessibility to networks. For instance, in energy and transport, it is useful to assess the degree of interconnection between different networks, and in particular their geographical link between the most developed areas and the less favoured regions.

(c) How is employment affected by changes in the sectors providing services of general interest?

Industries providing services of general interest have traditionally been run by the public sector and are major employers. The introduction of competition raises the fear of substantial employment adjustment costs. These fears represent a main source of resistance to the structural changes. For this reason, it is important to assess the extent to which these costs occur. The aim of the assessment is to appraise both direct and indirect effects on employment. Therefore, it is particularly important to broaden the scope of the analysis and to assess long-term impacts on the economy as a whole, alongside the short-term effects in the industries providing the services.

(d) How are these developments perceived by users/consumers?

The last issue to be dealt with is how developments in the performance of these sectors are perceived in practice. A mismatch may indeed arise between the developments observed and their perception by the public. As users and consumers should be the ultimate beneficiaries of the services provided by these industries, it is crucial to canvas their opinion. It should nevertheless be borne in mind that the beneficiaries are a multiplicity of actors ranging from private households to companies with differences in revenues, size and other characteristics. Therefore, different groups should be considered separately in any evaluation.

3.3 Issues

70. One of the main stumbling blocks for a comprehensive evaluation is the huge disparity in data availability. By providing guidance, the European Commission has played an important role in streamlining and standardising data collection. Since 2000, the Commission has published a list of structural indicators,[39] some of which are related to industries providing services of general interest. The Communication on a Methodology to evaluate services of general interest contains in its annex a list of indicators, some of which are currently unavailable, that provide an ideal map for evaluation. This list could be the basis for discussion with potential data providers to improve data collection. Alongside a lack of resources of national regulatory or statistical bodies and remaining differences in methodologies that make comparisons difficult, one increasing difficulty is that the process of market opening itself can affect the availability and quality of data. On the one hand, the introduction of competition has in some cases led to more comprehensive data gathering and

[39] See COM(2002) 551, 16.10.2002 and Commission Staff Working Paper in support of the Report from the Commission to the Spring European Council in Brussels – Progress on the Lisbon Strategy (COM(2003) 5), SEC(2003) 25/2, 7.3.2003

evaluation than existed before the emergence of private sector operators. On the other hand, some Member States are having difficulty where private companies refuse to disclose strategic information on the grounds that it is market sensitive, though it is not always apparent that this is the case. One issue for discussion is to strike the balance between the need to obtain data for evaluation and policy-making and the right of companies to treat this information as confidential.

71. In addition, the evaluation needs to reach the right balance between economic and social policy considerations, especially as regards service quality provision and social and territorial cohesion. This is an issue on which the existing legal framework relating to services of general interest provides only partial guidance.

72. To grasp these issues, the Commission has developed an evaluation strategy and provides the necessary input for the debate. So far, its role has included carrying out horizontal evaluations across countries and sectors, plus the task of ensuring more co-ordination between national regulators to make the conditions of competition and regulation more similar across Member States. However, the Commission cannot encompass, summarise and present a consolidated view representing all the often diverging views of the different interested parties on the performance of services of general interest. This means that there is a need for a broad debate on how to evaluate and on who should carry out this task. In addition, the evaluation carried out by the Commission at Community level does not preclude supplementary evaluations at other levels (in accordance with the principle of subsidiarity) or by other bodies. The question of whether an evaluator at Community level should be independent from the Commission and/or the Member States remains open to debate.

73. As suggested in the European Parliament's resolution,[40] public participation could be greatly expanded. The Parliament proposes to *«organise the debate within the various existing forums (Economic and Social Committee, Committee of the Regions, consultative bodies, associations involved in services of general interest initiatives and consumer associations)».* The results of this debate should be taken into account and provide guidance for the evaluations, and the evaluations should themselves be the subject of debate. Such a broad social debate on the performance of services of general interest is welcome, provided that the interests of all interested parties are well balanced and properly represented. Within the current institutional framework, it remains unclear what the respective roles should be of the different institutions and organisations in the evaluation of services of general interest and how the debate should be structured and organised.

[40] European Parliament report on the Commission Communication on «Services of general interest in Europe», COM(2000) 580 C5-0399/2001 – 2001/2157/COS; Final A5/0361/2001. Rapporteur: Werner Langen. 17.10.2001

4. The international dimension: trade policy

4.1 Liberalisation of trade in services of general interest within the context of the World Trade Organisation (WTO)

74. The Community and its Member States are parties to the General Agreement on Trade in Services (*GATS*),[41] which is the main multilateral set of disciplines on trade in services, where WTO members have undertaken binding commitments to open up, subject to listed limitations, specific services sectors to competition from foreign providers.

4.1.1 Services of general interest are not excluded as such from the GATS

75. The term «services of general interest» cannot be found in the GATS. GATS disciplines apply to all committed services with two exceptions:

- in the air transport sector, traffic rights and all services directly related to the exercise of traffic rights, and

- for all sectors, services provided to the public in the exercise of governmental authority, which means any service that is supplied neither on a commercial basis, nor in competition with one or more service suppliers.

It may be added that the supply of services to public entities through procurement – including services of general interest – is not currently subject to the GATS core obligations (most-favoured-nation, national treatment, market access, possible additional commitments). However, the Community has undertaken to grant most-favoured-nation and national treatment vis-à-vis the contracting parties of the Agreement on Government Procurement (GPA), also negotiated within the WTO framework.

4.1.2 The GATS provides for general and security exceptions, which to a large extent correspond to the exceptions of the EC Treaty

76. Subject to the requirement that such measures are not applied in a manner which would constitute a means of arbitrary or unjustifiable discrimination between countries where like conditions prevail, or a disguised restriction on trade in services, nothing in the GATS can be construed to prevent the adoption or enforcement by any Member of measures necessary to protect public morals or to maintain public order, to protect human, animal or plant life or health, to secure compliance with laws or regulations relating to the prevention of deceptive and fraudulent practices or to deal with the effects of a default on services contracts, the protection of the privacy of individuals in relation to the processing and dissemination of personal data and the protection of confidentiality of individual records and accounts, and safety (Article XIV of the GATS).

77. In addition, nothing in the GATS can be construed to require any Member to furnish any information, the disclosure of which it considers contrary to its essential security

[41] See the Commission publication «GATS. A guide for business» and the WTO publication «GATS. Facts and fiction». The text of the GATS is published in OJ L 336, 23.12.1994, p. 190

interests or to prevent any Member from taking any action which it considers necessary for the protection of its essential security interests (Article XIV bis of the GATS). The GATS preamble also provides for the right of Members to regulate the supply of services in order to meet national policy objectives.

4.1.3 The liberalisation of trade in services of general interest depends on commitments undertaken by WTO Members

78. For those services of general interest that are not excluded from the scope of the GATS, the degree of openness that countries offer is not set automatically and must be the subject of negotiations. Whereas some GATS disciplines – such as the Most Favoured Nation obligation and transparency – apply across the board to all services sectors covered by the GATS, the provisions concerning specific commitments - market access, national treatment and possible additional commitments - apply only insofar as countries have made a commitment in a given sector. The degree of sectoral coverage of Members varies greatly, and no Member has made commitments in all services sectors. Once undertaken, commitments can still be withdrawn or modified under specific conditions. The specific procedure is set out in Article XXI of the GATS.

4.1.4 The GATS does not require privatisation, nor deregulation of services of general interest. It is up to WTO Members to decide on these issues in the exercise of their sovereign rights

79. There is no single model of services of general interest within the WTO membership. The concept varies according to the different sectors and national traditions and legal conditions in the Members concerned. The GATS leaves it entirely for Members to decide whether they provide services of general interest themselves, directly or indirectly (through public undertakings), or whether they entrust their provision to a third party. Thus, services of general interest can be and are carried out either by public or by private undertakings, or jointly.

80. The objective of the GATS is to establish a multilateral framework of principles and rules for trade in services with a view to the expansion of such trade under conditions of transparency and progressive liberalisation. It is not to deregulate services, many of which are closely regulated for very good reasons. In addition, in terms of general exceptions, the GATS does not prevent the adoption or enforcement of measures necessary to protect *inter alia* public morals, public order, and human, animal or plant life and health.

81. It must be observed, however, that whenever WTO Members, in the exercise of their sovereign rights, have undertaken commitments in a given services sector, they are obliged to administer their services regulation for that sector in a transparent and predictable manner. In this context, GATS calls upon WTO Members to develop disciplines for certain specific measures that affect trade in services (qualification requirements and procedures, technical standards and licensing requirements). Such GATS disciplines should ensure that those specific measures are based on objective and transparent criteria and that they do not unnecessarily hamper trade in services having regard to the need to ensure the quality of the service. So far, only disciplines for the accountancy sector have been agreed, but they have not yet entered into force.

82. WTO Members can in any case, in the exercise of their sovereign rights, undertake commitments additional to market access and national treatment, under which they accept that they will abide by specific regulatory obligations. In this context, it has to be noted that about 75 WTO Members have agreed to certain common regulatory principles applicable to the telecommunications sector by subscribing to a «reference paper» which contains rules on, among other things, competition, interconnection, licensing, regulator's independence.

4.1.5 The GATS agreement does not preclude the imposition of public service obligations

83. GATS allows WTO Members to impose public service obligations in a liberalisation context. In their commitments, WTO Members can grant full market access and national treatment to foreign service providers, and at the same time impose on them the same public service obligations that apply to domestic service providers. Even when they go further and subscribe to common regulatory principles, as some have done through the telecommunications «reference paper», they can at the same time keep their right to define the kind of public (universal) service obligation they wish to maintain.

4.1.6 Subsidisation of services of general interest is not forbidden by the GATS

84. At present, the GATS only envisages negotiations with a view to developing the necessary disciplines to avoid trade-distortive effects of subsidies (Article XV of the GATS). In the absence of these multilateral disciplines, all subsidies are allowed, although subject to the national treatment principle, since subsidies are measures that affect trade in services. Accordingly, for those services where a WTO Member has undertaken market access commitments, a country that wants to limit access to subsidies to domestic service suppliers must specify this in the schedule of commitments as a national treatment limitation.

85. A WTO Member that has undertaken commitments in respect of services of general interest is therefore free to decide whether and to what extent domestic subsidies are granted to foreign service suppliers that enjoy market access to those services. Such decision will have to be transcribed in a national treatment commitment.

4.1.7 Community commitments in respect of services of general interest are undertaken in coherence with the internal market rules applying to these services

86. In the Uruguay Round, the Community has undertaken binding commitments for certain services of general interest (e.g. telecommunications, privately funded education, environmental, health and social and transport services). These commitments took into account the situation in the internal market, were limited to certain activities specifically listed and were subject to a number of specific limitations.

87. The specific commitments undertaken at the Uruguay Round have never gone beyond granting to foreign services suppliers the market access and national treatment that Community services suppliers enjoyed within the internal market in sectors open to competition. The rules of the internal market are also fully respected by the Community commitment to subscribe to the «reference paper» in the telecommunications sector. None of these commitments has constrained the internal policy regarding the organisation of these sectors. Member States also maintain the

right, even in areas where specific commitments have been undertaken, to impose public service obligations which are also applied to foreign private providers (for example, on universal service, quality standards or consumer/user protection)[42]. As regards the financing of services of general interest for which market access commitments were undertaken, the Community has reserved the possibility, by way of a horizontal limitation, of providing or subsidising services within the public sector.

88. As far as the current WTO negotiations in services are concerned, the Community has addressed requests[43] to other WTO Members for liberalisation in most services sectors: professional and other business services, telecommunications services, postal and courier services, construction services, distribution services, environmental services, financial services, news agency services, tourism services, transport services and energy services. No requests have been made on health services or audio-visual services to any country, and on education services only the US received a request limited to privately funded higher education services. Through these requests, the Community does not seek to dismantle services of general interest, nor to privatise State-owned companies in third countries. It is also recognised that liberalisation of trade in services may, in many cases, have to be underpinned by an institutional and regulatory framework to ensure competition and to help improve access to such services for the poor. In this respect, the requests in no way undermine or reduce host governments' ability to regulate pricing, availability and affordability of services of general interest as they choose. Indeed, the Community is simply asking that Community service suppliers be granted market access to compete with domestic services suppliers under the same conditions.

89. Likewise, the Community offers will not affect the provision of services of general interest within the Community, or the right of the Community to regulate its services sector and to design its own regulatory frameworks. In this context, the offer presented by the European Community and its Member States to the WTO on 29 April 2003,[44]while being comprehensive, do not propose any new commitments for health and education services. For other services of general interest (e.g. telecommunications services, postal and courier services, environmental services and transport services), the offer does not go beyond the state of liberalisation within the internal market and preserve the possibility of imposing universal service obligations.

90. As regards the financing of services of general interest, it is proposed that horizontal limitations be maintained in respect of subsidies in order to preserve the sustainability of the public sector. For the subsidies negotiations provided for by Article XV of the GATS, which are not very advanced, the Community will in any case take internal developments in respect of services of general interest into full consideration.

[42] In addition, the Community and the Member States may apply the exceptions of the GATS

[43] See http://europa.eu.int/comm/trade: «GATS: Pascal Lamy responds to Trade Union concerns on public services, Brussels, 7 June 2002» and «Summary Of The EC's Initial Requests To Third Countries In The GATS Negotiations, Brussels, 1 July 2002»

[44] See in http://europa.eu.int/comm/trade.

4.2 Liberalisation of trade in services of general interest in a plurilateral and bilateral context

91. In a bilateral context,[45] a number of agreements contain provisions for the liberalisation of services between the Community and the relevant trading partner. They normally cover all trade in services, with a few exceptions relating to audio-visual, maritime cabotage and air traffic rights. No specific exception for services of general interest is provided for in these agreements, except in cases where public utilities enjoy monopolies or exclusive rights.

92. The degree of liberalisation of trade in services varies from one agreement to another. The commitments undertaken by the Parties determine therefore the degree of liberalisation envisaged for services of general interest. While the number of sectors under consideration and the level of ambition for the liberalisation of services are different under GATS and bilateral agreements, the position of the Community is essentially the same in both contexts. In all circumstances, commitments undertaken by the Community in a bilateral context will also be consistent with the Community internal market.

93. In respect of subsidies, some bilateral agreements (the EEA and the Europe agreements) contain provisions that are based on the Community State aid regime. The Community monitors their implementation to ensure coherence with the Community regime. The other bilateral agreements entered into by the Community do not cover subsidies in the services sectors or, if they do, their provisions are not very stringent.

EUROPEAN COMMISSION

GREEN PAPER

PUBLIC PROCUREMENT
IN THE EUROPEAN UNION:

EXPLORING THE WAY FORWARD

GREEN PAPER

PUBLIC PROCUREMENT
IN THE EUROPEAN UNION:

EXPLORING THE WAY FORWARD

Communication adopted by the Commission on 27th November 1996
on the proposal of Mr. MONTI

Summary

1. An effective public procurement policy is fundamental to the success of the single market in achieving its objectives: to generate sustainable, long-term growth and create jobs, to foster the development of businesses capable of exploiting the opportunities generated by the single market and competitive in global markets, and to provide tax-payers and users of public services with best value for money. Every year, European contracting authorities buy goods and services worth some 720 billion Ecus, representing close to 2 000 Ecus per citizen of the Union. Because of the economic importance of public procurement, making purchasing efficient can lead to significant savings for public authorities, and, consequently, for tax-payers. Such considerations are particularly important for fiscal deficit reduction policies, imposed by the Maastricht convergence criteria. A policy of more openness in public procurement also leads, of course, to many other, perhaps less obvious benefits. Fair, transparent and non-discriminatory award procedures, together with the possibility for suppliers to have recourse to national courts to assert their rights, limit the risks of fraud and corruption in administration.

2. The main objectives of the Union's public procurement policy are: the creation of the conditions of competition necessary for the non-discriminatory award of public contracts, the rational allocation of public money through the choice of the best offer presented, suppliers' access to a truly single market with significant business opportunities, and the reinforcement of competition among European enterprises.

3. As far as impact is concerned, very encouraging results are already there with regard to the transparency of the contract award procedures. However, two major problems remain: on the one hand, insufficient and incomplete implementation by Member States of the public procurement Directives; on the other hand, a relatively limited economic impact to date, since effects on price convergence, public sector import penetration and the increase in the number of bidders have not so far matched expectations.

4. To improve the situation regarding these two problems, the Commission is presenting a Green Paper intended to provide a framework for a wide-ranging debate on public procurement in the European Union. This develops the Commission's initial thinking on a number of fundamental issues. Interested parties (Council, the European Parliament, Economic and Social Committee, Committee of the Regions, trade associations, contracting authorities and entities, suppliers and consumers) are invited to present their views. in writing no later than 31st. March 1997. On the basis of written contributions, the Commission will determine whether or not to organise a hearing with interested parties, and will draft a Communication on public procurement.

5. The issues addressed in the Green paper are:

- the objectives of the Union's public procurement policy and its impact to date,

- the implementation in national law and effective application of the Community legislation,

- how market access can be facilitated by information and training and also through the development of electronic procurement,

- how public procurement policy can be combined with other Community policies, in particular the policies on small and medium-sized enterprises (SMEs), on standardisation, on Trans-European Networks (TENs), on the Cohesion and the Structural Funds, on contracts awarded by the European institutions or financed by Community funds, in the social field, on the environment and on the defence sector, and, finally,

- access to other countries' procurement markets.

To assist the reader, a brief summary is provided at the beginning and a short list of key issues for debate at the end of each chapter.

6. A complete legislative framework has been set in place for public procurement. A period of stability in this framework is desirable and it is not therefore intended to make any fundamental changes. This does not of course mean the Commission will renounce its right of initiative. As regards the legal framework, it is important to redouble efforts with regard to both the implementation of the Directives by Member States and the application of the rules by contracting authorities and entities. This Green Paper contains a list of problems to do with the application of the Directives and puts forward possible solutions to be debated with interested parties (see chapter 3).

7. Now that the legislative framework is in place, entities and suppliers must exploit the opportunities it offers and must maximise benefits. Yet many contracting entities appear to lack detailed knowledge of their legal obligations; suppliers, particularly SMEs, frequently seem unaware of the market opportunities that exist. This is where the opportunities offered by training and information must be fully exploited. Looking to the future, the development of electronic tendering will play a key role in increasing transparency and access to public procurement (see chapter 4).

8. Public procurement policy has positive repercussions on other Community policies (see chapter 5).

- Making market access more transparent allows SMEs to unlock new potential markets, although these firms still face a number of difficulties in participating effectively in public procurement. The Green Paper presents measures which might be capable of improving the situation.

- In the field of standardisation, the Commission intends to step up efforts, in co-operation with business, to ensure that the standards institutions draw up European standards for use in contract documents, thereby facilitating the effective opening-up of public procurement.

- The commitment of public and private capital required for Trans-European Networks is encouraged with contract award procedures laid down by the Directives that guarantee an acceptable return for investors.

- Correct application of the Community rules also helps to allocate Community resources (from the Structural and Regional Funds, community-financed contracts or contracts awarded by Community institutions) more efficiently.

- Public procurement rules can contribute to a better achievement of social and environment policy objectives.

- In this Green Paper, the Commission confirms that it is open to any initiative aimed at stimulating competition in defence procurement, with a view to ensuring a European identity in security and defence policy and at the same time strengthening the competitiveness of our industry.

9. The entry into force of the new Government Procurement Agreement (GPA) of the World Trade Organisation, opens up a considerable number of markets in third countries to businesses in the Union. Globalisation of public procurement is well on the way. European enterprises must take up the challenge with determination. Faced with increasingly relentless international competition, success will depend on innovation and on an international vision of what is at stake. The Green Paper invites all interested parties to provide information on all of the problems they face in these markets. In this context of market opening, it is important to help associated Eastern and Central European countries, as well as those of the Mediterranean Basin, to develop best practice in awarding public contracts.

II. Laying the foundations for opening up procurement in Central and Eastern European Countries and in the Mediterranean countries

III. Questions

1. INTRODUCTION

1.1 An effective public procurement policy is fundamental to the success of the single market as a whole. Every year, the European Union's public authorities spend about 720 billion ECU buying goods and services: this represents 11% of EU Gross Domestic Product. With the completion of the Community's legal framework for public procurement, it is essential to launch thinking and discussions on how best to achieve its full potential: discussions in which the Member States, the European Parliament, and, crucially, the contracting authorities and suppliers themselves are invited to take part.

1.2 The European Union has already made considerable progress in its public procurement policy. The legislative framework for open and competitive public procurement is in place and is now being implemented by Member States. The parties involved in public procurement are gradually adapting to the new situation. This policy framework will continue to be an incentive for major change in traditional purchasing practices in the Member States, thus contributing to an environment favourable to economic development in Europe as a whole. Public procurement is already more open to competition than ever before. Wider access to public procurement in other countries, including those outside the Union, is already generating significant new market opportunities.

1.3 If our public procurement policy represents new opportunities, it also presents a formidable challenge. New rules necessarily involve major efforts to adapt traditional ways of working. For a contracting entity this means having to deal with new companies, often from another Member State right from the outset. For a supplier, it means: increased exposure to competition; the need to test new markets and the crucial requirement to remain internationally competitive. For the Governments of the Member States too, the challenge is real. As the major purchasers, they must follow the rules; they are also responsible for the transparency of the system; and they have to implement the Directives into their national legislation in accordance with their political commitments.

1.4 Now is the time to look at what we have achieved and what is still to be done. The process of transformation is already under way. It is the adoption of the Community Directives and their implementation, even if only partial, and the action of the Commission to protect the rights to which they give rise, which have put into place the essential elements of efficient purchasing. However, it is a difficult and sometimes painful process, particularly where relationships based on habit, special links and national preferences once reigned. Long-standing purchasing traditions that bred inefficiency are being progressively abandoned. Some contracting entities have already been able to demonstrate that, by applying the Community rules, they are getting the best value for money. Procurement markets of other Member States are beginning to open up; competition is intensifying and our industry is becoming better and better prepared to face challenges at international level. Yet more remains to be done if our public procurement policy is to achieve its full potential.

1.5 Of course, the primary responsibility for the success of this process lies with the contracting entities and suppliers, whatever their size. But the Commission and the Member States themselves have a major role to play;. They must work together to create the conditions in which competitive procurement can take place and our enterprises can flourish. The potential in economic growth and, ultimately, employment will go largely unexploited if barriers to cross-border transactions in goods and services are not removed. The smooth functioning of the internal market in procurement is, therefore, of relevance in the context of the evolving debate on a European Confidence Pact for Employment.

1.6 This Green Paper is intended to provide a framework for a wide-ranging debate. The chapters that follow set out the background against which the Commission is developing its initial thinking on a number of issues central to the Community's present and future public procurement policy. These issues include the effective implementation into national law and application of legislation; how market access can be facilitated by information and training and by the development of electronic procurement; how the correct application of public procurement law can be pursued while implementing other Community policies, in particular with regard to policy on small and medium-sized enterprises (SMEs), Trans-European Networks (TENs), standardisation, the Cohesion Fund and the Structural Funds and contracts awarded by the European institutions or using Community resources, on social policy, consumer policy and environment policy; and, finally, on access to other countries' procurement markets. To assist the reader, a brief summary is provided at the beginning of each chapter and a short list of key issues for debate at the end.

1.7 The Commission invites all interested parties (Council, the European Parliament, Economic and Social Committee, Committee of the Regions, trade associations, contracting entities, suppliers and consumers) to present their views. Responses to all or part of the Green Paper should be made in writing no later than 31st. March 1997.

For the attention of:
The Director-General - DG XV
Internal Market and Financial Services
Rue de la Loi 200
B-1049 Brussels

Fax: (+32 2) 295.65.00
E-mail: John.MOGG@DG15.cec.be

At the end of this written consultation phase, the Commission will decide whether or not to hold a hearing in Brussels with interested parties.

1.8 The Commission will draw up a special communication on public procurement on the basis of the contributions to the Green paper and the analysis and reflection stimulated by the communication on the impact and effectiveness of the Internal market[1]. That communication, which will include a plan of action, should set out what needs to be done to bolster the effectiveness of the legal framework and more fully achieve the objectives of the Community's public procurement policy.

[1] Document COM(96) 520.

2. THE BACKGROUND TO THE DEBATE

The objective of the Union's public procurement policy is to achieve fair and open competition for public contracts, thereby allowing suppliers to gain the full benefits of the single market and contracting authorities to choose from a more competitive and wider range of bids. The basic Community legal framework needed to meet these objectives has now been established: it strikes a fair balance between legal certainty and operational flexibility. The results already achieved on the transparency front are highly encouraging. As far as the economic impact of the rules is concerned, however, the data available are less favourable and show that problems still remain in terms of the practical effectiveness of the legislation, even if certain positive signs are beginning to emerge.

I. The objectives of the Union's public procurement policy

2.1 The foundations of the Community's open procurement rules are to be found in the EC Treaty, particularly in those provisions which guarantee the free movement of goods, services and capital, establish fundamental principles (equality of treatment, transparency and mutual recognition) and prohibit discrimination on grounds of nationality. To render these basic Treaty provisions more effective, detailed secondary legislation (in the form of directives) was required. These cover the award of public works, supplies and service contracts (the traditional sectors) by public authorities and by entities operating in the water, energy, transport and telecommunications sectors (utilities) and also provide means of redress for suppliers (for details, see Annex 1).

2.2 Before the present Community legal framework was in place, procurement tended to be focused on the market of each Member State. There was at times a high degree of protection for domestic suppliers and a large proportion of public sector contracts were usually awarded to domestic suppliers with little regard to value-for-money criteria. Under these conditions, there was little incentive for a domestic supplier to the public sector to improve its competitiveness. As a result, past purchasing policies all too frequently failed to take sufficient account of commercial considerations, with the result that the taxpayer and consumer were, probably unknowingly, left to bear the consequences in inefficiency and extra costs.

2.3 The primary objectives of the Union's public procurement policy, set within this context, have remained unchanged: to create the necessary competitive conditions in which public contracts are awarded without discrimination and value for taxpayers' money is achieved through the choice of the best bid submitted; to give suppliers access to a single market with major sales opportunities; and to ensure that the competitiveness of the European supplier base is strengthened. Developing an effective European public procurement policy is essential if the single market is to deliver long-term sustainable growth and job creation; a European supplier base that can exploit the opportunities of the largest integrated domestic market in the world and continue to compete successfully in global markets; and better public services at lower costs to the taxpayer and the utility customer. Public authorities and public utilities in the EU spend some ECU 720 billion per year on goods and services, which in 1994 was 11,5% GNP of the 15 Member States or, in other words, the totality of the Belgian, Danish and Spanish economies, i.e. nearly ECU 2 000 per EU citizen. The extent of European public procurement means that buying goods and services by effective purchasing systems can make significant savings for governments and thus for taxpayers. Such considerations are all the more relevant in view of the strong pressure to cut budget deficits in line with the Maastricht convergence criteria.

2.4 There are, of course, many other, perhaps less obvious, benefits of a more open procurement policy. Fair, non-discriminatory and transparent procurement procedures render perpetration of fraud and corruption in public administration more difficult. Whilst transparent procedures are not sufficient in themselves to eradicate fraud and corruption, an effective and dissuasive system of monitoring, procedural checks and proportional penalties helps to protect against breaches of public trust. In addition, it should be noted that, where Community funds are involved, instruments establishing standards of protection are already in existence[2] to deal with the problem of fraud and corruption,. These could provide a useful source of reflection for an in-depth discussion.

II. The impact so far

2.5 The Cecchini report on the cost of non-Europe[3] estimated that savings of around ECU 22 billion could result from greater transparency and an increased openness of public contracts. There is as yet no hard evidence that savings on this scale have been made. The same is true about price convergence or greater intra-community trade flows in public contracts for sensitive sectors. In co-operation with EUROSTAT, methods of investigation have been drawn up to assess in a comparable and harmonised way the importance and structures of public contracts in the various Member States. Two Member States (Portugal[4] and Greece[5]) have already volunteered to test these methods which quantify the significance of public contracts in these two countries by collecting different types of information (amount and number of contracts awarded by public entities, type of award procedure, products bought, features of firms who have won contracts, etc.,...). A similar exercise is planned for Germany before the end of the year.

2.6 The Commission presented a communication on the impact and efficiency of the legislation on the Internal Market (“1996 Review”)[6]. One theme is the liberalisation of public procurement contracts. It discusses whether certain of the expected benefits have been obtained in this sector by analysing in particular the effects of legislation on demand and supply, import penetration, price evolution and estimates of economies realised. The results show that public procurement markets in Europe are developing significantly even if public procurement policy has not yielded all the benefits, particularly because Member States have failed to incorporate the Directives into national law.

[2] See, for Community administrative penalties, Regulation concerning the protection of financial interests n° 2988/95, OJ n° L312, 8.12.1995, p. 1; regarding criminal penalties see the Convention on the protection of the European Communities financial interests (against fraud), 2607.95, OJ N° C316, 27.11.1995, p. 48 and the first additional protocol (regarding corruption), 27.9.1996, OJ n° C313, 23.10.1996, p. 1.

[4] Instituto Nacional de Estatistica, Portugal, March 1995.

[5] National Statistical Service of Greece, February 1995.

[6] See footnote 1. above.

2.7 The most visible effect of the Directives has thus undoubtedly been a major increase in the transparency of contract award procedures. The number of tenders advertised in the Supplement to the Official Journal (and in its electronic version, Tenders Electronic Daily) has steadily increased. The total number of procurement notices rose from 12.000 in 1987 to nearly 95.000 in 1995. Projections for the next two years suggest further increases to nearly 200.000. These figures are themselves a useful indicator of the effects of the public procurement Directives on the transparency of public contracts award procedures. Moreover, an enquiry of 1.600 suppliers has shown increased response rates to new business opportunities (90% for local markets and 70% for markets beyond the frontier). Nevertheless, it must be added that of the some 110.000 entities and contracting authorities to which the Directives apply, about 85%, especially local authorities, do not comply with their advertising and transparency requirements.

2.8 Firms supplying equipment to the public transport, telecommunications, electrical and health service sectors - all with important public sector clients - have undergone considerable structural change due to different factors, among which the rules on public contract award procedures can be assumed to have played a part. Joint ventures and mergers have taken place, allowing research and development efforts to be pooled. The overall result is, without doubt, a more efficient European industry, better placed to take advantage of the economies of scale offered by the single market and better prepared to compete at the global level.

2.9 Despite these few encouraging signs, there is still a major problem of non-compliance. Some Member States have not incorporated the Directives into national law. Only three Member States have fully incorporated all texts. Need one emphasise that the Commission has initiated 39 infringement procedures against the Member States concerned for failure to incorporate the Directives into national law ? This is a problem connected with ensuring greater compliance with the legislation which is discussed in the next chapter.

2.10 Moreover, it seems that in a number of sectors, contracting entities are not seeing the benefits which justify the efforts necessary to fulfil the obligations imposed by the Directives and are also detecting reluctance on the part of would-be suppliers (particularly those from other Member States) to bid for their contracts. This may be an indication of the existence of a time-lag for economic operators to adapt behaviour to take account of new rules and respond to new market opportunities. No doubt, certain economic operators have responded to observed or perceived competitive threats in a defensive manner rather than by expansionist strategies to build up presence and market share in other Member States.

2.11 Finally, the share of imports for public contracts in Europe remains modest : for direct cross-frontier business, they have risen from 1.4% in 1987 to 3% in 1995; and for purchases made through importers or local subsidiaries, they have increased from 4% in 1987 to 7% in 1995.

III. Questions

1. Do you have any other economic statistics which would be useful for assessing the impact of the Directives and their effects on employment?

2. Why are economic operators reluctant to tender for contracts in other Member States ?

3. APPLICATION OF PUBLIC PROCUREMENT LAW CURRENT STATE OF PLAY AND TRENDS

A legislative framework has been set in place for public procurement. The Commission recognises the need for a period of stability and does not therefore intend to make any fundamental changes to the framework. Neither does it renounce its right of initiative, of course and it is prepared to take or to propose the most appropriate measures wherever this should prove necessary.

The Commission stresses that efforts have to be stepped up with regard to both implementation and application of the legal framework, in order to achieve a level-playing - field for operators seeking public contracts throughout the Union.

In carrying out its task of monitoring the application of Community law, the Commission has found a number of problems to do with both implementation of the Directives into national law and actual application of the rules by contracting authorities and contracting entities. These are initial observations that the Commission will incorporate into the detailed examination of the application of the existing rules which it is required to carry out in accordance with the Directives.

For enforcement of the law on public procurement to be successful, speedy and effective means of redress must function satisfactorily at both Community and national level. The ways in which remedies operate do not always fulfil these conditions. With the Remedies Directives in place, most of the problems should now be tackled at national level. Encouraging the practice of attestation and making the conciliation procedure more accessible are also fundamental issues to be tackled.

I. Introduction

3.1 A Union-wide legislative framework for public procurement is now in place (see Annex 1). At this stage, the Commission recognises the need for a period of stability, as the framework has not yet produced its full effects. This stability should give all interested parties time to adapt to the new procurement rules and practices. Therefore, without prejudice to its right to initiate legislation, the Commission does not envisage any fundamental modification of the existing regime and confirms its determination to pursue its action in this area in accordance with the principles already established as far as the method chosen and the substance of the rules are concerned. Clearly, should new developments raise problems in specific areas or reveal shortcomings in the legislation, the Commission would not hesitate to take the most appropriate measures to ensure that European purchasers continue to benefit from an open and competitive supply and that suppliers continue to have genuine access to public procurement contracts while strengthening their competitiveness. Liberalisation is now taking place in the telecommunications and other utilities sectors. With regard to the application of the public procurement Directives, the Commission will check whether this liberalisation leads to the establishment of conditions of effective competition in the sector. If this should be the case, it will consider how best to respond to the situation. It should also be noted that most of the Directives require the Commission to review the application of the rules. It will have to carry out a detailed examination of their application in the near future. The debate prompted by this Green Paper should provide useful input for that exercise.

3.2 Community Directives must be implemented into national law. Their application - whether by national, regional or local administrations or by contracting entities in the utilities sectors - must not jeopardise the overall objective of establishing a level-playing-field in public procurement throughout the Union. The perception that not everybody is playing according to the same set of rules can be a major disincentive to opening up public procurement.

II. Directives must be implemented into national law

3.3 The Directives are an essential instrument for our public procurement system. They make it possible to boost economic efficiency and enable the internal market to function properly. The state of Member States' implementation of internal market legislation is regularly published by the Commission and discussed with Member States, including at ministerial level. The Commission has frequently expressed its continuing concern that the current level of implementation of public procurement Directives is inadequate (Table 1). Public procurement is one of the internal market areas where there are the most problems both in terms of communication of the implementing measures and in terms of the quality of implementation. The Services Directive, the consolidated Supplies Directive and the consolidated Utilities Directive are particular problem areas.

3.4 Even though most of the provisions of the Directives have "direct effect" in legal terms, failure to implement and/or faulty implementation prevent European citizens and businesses from taking full advantage of the internal market in public procurement. Thus, for example, major disparities can be observed between, on the one hand, the share of Community Gross National Product accounted for by some of the Member States which have not correctly implemented the Directives and, on the other, the number of notices published in these countries as a proportion of the total number of notices published in the Community. In other words, the number of notices published in these Member States appears low in comparison with their economic importance. The Commission therefore again calls on Member States to ensure that public procurement legislation is, first of all, implemented into national law. The lack of any implementing measures can provide contracting authorities and contracting entities with a ready-made excuse for not applying the rules.

3.5 As a next step, it is essential that Member States draft their national implementing provisions with the utmost care if the quality of implementation is to be sufficiently high to ensure that the objectives of the Community legislation are fully achieved. Faulty implementation can, in certain cases, weaken the rights which the Directives create for the benefit of operators and place the bodies which have to apply the rules in a situation where Community and national legislation are in conflict and consequently cause them to apply the Community rules in force incorrectly. Such a situation is just as serious as non-implementation, because it has the same effect in practice. Therefore, whatever the method used for incorporating the provisions of the Directives into national law, Member States must be sure to eliminate any contradiction between pre-existing national rules and the principles and provisions of Community law, so that operators will interpret and apply them properly. The Commission also calls on Member States to ensure that, wherever possible, the national legislative frameworks into which the Directives are incorporated are made clearer, for example by limiting references to other instruments and endeavouring to group together all the relevant provisions in a single text. This would facilitate application of the rules by purchasing entities and access to contracts for interested firms.

3.6 The Commission is aware of the fact that Community instruments are complex. Their complexity can perhaps explain some of the difficulties in implementation and, above all, in their application. But, this is a direct consequence of the fact that the questions to be solved in order to achieve the objectives pursued, are themselves complex. In implementing the Directives, the Commission is willing to afford the Member States, on request, all the necessary assistance to facilitate the understanding and simplification of the existing texts.

3.7 In any event, according to the information at the Commission's disposal, in some cases, the adoption of implementing measures, for which drafts were prepared in good time, has been delayed for no apparent reason. In other cases, Member States have refused to implement certain provisions of Community law. The Commission doubts whether such situations are justified and would, at the very least, be interested to ascertain any other reasons which might account for the difficulties encountered.

3.8 The Court of Justice of the European Communities has given judgement in several cases concerning the protection of individuals' rights under Community law when Member States are in breach of their obligations, particularly where the implementation of directives into national law is concerned. In *Francovich*[7], the Court established the principle of the liability of the State for damage caused to individuals by the non-implementation of a directive, the provisions of which grant rights to the individual, even though such rights may not have direct effect. In *Brasserie du Pêcheur-Factortame*[8], the Court went even further, recognising that under certain conditions, State liability may be incurred in respect of damage caused by any breach of Community law, regardless of the State body whose action or omission is responsible for the breach. It is thus probable that individuals will avail themselves of this case law before national judges in order to obtain compensation for damage suffered, including loss of profit, and thereby enjoy effective protection of their rights.

III. The law on public procurement must be correctly applied

3.9 While it is essential that the proper legislative framework should be in place through faithful implementation of the Directives into national law, it is equally important that the rules should be correctly applied by contracting authorities and contracting entities.

3.10 In carrying out the task conferred on it by Article 155 of the EC Treaty of ensuring that Community law is complied with, the Commission has identified a number of cases where application of the rules by purchasing entities has caused problems. Without claiming to be exhaustive, the following points group together some exemplary cases of incorrect application of Community law.

A Issues linked to incorrect application of the Directives

(a) Basic definitions in the Directives

3.11 The first type of problem encountered has to do with the correct interpretation of the scope of the different concepts used in the Directives. For example, in *Beentjes*[9] the Court of Justice defined more precisely what is meant by the term "contracting authority" used in the Directives, stressing the need to interpret the concept in functional terms. Experience has also shown how difficult it is to circumscribe the notion of "contracting entity" as used in the Utilities Directive, since it refers both to the subjective character of entities and to the activity carried on in one of the utilities sectors. The Directive specifies a large number of special cases where purchasing bodies, although covered by the notion of contracting entity are not subject to the rules of this Directive.

3.12 It has also proven difficult in several cases to establish precisely what constitutes a "public procurement contract". The Directives define public procurement contracts in fairly broad terms in order to bring within the scope of the Community rules all kinds of contracts for consideration concluded in writing between a contracting authority and a contracting firm. Despite this broad definition, certain contracting authorities have endeavoured to evade application of the Directives.

3.13 Similar points can also be made with regard to other concepts used in the Directives, and in particular that of a "work", for which some guidance is given in the text itself, but which can be given different interpretations in certain cases. For other concepts, such as that of "supplies" or "services", the Commission notes that some purchasers try to take advantage of the flexibility of the definitions in order to evade application of the Directives by artificially splitting up different contracts that do in fact form a whole.

3.14 The fairly general nature of these concepts is a necessary consequence of the fact that they have to be applied in a wide variety of national situations and legal systems; the Community legislator had to strive to take account of this variety. Care must therefore be taken to ensure that the concepts concerned are interpreted in a way which is consistent with the intentions of the legislator and enables his objectives to be achieved.

[9] Judgement of 20.09.1988 in Case 31/87 [1988] ECR 4635.

(b) Excessive use of negotiated procedures

3.15 A second type of problem has to do with the choice of contract award procedures, and more specifically the use of negotiated procedures. Under the "traditional" Supplies, Works and Services Directives, the negotiated procedure - particularly where there is no prior publication of a notice - is an exceptional means of awarding contracts that may be used only in exhaustive list of cases. The Court of Justice has stated (in *Commission* v *Italy*[10]) that the provisions governing the negotiated procedure must be interpreted strictly and that the burden of proving the actual existence of exceptional circumstances justifying the derogation lies on the person seeking to rely on those circumstances. But a number of infringement proceedings brought by the Commission and judgements handed down by the Court bear witness to the fact that contracting authorities use the procedure much more than they should under the existing strict rules, in particular by claiming extreme urgency where there is none or where the urgency has arisen owing to factors for which they are responsible, or by wrongly claiming that there is only one supplier or contractor capable of performing the contract.

3.16 In cases where it is allowed, the negotiated procedure appears to enable an economically more efficient outcome to be arrived at than a traditional call for competition, thus proving to be a rational method of reducing public purchasers' costs while achieving the objectives pursued. The fact remains, however, that the procedure is less favourable to the goal of market transparency.

(c) Unsatisfactory quality of notifications

3.17 A third type of problem concerns the advertising of contracts. Some of the particulars specified in the model notices annexed to the Directives are missing from a large number of contract notices published in the Official Journal. Cross-checks on published notices have also revealed that the obligation to publish prior information notices and contract award notices is still widely ignored.

3.18 However, transparency, which is a necessary precondition for opening up public procurement, requires contract notices to be complete. Failure to advertise contracts rules out effective competition and the resulting benefits. Each type of notice laid down by the Directives follows a specific line of reasoning. The prior information notices (or periodic information notices in the Utilities Directive) are intended to enable firms, and particularly SMEs, to ascertain purchasers' procurement requirements sufficiently early and to organise themselves accordingly so that they can submit better tenders. The purpose of tender notices proper is to give economic operators all the information they need in order to decide whether and how to bid for a particular contract. Contract award notices enable firms which have taken part in the tendering procedure to check that their rights have not been infringed and provide useful information for analysing market trends in different sectors.

[10] Judgement of 10.03.1987 in Case 199/85 [1987] ECR 1039.

(d) Excessive use of accelerated procedures and imposition of deadlines that are too short

3.19 A fourth type of difficulty relates to the shortening of deadlines through the use of accelerated procedures. Scrutiny of notices published in the "S" Supplement to the Official Journal in pursuance of Directive 92/50/EEC has revealed that a large proportion of the contracts concerned are awarded by accelerated procedure and that, in consequence, the periods allowed for submitting requests to participate and tenders are shortened substantially. Since these periods are thus reduced to minima of 15 days and 10 days respectively, it becomes extremely difficult for firms from other Member States to bid for such contracts. Unlike the Utilities Directive, the "traditional" Directives allow the accelerated form of restricted and negotiated procedures to be used only in cases where urgency renders the normal deadlines impracticable. This means that accelerated procedures should be exceptional. In the light of the above findings, it would appear that they are not regarded as such by contracting authorities.

3.20 A similar but more serious problem arises in the fairly frequent case where purchasing entities set deadlines for participation in contract award procedures that are shorter than the minimum periods laid down by the Directives. Clearly, such behaviour, which is in breach of the applicable rules, considerably restricts or even completely prevents genuine competition between all interested suppliers.

(e) Selection and award criteria

3.21 A fifth type of problem has to do with the criteria applied by contracting authorities in contract award procedures when checking the suitability of candidates (selection criteria) and awarding contracts (award criteria).

3.22 In a number of cases the Commission has challenged, and the Court of Justice has found incompatible with Community law (*Transporoute*[11]), the practice adopted by some contracting authorities of laying down criteria for the technical capacity of candidates other than those listed exhaustively in the Directives. It has also been found that the suitability of candidates has in some award procedures been tested on the basis of clauses that cannot be regarded as selection criteria.

3.23 Furthermore, although the Court has made it perfectly clear that selection and contract award are quite separate phases and therefore that the rules and criteria used in the two phases should not be confused (*Beentjes*[12]), experience shows that many contracting authorities continue to take account, when awarding the contract, of factors that are covered by the selection criteria. This can lead, in certain cases, to the contract not being awarded on the basis of the best tender for that particular contract but to the candidate with the most experience or financial strength. Similar problems arise where purchasers, sometimes relying on national rules which are not compatible with Community law, use award criteria based on factors which are not provided for in the Directives and are therefore unacceptable. Cases where the award criteria are based fairly loosely on regional, social or environmental considerations provide ample illustration of this problem.[13]

[11] Judgement of 10.02.1982 in Case 76/81 [1982] ECR 471.

[12] See footnote 9.

[13] The issues are further discussed in Chapter 5.

B Issues linked to situations which do not fall within the scope of the Directives

3.24 Community law on public procurement is based on a set of rules and principles, in particular the principles of non-discrimination, equality of treatment, transparency and mutual recognition. As the Court has emphasised (*Commission* v *Italy*[14]), the Directives are designed only to ensure the effective attainment of these principles, but it is clear that, given their nature, the principles must apply in all situations where public procurement and similar contracts are involved, and in particular contracts which are not covered by the Directives. Some situations which are particularly significant are mentioned below by way of example.

(a) Concessions or similar contracts

3.25 For the completion and/or management of large infrastructures as well as for the supply of certain services, contracting authorities have recourse more and more frequently to legal mechanisms such as concessions or similar contracts or other awards of special or exclusive rights. This is, in many cases, the result of budgetary constraints to which the contracting authorities are subject and it also meets their concerns to ensure better management of the services. Many projects relating to trans-European networks are an illustration of this.[15] At all events, many complaints received by the Commission concern concessions, similar contracts or other awards of special or exclusive rights.

3.26 Contracting authorities appear to consider that Community law is not applicable to the award of these contracts or rights and, in many cases, they do not implement the measures necessary to ensure transparency and open competition. On the contrary, in this type of situation, contracting authorities must respect the provisions of the EC Treaty, in particular the rules governing free movement of goods and services as well as fundamental principles such as non-discrimination, equality of treatment, transparency and mutual recognition. Moreover, by virtue of the Works Directive, Member States are also bound by the rules relating to publicity when awarding works concessions. The Commission considers that this lack of respect for these fundamental principles of the Treaty is far from satisfactory as it obstructs the proper functioning of the internal market. It does not allow contracts (or rights) in which important economic interests are at stake to be opened up to competition.

3.27 At a later stage and with a view to reinforcing the opening up the award of these contracts to even more competition, consideration could be given to the adoption of rules governing procedures for the competitive award of exclusive rights to provide public services through a system of concessions. The aim of introducing such rules would be to afford new public or private operators easier access to contracts for public services and to instil in existing operators an enterprise culture which is closer to the concerns of users, while still allowing exclusive rights to be granted where these are necessary for maintaining a service in the general economic interest. Such an approach would enable Member States to choose for their citizens operators of public services who are the most efficient in terms of both cost-effectiveness and quality of service. In the case of inland transport services, the Commission has already presented this approach in its Green Paper entitled "Citizens' network."[16]

[14] See footnote 10.

[15] See also Chapter 5, point III.

[16] COM(95) 601 fin - 29.11.95

(b) Public procurement contracts below the thresholds laid down in the Directives

3.28 The procedures provided for by the Community Directives apply exclusively to public procurement contracts whose estimated value exceeds the specified thresholds. Some contracting authorities consider that, for procurement contracts below these thresholds, no Community provision applies, with the consequence that these procurement contracts are sometimes awarded without being put out to tender. Such contracts are often of considerable importance, particularly for small and medium-sized enterprises. As in the case of the granting of concessions and similar rights, these contracts must be awarded in accordance with the provisions of the EC Treaty concerning the free movement of goods and services as well as its underlying fundamental principles of non-discrimination, equality of treatment and transparency.

(c) Changes to rules in the course of individual procedures

3.29 In several cases brought to the Commission's attention, contracting authorities or contracting entities have, when awarding public contracts whose value exceeds the thresholds laid down in the Directives, engaged in behaviour or taken decisions incompatible with Community law, even if the rule or prohibition to be complied with is not expressly laid down in the Directives. This is the case, for example, where substantial amendments are made to the tender specifications in the course of the procedure. One contracting authority thus changed the site of the work to be performed while continuing with the award procedure. In another case, the authority cancelled a large proportion of the works initially planned. Another case revealed changes to the financing terms. The Commission maintained that these changes were substantial and should entail the cancellation of the procedure under way and launching of a new procedure through publication of a new contract notice. Certain cases have revealed a different problem, namely negotiation with one or more candidates in open or restricted procedures. The Commission held that such negotiation was not allowed as it was contrary to the principle of equal treatment and its interpretations have been confirmed by the Court of Justice.[17] The same considerations as those developed above in connection with concessions and contracts below the thresholds apply here since, even if these situations are not regulated by the Directives, they are nevertheless subject to the general principles of Community law.

C Preliminary conclusions

3.30 The examples cited above demonstrate that the application of the Community legal framework in the Member States still lacks consistency. It therefore appears that there is a clear need for further explanation and elucidation of the applicable rules. To this end, the Commission considers it timely to intervene to clarify some of the points mentioned earlier either by means of interpretative communications and/or through guidelines or even through other appropriate means or new rules.

[17] See judgements of 22.06.1993 in Case C-243/89 *Commission* v *Denmark* [1993] ECR I-3385 and 25.04.1996 in Case C-87/94 *Commission* v *Belgium* (not yet published).

3.31 This situation is clearly unsatisfactory, since the efforts to ensure that the Directives are completely and correctly implemented into national law would come to nothing if they were not properly applied in practice. The Commission is determined to tackle these problems actively. The remainder of this Green Paper (and particularly this and the following chapters) sets out a number of options envisaged for achieving more effective application of the public procurement rules. It is important for the Commission to ascertain whether the sectors concerned think that these options are likely to provide satisfactory solutions to the problems mentioned or whether other solutions can be envisaged.

IV. Monitoring application of the law on public procurement

3.32 If we are to remedy the problems that have arisen in connection with the implementation and application of Community law and therefore achieve the objectives we are pursuing, all the authorities concerned must play their part and take the most appropriate initiatives, starting with systems for monitoring the behaviour of contracting authorities and entities, to act swiftly in order to restore compliance with the law. Such systems and powers already exist at Community and national level, but they need to be strengthened.

3.33 Member States and the European Commission must shoulder their responsibilities. Member States must ensure that obligations deriving from Community legislation are fulfilled, inter alia, through appropriate systems of control and sanctions (penalties), which are both effective in practice and have a deterrent value (Article 5 of the EC Treaty). The Commission, for its part, is required by Article 155 of the EC Treaty to ensure that Member States respect and fulfil these obligations, taking into account not only the letter of the law, but also the objectives the legislation is intended to achieve. Enforcement measures must improve compliance and build confidence among suppliers in the satisfactory operation of the system.

A The Remedies Directives

3.34 It is clear that the reactions of suppliers provide the best and most immediate way of ensuring that contracting entities practise open and competitive tendering. They are best placed to see whether the procurement rules are being followed and they can, where necessary, quickly draw purchasing entities' attention to breaches they have committed. Sometimes, breaches are immediately corrected when the contracting entity is made aware of them. When they are not corrected, however, formal remedies can be used, including action through the courts.

3.35 With the Remedies Directives in place, economic operators in every Member State have the possibility of lodging before a national court or tribunal (or body whose decisions are subject to judicial review) a complaint for violation by purchasing entities of the rules laid down in the Directives. The Remedies Directives require the bodies in question to be empowered to grant interim relief (by suspension of the contract procedure, for example), to deliver judgements on the compatibility of procurement procedures with the rules and, where appropriate, to set aside or ensure the setting-aside of decisions taken unlawfully, to require the offending terms to be removed from calls for tender and to award damages. The extent of the remedies available to suppliers should make them the most effective means of protecting the rights of firms bidding for contracts.

3.36 Suppliers need to be given full information about their rights under the Remedies Directives with regard to other Member States' procedures. The Commission will publish guides to make economic operators aware of what can be done when potential infringements in other Member States are identified, including the procedures that are available; how they can be used and the possible rights to compensation they may enjoy. Mention should also be made here of the possibilities offered by the recent case-law of the Court of Justice on the damage suffered by individuals as a result of breaches of Community law committed by Member States (see point 3.8 above).

B Appropriate sanctions

3.37 In the establishment of the legal framework on public procurement by national authorities, an essential element is the introduction of appropriate sanctions. In its communication to the Council and Parliament on the role of sanctions[18], the Commission has already highlighted public procurement as a sector where the possibility of introducing a common system of penalties might be considered with a view to upholding the integrity of the law, and where discrepancies between the sanctions applied by different Member States in cases of infringements of Community law could hamper the effectiveness of this policy. The Council, for its part, in its resolution of 29th June 1995 on the issue of penalties in Community law[19], has also recognised the importance of this issue. It has encouraged the Commission to ensure efficient implementation of Community legislation, including sanctions. If necessary, this could involve provisions relating to sanctions in future Commission proposals. Moreover, it has asked Member States to give positive support to Community action in this field.

3.38 The Commission is concerned that, in practice, the application of the Remedies Directives may vary considerably between Member States, and sometimes even within a Member State. It has also been made aware of the considerable differences which exist between Member States, particularly as regards the requirement for complainants to provide proof of an infringement in order to receive damages, as well as the amount of damages awarded. In some cases, courts and tribunals have awarded successful complainants only a purely symbolic amount; in others complainants have been awarded only the costs of putting together their bid (these costs can be substantial but in no way provide full compensation for losing a contract). The Commission invites Member States and other interested parties to comment on the effectiveness of existing remedies in Member States and on any discrepancies that may exist between the sanctions applied. In addition to the obligation to provide for full compensation for damages suffered, the Commission would also welcome reactions to the desirability of the award consisting of liquidated damages of a sufficiently dissuasive sum, exceeding the damage suffered.

[19] OJ No C 188, 22.7.1995, p. 1.

C Complaints

(a) At Community level

3.39 The Commission, as guardian of the Treaty, investigates complaints it receives from firms which consider that they have been harmed and seeks to resolve the problems raised. Many such cases have been settled as a result of the Commission's intervention and without referral to the Court of Justice. However, when the Commission finds itself in the situation where it must pursue a case, experience has demonstrated that the infringement procedure provided for under Article 169 of the EC Treaty is not capable of ensuring rapid and effective redress. Whilst the Commission is committed to speeding up its internal procedures, the different stages in the procedure leading to a Court judgement (involving, in the first instance, a letter of formal notice to the Member State authorities concerned and, in the second, a reasoned opinion) can last up to three years and, in some cases, even longer. This particularly arises when the requisite information cannot be obtained in time. In public procurement such lengthy procedures may often be ineffective.

3.40 As indicated in its opinion on the Intergovernmental Conference "Reinforcing political union and preparing for enlargement", the Commission considers that the means used to ensure the application of Community law should be made more effective, in particular as far as the internal market is concerned. The Commission has also taken the view that the role of the Court of Justice should be reinforced, especially in relation to compliance with its judgements.

3.41 Some commentators have pointed to a number of avenues that could be explored with a view to achieving these objectives. One possibility would be to confer on the Commission more effective investigative powers than it has at present, since they considerably limit the effectiveness and promptness of its action in the public procurement field. The system based on Regulation (EEC) No 17/62 in the competition field could provide a useful example of this approach. In the same way, some observers have considered extending the supervision procedures and measures provided by the Regulation (Euratom, EC) 2185/96[20] for the protection of the financial interests of the European Communities to public procurement in general. These provisions are, in fact, applied to the award of public contracts involving Community financing, for example, in the case of trans-European networks (TENs), the Structural and Cohesion Funds or contracts with third countries (see Chapter 5).

(b) At national level

3.42 The Commission has neither the resources, nor the information, to identify and resolve each and every breach of Community rules throughout the EU. From a practical point of view, the vast majority of individual problems encountered by economic operators should be tackled at national level. It goes without saying, however, that the Commission will not hesitate to intervene where appropriate to maintain the integrity of Community public procurement law. The Commission also confirms its determination to play its full role in enforcement, in particular in the pursuit of cases where there are important economic interests and/or legal issues at stake.

[20] OJ of 15.11.1996

3.43 The emphasis the Commission wishes to place on the full and effective application of public procurement rules at national level has already been recognised by some Member States. Sweden, for example, has entrusted the supervision of its contracting entities to an independent authority. Experience suggests that not only does this authority handle particular complaints, its very existence may even prevent behaviour giving rise to complaints, thereby reducing the potential burden on national courts and tribunals as well as on the Community institutions. With a view to monitoring application of the rules more effectively at national level, it could be worthwhile for other Member States to set up a similar body.

3.44 In order to be effective (and recognised as such) an authority such as this would need to be genuinely independent and have the power to require contracting entities to correct procedural errors. However, the standard by which its potential contribution should be evaluated should not, in the first place, be the detection of errors but the achievement of better procurement. Such authorities could play a key role in improving procurement systems: they could provide useful advice to contracting entities, check procurement practices to promote efficiency and ensure that mandatory reporting requirements were in place to enable Member States to supply any necessary statistical data to the Commission. Moreover, it might be useful to exchange information regularly among similar bodies. In this way, a permanent administrative network could evolve between Member States. The creation of authorities of this kind cannot undermine the current distribution of powers between the Commission, as guardian of the Treaty, and the national courts, responsible inter alia under the Remedies Directives for protecting the rights of businesses. Any dispute that might arise between the Commission and these authorities would have to be settled by the Court of Justice, which ensures, in accordance with Article 164 of the EC Treaty, that Community law is interpreted uniformly and applied correctly.

3.45 The Commission invites Member States to consider the establishment or appointment of such an independent authority. The Commission believes that, in some cases, existing bodies could be used for that purpose. Indeed the tasks of such an authority could form part of the functions of a Member State's national court of auditors or of an equivalent authority with genuine and unquestionable independence. The Commission will pay particular attention to the reactions of all interested parties to the concept of national independent authorities for public procurement. It invites any Member State(s) to run a pilot project to test how feasible the application of the concept might be.

D Other means for settlement of disputes

(a) Attestation

3.46 Among the measures under consideration with a view to ensuring that the existing rules are applied more effectively, the Commission considers that greater advantage should be taken of the attestation and conciliation procedures, which have already been established under the Remedies for Utilities Directive but have so far not been used.

3.47 Those contracting entities which apply best procurement practice and set up sound procedures internally are most likely to reap maximum benefits from the Community procurement regime now in force. It is for this reason that the Remedies for Utilities Directive provides for the creation of an attestation procedure under which contracting entities can undergo independent attestation of procurement procedures to check that they are in compliance with the Directive and geared to a rational use of public money. Such attestation, rather like a financial audit, is undertaken by an objectively independent body qualified and authorised to carry out this function. There is no comparable provision in the Remedies Directive applicable to the "traditional" sectors.

3.48 In order to be awarded a certificate of good procurement practice, contracting entities must demonstrate they have procedures in place which, on the basis of past experience, appear to work and to be in conformity with the rules. While an examination of the past procurement record does not, in itself, offer an absolute guarantee as to future procurement, it does afford the contracting entity a degree of confidence that its procedures are sound. The publication of the attestation in the Official Journal could help to give would-be suppliers confidence that it is worth the trouble of tendering because the attested entity has a proven record of competitive and open public procurement. Utilities that accept and meet the prescribed standards could enjoy the advantages of greater choice of suppliers and more competitive bids and so obtain best value for money.

3.49 In conformity with the mandate given by the Commission to the European standardisation bodies CEN and CENELEC, a European standard for attestation was approved in June 1995[21]. Member States must now make appropriate arrangements to ensure that attestators are appointed and can begin work. The Commission is keen to see utilities seek attestation. Moreover, in view of the benefits of attestation procedures the Commission also believes that similar arrangements could usefully be extended to contracting entities outside the utilities sectors and it would welcome a debate on this issue. Similarly, the Commission intends, as a priority, to apply the attestation arrangements to contracting entities awarding contracts involving the Community Funds (see Chapter 5 below).

(b) Conciliation

3.50 Settling disputes amicably is always to be preferred. In this regard the Remedies for Utilities Directive makes provision for a "conciliation" procedure, whereby suppliers and contracting entities may agree to discuss and settle any disputes that arise between them about the correct application of Community law by using independent conciliators. However, in their three years of operation, these procedures have not so far been used. This may in part be due to a lack of information among suppliers and contracting entities on how the procedure works. The Commission would welcome a debate involving Member States, experienced conciliators, contracting entities and industry on how to improve the conciliation procedure and ensure that it is more accessible and operational.

[21] Standard EN 45503 : 1996, published by CEN/CENELEC on 24.1.1996

V. Questions

1. Do you have views on the effectiveness of Member States' implementation of the Directives? What, in your opinion, are the reasons for the difficulties encountered by Member States in this area ?

2. Do you agree with the list of problems to do with application of Community legislation as presented? Should attention be given to other types of erroneous application of Directives? Do you think that there are other reasons for the problems than those mentioned in the text?

3. What, in your view, are the points on which interpretative communications or guidelines would be useful in order to explain and elucidate the applicable rules?

4. How effective are existing remedies in the Member States? Have you found discrepancies between the remedies and sanctions applied within and between Member States that are liable to affect the smooth operation of the internal market in this area? If so, should action be taken?

5. Would liquidated damages exceeding the actual loss suffered be useful?

6. Do you think that, in order to be able more effectively and more swiftly to carry out its task of monitoring compliance with Community law, the Commission should be given more effective investigative powers than it has at present, along the lines of those conferred on it by Regulation No 17/62 in the competition field?

7. Could the establishment of an independent supervisory authority in each Member State improve procurement systems and aid effective enforcement of the rules? Should the Commission establish systems of co-operation at Community level between such independent authorities, calculated to promote a uniform application of the rules for awarding public contracts and fairer access for all to public procurement?

8. Do you agree that attestation should be promoted as an effective means of achieving sound public procurement procedures ? Should attestation be extended to contracting entities outside the utilities sectors? If so, how could this best be achieved (for example, could it be on a voluntary basis)?

9. What is your opinion on the reasons why the conciliation procedure provided for in the Remedies for the Utilities Directive has not yet been used?

4. IMPROVING ACCESS TO PUBLIC PROCUREMENT MONITORING, INFORMATION, TRAINING, ELECTRONIC TENDERING

Now that the regulatory framework is in place, entities and suppliers must exploit the opportunities it offers and maximise benefits. Through monitoring, information has to be collected for evaluation of the economic impact of the regime and to allow suppliers to analyse the specific public procurement demand in the whole of the Union. Monitoring is also necessary in order to enable the Commission to check application of the rules consistently. Information and training can contribute decisively to optimally ensuring effective, value- for- money public procurement. Yet many contracting entities appear to lack detailed knowledge of their legal obligations; suppliers, particularly SMEs, frequently seem unaware of the market opportunities that exist. This is where the opportunities offered by training and information must be fully exploited. Training stimulates the adjustment of old ways of thinking and acting towards a culture that promotes transparency and openness in the choice of suppliers and procurement to the highest commercial standards. Information is the driving-force for efficient public procurement and by improving its quality, it will be made easier for both contracting entities and suppliers to exploit the opportunities offered. Looking into the future, electronic tendering will play a key role in further enhancing transparency and access to public procurement.

I. Monitoring public procurement

4.1 The supervision of correct application of the existing legal framework has to be complemented by permanent monitoring of public procurement practice. A full understanding of the economic realities underlying the award of public contracts is necessary. The relatively homogeneous EU regulatory regime covers increasingly heterogeneous contracts. Services procurement in particular needs to be monitored because it has only recently become subject to the Community rules. Such monitoring could involve, for example, obtaining regular information on the classification of contracts in accordance with Annexes IA and IB to Directive 92/50/EEC and on the behaviour of contracting authorities in this area. To allow monitoring of the economic impact of the Union's public procurement regime, analysis of competition and prices paid by the entities is needed, together with a sound understanding of the size and the structure of the demand side and the information needs of the supply side. On this basis it will be possible to consider to what extent the current regime is meeting the needs of contracting entities and economic operators.

4.2 The Commission intends to design a framework for the monitoring of the economic impact of public procurement and is currently studying ways of optimising the use of data collected from various sources (Tenders Electronic Daily - TED, EUROSTAT). The monitoring exercise should eventually permit the development of price indicators for a representative basket of goods purchased by entities subject to the Community rules. As previously stated, it is only by securing the best and most competitive supplier that contracting entities will be able to provide the best service to the public.

4.3 The Commission reaffirms its commitment to ensuring day-to-day compliance with the Community's Directives in accordance with the principles enshrined in the Treaty. The economic monitoring should also allow the market analysis of particular procurement sectors in all Member States. On this basis the Commission will be able systematically to identify problem areas and to carry out its role of supervision in a more coherent manner, rather than simply reacting to individual complaints. Databases (including Tenders Electronic Daily) are valuable instruments for the collection, analysis and dissemination of information and can perform a useful function in monitoring compliance with the law. A system of periodic controls to identify consistent cases of non-publication of tenders has also been set up. However, the sheer volume of public procurement transactions (and the number and range of public entities) makes detailed monitoring by the Commission alone an impossible task. This is especially true in determining whether public entities publish information about all relevant tenders. Against this background, the Commission would be interested in receiving suggestions on improving the monitoring of public contract award procedures, both at Community and at national level. It would also like to receive reactions to the question of whether the Commission should look again at the operation of a European Observatory. This observatory was created within the framework of the Advisory Committee on Public Procurement to monitor the application of the public procurement rules by Member States' contracting authorities, but has not, so far, been fully operational, despite the fact that it is in no way intended to develop into a technical assistance department or an agency. The idea of introducing cross-checking procedures could also be usefully exploited in this context.

II. Information

4.4 Information related not only to the legal framework and the data available on public procurement contracts, but also to observed irregularities and malfunctioning, is the key to ensuring optimally effective and honest value-for-money procurement.

(a) Improved readability of the legal framework

4.5 Improvements in transparency and the dissemination of information are crucial to support efforts to improve procurement practice. The Commission has already taken a number of steps to improve both the quality and quantity of information about the rights of suppliers and the obligations of procurement entities under EU rules. Although all EU public procurement directives have been brought together and published in a single volume, the rules themselves would be easier to understand if each Directive were consolidated in such a way as to group together all the provisions applicable to public procurement in a particular sector. For public supply contracts, public works contracts and contracts in the utilities sectors (water, energy, transport and telecommunications), the adoption by the Council of Directives 93/36/EEC, 93/37/EEC and 93/38/EEC has brought about a formal consolidation. But such a formal consolidation may not be possible each time a procurement Directive is amended. Where it is not, other means could be envisaged.

4.6 To facilitate understanding of the public procurement rules, the Commission is committed to publishing a number of Vademecums (interpretative communications) which will explain and clarify questions on the application of the Directives. These Vademecums will update those first published in 1987 (on the Works and Supplies Directives) and provide equivalent texts in respect of the Services and Utilities Directives. The Commission reaffirms that it will also make available written guides on national remedies procedures and the means by which suppliers can pursue their rights.

(b) Dissemination of notifications

4.7 Providing information to clarify the legal framework is important. Equally important is ensuring the availability of information and data for suppliers to be able to bid for contracts. Good and easily available data is vital in exploiting procurement opportunities. Now, over 130 000 procurement notices are published each year in the EC Official Journal and it is no easy task for suppliers to identify out of this mass, the specific calls for tender in which they have an interest. The Commission is aware that there are problems disseminating this amount of information in a transparent way by means of the paper copy of the Supplement of the Official Journal. The possibility of ultimately shifting the publication system away from the paper version is under consideration.

4.8 The Commission has already carried out a market survey of subscribers to the Supplement to the Official Journal and TED in order to find out what improvements can be made to the information and to its presentation. This survey has shown that only a small number of subscribers prefer the current publication to any other possible alternatives. The majority would prefer to find the information on the World Wide Web or on a CD-ROM with search facilities. Selective subscriptions to the Supplement may also be possible so that users would receive information only on contracts which are of particular interest to them. Whilst it is expected that such improvements will make public contracts more accessible to businesses, we must go further and improve access to information in step with each and every advance in technology.

4.9 Today, problems with the quality of tender notices are also frequent. Although several Directives require the nature of the procurement to be described using a code from the CPA (Classification of Products by Activity) or the CPC (Central Product Classification), only a few entities use these nomenclatures. This is costly for the European taxpayer. The Commission has developed the Common Procurement Vocabulary (CPV) as a list of codes based on the CPA but geared to the specific needs of the procurement process. The CPV has recently been published in a revised version[22] together with a recommendation[23] to encourage its use by entities, in order to allow definition of the nature of the procurement in CPV terms by those responsible for procurement. Extending the use of the CPV to all entities and contracting authorities could improve the transparency of public procurement in the Union and allow significant savings for the taxpayer because the publication process, including translation into all 11 languages, could by made easier. The Commission seeks comments from the interested parties on whether, in this context, use of

[22] OJ S 169 of 3.9.96

[23] OJ L 222 of 3.9.96

the CPV should be made obligatory. An alternative solution would be to levy a charge on those entities which have not used the CPV and the standardised electronic forms to identify the nature of their procurement, proportional to the extra costs of processing these notices.

III. Training

4.10 Changing traditional procurement practices will only succeed if there is a change in management ethos away from closed relationships with national suppliers to a transparent and truly commercial environment where doors are open to other bidders and value for money is the primary motivation. Training on procurement rules and best practice may well be the best and least costly way to achieve such a change. Yet for some governments, this is sometimes depicted as a costly luxury, the first to suffer cuts in times of budgetary stringency. New procurement techniques, such as electronic notification and electronic tendering, will not deliver greater efficiency and lower costs unless procurement officers know how to use them.

4.11 Welcome changes are visible. Current discussions on improving Europe's competitiveness increasingly focus on the importance of continuing education and the application of knowledge. For procurement, this must result in still greater efforts to provide systematic and rigorous training for officials in order to give them the tools that effective procurement demands.

4.12 However pressing the need, we cannot expect those, whose practices are traditional, to change overnight. To nurture an optimal procurement policy demands a real awareness of what procurement of the highest commercial standard actually entails. The Commission believes that steps must now be taken to stimulate the training of procurement officers in the new and evolving skills they need and to help them to better understand the new role they are called upon to play. If we are to bring about real change, however, a programme needs to be developed which spreads training throughout the Community; a programme that focuses on best procurement practice and which is not simply a one-off event. The application of information technology in procurement and the exchange of information on best practice could be covered. The elaboration of such a programme would involve many players: the Commission, Member States, national sectoral associations, businesses, universities and other interested parties.

IV. Electronic tendering

4.13 Our current procurement regime is based on the use of traditional administrative practices and means of communication: it is mainly a paper-based system of notification, dissemination and tendering. Now, thanks to progress in data processing and telecommunications, we do not need to proceed as we have in the past. It is time to take our procurement policy into the future; to benefit from the opportunities offered by today's advances in information technology. In the short term, new information technologies are helping us to introduce electronic notification of tender notices and the dissemination of information to suppliers. In the longer term, the use of computer systems and telecommunications will revolutionise the way in which contracts are awarded. An "electronic marketplace" could be developed in which suppliers could list products and prices in electronic catalogues, and contracting entities could compare prices and conditions and order electronically the best value item that meets their needs. We all stand to benefit; electronic procurement will be more transparent, more open to dialogue with suppliers, and far more efficient than any present paper-based system.

4.14 The European Union cannot afford to fall behind in this area. The recommendations of the Bangemann Group report[24] to the European Council identified public procurement as one of the ten top-priority applications for the use of information technology in the public sector. The report suggested that at least 10% of all contracting entities should have electronic tendering procedures in place within the next two to three years. Clearly, two years later, major efforts are needed at all levels to meet that target. At the G7 Summit Conference on the Information Society held in 1995, the participants called on the private sector to seize the initiative and committed themselves to encourage the private-sector development of information networks and the provision of new information-related services.

(a) Current state of play

4.15 The notification and dissemination of tender notices is the most appropriate point at which to apply information technology to public procurement. Under our Directives, contracting entities are under the obligation to publish notices about their calls for tender in the Supplement of the EU Official Journal. This supplement already runs to more than 300 pages per daily issue and the expectation is of continued expansion in the year ahead. Not surprisingly, suppliers find it difficult to identify the tender opportunities which interest them. The system must, quite simply, be made more efficient and more simple to use.

4.16 Considerable progress has already been made. The TED database was introduced a decade ago and has been updated recently by the development of more user-friendly software, the application of the Common Procurement Vocabulary (CPV) and the provision of access to the INTERNET. Further improvements are now under way.[25]

(b) Electronic notification

4.17 With today's technology, opportunities abound for increasing transparency, cutting operating costs and reducing delays. To this end, the Commission has embarked upon an ambitious programme known under the acronym SIMAP (“Système d’information pour les marchés publics”) which builds on the experience of TED. SIMAP covers a range of different projects. Its most immediate aim is to increase the capacity of the current publication system so as to cope adequately with the growing number of notices which need to be published. SIMAP will eventually make it possible to provide better tender information more quickly - a change which is both urgently needed (given the rapid growth in published tenders), and vital if we are to improve the transparency of contract award

[24] Europe and the Global Information Society: Recommendations presented to the European Council at Corfu, Brussels, 26.5.1994.

[25] See also points 4.7 to 4.9.

procedures in Europe. SIMAP offers the prospect of improved monitoring, market analysis and the exchange of a variety of other useful information so as to make it easier for suppliers to identify sales opportunities.

4.18 Under SIMAP a number of pilot projects have already been launched involving a limited number of contracting entities and information providers. They focus on the electronic communication of procurement notices between contracting entities and the Official Journal and TED, and on facilitating on-line access to information for suppliers. If these pilots are successful - and the first signs are encouraging - they could eventually be developed into an operational system of electronic notification and dissemination of information to which all interested parties in the Union would have access (using a Community-wide electronic bulletin board system on procurement).

4.19 Using such a system, contracting entities would have the means for transmitting their notices electronically rather than in paper form. A key question will be how the shift from paper to electronic transmission can be achieved. The latest modifications to the legislative texts already propose changes to permit the electronic transmission of notices. Initially, and for a period of several years, the paper-based and electronic systems will co-exist. We shall need to decide whether such a change could be achieved on a voluntary basis or whether it would be advisable to legally oblige contracting entities to transmit notices in electronic form and, whether such an obligation should be introduced first in a limited way at central government and utilities level, before extending it to other contracting authorities. Such electronic transmission of notices could also make it possible to shorten the time needed for disseminating the information and perhaps, ultimately, the deadlines for bidding. The Commission invites comments on this issue.

(c) Electronic dissemination

4.20 It is clear that, with the steady rise in the number of notices published and the improvements in technology for electronic publishing, the paper version of the OJ/S will in time be superseded by electronic versions. The market survey of subscribers has confirmed that the majority would prefer to find the information over the World Wide Web and many would be interested in a CD-ROM. A CD-ROM is already being developed and further improvements to the TED database such as the development of INTERNET access will doubtless attract more interest.

4.21 There are currently around 13,000 subscribers to the Official Journal Supplement. This can only be a small part of the number of suppliers potentially interested. The electronic or on-line versions must be designed to attract new subscribers, as well as to replace the paper version for existing subscribers, for whom it is becoming increasingly difficult to use.

4.22 Once these replacement systems are in place and accepted by subscribers, the obligation to publish the OJ supplement on paper could be modified to refer to electronic means, so that the paper version could be phased out as demand falls.

4.23 As a result of the findings of the market survey, the Commission is considering the possibility of printing short summaries of notices in a much slimmer OJ supplement and giving full information only in a database, also available as a CD-ROM or via the INTERNET. It is also considering the possibility of producing only the database version or of providing the information only through third parties under licence.

4.24 The Commission would be interested in reactions to or comments upon these various options from all the interested parties, Member States, contracting entities and suppliers.

(d) Fully electronic tendering system

4.25 The opportunities offered by technology are wider than the relatively straightforward electronic transmission and dissemination of notices. In the longer term, the way forward for electronic procurement will undoubtedly be a fully electronic tendering system. This could include the extension of electronic procurement to meet existing mandatory requirements under the Directives (such as the obligation to publish) but, far more dramatically, to cover every other part of the procurement process. A full electronic tendering system could cover the exchange of tender documents and tenders as well as information exchange during the life of the contract (including invoices and payments). However, unlike the publication of notices, such applications would fall outside the Commission's direct area of responsibility; it would be a matter for the commercial judgement of contracting entities and economic operators. The Commission will, of course, be closely associated with these developments: they will certainly significantly affect the EU regulatory framework for public procurement; and there are real dangers that incompatible national systems could create major new internal (and external) trade barriers.

4.26 Our regime must be responsive and ready to meet the challenge posed by a constantly changing public procurement environment. No specific provisions in the public procurement directives deal with the use of information technology. Our existing rules will, whenever possible, be interpreted in such a way as to allow and to accommodate the new developments. Although the Commission starts from a presumption that no amendments to the legal framework on public procurement will be proposed, it is not excluded that those stemming from changes of a technical nature which do not overturn the essential principles of the regime may call for specific legal proposals. Electronic procurement could be one such area.

(e) Experience outside the European Union[26]

4.27 How developments in information technology will be integrated in procurement in the coming years is uncertain, but important pointers are available. The US Administration has licensed information on tender notices to a dozen private companies which have developed so-called value-added networks (or VANs). These networks offer high-quality information about procurement possibilities in the US and abroad. Similar private sector involvement can be found in Canada. Because of the commercial value of procurement

[26] See also Chapter 6.

data, the private sector may be interested, for example, in their dissemination in Europe, even if multilingualism in the EU might retard the process. The Commission would welcome expressions of interest from private sector operators. Consideration must be given as to how the availability of information about potential suppliers of goods and services can be improved and how industry can be stimulated to provide the infrastructure for electronic trading with contracting entities. This requires much thought from all interested parties, in particular to find ways of co-operating to develop the necessary tools and services.

4.28 Electronic procurement is a global phenomenon. Our major trading partners have all embarked on ambitious programmes to develop integrated electronic access to their procurement information and to expand electronic tendering for their acquisitions. As with many new and exciting developments, there are opportunities as well as threats. The opportunities include the greater availability of information on public contracts: sophisticated software programmes can now give suppliers the information they need at the push of a button - irrespective of their geographic location. The threat is that national policies and interests could prove to be too great for governments. This could result in technically incompatible systems - making it more difficult to communicate; and consequently we may not be able to reap the expected benefits of electronic tendering. With the Commission's support, the Government Procurement Committee of the World Trade Organisation (WTO) - which deals with matters relating to the Government Procurement Agreement (GPA) - has already begun to discuss the application of information technologies in public procurement. Industry is also inviting us to examine the possibility of establishing a system of public purchasing using electronic means of communication, compatible between the European Union and the United States. These discussions within the GPA Committee also aim to reach a consensus on compatible systems in all GPA signatory countries. The key issues of internationally acceptable standards and technical procedures will therefore be tackled.

(f) Conclusion

4.29 Having considered reactions to this Green Paper, the Commission will publish a strategy paper on electronic procurement which will take account of reflections on electronic commerce and the information society. Its aim will be to prepare, with the help of Member States, an action plan setting out the way electronic procurement could develop over the next five years.

V. Questions

1. Is sufficient attention given to monitoring the application of the procurement rules as a way of preventing problems or detecting possible breaches? Are there suggestions to improve Community and Member State monitoring systems? Do you see merit in cross-border monitoring, for example by developing the concept of the European Observatory to look at rates of compliance in the public procurement market?

2. Positive incentives to stimulate efficient follow-up procedures in this sector are vital. Are there incentives (cross-checking, publication of results achieved, awards etc.) that could be applied at national level?

3. Are you satisfied with the information provided by the Commission or Member States on public procurement issues? Would a regular information bulletin reporting on public procurement developments and stimulating the exchange of views and experience at the European level be useful?

4. What other sources of information are available? What sort of statistical information would meet information and transparency requirements?

5. Regulations are now in place to protect the Community's financial interests. These contain provisions obliging Member States to communicate cases involving fraud or other irregularity to the Commission on a regular basis. These obligations already apply to public procurement dossiers, where there is Community financing. Could this information system be extended to public procurement in general?

6. Are there any training initiatives in your Member State? (Please give details.) Is sufficient attention being paid to training in relation to the application of information technology in public procurement?

7. Is a Community-wide programme needed to stimulate training and spread best procurement practice? What form should it take and what should be its duration? How can Member States, the procurement profession, academics and business play their full part in such a programme?

8. What improvements to the Official Journal Supplement or to the Tenders Electronic Daily database are needed?

9. Does electronic notification and tendering offer opportunities to make procurement more efficient and more accessible to suppliers? Can they contribute to the opening-up of public procurement?

10. How can increased electronic transmission of notices by contracting entities best be encouraged (voluntarily or as a legal obligation)? What incentives can be provided to encourage such transmission?

11. What elements would you regard as essential to exploit the wider potential of electronic tendering in public procurement? What role should be played by the Commission, the Member States, contracting entities, suppliers and software writers ?

12. Is the private sector interested in providing procurement information services in the Union?

13. Should discussions aimed at reaching consensus with our major trading partners on the technical compatibility of electronic tendering systems be given high priority?

5. PUBLIC PROCUREMENT AND OTHER COMMUNITY POLICIES

Public procurement policy has positive spin-off effects on other Community policies. Although SMEs firms still face a number of difficulties in effectively winning contracts, more transparent market access, for example, allows these firms to unlock new potential markets. In this chapter, the Commission presents measures that could improve the situation.

In the field of standards, the Commission intends to step up efforts, in agreement with business, to ensure that the standards institutions draw up European standards for use in contract documents, thereby contributing to the effective opening-up of public procurement.

The massive capital commitment required for Trans-European Networks is encouraged with contract award procedures laid down by the Directives that guarantee an acceptable return for investors. The Commission is prepared to clarify the legislative framework should this prove necessary in order to build partnerships between the public and private sectors for these projects.

Correct application of the Community rules also helps to allocate Community resources from the Structural and Regional Funds in the most efficient way. With this objective, the Commission is proposing a number of measures to improve compliance with these rules in procedures for the award of contracts part-financed by these Funds. The Green Paper deals with contracts awarded by the Community institutions or by non-Member countries who benefit from Community resources.

Public procurement rules can contribute to the achievement of social and environment policy objectives. A description of the possibilities offered by the Directives in these areas is given in this chapter. In the light of the outcome of the debate initiated by the Green Paper, the Commission will consider how better account can be taken of social and environmental aspects in the application of the rules.

Lastly, the Commission would welcome any initiative aimed at stimulating competition in defence procurement, with a view to conferring a European identity on security and defence policy and at the same time strengthening the competitiveness of our industry.

I. SMEs

5.1 Most of our larger companies now have considerable experience in bidding for public contracts in other countries. They are usually well placed to obtain information about particular calls for tender and sufficiently experienced in order to participate in them. They often continue to submit tenders through their local subsidiaries or via consortia in which the lead company is from the same Member State as the purchasing entity. The number of contracts won directly by firms based in other Member States remains small. This also holds true for small and medium-sized enterprises (SMEs), which face greater difficulties on account of their size. Although a survey of SMEs undertaken in 1994 by the Euro Info

Centres[27] identified firms which had won contracts in other Member States, these are only isolated cases that cannot be used to establish a general trend.

5.2 And yet SMEs should win a larger share of public contracts given their importance in the European economy: they account for over 65% of turnover generated by the private sector in the European Union. Wider SME participation in public procurement would lead to the creation of a core of SMEs capable of seizing opportunities offered by open public procurement not only within the European Union but also in countries covered by the GATT Agreement on Government Procurement (see Chapter 6) and would also in the long run enable SMEs to make a greater contribution to growth, competitiveness and employment. The basic objectives of an internal market in procurement (widening the choice of value-for-money suppliers for procurement entities and increasing the competitiveness of EU industry) will not be met unless SMEs can also secure genuine access to Europe's markets.

5.3 Work carried out on the basis of various communications or resolutions on the subject of SMEs and the internal market[28] has identified a long list of obstacles encountered by SMEs during contract awards, both upstream and downstream of the award procedure.

5.4 When planning their business activities, SMEs thus already encounter difficulties in organising themselves in order to bid effectively for the contracts of interest to them. This is because they find it difficult to adjust their activities to market demand; they lack practical information on contracts put out to tender in their sector; they lack the trained staff and technical assistance necessary to cope with prequalification procedures, particularly in the utilities sectors, and where appropriate, to prepare bids; they have problems in meeting quality certification requirements; and they are often too small in comparison with the contracts covered by the Directives and put up for competition at Community level. The problem of size is compounded by the difficulty in setting up effective and advantageous forms of partnership between SMEs.

[27] Survey on the impact of the internal market on business, involving more than 140 small and medium-sized companies in 12 Member States. See Commission press release IP (95) 364, 10.4.1995.

[28] See, for example, the Commission communications; of 7.5.1990 on promoting SME participation in public procurement in the Community (COM (90) 166); of 1.6.1992 on SME participation in public procurement in the Community (SEC (92) 722); of 3.6.1992 on measures relating to the industries supplying utilities sectors in the structurally disadvantaged regions of the Community (SEC (92) 1052); of 18.11.1992 on the problem of the time taken to make payments in commercial transactions (SEC (92) 2214); of 22.12.1993 on making the most of the internal market: Strategic programme (COM (93) 632); and of 3.6.1994 on the implementation of an integrated programme in support of SMEs (COM (94) 207); the Council resolutions of 22.11.1993 on strengthening the competitiveness of enterprises, in particular small and medium-sized enterprises and craft enterprises, and developing employment in the Community (OJ No C 326/1) and of 22.4.1996 on the coordination of Community activities in favour of small and medium-sized enterprises and the craft sector (OJ No C 130/1); and Parliament's resolution of 21.4.1993 on the Commission communications "Towards a European market in subcontracting" and "SME participation in public procurement in the Community" (OJ No C 150/71).

5.5 SMEs also have to contend with a number of problems in the contract award phase. For example, it is difficult for them to gain rapid access to the information necessary for preparing bids, especially for identifying and interpreting tender notices potentially of interest to them, the subject-matter of the contract, the regulations applicable (including national rules) and the standards and technical specifications to be complied with. In particular, a recent study[29] has shown that late transmission of contract documents by contracting authorities is a real barrier to participation by SMEs, since in many instances (over 50% of the cases studied) it prevents them from submitting a valid bid before the deadline expires. The costs of submitting tenders and the securing of financial guarantees at competitive rates are also substantial obstacles for these firms.

5.6 Even when performing contracts they have won, SMEs face special difficulties: in meeting the requirements of performance bonds they have accepted when contracts were concluded; in securing payment for their works or supplies on time; in settling any disputes quickly and cheaply; and in obtaining adequate protection as subcontractors.

5.7 Action has already been taken to tackle these problems at Community level. As far as the availability of information is concerned, some Community sponsored networks (including a core group of Euro Info Centres specialised in public procurement) have already developed information and market support services, in co-operation with private consultants. These networks, together with a number of local, sectoral or national services, provide information on contract opportunities even below the thresholds of the Directives - as well as additional information about the procurement plans of specific contracting authorities. Moreover, the new design of tender notices published daily in the Official Journal certainly facilitates the task of SMEs, which have access to it, in obtaining sufficient information on procurement opportunities, particularly in other Member States.

5.8 The Commission has also adopted a number of measures aimed at providing information and technical assistance to SMEs in disadvantaged regions in breaking into European procurement markets. These include PRISMA[30] (Preparation of Regional Industry for the Internal Market), which ran until 1994, and the newly launched SMEs[31] and INTERREG II[32] initiatives, which also cover the promotion of partnerships between SMEs in different Member States and specialised training.

5.9 The Commission believes that other initiatives should be taken. It would welcome comments on the options for action envisaged in this area and described below.

5.10 As far as general information is concerned, it could prove useful to draft a practical guide for SMEs, explaining how they can prepare for participation in public procurement, and to draw up interpretative documents on some aspects of the Directives that concern

[29] Euro Info Centre Aarhus County, Analysis of irregularities occurring in tender notices published in the Official Journal of the European Communities 1990-1993. Study presented to the Commission in 1996.

[30] PRISMA (91/C 33/05), OJ No C 33/9 of 8.2.1991.

[31] SMEs Initiative (94/C 180/03), OJ No C 180/10 of 1.7.1994.

[32] INTERREG II (94/C 180/13), OJ No C 180/60 of 1.7.1994..

these types of business more particularly, such as the splitting of contracts into lots, the publication of prior information notices, and the problem of the time limits for distributing documentation on contracts.

5.11 As regards information on specific contracts, consideration could be given to adapting TED to the specific requirements of SMEs. Another possibility would be to take advantage of the increasing popularity of the INTERNET and World Wide Web to provide access to such information for a much wider audience. There are few technical obstacles to such developments, but there may be a need for co-ordination at a European level if such initiatives are to succeed. It could also be useful to press for greater transparency on the part of contracting authorities by encouraging them to use wherever possible the Common Procurement Vocabulary (CPV) and standard forms for procedural documents, which would facilitate electronic data interchange.[33]

5.12 As far as preparing for contract award procedures is concerned, the opening-up and simplification of contracting authorities' practices through the training of procurement officers, the exchange of officials and the exchange of information on good procurement practice could only make it easier for SMEs to bid for contracts.

5.13 Given their size, it would be easier for SMEs to take part effectively in an ever more global market if frameworks were established for co-operation between them. It could therefore be worth looking into the question of whether the European Economic Interest Grouping (EEIG) is suitable for promoting co-operation between SMEs, particularly for cross-border public procurement.

5.14 An aspect which is extremely important for SMEs, but is not dealt with directly by the Directives, is subcontracting. The Commission has been called upon to "pursue, in concert with the Member States, its general role of instigating, initiating and co-ordinating measures aimed at creating a propitious environment for subcontracting"[34]. To that end, action could be taken in this area, for example to improve the existing network of databases on subcontracting and to encourage the establishment of approved codes of practice and standard contractual clauses. In order to gauge the economic importance of sub-contracting, pilot studies have been carried out in 10 Member States using as a basis the common methodology developed by EUROSTAT. These studies were carried out on sub-contracting enterprises or those ordering in three economic sectors (cars, electronics, textiles/clothing) and the results will be published before the end of 1996.

5.15 Another aspect which closely concerns SMEs is payment periods. On this topic the Commission, after carrying out wide-ranging consultations, adopted a recommendation[35] in which it calls on Member States to ensure that their contracting authorities are disciplined in the matter of payment. The recommendation thus provides, for example, for a time limit by which payments should be made and for the payment of interest in the event of late

[33] See in this connection the arguments developed in Chapter 4.

[34] See Council resolution of 26th September 1989 on the development of subcontracting in the Community (OJ No C 254/1 of 7.10.1989).

[35] Commission recommendation on payment periods in commercial transactions (OJ No L 127/19 of 10.6.1995 and OJ No C 144/3 of 10.6.1995).

payment. Member States are to submit reports by the end of 1997 on the action they have taken to implement the recommendation; the Commission would be interested in having at this stage the reactions of the parties concerned on this matter.

5.16 On a more general note, the Commission takes the view that the effective access of SMEs to public procurement could be achieved through a set of concrete measures based on a thorough analysis of these firms' practical needs and opportunities, and in particular through the development of networks of support services which would provide them with the necessary information, technical assistance and suitable training. Following the consultations launched by this Green Paper, the Commission intends to present a communication on the measures it proposes in this area.

II. Standardisation

5.17 Standards and technical specifications describing the characteristics of the works, supplies or services covered by contracts play a crucial role in our efforts to open up public procurement. The use of national standards can significantly restrict access to contracts for non-national suppliers. With this in mind, the Directives provide that contracting authorities define technical specifications with reference to European standards or technical approvals, without prejudice to mandatory national technical rules, in so far as these are compatible with Community law. This was a problem the Directives sought to resolve by requiring contracting entities to refer to European standards where they exist. Under Commission mandates issued within the framework of the 1985 Council resolution on a new approach to standards and technical harmonisation,[36] the European standardisation bodies (CEN, CENELEC, ETSI) have developed many European standards which are then implemented into national standards. In addition mandates in support of public procurement have been issued on a number of occasions. This effort must be stepped up since certain markets are to this day still *in practice* closed off, chiefly owing to insufficient standardisation work. Together with industry, the Commission is currently determining where further mandates are needed. The Commission would welcome comments from interested parties on the general issue of standardisation and technical specifications in public procurement and on the identification of areas where the absence of European standards poses problems for the opening-up of public procurement.

III. Trans-European Networks (TENs) and transport in particular

5.18 The Maastricht Treaty committed the European Union to promoting the creation of a web of Trans-European Networks (TENs) in the transport, energy and telecommunications sectors. Successfully developing TENs will contribute to the optimal use of the opportunities offered by the single market; investing in TENs is an investment in our future. This policy is crucial to the overall competitiveness of the EU economy and, both directly and indirectly, to the creation of employment. Several key projects are already under way, including the Øresund road and rail link between Denmark and

[36] Resolution of 7.4.85, OJ C 136/1 of 4.6.1985.

Sweden, upgrading Malpensa airport for Milan and the rail link between Cork and Stranraer. However, progress on other priority TENs has been slow.

5.19 Against a background of ever tighter government budgets, the European Council has emphasised the importance of private finance in the Union's efforts to increase investment in TENs infrastructures. Investment projects are increasingly unlikely to be funded only by grants from local or national governments. They demand a massive financial commitment. There is therefore a need to find fresh ways of raising capital. Many private sector organisations have made it clear that they are increasingly ready to invest substantially in TENs projects and are willing to do so on a risk-financing basis. But a number of obstacles still have to be overcome.

5.20 The Commission's report to the Madrid European Council (December 1995) outlined ways of overcoming obstacles to the private financing of Trans-European Network projects. Apart from the problem of how to ensure an acceptable rate of return for projects, the report also referred to the problem of non-commercial risks arising due to changes in public policy. The Commission is presently looking into this issue. The private sector has also expressed concern about the application of EU public procurement rules; in some circles, it has been claimed that the Directives may inhibit private sector involvement.

5.21 The ultimate objective of the Community's public procurement directives is to achieve fair and open competition for procurement contracts in the internal market. Their aim is to facilitate and not to obstruct private sector involvement in projects. The Commission believes that the Community public procurement rules can facilitate private sector participation in Trans-European Networks, without any need, at this stage, to amend the existing legal framework. Should clarification of the framework prove necessary, the Commission is prepared to tackle the different questions arising with the parties concerned to ensure that partnership between the public and private sectors is in no way inhibited. As announced in its report to the Madrid European Council, the Commission has also set up a TENs Help Desk to provide a one-stop shop to answer enquiries from private sector TENs participants.

5.22 To date, industry has identified three principal concerns which, while not being exclusively concerned with TENs projects, are certainly of considerable importance in that particular area. These concern the pre-tendering phase, concessions to consortia and use of the negotiated procedure.[37]

(a) The pre-tendering phase

5.23 The private sector has indicated its reluctance to engage in pre-tender discussions or studies without an assurance that it will not be excluded from the subsequent tendering procedures, fearing a potential infringement of the principle of equal treatment. The Commission recognises that, in view of the complexity of most of the projects - some of which may require solutions never attempted before - a technical dialogue before the calls for tender between the awarding authority and private parties involved may be necessary. If, through the introduction of specific safeguards - affecting matters of substance as well

[37] See discussion in Chapter 3.

as procedure - contracting authorities refrain from requesting or accepting information that would have the effect of restricting competition, the principle of equal treatment will not be violated.

(b) The award of concessions to consortia

5.24 As previously stated (see Chapter 3), the award of a public works concession is the usual way of enabling the private sector to participate on a risk basis in the building and operation of infrastructure projects in partnership with the public sector. The Commission notes that, in line with the applicable Community rules, it is essential that consortia, participating on a risk basis, can bid for concessions knowing they will be able to award contracts to their associates within the consortium in respect of the necessary supplies, works or services. The provisions of the public works Directive applying to the award of works concessions for the construction of public transport infrastructures permit the winning consortium to do so.

(c) The use of the negotiated procedure

5.25 Complex works and services contracts may in some cases justify the use of the negotiated procedure. Under the Utilities Directive, contracting entities already have a free choice between three procedures (i.e. open, restricted or negotiated procedures) involving a prior call for competition. In the traditional sectors, however, as has already been mentioned (see Chapter 3), the negotiated procedure may be used only in certain well-defined circumstances that are listed exhaustively in the Directives. For example, the public services Directive allows an award by negotiated procedure where a service is complex and cannot be specified with sufficient precision, particularly in the field of intellectual services. The public works Directive allows the use of the competitive negotiated procedure in exceptional cases where, for instance, the nature of the works or the attendant risks do not permit prior, overall pricing.

IV. Procurement involving Union funds

(a) Structural and Cohesion Funds

5.26 The Structural and Cohesion Funds have contributed over ECU 50 billion to public authority investments in the Member States during the past two years. Through other financial instruments (including European Investment Bank loans and grants from other Community sources) the Union has provided a further contribution of over ECU 34 billion. Moreover, by means of financing from the Funds, the Union expects to spend ECU 57 billion over the next two years. It is undeniable that Member States must have confidence amongst themselves that each and every one of them respects the rules; that the best value for money is being achieved in the expenditure of European taxpayers' money and that the risk of fraud is minimised. Our rules on public procurement and on the protection of the financial interests of the Community have a central role to play in this, it being understood that there can be no discrimination in their application, whether it is a question of contracts financed from national resources or contracts qualifying for support from the Structural and Cohesion Funds.

5.27 The present system of control is based on the 1989 Commission communication to the Council.[38] It clarifies the obligation on Member States to ensure, systematically, that the public procurement rules have been respected and to confirm that for each and every request to the Commission for payment of funds the rules have been honoured. However, very few Member States have put into place a systematic and thorough mechanism for monitoring compliance with the public procurement rules. The Commission, for its part, can release the funds only upon explicit confirmation of that compliance. If the rules have not been followed (for example, if tenders have not been correctly advertised) funding can be suspended, and then, if necessary, withdrawn and infringement procedures started**.** In the case of the Cohesion Fund, and large ERDF projects an *ex ante* verification is systematically made as part of the examination of applications for part-financing.

5.28 The Commission must increasingly rely on Member States to fulfil their obligations, especially since the volume of individual projects is steadily growing. The problem has become more acute and needs resolution. Indeed, following the reform of the Structural Funds, the management of funds (particularly the choice of and follow-up to funded projects), has been devolved to each Member State. Greater authority over fund management goes hand in hand with greater responsibility to control compliance with procurement rules. Improving the current system of control at the Member State level is therefore vital. It is appropriate to recall that an important discussion is taking place as part of SEM 2000 on the need for greater transparency and rigour in the use of the Structural Funds. In this context, concrete proposals will be submitted to the Dublin European Council, directed at clarifying certain criteria and also at promoting co-operation and dialogue between Member States and the Commission in the framework of partnership, and in the interest of the beneficiaries. The conditions for the application of financial adjustments in cases of fraud and irregularity are also tackled, including net correction in the extreme case where a Member State persists in failing to meet its audit obligations. Work will continue in 1997. At the same time, one should recall and underline the rules of transparency, under which there is an obligation to communicate established cases of irregularity or fraud to the Commission.

5.29 Although ultimately, responsibility for improving procedures rests with the Member States, the Commission will use its best offices to ensure that improved systems of control are introduced as soon as possible. Any solution must go beyond identifying particular problems in specific projects. Our goal must be to create a regime that adds value. Accountability, performance and results must become bywords in Structural Fund management. The likely benefits are clear: considerable savings at all levels; more effective spending of limited resources; a healthier employment situation in the regions concerned; more confidence from our citizens that EU money is well spent; and projects that work for their users. To demonstrate proper regard for the use of public money and to win public support, the Commission believes that Member States should publicise the fact that value-for-money has been achieved in any particular project.

[38] COM (88) 2510 and OJ No C 22 of 28.1.1989.

5.30 Improvements to the regime itself could be made by introducing relatively small changes in procedures. One such change would be the introduction, for each project, of a statement signed by the responsible national official that the Union's public procurement rules have been complied with. Such a statement of personal accountability has been used in other areas and in some third countries, most notably in the United States; it has proved to be one of the most effective ways of securing the best price and preventing fraud. More widely, thought could be given to developing a code of good conduct to which national officials could commit themselves. Clearly, the feasibility of such measures would have to be looked into in the light of the different systems of staff regulations for civil servants in Member States.

5.31 The idea of individual accountability is inspired by the notion of prevention. Our policy in handling Structural Funds must anticipate - prevention is better than cure. The application of the system of attestation (see Chapter 3) to contracting entities receiving EU funds could significantly improve the situation and provide assurances that recipients have mechanisms in place that are capable of securing value-for-money equal to best commercial practice. It is our common interest that EU funds are spent effectively. Certifying by means of attestation that an effective procurement system is in place calls for only a small effort from public authorities in return for the benefit of saving considerable sums of EU money.

5.32 A more far-reaching proposal could be the use of the independent authorities referred to in Chapter 3 to promote compliance with public procurement rules in respect of European Union funds. Without prejudice to the Commission's competence, such bodies could play a key role not only in monitoring public authorities' behaviour, but also in advising them. These functions could also be the responsibility of a Member State's national court of auditors or an equivalent independent authority.

5.33 Implementing proposals will not solve each and every problem. A transformation of public procurement that involves funds of the Union - permanently and structurally - will only be achieved if such specific solutions are accompanied by a process of ongoing change in close partnership with the Member States. It may be necessary to formalise such initiatives (for example to establish accountability) in order for real and lasting change to be achieved. This is also in keeping with the spirit and objectives of the “good sound management” exercise (SEM 2000) carried out by the Commission and the personal representatives of Member States, following on from the impetus given by the Madrid European Council in 1995. The conclusions of this group confirm the need to be concerned about rigour and transparency in making good use of appropriations and about sharing responsibilities, and will be presented to the Dublin European Council in December 1996.

5.34 With an improved system of checks in place at national level, the Commission, for its part, could concentrate on an *ex post* verification of projects (for example in close co-operation with the independent body designated in each Member State). The Commission could also be invited to carry out an audit of the checking systems established in each country. The Commission will, in addition, seek to improve information flows between the Commission and the Member States on projects, especially through the use of modern information technologies.

(b) Public procurement by the European institutions or financed by non Member countries benefiting from Community resources

5.35 When awarding contracts for their own operational requirements or for the purposes of implementing the different policies for which the Community is responsible, the European institutions are required by Article 56 of the Financial Regulation to follow the same rules as those applicable to national contracting entities under the Directives on public procurement. Furthermore, only contracts awarded by the Council and the Commission are covered by the provisions of the GPA of the World Trade Organisation (see Chapter 6). The exceptions to the obligations laid down by these instruments concern: (a) in the case of the GPA, contracts concluded in connection with food aid; (b) in the case of the obligations deriving from Article 56 of the Financial Regulation[39], the same derogations as those laid down in the Directives plus, in accordance with Title IX of the Financial Regulation, contracts awarded in the context of external aid financed from the Community budget, with the exception of public service contracts awarded for the Commission's own requirements, to which the normal rules apply. Clearly, although they fall outside the scope of the Directives, all of these contracts, which are financed from Community resources (general budget, EAGGF and under EDF) and under Community programmes (e.g. PHARE, TACIS, MEDA, etc.), are still subject to specific rules and the fundamental principles governing the award of contracts, in particular transparency and equality of treatment.

5.36 These wide-ranging general obligations have been spelt out in greater detail by recent amendments to the Financial Regulation and will be clarified further still by other amendments which the Commission intends to propose with a view to circumscribing the above mentioned derogations in order to ensure that they are interpreted restrictively. The Commission's action forms part of its efforts to improve financial management, as provided for in the guidelines of the SEM 2000 operation.

5.37 The aim of this legislative framework is, by encouraging competitive tendering, to enable more efficient use to be made of the Community's general budget and of funds for development co-operation. The departments concerned must therefore endeavour to apply it as comprehensively as possible. The Commission wishes to ascertain whether the measures taken are sufficient to ensure fair access to contracts awarded both by the European institutions and by other bodies or third countries under Community programmes and using Community funds. In this connection, third countries in receipt of financial aid from the Community budget should also be invited to commit themselves to meeting certain obligations, particularly as regards on-the-spot checking for irregularities, recovering sums misappropriated and penalising irregular dealings.

[39] Financial Regulation of 21.12.1977 applicable to the general budget of the European Communities, as last amended by Council Regulation (ECSC, EC, Euratom) No 2335/95 of 18.09.1995 (OJ No L 240 of 7.10.1995).

V. Procurement and social aspects

5.38 The European Union's social policy contributes to promoting a high level of employment and social protection (Article 2 of the EC Treaty), the free movement of workers, equality of opportunity between men and women, stronger economic and social cohesion, better living and working conditions, a high level of health protection, high standards of education and training and the integration of the disabled and other disadvantaged groups into society.

5.39 Contracting authorities and contracting entities may be called upon to implement various aspects of social policy when awarding their contracts, as public procurement is a tool that can be used to influence significantly the behaviour of economic operators. As examples of the pursuit of social policy objectives, one can mention legal obligations relating to employment protection and working conditions binding in the locality where a works contract is being performed or so-called "positive action". The latter occurs where public procurement is used as a means of achieving the desired objective, for example by providing a captive market for a disabled workshop which could not reasonably expect to compete on equal terms with normal commercial enterprises enjoying normal levels of productivity.

5.40 The legal framework created by the Treaty and the Directives continues to apply in these situations. For this reason, since the entry into force of the public procurement directives, questions have constantly arisen as to whether and to what extent social objectives can or should be pursued, given the specific limitations imposed by the public procurement directives in order to prevent their whole purpose being frustrated.

5.41 Provisions which have been included in all the Directives offer an initial possibility for pursuing social objectives by allowing contractors or suppliers to be excluded where they have been convicted of an offence concerning their professional conduct or have been found guilty of grave professional misconduct. These rules clearly also apply where the offence or misconduct involves an infringement of legislation designed to promote social objectives. In these cases, then, the provisions in question indirectly allow contracting authorities to pursue such objectives by excluding from contract award procedures candidates who have failed to comply with such legislation.

5.42 Another possibility is to require successful tenderers to comply with social obligations when performing contracts awarded to them, for example obligations aimed at promoting the employment of women or the protection of certain disadvantaged groups. Checking of compliance with such conditions should take place outside the contract award procedure (see the judgement of the Court in *Beentjes*, cited earlier, and the Commission communication on public procurement: regional and social aspects[40]). Clearly, contract performance conditions are allowed only where they do not result in direct or indirect discrimination against tenderers from other Member States. Sufficient transparency must also be ensured by mentioning the conditions in the contract notices or contract documents.

[40] Commission communication of 22.9.1989, COM(89) 400 final, OJ No C 311of 12.12.1989.

5.43 On the other hand, the Directives do not currently allow social considerations to be taken into account when it comes to checking the suitability of candidates or tenderers on the basis of the selection criteria, which relate to their financial and economic standing or their technical capability, nor when it comes to awarding contracts on the basis of the award criteria, which must relate to the economic qualities required of the supplies, works or services covered by the contract. As against this, however, it should be added that, in the case of contracts falling below the thresholds for application of the Directives, purchasers may include social preferences in the award criteria, provided that they are extended without discrimination to all Community nationals with the same characteristics.

5.44 The question that arises here is, first, whether the possibilities offered by public procurement law for pursuing Community and national social-policy objectives in respect of the different groups concerned need to be clarified by means of an interpretative communication and, second, whether these possibilities are sufficient to satisfy needs or whether other measures need to be taken in order to achieve these objectives in applying the Community rules on public procurement, while safeguarding fair competition.

VI. Procurement and the environment

5.45 Environmental protection policy has become one of the most important Community policies, following the amendments made to the EC Treaty first by the Single Act and then by the Maastricht Treaty. Over 200 legislative instruments have been adopted, concerning inter alia action to combat air, water and soil pollution, waste management, product safety standards, environmental impact assessment, and the protection of nature. Article 130r of the EC Treaty also provides that environmental protection requirements must be integrated into the definition and implementation of other Community policies. Several Member States have, for their part, developed extremely advanced environmental protection policies.

5.46 In this specific sector, Member States (and their public authorities) have, increasingly, started to integrate environmental considerations into their public procurement practices. Because of its size, public procurement can have an enormous impact on certain business activities; it can even give a major push to the commercial development of certain products. The Danish Government has recently adopted an 'Action plan for a sustainable environmental/’green’ policy for public procurement'. Other Member States are also examining what steps can be taken to promote procurement of green products and services. In addition, the OECD recently adopted a Recommendation on improving the environmental performance of government,[41] which urges member countries, and in particular their governments, to establish and implement policies for the procurement of environmentally friendly goods and services.

5.47 The application of the public procurement directives does indeed leave scope for public authorities to promote environmental protection. It would undoubtedly be desirable in this connection to clarify the possibilities offered by the general provisions of existing

[41] OECD Council Recommendation C(596)39/Final, 20.2.1996.

legislation for taking environmental concerns into account and, at the same time, to define more precisely the limits to these possibilities.

5.48 First, as with social objectives, environmental protection can be achieved through specific rules for the infringement of which a supplier or contractor can be convicted of an offence concerning his professional conduct or found guilty of grave professional misconduct. In such cases, the Directives allow contracting authorities and contracting entities to exclude from contract award procedures any supplier or contractor who has been found guilty of breaching such rules.

5.49 Second, environmental protection considerations can be incorporated into the technical requirements relating to the characteristics of the works, supplies or services covered by contracts, namely the technical specifications which purchasers must indicate in the general contract documents and with which tenderers must comply, in accordance with the Directives. Efforts should be made to develop European standards or common technical specifications which incorporate and promote environmental concerns while avoiding the negative implications for the single market that would result from establishing criteria that are over-specific. An example of such a specification could be a European eco-label, complying with Community law. In any event, purchasing entities can already encourage firms to adopt a more active approach towards the environment by ceasing to reject tenders for goods that incorporate reconditioned components or recycled materials despite the fact that their technical characteristics satisfy the requirements laid down in the contract documents.

5.50 Third, the Directives allow, under certain conditions, environmental protection objectives to be included among the criteria for selecting candidates. These criteria are designed to test candidates' economic, financial and technical capacity and may therefore include environmental concerns depending on the expertise required for specific contracts.

5.51 Fourth, during the contract award phase environmental factors could play a part in identifying the most economically advantageous tender, but only in cases where reference to such factors makes it possible to gauge an economic advantage which is specific to the works, supplies or services covered by the contract and directly benefits the contracting authority or contracting entity. In the case of contracts falling below the thresholds for application of the Directives, environmental preferences may be used as an award criterion provided that they are non-discriminatory and open to all tenderers in the Community on the basis of the mutual recognition principle.

5.52 Fifth, purchasing entities can pursue environmental protection objectives through performance conditions imposed contractually on successful tenderers. In other words, a contracting entity can require the supplier whose tender has been selected to perform the contract in accordance with certain constraints aimed at protecting the environment. Clearly, such performance conditions should not be discriminatory or in any way disturb the smooth functioning of the single market. The conditions should also be mentioned in tender notices or contract documents to ensure that bidders are sufficiently aware of their existence. Lastly, verification of the successful tenderer's ability to perform the contract in accordance with the conditions should take place outside the contract award procedure.

5.53 Within the limits of the possibilities set out above, the Commission would be most interested to receive information on the experience of Member States or individual contracting entities in taking environmental objectives into consideration in their purchasing. The Commission, in its proposed Decision on the review of the 5th.Action programme for the environment, has already indicated that further action could be needed to take better account of environmental considerations in the application of Community public procurement rules, while safeguarding fair competition.

VII. Defence procurement

5.54 In 1990 the total defence procurement expenditure by EU defence ministries amounted to ECU 65-70 billion. Whilst a large part (around one third) of such purchases is already covered by the public procurement directives, the benefits of open procurement in this sector are still to be fully exploited. A 1992 study carried out for the Commission on the costs of non-Europe in defence procurement, including contracts for military equipment, suggested that major savings (ranging from ECU 5 billion to ECU 11 billion on the basis of 1990 figures, according to the different possible scenarios) can be achieved in this area. The Commission welcomes any move to introduce more competition into defence procurement. This will result not only in direct economic savings, but also in economies of scale from longer production runs and, ultimately, in a more competitive European defence industry. As a contribution to the debate the Commission recently issued a communication entitled "The challenges facing the European defence-related industry - A contribution for action at European level"[42]. Since the defence-related industry depends almost exclusively on public purchases, public procurement is extensively dealt with in this communication. Nevertheless, as a competitive European defence industry is also an essential precondition for conferring a European identity on security and defence policy, the special nature of the sector has to be taken into account. This could prompt some adjustments to the procedures laid down in the public procurement directives. Neither should initiatives taken by the Western European Union (WEU) and other similar organisations working in the defence co-operation field be overlooked.

VIII. Procurement and consumer policy

5.55. The implementation of an effective procurement policy, which improves market access and transparency in an increasingly integrated Single Market can bring significant benefits to consumers, providing them with better quality and more economically efficient services and infrastructures. In this context, it would seem important to take greater account of consumer policy in Union procurement policy. Promoting more transparency and dialogue with consumer organisations would be particularly welcome.

[42] Commission communication of 24th January 1996, COM (96) 10 final.

IX. Questions

1. For general information purposes, do you think that it would be useful to compile a practical guide explaining to SMEs how to prepare themselves for taking part in public procurement, and for interpretative notices to be drawn up on aspects of the application of the Directives which are of special interest to SMEs? On what topics, in your view, should these documents particularly focus?

2. Given that some Community-sponsored networks already supply additional information on procurement, particularly to SMEs, should their role be reinforced? If so, how?

3. What is your opinion on the options under consideration for improving the information available to SMEs about specific contracts (adaptation of TED, using the INTERNET, the CPV and standard forms)? Do you think that there are other avenues which should be explored?

4. Is the EEIG (European Economic Interest Grouping) an appropriate instrument for promoting co-operation between SMEs, especially in cross-border public procurement?

5. Do you think that, to promote greater SME participation in public procurement, other action should be taken at Community level, particularly on the issues of subcontracting and payment periods? If so, what type of action? For example, should one consider the fixing of mandatory payment periods, after which interest on late payment and, if need be, damages and interest would be due?

6. What are, in your view, the most appropriate ways of developing networks of SME support services? What type of services in particular should be provided by these networks?

7. In your opinion, to what extent has the standardisation policy pursued by the European standards bodies (CEN, CENELEC, ETSI) on the basis of Commission mandates been successful in eliminating obstacles to the opening-up of public procurement?

8. Which product sectors should be given priority in determining further mandates for European standards?

9. A number of anxieties expressed by the private sector have been dealt with in the part of this Chapter concerned with TENs. Has the clarification of the relevant provisions been sufficient to dispel these anxieties or should further written guidance be given on the application of the Directives to public tendering for TENs or other major projects (for example, through an interpretative communication)?

10. Do you know of any other issues related to tendering procedures for contracts that need clarification or resolution to facilitate private participation in TENs or other public/private partnerships?

11. Do you agree that, as an incentive to the effective management of the Structural Funds, wider publicity should be given by Member States and contracting entities to the fact that value for money has been achieved in procurements for EU co-financed projects?

12. Would it be useful to require the persons responsible to sign a personal statement that, in respect of a particular project, value for money has been obtained and that the public procurement rules have been followed?

13. Are there any other ways of increasing the effectiveness of the public procurement rules when structural funds are utilised ?

14. Do you think that contracting entities receiving funds from the Union should be encouraged to undergo attestation to ensure that an effective procurement system is in place?

15. Do you think that it could be useful and efficient if an independent national authority, co-operating closely with the Commission, were to assist contracting authorities when their procurements are financed from Community funds?

16. Do you think that the rules governing contracts awarded by the Community institutions and contracts awarded by other bodies or third countries under Community programmes and using Community resources are adequate to ensure fair access to these contracts for all interested parties?

17. In your opinion, do the possibilities offered by public procurement law for pursuing Community and national social policy objectives need to be clarified, for example by means of an interpretative communication?

18. Do you think that these possibilities are sufficient to satisfy needs? If not, what other measures do you think could be taken in order to ensure that social policy objectives are more effectively achieved in the application of the Community rules on public procurement, while safeguarding fair competition?

19. In your opinion, are obligations relating to health and safety at the workplace taken sufficiently into account during the preparation of tender notices and contract documents? What improvements can you suggest?

20. What has been your experience with the promotion of "green" products and services procurement under the Directives? Is there a need for the Commission to clarify the possibilities for incorporating environmental protection concerns in the application of the public procurement directives (e.g. by means of a Commission communication)?

21. Do you think that the possibilities offered are sufficient to attain the objectives pursued? If not, what measures do you think could be taken in order to ensure that environmental protection objectives are more effectively achieved in the application of the Community rules on public procurement, while safeguarding fair competition? Should the eco-label be included among the technical specifications mentioned in the general contract documents, or should application for registration under the Environmental Management and Audit Scheme figure among the selection criteria?

22. Given the absence of competition in the military equipment sector, should this not be governed by a system of public procurement as desired by some Member States?

6. PROCUREMENT OUTSIDE THE UNION

With a new World Trade Organisation Government Procurement Agreement (GPA) in place, globalisation of public procurement is certain to grow. Our industry must reply positively and effectively to this challenge; world-wide competition will be intensifying and success will hinge on innovation and international thinking to meet the challenge. Further market opening must be actively pursued; a constructive, ongoing dialogue with our industry is critical to identify new market opportunities and to help set objectives for any future negotiations. To this end, the Commission invites Member States and industry to provide information on any problems particular markets might pose and to suggest possible solutions, in particular where market opening agreements are under negotiation.

The preparation of the associated countries of Central and Eastern Europe for accession to the Union remains a major priority. The Commission's White Paper provides guidelines on the full range of single market policies, including public procurement. The Commission and the Member States have already made considerable efforts in helping to lay the foundations for an effective public procurement system. These efforts must be intensified. Training on best procurement practice and ready access to sound legal advice are paramount.

Similarly, in line with the Commission’s attempts to improve links with countries in the Mediterranean basin and as is provided for in the agreements concluded with Turkey, Morocco and Tunisia, the Commission will also look at ways of assisting in the development of competitive public procurement practices there.

I. Access to world procurement markets - Getting a fair deal for Europe

6.1 Increased liberalisation of EU markets must, to the greatest extent possible, be mirrored throughout the world in order to maximise the benefits to our industry of competitive tendering. The EU has been instrumental in achieving large-scale procurement liberalisation with its major trading partners, through the first-generation GATT Agreement on Government Procurement of 1979, the European Economic Area (EEA), the Europe Agreements, and more recently through a new WTO Government Procurement Agreement (GPA), concluded alongside the Uruguay Round.

6.2 The new GPA came into force on 1st January 1996. In addition to the European Union, the contracting parties are the US, Canada, Japan, Israel, South Korea, Norway and Switzerland. Aruba and Liechtenstein recently joined the agreement, and Singapore is in the process of acceding. The agreement's coverage includes contracts awarded by lower levels of government (such as individual states in federal countries, provinces and cities) as well as by entities operating in a number of utilities sectors (such as electricity, urban transport, water, ports and airports). Whereas the 1979 GPA was limited to public supply contracts, public works and public service contracts now fall within the scope of the new GPA. Significantly, suppliers will also have the right to challenge the award of contracts where they feel that they have been discriminated against. The Commission estimates overall that the new GPA will open to international competition public contracts worth around ECU 450 billion every year. That represents approximately a tenfold increase in the value of contracts opened to bidding under the 1979 GPA.

6.3 Many discriminatory provisions which kept EU business out of huge procurement markets in third countries were removed at the beginning of this year. New business opportunities have been created for industries as diverse as banking and heavy engineering. In the US, most discriminatory "Buy American" provisions, some dating from the 1930s, have been removed by the Federal Government as well as by 39 of the 50 state governments (including California, New York, Texas, Illinois and Florida). As a result, market opportunities worth around ECU 100 billion per annum will be available to EU business. The GPA also represents major progress on opening up procurement markets in south-east Asia. Japan for example agreed to cover the award of contracts by its 47 prefectures which are responsible for the bulk of procurement expenditure, particularly in the area of construction and civil engineering. In South Korea, which will apply the GPA from 1997, EU business will be able to bid for contracts throughout the public sector without the compulsory technology transfer, buy-back or local content arrangements that applied in the past.

6.4 But we cannot stand still. Despite major progress achieved to date, not all restrictions on tendering opportunities have been removed; certain important restrictions have remained in place in the countries which are signatories to the GPA (in which case, the Community has followed the principle of reciprocity). Moreover, the GPA, which is for the time being a plurilateral agreement, is intended to become a multilateral agreement, which means that a large number of countries have yet to accede. As the European market is generally open for suppliers from third countries, it is in the interest of European business that the Community should seek, in negotiations with third countries, to agree on market-access arrangements which achieve full reciprocal liberalisation of procurement.

6.5 Further opening-up of public procurement world-wide will therefore remain our key target. Results will be sought from the multilateral process in the WTO, by completing the coverage of existing parties to the GPA and by enlarging its membership. Future applicants for membership of the WTO such as China and Taiwan should, as a matter of principle, join the GPA, if necessary after a transitional period. (Indeed, Taiwan has already tabled an offer to join.) The Commission already strongly encourages present WTO members to accede to the GPA, particularly those with observer status under the Agreement. The multilateral approach through the WTO remains the key forum for our efforts. A parallel negotiation should be initiated in order to reach an agreement on transparency, opening up and systems of remedies in public procurement. The end objective remains national treatment and the effective application of the most favoured nation clause for all the public contracts and all Members of the WTO. To further this process, the European Union also proposes an advance revision of the GPA of 1994, which would include the extension of the Agreement, the abolition of discriminatory measures and practices and its simplification and improvement. Bilateral negotiations are, nonetheless, still needed. The Commission is therefore already in negotiation with Switzerland and South Korea. In a similar vein, the Commission is looking at gaining market access for EU suppliers in the countries of the Mediterranean Basin. Further to the Barcelona Declaration which aims to establish a Free Trade Area between the Community and the Mediterranean countries in time for the beginning of the next century, an Association Agreement covered by Article XXIV of the GPA has been reached with Israel. This agreement has been completed by two specific agreements on public procurement. These, which are not yet ratified, aim to broaden offers made on a reciprocal basis under the GPA and to open the telecommunication procurement markets of both parties. A Customs Union Agreement with Turkey has also been concluded which makes provision for future access to public procurement on a reciprocal basis. A similar approach has been taken in two Interim Association agreements concluded with Morocco and Tunisia.

6.6 European industry already has much detailed knowledge of local difficulties in tendering in third countries. As indicated in its Communication on a market access strategy[43], the Commission must, if this strategy is to be effective, have first-hand up-to-date knowledge of the problems that suppliers face in third country markets so that it can remove those barriers which are most harmful to European interests. It would be helpful to have details of the experience industry has. The new interactive data base, accessible on the INTERNET, makes it possible for industry to inform the Commission directly about its market access problems. This will enable the Commission to evaluate the problems and to examine and decide upon what action should be taken to resolve them. On the other hand, in order to identify problems of access and to help set objectives for future negotiations with third countries, the Commission has launched a major multi-country study on public procurement regimes in 19 countries in Asia, the Middle East and Latin America. The results of the study will be available shortly. The contribution of European industry to this study would be most welcome.

6.7 However, compiling and analysing information is only half the battle. Agreements are only useful if they can be made to work in practice. The Commission will therefore take steps to ensure that the GPA is made to work effectively. It will draw on its network of delegations in third countries to assist it in this task. The Commission also invites Member States to provide assistance where necessary to ensure that its suppliers are treated fairly. When necessary and appropriate, the Commission will not hesitate to use the consultation procedures provided under the GPA. If these consultations fail to resolve the issue, the Community may make use of the WTO dispute settlement procedures.

6.8 But competition is not a one way street. The Community and the Member States can help in creating the right conditions, but European industry must itself be prepared to fight strong competition for public sector contracts inside the Union from third country suppliers who now benefit from the GPA. Suppliers should, in time, seek to maximise the commercial opportunities the Agreement offers to increase their exports to third countries, and increase their share of third country procurement markets. Those who adapt to change and seek to find new markets will generally be the most successful. Those who are complacent and wait are most at risk.

[43] doc. COM(96) 53 final

II. Laying the foundations for open procurement in Central and Eastern European Countries and in the Mediterranean countries

6.9 Following the entry into force of the Europe Agreements, which are covered by Article XXIV of the GPA, suppliers from Hungary, Poland, the Czech Republic, Slovakia, Bulgaria, Romania, Slovenia (and shortly the Baltic States) have access to public tenders in the EU. At the end of a ten-year transitional period, suppliers based in the EU will also have access to public tenders in the associated countries. It is, therefore, vital that suppliers in the associated countries take up the challenge of participating in contract award procedures in the EU. They must also begin to make advances in competitiveness that will enable them to compete effectively with EU companies in domestic tender procedures following the transitional period. Similarly, in line with the Commission's attempts to improve links with countries in the Mediterranean Basin and as is provided in the agreements concluded with Turkey, Morocco and Tunisia, the Commission will also look at ways of assisting in the development of competitive public procurement practices there.

6.10 One of the major challenges facing the Union is to help the countries of Central and Eastern Europe (CEECs) to prepare themselves for EU membership. A key element in the pre-accession phase is the alignment by the CEECs of their legislation with Community legislation governing the single market. At the request of the Essen European Council, the Commission set out the basis of its strategy in the White Paper on the preparation of the associated countries of Central and Eastern Europe for integration into the internal market of the Union.[44] Presented to the Cannes European Council in June 1995, the White Paper gives guidance on the legislative measures that the countries concerned need to put in place in order to set up the necessary regulatory structure by the time of their accession to the EU. The White Paper makes it clear that, in the area of public procurement, the right administrative procedures must be established by law in order to foster competitive tendering for public contracts and to encourage competition between suppliers for those contracts.

6.11 However, open and competitive public procurement procedures are a relatively new phenomenon for most suppliers and contracting entities in the CEECs. Aligning domestic legislation with that of the internal market will not in itself bring about the changes that are necessary for suppliers and contracting entities to establish an efficient procurement system. The legislative framework that is being put in place will be reinforced by relevant and targeted technical assistance. Procurement officials need to be given the appropriate training to be able to define the goods and services that they are seeking to buy as effectively as possible, based on a thorough understanding of the economic and financial implications. Training will also help in improving the administrative and managerial skills that are needed to run an efficient procurement and contract management system. Suppliers too must adapt themselves to the culture of providing the goods and services that their public clients require, and improve their ability to prepare and submit competitive tenders.

[44] COM (95) 163 of 3.and 10.05.95.

6.12 The European Union is already supporting the CEECs in their first efforts to lay the foundations for efficient and open procurement. Valuable assistance, especially in the drafting of laws and the setting-up of administrative frameworks, is being delivered through PHARE and the mostly PHARE-financed SIGMA programme[45], which operates under the auspices of the OECD. The Commission has also established a new multi-country facility called the Technical Assistance Information Exchange Office. The Office will be a focal point for enquiries for help and advice from the Commission. It will also be a 'one-stop shop' where information on technical assistance relating to the internal market can be delivered and exchanged.

III. Questions

1. How effective in terms of market opening has the Government Procurement Agreement been? Is there a need for further initiatives?
2. From a business perspective, which countries (or group of countries) and which business sectors should be given the highest priority in future market opening initiatives?
3. Do you believe that a set of common principles (such as transparency and non-discrimination) would be enough to ensure that real market opening is achieved in future in developing countries?
4. Are there any other barriers (regulatory or non-regulatory) preventing successful participation in third countries' procurement that fall outside the scope of the GPA?
5. Would it be useful to set up an advisory group of industry representatives to assist the Commission on matters relating to access to procurement in third countries?
6. What additional steps could be taken by the Community or by the Member States to help suppliers enforce their rights under the GPA and ensure that other contracting parties play by the rules?
7. Do you believe that the Community should give priority to helping the CEECs to develop public procurement skills? If so, what would be the most effective means of providing training for the CEECs?
8. Would the procurement profession be ready to take an active role in providing assistance and lending expertise to the CEECs? Have you already been involved in any training programme? If so, what conclusions would you draw from your experience for future programmes?
9. Given that the Commission is looking at ways of assisting in the development of public procurement practice in the Mediterranean Basin, what initiatives do you think appear appropriate in this matter?

[45] Support for Governance and Management in Central and Eastern European Countries.

Annex I

The first Community procurement Directives, on public works (71/305) and public supplies (77/62) made a positive, but limited, contribution to more competitive procurement. The scope of these Directives was restricted. Major portions of public procurement, such as procurement in the water, energy, transport and telecommunications sectors and contracts for services, were not covered by these rules. Moreover, there was no harmonisation of remedies procedures, so that suppliers excluded from contracts in violation of the Directives often had no means of challenging doubtful procurement decisions or seeking compensation. The rules also left open too many loopholes for procurement entities to avoid open procedures on grounds that were not objectively justified. Subsequently changes have been made to the EU procurement rules to respond to public and political reaction to past improprieties and perceived weaknesses in the system.

The EU legal framework for public procurement was completed between 1987 and 1993 as part of the 1985 Internal Market White Paper programme. The public supplies and public works Directives were updated, in 1988 and 1989 respectively, and then consolidated in 1993 (as Directives 93/36 and 93/37). Procurement of service contracts was included in the EU's open procurement regime by Directive 92/50, in force since 1st July 1993. A Directive on supplies and works procurement by utilities in the water, energy, transport and telecommunications sectors, covering both public undertakings and undertakings to which Member States have granted special or exclusive rights, was adopted by the Council in 1990 (Directive 90/531/EEC). A consolidated version of the Utilities Directive, including service contracts, was adopted in June 1993 (Directive 93/38), superseding Directive 90/531 with effect from its entry into force on 1st July 1994 (1st January 1997 for Spain and 1st January 1998 for Greece and Portugal). Two specific Directives on remedies exist, one for the 'traditional' procurement sectors (89/665, as amended by the Services Directive 92/50) and one for the utilities sectors (92/13). The Remedies Directives require Member States to ensure that administrative or legal remedies are available to suppliers in the event of non-compliance with the substantive rules on open procurement.

The Directives require Member States to ensure that award procedures for contracts over specific thresholds are transparent and competitive. The Directives include rules covering the publication of tenders; the procedures for awarding contracts which must be followed (for example, technical specifications must normally refer to European standards where they exist or, in the absence of European standards, to national standards referring to international standards); and the selection and award criteria which may be used. The thresholds defining which contracts fall under the Directives' rules are set at ECU 200 000 for supplies and service contracts (ECU 400 000 for contracts awarded in the utilities sectors and approximately ECU 130 000 for contracts falling within the scope of the application of the agreement on public contracts of the World Trade Organisation) and ECU 5 million for works contracts. These thresholds are defined with a view to ensuring the competitive procurement rules apply to contracts likely to interest suppliers from other Member States while allowing administrative and procedural costs on smaller contracts to be kept to a minimum.

COMMUNICATION FROM THE COMMISSION

PUBLIC PROCUREMENT IN THE EUROPEAN UNION

1 INTRODUCTION 1

2 ADAPTING THE REGULATORY FRAMEWORK TO MARKET CHANGES 5

2.1 The ground rules: simplification and flexible response to market developments 5

2.1.1 Objective 5

2.1.2 Presentation of a legislative package 5

2.1.2.1 Adjustment of the scope of Directive 93/38/EEC in line with changes in the sectors it covers 6

2.1.2.2 Facilitating dialogue 7

2.1.2.3 The role of framework contracts 8

2.1.2.4 Treatment of concessions and other forms of public-private partnership 8

2.1.3 Clarification and consolidation 10

2.2 Improving the implementation of public procurement policy: a joint responsibility for the Member States, the Commission and economic operators 11

2.2.1 Objective 11

2.2.2 Improving checks at the Community level 12

2.2.3 Independent authorities 13

2.2.4 Market monitoring 14

2.2.5 Attestation: a guarantee of non-discriminatory procurement 15

2.2.6 Fighting corruption 15

2.2.7 Contracts awarded by the Commission 16

3 DEVELOPING A FAVOURABLE ENVIRONMENT FOR BUSINESSES, AND IN PARTICULAR SMES 18

3.1 Training, information and measures helping SMEs 18

3.1.1 Objective 18

3.1.2 Information 18

3.1.3 Training and commercial practices ("best practice") 19

3.1.4 Measures in favour of SMEs 19

3.1.5 Qualification of suppliers 20

3.2 Towards efficient electronic procurement 20

3.2.1 Preparing the EU to meet the exciting new challenge of electronic commerce 20

3.2.2 The way ahead: pan-European electronic procurement 22

3.2.3 Measures proposed 23

4 COMPLEMENTING AND ACHIEVING SYNERGY WITH OTHER COMMUNITY POLICIES 25

4.1 Objective 25

4.2 Defence 25

4.3 Protection of the environment 26

4.4 Public procurement and social aspects 28

4.5 Consumer protection 29

4.6 International aspects 29

4.6.1 Opening up third-country public procurement markets for European companies 29

4.6.2 Integrating neighbouring economies into the Union's public procurement policy 30

4.6.3 Ensuring efficiency in the award of contracts financed by the EU within the context of external aid 30

ANNEX 1 : STATE OF TRANSPOSITION 32

ANNEX 2 : TIME TABLE 33

1 INTRODUCTION

Optimising the functioning of the internal market is of vital importance for the European Union. The Commission's *Single Market Action Plan*[1], which was endorsed by the Amsterdam European Council and the European Parliament, is intended to ensure that the single market fulfils its potential. As part of the Action Plan, the Commission published, in November 1997, the first edition of the *Scoreboard*[2] containing detailed indicators on the state of implementation and application of single market legislation.

The Scoreboard confirmed that public procurement is one of the key areas of the single market where results do not yet meet expectations. This is particularly significant because of the economic importance of public procurement markets: they represent more than ECU 720 billion or about 11% of the Union's GDP, equivalent to half of the GDP of the Federal Republic of Germany.

Existing policy aims to open up national public procurement markets to competition from other Member States, offering competitive suppliers significant opportunities. Today these opportunities extend to the EEA countries and Europe's major trading partners, the USA, Canada and Japan. As regards the EEA, this extension results from the integration of the Community "acquis" in public procurement in the Agreement on the EEA and, in consequence, in the legislation of the EFTA countries signing it. The agreement guarantees access of these countries' suppliers to the Community market in the same way as Community firms are guaranteed access to the markets of the EFTA countries. Existing policy seeks to encourage transparent and competitive purchasing behaviour in order to deliver the best value for money. Community-wide competition for public contracts will lead to an efficient allocation of resources and thus enhance the quality of public services, improve economic growth, competitiveness and job creation. Efficient procurement is particularly important on the eve of the single currency and in the prevailing climate of stability and budgetary restraint necessary for such fundamental change to occur and develop under satisfactory conditions. A good public procurement policy, by preventing inefficient public spending and by providing a major means of avoiding corruption, can give taxpayers confidence that their money is being spent correctly and thus reinforce public trust in government. While the fight against corruption is not the primary objective of public procurement, improvements in public procurement procedures can make a useful contribution[3]. Accordingly, proposals in this communication aimed at enhancing transparency and clarity, such as publication of tendering information or the designation of independent authorities in each Member State, will help create a system which minimises opportunities for corruption.

[2] Single Market Scoreboard, No 1, November 1997, SEC 97/2196.

[3] See Commission Communication to the Council and the European Parliament on *A Union Policy against Corruption (COM(97)0192 – C4-0273/97).*

The legal framework composed of the principles and rules enshrined in the Treaty and developed in detail by six Directives, was completed nearly four years ago, the first Directives dating back more than twenty years. However, several Member States have failed to implement all the Directives. As the November 1997 Scoreboard shows, public procurement is one of the areas where the deficit in transposition is greatest, with only 55.6%[4] of the Directives correctly implemented in all Member States. Moreover, the Commission's communication on the *Impact and Effectiveness of the Single Market*[5] makes it clear that the economic results so far achieved fall short of expectations. The level of import penetration in the public sector (that is, the sum of direct and indirect imports by public purchasers) may have risen from 6% in 1987 to 10% today. It can be observed, however, that specific sectors remain closed because of the use of standards and certification and qualification systems. Moreover, there is no clear evidence of price convergence between Member States over the same period.

Concerned by Member States' failure to implement the Directives and by the disappointing economic results, the Commission launched its Green Paper on *Public Procurement in the European Union: Exploring the Way forward*[6], published in November 1996. The high level of response to the Green Paper is gratifying. Nearly 300 contributions have been received from a wide range of key players and the Commission thanks all - institutions, Member States, suppliers and purchasers, representative organisations on the demand and the supply sides and other interested parties - for their valuable contribution. Discussions in the Council, in the European Parliament and in the Advisory Committees for public procurement have been extremely productive and helpful.

The Commission has carefully analysed all of the contributions received. The measures proposed by the Commission in the present communication take them fully into account, recognise that procurement policy needs to be reinvigorated in order to reap the full benefits of the regime and define the direction that public procurement policy in the European Union will take over the next five years.

The conclusions the Commission draws from the debate are twofold. First, the Union must take action to ensure the public procurement regime in place delivers the economic benefits it has promised. Secondly, it must adapt existing instruments to the changing economic environment. Achieving this will require enormous effort from all those involved: the Commission, the Member States and the private sector. While the aims of the internal market policy have remained the same since the adoption of the Treaty of Rome, Europe has gone through immense changes since the adoption of the first public procurement Directives in the 1970s. These are the information revolution, the change of attitude to the State's role in the economy combined with the introduction of budgetary restraint – privatisation, liberalisation of utilities, public-private partnerships – and the increase of cross-border trade in goods and services brought about by the internal market. Together, they have resulted in a highly competitive commercial environment and an increased public awareness of the need to fight corruption and prevent misuse of public finance.

[4] See Annex I.

[5] COM (96) 520 final, 30.10.1996.

[6] COM (96) 583 final, 27.11.1996.

The main theme emerging from the Green Paper debate is the need to simplify the legal framework and adapt it to the new electronic age while maintaining the stability of its basic structure and avoiding unnecessary changes involving further legislative work at Community and national level.

The Community's response and the measures proposed in this communication contain the following main elements:

- The Commission recognises that a stable legal framework is crucial to the smooth operation of public procurement markets and to maintaining market players' confidence in the efficiency of the system. However, the current legal framework does not exist for its own sake but in order to attain the benefits of the single market in the area of public procurement. Rules, policy and enforcement should follow reality rather than the other way round. In the light of the momentous changes, which have occurred since the publication of the first Directives in the seventies, the Commission recognises the need to re-orient its policy and streamline its rules.

- The Commission acknowledges the complexity of the current legal framework and the rigidity of its procedures. It intends, therefore, to simplify the former and make the latter more flexible. Simplification, in this context implies, on the one hand, the clarification of existing rules and, on the other hand, their amendment. In order to preserve the stability of the framework, priority will be given to clarification of existing rules to resolve the most complex issues. Where clarification is not sufficient or where it is felt that the current framework is not flexible enough to take account of new practices or market reality, the Commission intends to propose amendments through a legislative package.

- The use of information and communication technologies (ICT) in public procurement will determine our ability to adapt in the future and maintain a competitive European industry. Fully-fledged electronic procurement will allow the procurement process to take place much more rapidly and significantly reduce transaction costs over the entire lifecycle of the goods or services purchased.

- Simply laying down and enforcing legal rules cannot on its own guarantee economic benefits. Other measures aimed at improving market access are equally important and necessary:

  - It is of the utmost importance, if one seeks to achieve efficient purchasing, to give the different operators involved in a given public procurement a training, which makes real professionals of them. This training should not focus on the legal provisions as such but on how to use them in an effective way in day-to-day procurement and on how to develop new ways of working in a changing market environment.

  - The relatively low response from suppliers to the enormous volume of contract opportunities needs to be addressed through raising awareness of what is at stake, improving transparency of, and access to, information on contract opportunities, general market monitoring and other useful information.

- Specific action in favour of the participation of SMEs has been sought by the European Parliament. Measures will be taken in connection with the general problems of supplier participation.

In the process of ensuring a single market for procurement, Member States and European industry have a key role to play. Governments, by enforcing the legal framework and by setting a good example themselves, will help to build confidence in the openness of their procurement markets. European industry, for its part, should actively seek out new market opportunities and when it encounters difficulties, should be more courageous in defending its rights. Public procurement is too fundamental for the European economy to be left in the hands of a limited number of specialists: only the establishment of a real partnership between the Community, the Member States and industry will bring about the benefits that are to be expected.

2 ADAPTING THE REGULATORY FRAMEWORK TO MARKET CHANGES

2.1 The ground rules: simplification and flexible response to market developments

2.1.1 Objective

It is evident from the debate launched by the Commission's Green Paper that the existing legal framework[7] and procedures need to be simplified. The Commission endorses the call for simplification, which is in line with one of the strategic targets of its Single Market Action Plan, namely that of strengthening the existing legal framework by simplifying and improving national and Community rules (Strategic Target 1, Action 4).

The Commission is in any event under the obligation to re-examine the application of the Directives within the deadlines laid down therein, as Parliament pointed out in its opinion on the Green Paper. This communication is therefore a response both to Parliament's request and to the obligation laid down in the Directives.

"Simplification" means in this context both the clarification of provisions which are obscure or complex and adjustment of the rules in force where the problems to be addressed cannot be resolved through interpretation of the provisions.

The Commission takes the view that certain important issues cannot be dealt with through mere interpretative documents and that the legislation needs to be amended. Such amendment will not be tantamount to over-regulation but will endeavour on the contrary to make the rules and procedures clearer and more flexible. Amendments will be precisely targeted so as to preserve the structure and foundations of the legal framework.

These amendments are in line with measures announced in the Single Market Action Plan, in which the Commission stressed the need to remedy weaknesses in the existing legal framework for public procurement in order to ensure that the single market functions properly in this area (Strategic Target 1, Action 5).

2.1.2 Presentation of a legislative package

Although the Commission is convinced of the need to adjust some aspects of the existing legal framework, it would stress that, three years after expiry of the deadline for transposing the last of the Directives adopted in the public procurement field, the

[7] Directives 93/36/EEC, 93/37/EEC and 92/50/EEC on public supplies, public works and public services (the "traditional" Directives) as amended by directive 97/52/EC; Directive 93/38/EEC on procurement procedures of entities operating in the water, energy, transport and telecommunications sectors (the "Utilities Directive"); Directives 89/665/EEC and 92/13/EEC on review procedures (the "Remedies Directives").

requisite national legislation is still not fully in place in all Member States. Many of the contributions prompted by the Green Paper, and in particular Parliament's opinion, deplore this state of affairs and call on the Commission to act as a matter of urgency.

The Commission invites the Member States to demonstrate their political commitment to putting an end to delays in transposition at the earliest possible opportunity. Since the transposition and correct application of the Directives is a precondition for the proper implementation of public procurement policy, the Commission reaffirms its determination to take all the necessary steps to ensure that Member States fulfil their obligations. It is proposing a set of measures to that end (see point 2.2 below).

The Commission intends to table a set of amendments to the existing legal framework concerning the following aspects:

- Submission of proposals to exclude from the field of application of Directive 93/38/EEC, the sectors or services to which it currently applies (water, energy, transport and telecommunications) that operate, in each of the Member States, under conditions of effective competition.
- introduction of more flexible procedures, namely a competitive negotiated procedure and framework contracts, in response to the criticism sometimes levelled at the system that procedures are excessively rigid and formalistic and, where complied with strictly, can lead to malfunctioning in the award of contracts;
- adoption of rules to take account of certain trends, such as concessions and other forms of partnership between the public and private sectors and privatisation, to ensure that their proper functioning is compatible with that of the single market;
- fully electronic procurement (see point 3.2 below).

These measures will be tabled by the Commission in a legislative package designed to make certain adjustments to the existing legal framework in areas where interpretation of the rules to take account of changing circumstances would not be sufficient to solve the problems.

2.1.2.1 Adjustment of the scope of Directive 93/38/EEC in line with changes in the sectors it covers

Following the liberalisation of some of the sectors covered by Directive 93/38/EEC, it is necessary to examine the degree of openness to competition of the liberalised sectors with a view to deciding whether the constraints the directive impose on contracting entities are still justified. They were introduced because of the lack of competition resulting from the State's decision to grant a monopoly or a privileged position to an operator. In return for this preferential treatment by the State, the operators concerned had to comply with certain advertising and procedural requirements when awarding contracts. If a sector is found to be effectively open to competition, the constraints imposed by the directive should be removed.

The Commission was the prime mover in the process of liberalisation in the sectors covered by Directive 93/38/EEC (see 3. Report on the implementation of the telecommunication regulation package[8]). It must now take account of the changes that have occurred and the new factors that are emerging on the market, by excluding from the scope of the Directive entities operating under real competitive conditions in the same way as private entities which base their decisions on purely economic criteria.

The Commission intends, before the end of 1998, to submit proposals to exclude from the field of application of Directive 93/38/EEC sectors or services to which it applies (water, energy, transport and telecommunications) which operate, in each of the Member States under conditions of real competition.

In the immediate future, the Commission is resolved, in the light of the jurisprudence of the Court of Justice, to use the possibilities provided by Article 8 of Directive 93/38/EEC to exempt services in the telecommunications sector operating in a fully competitive environment. Accordingly, the Commission invites the contracting entities to notify the services that they consider excluded from the scope of the Directive.

In its evaluation of the real operation of competition, the Commission will take particular account of the degree of transposition and implementation of the relevant Community legal framework.

2.1.2.2 Facilitating dialogue

Many contributions confirmed the Commission's finding that, especially in the case of particularly complex contracts in areas that are constantly changing, such as high technology, purchasers are well aware of their needs but do not know in advance what is the best technical solution for satisfying those needs. Discussion of the contract and dialogue between purchasers and suppliers are therefore necessary in such cases. But the standard procedures laid down by the "traditional" Directives leave very little scope for discussion during the award of contracts and are therefore regarded as lacking in flexibility in situations of this type.

The Commission will therefore propose amendments to the existing texts of the Directives with a view to making procedures more flexible and allowing dialogue in the course of such procedures and not just in exceptional circumstances. It will propose a new standard procedure, the "competitive dialogue", which would operate alongside open and restricted procedures and would replace the existing negotiated procedure with prior publication of a notice. The conditions and the rules under which contracting authorities would be allowed to use this new procedure and the details of the procedure itself will have to be spelt out and will be based *inter alia* on the principles of transparency and equal treatment. The only remaining exceptional procedure would then be a "direct-agreement procedure", the conditions for the application of which must be construed strictly, in line with the case law of the Court of Justice.

[8] COM (98) 80, 19.2.1998

This is an initiative which does not aim to introduce new regulatory constraints: on the contrary, it is clearly designed to achieve the procedural simplification and flexibility called for by all interested parties who took part in the Green Paper debate, whether from the institutional sphere or the private sector. It will give operators more room for manoeuvre, which will not fail to yield beneficial effects in terms of the quality and efficiency of procurement.

2.1.2.3 The role of framework purchasing

On markets, which are constantly changing, such as the markets for information technology products and services, it is not economically justifiable for public purchasers to be tied to fixed prices and conditions. Public purchasers therefore increasingly feel the need to manage their procurement on a long-term basis. The essential features of contracts of this nature should consequently offer the necessary flexibility. The question of the compatibility of such flexibility with the traditional Directives was raised in many of the contributions.

With a view to simplifying procedures and clarifying the situation, the Commission will propose amendments to the existing instruments, which would permit more extensive use of flexible contracts allowing product developments and price changes to be taken into account. Long-term contracts may, however, pose a threat to competition in that they could cause positions to become entrenched and certain firms to be shut out. It is essential therefore that precise rules be laid down for the use of these procedures. Without anticipating the direction that will be taken by discussions on this issue, the Commission takes the view that objective and transparent information should be published on framework contracts. Once candidates had come forward, lists of potential contractors could be drawn up. To ensure that these contracts are not walled off, lists should either be valid only for a limited period or be kept permanently open to new firms.

2.1.2.4 Treatment of concessions and other forms of public-private partnership

The concept of public-private partnership encompasses the different ways in which private capital can take part in the financing and operation of infrastructures and public services. The role, which the public authorities still play in such partnerships, varies greatly according to the situation concerned. The Commission has no intention of intervening in Member States' decisions as to whether these infrastructures and services are to be financed and operated by the public or the private sector, since such decisions are their responsibility. However, if it is to be fully in tune with reality, the Commission has a duty to devise a legal framework, which allows the development of these forms of partnership, while guaranteeing compliance with the competition rules and the fundamental Treaty principles.

At present, only works concessions are subject to specific rules laid down in a Directive; service concessions, public service contracts or other partnerships involving the provision of services are not covered[9]. Treaty rules and principles such as equal treatment and non-discrimination are of course applicable, but cannot always be readily implemented in specific cases. A legal framework therefore needs to be devised for these arrangements in order to clarify and simplify the conditions in which they may operate, thereby ensuring greater legal certainty.

In the interests of simplification and clarification, the Commission envisages the following action to establish uniform principles for all types of concession.

In the first stage, the Commission will draw up an interpretative document explaining and spelling out the rules and principles that it considers, on the basis of the cases it has had to deal with, should apply to concessions. In this context, the Commission wil! also be examining other forms of public-private partnership in order to determine whether and to what extent the public procurement rules can constitute an appropriate legal framework for ensuring compliance with the Treaty rules without hindering the development of these forms of co-operation. This rethink could lead to clarification or even adjustment of existing instruments. In the same way, the Commission intends to tackle some urgent interpretation problems that have arisen in connection with Trans-European Networks (TENs). It has already announced to the high-level group chaired by Mr Kinnock and to other bodies its intention to publish an explanatory guide providing concrete solutions to certain questions arising in this area in the light of the existing legal framework.

In a second stage, the Commission envisages proposing amendments to the Directives in order to cover all forms of concessions, that are not yet subject to regulation. The aim would be to guarantee that partners were chosen after Community-wide competition ensured by prior publication of a notice and minimum procedural rules, which, in the interests of flexibility, allow ample scope for, dialogue between the parties involved while upholding the principle of equal treatment. To respond to the legitimate concerns voiced by certain operators, the amendments would include provisions allowing the chosen consortium to award contracts to its partners, provided that the existence of such contracts is announced during the award procedure.

One aspect of the public-private partnership issue is the trend towards privatisation in which the public authorities transfer to the private sector responsibility for tasks that they previously carried out themselves. The process can take many different forms, ranging from a simple transfer of assets to more complex arrangements. These could combine transfer of ownership from a public body to the private sector and the establishment of a contractual relationship (purchase of goods or services, concessions, etc.) between that body and the privatised entity in question.

[9] Except for the public tendering procedures in cases where for reasons which are in the public interest, Member States restrict access to intra-Community air routes or to the ground handling markets at Community airports.

The option of whether or not to carry out such privatisation falls entirely within the competence of Member States. The Commission ought nevertheless to ensure the removal of all the obstacles that could unduly hinder this type of transaction.

It is clear that the rules and principles of the Treaty, particularly Articles 34, 52, 59 and 67 on free movement of goods, the right of establishment, freedom to provide services and free movement of capital have a valid application as regards the transfer of assets to private purchasers.

The Commission will look into the problems arising in this area from the standpoint of the public procurement Directives and, in the interests of clarity, publish an interpretative document on the topic.

2.1.3 Clarification and consolidation

As stressed in the introduction to this communication, the Commission is convinced of the importance of a stable legal framework in providing a favourable environment for businesses. The framework must, however, also be transparent. The Commission will therefore endeavour, wherever possible, to avoid constantly amending legislation and to solve problems that arise through interpreting the law in a manner that takes account of changing circumstances and in the light of the principles developed by the Court, the only institution which has the power to give an authentic interpretation of Community law.

The Commission therefore undertakes to shoulder its responsibilities by clearly stating its position on the complex questions which have arisen in relation to the application of Community law and which were mentioned in responses to the Green Paper.[10]

[10] The Commission proposes to clarify the following particular topics in an interpretative document:

- definitions of such basic concepts as "body governed by public law", "work", "special or exclusive rights", "contracting authority" and "contracting entity" and the borderline between works contracts and service contracts;
- service contracts covered by the Directive, in particular the situation of financial services and R&D services;
- "in-house" contracts, i.e. contracts awarded within the public administration, for example between a central and local administration or between an administration and a company wholly owned by it;
- the "technical dialogue" whereby a contracting authority enters into technical discussions with potential bidders when determining its needs, before the contract award procedure is initiated, while observing the principle of equal treatment and safeguarding competition;
- the methods to be used for calculating whether or not a contract exceeds the thresholds for application of the Directives;
- an operational distinction between selection criteria and award criteria;
- identification of "abnormally low tenders" within the meaning of the Directives;
- definition of the concept of "irregular", "unacceptable" and "inappropriate" tenders within the meaning of the Directives;
- the conditions in which "variants" may be used;

The Commission also intends to adopt interpretative communications, particularly in the following areas:

- the Treaty rules applicable to contracts not covered by the directives and the relevant principles clarified by the jurisprudence of the Court of Justice, such as, for example, the principles of equality of treatment, non-discrimination, transparency, mutual recognition and proportionality and the principles applicable to the stage following contract award;

Bringing the Commission's position on these problems to the attention of all parties will enhance legal certainty, and this will in turn help to create a favourable climate that will encourage firms to be more active in bidding for contracts.

The view is also taken in many quarters that the "traditional" Directives (on supplies, works and services) should be consolidated in order to iron out inconsistencies and make them easier to understand.

The Commission intends ultimately, once the work on interpretation and adjustment of the existing legislation is complete, to combine the three "traditional" Directives into a single instrument. The consolidation exercise would be strictly confined to incorporating the adjustments and clarifications made since the Directives were adopted and eliminating any inconsistencies.

It should not be forgotten, however, that if consolidation of the Community Directives is genuinely to result in greater clarity of the rules applicable in the field of public procurement, it must be backed up by consolidation and clarification of the relevant national rules.

2.2 Improving the implementation of public procurement policy: a joint responsibility for the Member States, the Commission and economic operators

2.2.1 *Objective*

If the single market is to function properly, the ground rules must be applied and observed uniformly in all Member States; this is far from being the case at present, a fact which is highlighted by various surveys and many of the contributions.

For this purpose, Member States must shoulder their responsibilities for ensuring compliance with the existing rules, and it is up to economic operators to use the instruments (particularly the means of redress) available to them to make the single market work in the field of public procurement. This allocation of responsibilities is in line with the principle of subsidiarity and in tune with the idea of the partnership between the Community institutions, the Member States and economic operators, which is necessary for the successful liberalisation of public procurement.

The Commission recognises the need to continue streamlining infringement proceedings under Article 169 of the Treaty and its own internal procedures. However, it must also

- the conditions under which environmental criteria can be taken into account in public procurement (the use of "eco-labels", "eco-audit" systems, taking into account of production and working methods and the correct use of standards at different levels will be dealt with, inter alia).
- the conditions under which social criteria can be taken into account in public procurement.

establish better co-operation with Member States, for, in view of the large number of cases concerning public procurement, it is necessary that the citizen can quickly obtain satisfaction as regards to the difficulties he encounters.

This is why, in pursuance of the subsidiarity principle, the Commission is encouraging Member States to set up or to designate independent authorities, which would deal with the vast majority of disputes in the public procurement field. The Commission would thus concentrate on cases having a Community-wide impact or raising major questions of interpretation. The objective pursued is to deal with problems at the appropriate level.

The Commission is also concerned with fighting irregularities affecting public procurements under two aspects i.e.

- Corruption occurring during the procedure for awarding the contract.
- Irregularities occurring during the execution of the contract once awarded.

This is particularly true for the contracts either awarded by the Commission (direct expenditure) or financed by the Commission (indirect expenditure) where the Communities' financial interests are at stake.

2.2.2 Improving checks at the Community level

Infringement proceedings under Article 169 of the Treaty are the main weapon in the Commission's arsenal for enforcing Community law. But the Article 169 procedure cannot on its own guarantee the rapid and effective settlement of disputes which is necessary in public procurement: by the time the dispute is settled, contracts have more often than not already been awarded, or even performed.

The European Parliament proposes strengthening the Commission's powers to conduct investigations and impose penalties in this area, along the lines of the powers it exercises in the competition field, so that it can enforce the legal framework effectively. The Amsterdam European Council has also requested the Commission to make proposals to it for the setting up of an efficient mechanism for combating serious infringements of Community law in the field of free movement of goods.

The Commission will consider whether it is opportune to provide, if necessary, such a mechanism for dealing with infringements of the public procurement rules. It could also consider having recourse, in appropriate cases, to Article 90, paragraph 3, of the EC Treaty.

The Commission is determined to speed up its own procedures for dealing with infringement cases.

However, these efforts also require the co-operation of Member States, which should respond to the Commission's requests within the specified time limits. More generally, the Commission is firmly resolved, in all cases where it proves necessary, to use the procedure available under Article 171 of the EC Treaty, under which the Commission can request the Court of Justice to impose penalty payments on Member States which fail to comply with a Decision establishing a breach of the public procurement rules.

Another shortcoming pointed up by certain contributions resides in the fact that the Commission does not act systematically against infringements of the public procurement rules but haphazardly, as and when it receives complaints.

In response to this criticism, the Commission undertakes to follow an approach, which will be less reactive and more proactive. It will therefore first seek to prevent infringements by reinforcing co-operation with Member States e.g. when they prepare for major events or when they plan large infrastructure projects having particular public procurement relevance. In the second place, the Commission will pay special attention to particularly serious infringements brought to its knowledge by whatever means, including the media; in such cases it will take the initiative in launching proceedings under Article 169. Finally, when a specific case brought to its attention raises a general problem of application, it will check the situation in all Member States and initiate proceedings against all similar infringements.

2.2.3 *Independent authorities*

In its Green Paper, the Commission invited the Member States to designate independent authorities specialised in public procurement.

The Commission is not proposing that new institutions are set up from scratch, but rather that already existing bodies, such as audit offices or competition authorities, be used for the purpose. Without trying to evade its responsibilities as the guardian of Community law, the Commission takes the view that it cannot set itself up as a kind of "super enforcement authority" for settling all disputes in the public procurement field. Neither does it have enough human and material resources to solve all the problems arising. The aim of devolving the handling of disputes to national authorities is to relieve the Commission of some of the caseload of disputes currently submitted to it. This would enable it to concentrate on its rule-making tasks and on those cases which have a Community-wide impact or raise major questions of interpretation, while complainants would be able to find solutions to their disputes at national level.

The Commission therefore encourages Member States to set up or designate independent authorities with the task of identifying problems of interpretation and discussing the treatment of individual cases. These authorities would serve as contact points for the rapid, informal solution of problems encountered in gaining access to contracts, and could co-operate with each other and with the Commission, in the latter case *inter alia* with a view to producing reliable statistics.

These positive effects will be further enhanced following the pilot project for co-ordination and co-operation between these authorities suggested by Denmark and soon to be implemented.[11] Under this project, a supplier facing a problem with a procurement procedure in another Member State can contact the independent authority in that country. However, he can also address himself to the authority in his own country, which would then contact the authority in the Member State concerned. These contacts should enable a rapid, informal and adequate solution to be found. This could contribute to the creation of a genuinely open European procurement market without obliging suppliers to go to court.

2.2.4 Market monitoring

An effective public procurement policy is feasible only if all the parties involved (purchasers, suppliers and public authorities) have sufficient information on the real operation of the market and on the - particularly economic - impact of the policies pursued.

Very little information is currently available. What does exist is too patchy to serve as a tool for assessing the effectiveness of current policy and the economic benefits for the main players. Member States and contracting entities currently supply the statistics required by the Directives and the Agreement on Government Procurement (GPA) very late, if at all. The amount and complexity of the information required goes some way towards explaining this situation.

The Commission will propose that these statistical requirements be scaled down to the minimum strictly necessary for effectively monitoring the market. It will ensure that statistical reporting obligations are complied with.

In future, an alternative solution for obtaining these statistical data could be based on contract award notices within the SIMAP system. The necessary information could be gathered from these notices if the format was adjusted and notices actually published. The possibility of requiring price information only on a confidential basis, enabling the Commission to aggregate the data, could be considered.

The Commission insists on compliance with the obligation to publish contract award notices (CANs) and will use all necessary means at its disposal in order to enforce it. If the obligation were complied with, it could consider abolishing the requirement to supply statistical data.

Within the SIMAP system a market analysis tool will be developed to present market information in a user-friendly manner. Suppliers and purchasers could use this

[11] The pilot project suggested by the Danish Government is supported by the Commission. It is the first concrete project following up ideas developed in the Action Plan for the Single Market under Strategic Target 1, Action 2 (establish a framework for enforcement and problem solving) and follows the logic of the so-called observatory, launched via the Advisory Committee for Public Procurement in 1994.

information to gain a better understanding of the markets they are working in. Such a system would significantly improve transparency of procurement markets.

In order to pursue the series of statistical surveys in the Member States, which have so far been carried out, by the national statistical offices in Greece, Portugal and Germany, the Commission invites other Member States to volunteer for such a study.

Bringing together all the information available, the Commission will define indicators to measure market trends and the impact of public procurement policy over time.

Alongside these planned actions, the Commission will if necessary carry out additional economic studies.

2.2.5 Attestation: a guarantee of non-discriminatory procurement

Bearing in mind that prevention is better than cure, the EU set up an attestation system for purchasers. Nevertheless, as can be seen from the contributions to the Green Paper debate, if the system is to be used, it must confer certain benefits on the entity undergoing attestation.

Among these benefits, the Commission is thinking in particular of exemption from certain constraints currently imposed by the Directives, which could be seen as an excessive burden for an entity that had agreed to undergo attestation.

Nevertheless, even if an entity were exempted from certain requirements, the basic principles, such as transparency, non-discrimination and equal treatment of all suppliers, would still apply.

2.2.6 Fighting corruption

The Commission in its Communication on Corruption[12] highlights the importance of public procurement for an effective Union-wide policy to the fight against corruption.

The Commission will explore the possibility of obliging public procurement entities to enter into anti-corruption pledges and a corresponding obligation on tenderers to agree that they will not use bribery to obtain a contract.

[12] See Commission Communication to the Council and the European Parliament on *A Union Policy against Corruption (COM(97)0192 – C4-0273/97).*

The need for a blacklisting system has been raised within the European Union on at least two fronts. Firstly, the Commission's Communication on Corruption mentioned above commits the Commission to working on a scheme of blacklisting applicable to areas where Community finances are at risk. Similarly, the European Council in June 1997 adopted an *Action Plan for Combating Organised Crime*[13]. This contains a recommendation that Member States and the Commission provide for the possibility of exclusion from public tender procedures of an applicant who has committed or is under investigation or prosecution for having committed an offence connected with organised crime.

The Commission will explore how a blacklisting system could be used as an anti-corruption tool.

2.2.7 Contracts awarded by the Commission

The Commission has been criticised by other Community institutions (the Council (internal market) and the Economic and Social Committee) and by economic operators with regard not only to its own contract award procedures but also to the contracts it finances (on the latter, see point 4.6.3 below).

Other shortcomings, such as excessive delays in paying contractors and failure to publish indicative and contract award notices, as required by the Directives, have also been mentioned.

The Commission is nevertheless convinced that considerable progress has been achieved in recent years, particularly in the wake of the SEM 200 (Sound and Efficient Management 200) programme, which is aimed at rationalising its procurement and managing it on a more professional basis.

As regards the fight against corruption and financial irregularities concerning contracts to be awarded by the Commission, its communication on "Sound Financial Management and Administration Improving Action against Incompetence, Financial Irregularities, Fraud and Corruption"[14] of November 1997 explicitly deals with public procurement and announces a number of measures to be taken to improve its procedures for awarding contracts. In particular, it has improved its internal administrative procedures concerning public procurement and established an internal early warning system.

The Commission reaffirms its commitment to observing the same rules as national authorities. The contract award procedures of the Community institutions already provide for the application of the Council public procurement directives on works, supplies and services. The Commission proposes to add a reference to the multilateral agreement on public procurement concluded within the framework of the WTO. It undertakes to be

[13] OJC 251 of 15.8.97, page 1.

[14] SEC(97) 8198 18/11/97.

more careful in complying with the Directives and to tighten its payment discipline. The Commission has undertaken to include in all its contracts involving identifiable deliverables, a clause obliging payment within 60 days of receipt of the claim with interest in case of delay. For contracts falling below the thresholds laid down in the Directives, it will likewise observe the principles of transparency, non-discrimination and equal treatment.

The Commission intends to explore the different possible methods of re-enforcing monitoring of observance of the principles and rules applicable to the award of public contracts, including the designation of an independent authority accessible to goods and services providers. This authority could exercise monitoring responsibilities and other functions, especially those of conciliation and assistance.

In the interests of transparency, Commission departments will make more extensive use of new IT systems, in particular the Internet. They will thus offer access to much more information than is currently available via the Official Journal and the TED database, thereby making it possible, among other things, to consult tender specifications on the Internet and even print them direct, so that interested suppliers can obtain these documents forthwith.

3 DEVELOPING A FAVOURABLE ENVIRONMENT FOR BUSINESSES, AND IN PARTICULAR SMEs

3.1 Training, information and measures helping SMEs

3.1.1 Objective

The opening-up of public procurement markets to competition is a significant supply-side operation. Eliminating red tape is of enormous economic importance, creating business opportunities for competitive European suppliers from nearly all economic sectors.

The weakness of the impact of the Community regime is due in particular to the low response rate of suppliers. This is confirmed by the findings on public procurement published in the "*The Single Market Review*"[15]. Moreover, a recent supplier survey revealed that an average of only 10% of suppliers answer calls for tenders. In this connection, many contributions to the Green Paper, and in particular that of the European Parliament, highlight the disappointing record of SMEs and their specific problems.

An efficient public procurement policy needs to increase supplier participation. The Commission therefore proposes a set of measures addressing the various aspects of the problem: Making markets more transparent through better information; Increasing confidence in contract procedures by training focused on professionalism and best practice; Specific action to help SMEs overcome obstacles to selling to the public sector; Promoting mutual recognition of qualification procedures by contracting entities, thus reducing the costs to suppliers of entry to public procurement.

3.1.2 Information

The information given on public procurement is a key element in creating a business friendly environment. Indeed, low supplier participation may indicate that information on potential public procurement markets must be extended and made more accessible.

The Commission will therefore exchange the present system of publication for an Internet based solution. This will allow free and easy access to information essential to potential contractors, including purchaser profiles (see point 3.2) and market monitoring information (see point 2.2.4). Commission and Member States need to work together to make information on the legal framework in the different Member States and on administrative procedures available. The Commission will also draw up interpretative texts (see point 2.1.3).

[15] The Single Market Review, Subseries III: Dismantling of Barriers, Volume 2: Public Procurement (OPOCE 1996).

3.1.3 Training and commercial practices ("best practice")

A higher degree of professionalism among both purchasers and suppliers could significantly improve the environment in which public procurement takes place. Adequate training is therefore of the utmost importance in the opening up of markets, and there is wide support for a Community initiative for this purpose. Given the wide field to be covered, the diversity of administrative cultures and training programmes, a training policy will only be effective with the participation of Member States and economic and training actors at national, regional and local levels. The Commission, for its part, will develop a framework for implementing an effective public procurement training policy in the Union. This policy will also take into account measures to integrate environmental, social and consumer protection objectives.

The Commission, on the basis of contributions from Member States and other interested parties, will complete a stocktaking of existing training needs, best practices, actions and current programmes in this field.

The Commission will examine the results of the stocktaking exercise with a view to developing guidelines on a public procurement training policy. This policy will make full use of the possibilities offered by information technology.

3.1.4 Measures in favour of SMEs

SMEs have the potential to supply that additional competition, flexibility and capacity for innovation essential to the successful opening up of public procurement markets. Every effort to make public procurement more accessible for businesses should start off from the point of view of the SME. While the Community regime has enabled SMEs to enjoy some success in breaking into regional and national procurement markets, however, experience of direct participation in cross-border contracts has remained disappointing.

Replies to the Green Paper suggest many reasons for this failure. SMEs face obstacles at every stage of the procurement procedure. SMEs must surmount many problems, such as lack of information about potential contracts, inability to draw up business plans, mismatch between the size of the enterprise and the large size of many contracts, anxiety about currency fluctuations, and the need to meet standards, certification and qualification requirements. Other problems, such as delays in payment, may arise in the post award stage.

The Commission will adopt a comprehensive and concerted approach in a communication on SMEs and public procurement. This strategy will, in particular, develop the possibilities of improving access to information, crucial for SME, by consistent application of information and communications technology.

This approach will be based particularly on an information policy based on electronic communication, high quality services provided by European-scale networks focused on SMEs, on better mutual recognition of qualification systems, on clarification of general provisions generally applicable to below thresholds, on promoting co-operation between SMEs and on the conditions for SMEs participation in large-scale projects.[16]

3.1.5 *Qualification of suppliers*

Purchasers must be given the confidence to deal with new and previously unknown suppliers. Several Member States have set up nation-wide qualification systems, while in other Member States individual contracting entities have created their own qualification system.

The Commission sees an important role for qualification systems, provided they do not result in additional barriers for suppliers. The principle of mutual recognition applies in this area: a supplier which has been qualified in one Member State should also be able to use this qualification in others, without having to be qualified again or at least without having to go through the full qualification procedure in other Member States. The Commission will use all the means available to it, in particular the powers conferred on it by Article 169, to ensure that the principle of mutual recognition is respected and that qualification systems are used to open up markets rather than to create new barriers.

In order to make different national qualification systems in the construction industry more comparable, the Commission has given a mandate to the standardisation bodies CEN and CENELEC to develop a European standard for qualification of construction enterprises for contracts covered by Directive 93/37/EEC. This standard, which the Commission awaits, will ensure a balance between the legitimate requirements of contracting authorities to have certain information at their disposal and the wish of suppliers to see administrative requirements limited to a strict minimum.

The Commission will also consider in which other areas a similar process of harmonisation of qualification systems can be undertaken.

3.2 Towards efficient electronic procurement

3.2.1 *Preparing the EU to meet the exciting new challenge of electronic commerce*

One of the most exciting and challenging developments for the future of public procurement is the emergence of the new Information and Communication Technologies (ICTs). These technologies allow the current procedures to run more smoothly and could

[16] See also points 2.1.3, 3.1.2., 3.1.3., 3.1.5., 3.2. of this communication and OJ C 285 of 20.9.1997, p. 17. For the European Economic Interest Grouping (E.E.I.G.).

enable a more efficient purchasing process, reducing the need for detailed regulation. They also offer the best possibility yet to ensure meaningful participation of SMEs in the procurement process. The Commission and the Member States are co-ordinating their efforts in this regard within the SIMAP project, which has been funded through the Commission's IDA project[17].

On 12th December 1997, the Commission proposed a second phase of the IDA programme to the EP and the Council. In this second phase, the Commission proposes to enhance and extend the SIMAP-project to comprise the entire procurement process.

The Commission will ensure that the tools and systems developed through its SIMAP Information System will be compatible with and not duplicate tools already developed by the private sector The Commission will furthermore ensure that all the requirements of the Member States are taken into account in the SIMAP framework.

The SIMAP system for electronic creation and submission of procurement notices has been tested through pilot projects with a limited number of purchasers and suppliers throughout the Community and the EEA and will now be made available to all contracting entities.

The Commission will provide the possibility to all contracting entities to electronically prepare and submit their notices for publication through procurement transparency system operated by the EU institutions. Several options, including electronic mail and the Internet, will be provided.

The software developed through Simap has been found to result in substantial savings for the EU taxpayer and deliver better information to suppliers through more consistently accurate notices. However, costs to the taxpayer will remain unacceptably high so long as contracting entities continue to submit poor-quality notices, which do not comply with the legal obligations imposed by the Directives. Finally several comments stress the high costs of TED and the difficulties of using the paper OJ "S" series on account of the increasing number of notices published.

The Commission will consider incentives to encourage contracting entities to use these electronic means of submission. Currently a notice must be published within twelve days of being sent. Where electronic mail and the Internet are used to provide instant publication the Commission intends to propose to reduce the overall length of the procedure, for example from 52 to 40-45 days (in an open procedure).

The Commission will continue to publish notices without cost to the procuring entity only when it submits a notice which complies with the

[17] Interchange of Data between Administrations

formal requirements of the Directives, includes a reference to the CPV and follows standard forms or model notices. In other cases the costs of ensuring notices meet those requirements will be recovered from the contracting entity concerned.

The Commission has decided to discontinue the publication of the paper version of the Supplement to the Official Journal from July 1998. It will be replaced by the CD-ROM version already being available. Moreover, the TED database will be made available to all users for free over the Internet.

For ease of use suppliers should be able to find all notices in one single location. In order to prepare a bid, however, suppliers need more information than that provided in the notice. They need in particular the tender documents themselves. The new ICTs, and in particular the emergence of the Internet, offer important new opportunities in this regard. Another basic characteristic of this development will be to make it easier than at present to publish tender notices in all the Community languages.

The Commission will encourage the publication of all tender documents, in particular in open procedures, on the Internet. It invites contracting entities who already have a site ("homepage") on the Internet, to make tender documents available on a "purchaser profile" on their homepage. In order to promote the establishment of such purchaser profiles the Commission will make model software available over its SIMAP homepage.

3.2.2 The way ahead: pan-European electronic procurement

Although the Commission has a clear role in the collection and dissemination of public procurement notices, the development of fully-fledged electronic procurement systems is not its direct responsibility.

The Commission calls for the active participation of interested purchasers and suppliers, companies active in the ICT sector and others, including Euro Info Centers, in order to stimulate the development of a pan-European electronic procurement environment in which a substantial number, for example 25%, of all procurement transactions takes place electronically by the year 2003.

Member States also have a very important role to play in promoting electronic procurement. The highest potential for savings will probably exist for relatively small purchases of readily available, "off-the-shelf" products. Such purchases often remain below the threshold values laid down in the Directives.

The Commission will seek a commitment from the Member States to ensure mutual compatibility and interoperability of electronic procurement systems which they set up for below threshold purchases. To facilitate such compatibility it will publish any necessary specifications on the SIMAP homepage.

Pilot projects will be identified which use electronic mail, electronic data interchange and Internet technology to conduct procurement activities. These projects will, of course, need to respect the principles of non-discrimination and transparency. Specific attention will be given to the use of electronic catalogues, virtual procurement networks and the promotion of best practice through procurement clubs.

The Commission will come forward with recommendations for further measures to be taken in modifying the legal regime, developing standards or specifications or establishing a regulatory framework. The Commission will ensure that the requirements of electronic procurement are taken into account in any proposals for standards or legislation on digital signatures.

The Commission recognises that electronic procurement needs to be seen in the context of globalisation. It will increasingly play an important role in opening-up markets outside the EU (see also point 4.4). Bilateral contacts have already started with some of our major trading partners.

The Commission will seek agreement with its international partners in the WTO in order to simplify and harmonise the exchange of information on both public procurement opportunities and statistics in the electronic procurement context.

3.2.3 Measures proposed

The majority of comments received highlighted the need to allow the widespread use of Information and Communication Technologies (ICT). Recent amendments to the Directives already allow the use of electronic mail in some procurement procedures. Further changes are needed, however, to allow its use e-mail for all exchanges of information specified in the Directives (see also point 2.1.2).

The Commission will propose amendments to the Directives to put electronic means of exchanging information on an equal footing with other means.

The hardly predictable development of electronic procurement makes it difficult to modify the Directives to reflect the latest state of the art. The Commission intends to encourage electronic procurement through pilot projects, before proposing major changes to the regime. These pilots may need waivers from certain provisions in the Directives for the duration of a pilot. Where pilots demonstrate their value, formal changes of the Directives can, be contemplated to allow for their general and more permanent application. Obviously the underlying principles (non-discrimination/equal treatment, transparency etc.) should not be jeopardised by such waivers and should at all times be guaranteed.

The Commission will allow as soon as possible the running of pilot projects in order to test specific electronic procurement procedures. To this effect it will also take the necessary legislative initiatives to allow such projects to take place as soon as possible while respecting the principles of the public procurement regime. The details of these initiatives will be determined after discussions with all interested parties, including in particular the Member States who should allow similar projects to take place for below-threshold purchases. The Commission will continue to take an active part in related discussions which are currently taking place in the WTO committees on modifying the Government Procurement Agreement (see point 4.6.2).

4 COMPLEMENTING AND ACHIEVING SYNERGY WITH OTHER COMMUNITY POLICIES

4.1 Objective

The Communities' public procurement policy integrates Member States' procurement markets into the single market putting in place a market economy with free competition. The decision in favour of "best value for money" principle is more and more heard in the area of defence procurement. Budgetary pressure and the need for a serious restructuring of the supply side in this sector have fostered a debate on how to extend the principles of competitive procurement to defence procurement.

The best value for money objective in public procurement does not exclude taking environmental, social and consumer protection considerations into account. Nor does it require changing the present rules. It is, however, necessary to lay down clear guidelines to purchasers on how they how environmental and social criteria can be taken into account in their contract award procedures, while complying with Community law, particularly as regards transparency and non-discrimination and the public procurement rules. Such guidelines are necessary if European suppliers are to be placed on an equal footing.

Public procurement contracts in third countries are of significant interest for European firms, especially when it comes to infrastructure projects. Opening these market opportunities for our European suppliers is therefore an integral part of the Communities' public procurement policy. In order to allow European firms to win procurement contracts outside the Union and the European Economic Area, the same objectives as followed for inside the Union need to be pursued vis à vis our trading partners.

4.2 Defence

In its recent communication to the Council, the European Parliament, the Economic and Social Committee and the Committee of the Regions entitled *Implementing European Union Strategy on Defence-related Industries*[18], the Commission announced measures in defence procurement, following the appropriate procedures in accordance with Article M of the Treaty on European Union, to lay down binding principles, rules and mechanisms for transparency and non-discrimination in procurement, taking the current Community public procurement rules as a model.

The rules that will apply to procurement of defence equipment will contribute substantially to the creation of a competitive defence technological and industrial base.

[18] COM(97) 583 final, 4.12.1997.

The framework should make provision for competitive tendering whenever feasible.

Furthermore, it must favour the maintenance and development of the fundamental industrial capabilities and key technologies at European level. In addition, the rules must guarantee security of supply, while enabling a progressive elimination of over-capacity.

To this end, taking into account the need to build broad support in this matter, it is necessary to establish an appropriate set of principles, rules and mechanisms on procurement by the defence sector. In order to take into account the specificity of the defence sector, and in particular the need for confidentiality and security of supplies, an appropriate level of flexibility should be envisaged where necessary.

For this purpose, materials for the defence sector could be divided into three categories:

- Products intended for the armed forces but not for military use, and therefore covered neither by Article 223 EC nor by Article 2 of Directive 93/36/EEC (markets declared secret, protection of vital interests, national security, etc.). As these products are already subject to the Community public procurement rules, the Commission will specify, where appropriate and in the most suitable form, the conditions for the application of these rules;

- Products intended for the armed forces and for military use, but not constituting "highly sensitive defence equipment". The Commission could work out a fairly flexible set of rules, while respecting the principles of transparency and non-discrimination, inspired by the existing Community public procurement rules;

- Highly sensitive equipment covered by the scope of Article 223 EC. These products could be exempted from the rules referred to above, when safety or the protection of vital national interests of the country in question so requires. A notification mechanism for this purpose should be provided in order to ensure a degree of control and transparency.

4.3 Protection of the environment

The environment is becoming an increasingly important component of any modern economic policy. The Amsterdam Treaty fully recognises this by raising environmental objectives to one of the Union's priorities. As confirmed by the contributions received, more and more public purchasers wish to buy products and services, which are environmentally friendly. Several Member States are already pursuing an active policy. OECD has adopted a recommendation on "Greening Public Procurement"[19]. For its part, the Commission is implementing a plan for environmental protection in its administration, and, in particular, it's purchasing.

[19] Recommendation of the Council on Improving the Environmental Performance of Governments, adopted 20.2.1996.

The Commission re-emphasises that Community law, and the public procurement directives in particular, offer many possibilities of taking environmental protection into account in public purchasing. The Commission recalls the existing possibilities below.

- In general, any administration which so wishes can, in defining the goods or services which it intends to purchase, choose the products and services which correspond with its pre-occupations for the protection of the environment. The measures taken must, of course, comply with the rules and principles of the Treaty, particularly that of non-discrimination.

- The rules of the public procurement directives allow, in certain instances, the exclusion of candidates who are in breach of national environmental legislation.

- Purchasing organisations can draw up technical specifications concerning the characteristics of works, supplies and services, which are the object of public procurement, which take account of environmental values. They can from now on encourage the development of a positive approach by companies to the environment, in accepting tenders offering products, which meet the requirements, defined in the specifications.

- The directives allow the inclusion of the objective of protection of the environment in the criteria of selection of candidates in so far as these criteria are aimed at testing their economic, financial and technical capacity.

- As regards the award of contracts, environmental elements can serve to identify "the most economically advantageous offer", in cases where these elements imply an economic advantage for the purchasing entity, attributable to the product or service which is the object of the procurement. In evaluating tenders, a purchasing organisation can, for example, take account of costs of maintenance, treatment of waste or re-cycling.

- A contracting authority can require the supplier, whose tender has been accepted, that the deliverable, which is the object of the contract, be provided with due regard to certain constraints aimed at safeguarding the environment. These conditions of execution must be known in advance by all the tenderers.

In general, the Commission reiterates that the object of public procurement remains essentially economic and that it is of the utmost importance to determine, for each procurement, the environmental factors linked to the goods and services required, which can, in consequence, be taken into consideration in a contract award procedure.

The possibilities offered by the existing regime, which have just been spelled out above, will be developed and clarified in a specific interpretative document in order to enable the optimum consideration of environmental protection in public procurement (see point 2.1.3). In this exercise, the Commission will, in particular examine how far it is possible to refer in technical specifications to the European eco-label or even to national eco-labels. In the same way, it will analyse the question of whether purchasing entities can require suppliers to have an eco-audit system, such as EMAS or ISO standard 14001.

The Commission cannot, however, propose solutions in an interpretative document, which go beyond the existing public procurement regime. These would require amendments to the legislation.

In order to promote those practices which give the best results and respect the principles stated above concerning the integration of environmental aspects in public procurement, the Commission undertakes, with interested Member States and the private sector to develop initiatives which would make it easier to define environmental concerns in the tender documents in a balanced manner.

4.4 Public procurement and social aspects

Social policy is of the greatest importance for the European Union. It aims, among other things, at promoting a high level of employment and social protection. Furthermore, the Amsterdam Treaty lays down as a priority the elimination of inequality and the promotion of equality between men and women in all the policies and activities of the European Union and requires it to combat every type of discrimination.

The Commission has already indicated in its Green Paper the conditions under which social criteria can play a role in contract award procedures, particularly the possibility of including the obligation to comply with existing social legislation, especially Community social legislation and, where appropriate, that emerging from the International Labour Organisation (ILO).

There is a range of possibilities for public administration to take the pursuit of social objectives into consideration in their purchasing:

- The rules of the public procurement directives allow the exclusion of candidates who breach national social legislation, including those relevant to the promotion of equality of opportunities.

- A second possibility is to lay down as a condition of execution of public contracts, compliance with obligations of a social character, aimed for example at promoting the employment of women or encouraging the protection of certain disadvantaged groups. Of course, only those conditions of execution are authorised which do not discriminate, directly or indirectly, against tenderers from other Member States. Moreover, indicating these conditions in the tender notice or the specification must ensure sufficient transparency.

Contracting authorities and entities can therefore be called upon to implement the various aspects of social policy in awarding contracts, public purchases in practice constituting a significant means of influencing the behaviour of economic operators. One can cite, as an example of this situation, legal obligations to protect employment and working conditions, which must be enforced on the site where a public works contract is being carried out. Yet again, there are the so-called "positive actions", that is the use of a public contract as a means of achieving the objective sought, for example, establishing a captive market for a sheltered workshop, which could not reasonably be expected to stand up to competition from classic commercial companies with a normal level of productivity.

As in the case of the environment, the Commission intends to clarify the principles, which can be applied to allow social factors to be taken into account.

It re-iterates that public contracts can be a means of influencing the actions of economic operators, providing the limits laid down by Community law are respected. In this context the Commission encourages the Member States to use their procurement powers to pursue the social objectives mentioned above. The Commission will act similarly in its own procurement activity.

4.5 Consumer protection

The improvement of market access and transparency through the implementation of an effective procurement policy will bring significant benefit to consumers, including better quality and more economically efficient services and infrastructures. It is therefore necessary to take greater account of consumer policy in the Union's procurement policy, especially with regard to the promotion of transparency and dialogue with consumer organisations.

4.6 International aspects

4.6.1 Opening up third-country public procurement markets for European companies

The Government Procurement Agreement (GPA), which was last amended in 1994, lays down disciplines between a limited number of countries including the world's major trading blocks. These disciplines cover the traditional national treatment and most favoured nation principles but also contain precise requirements with regard to procurement procedures, akin to those in the Directives. Thus the GPA affects the regulatory regimes of the adhering countries, including the EU, in a far-reaching manner.

The Commission will continue to take all steps necessary to ensure that the legal instruments creating opportunities for EU companies are effectively complied with.

On the multilateral front, it will seek to further open up third country public procurement world wide, with a view to eliminating those barriers to trade, which are harmful to European interests. The EU's final objective is to obtain multilateral adherence to a code on procurement though its inclusion in the WTO single undertaking. The work undertaken in the WTO, such as the review of the GPA, the negotiations on public procurement of services within the GATS and the working group on transparency rules in government procurement, should help to achieve this objective. In addition, there are ongoing processes in other fora, such as the OECD or Uncitral.

On the bilateral front, the Commission will continue its efforts to open-up third country markets by concluding bilateral agreements as an alternative or as a complement to its multilateral policy.

Electronic procurement is becoming increasingly widespread and will be one of the main aspects of our external policy in procurement. It is already one of the key aspects, which are being discussed at multilateral level, in particular in the WTO's GPA and Transparency Groups. The use of ICTs can indeed play a major role in achieving real and meaningful transparency of procurement world-wide. But the Commission sees its task at the multilateral level first and foremost as ensuring that the EU's international commitments are consistent with its internal policy on electronic procurement so that the development of the latter is not hindered. In addition, it will, as indicated in point 3.2 above, pursue these matters bilaterally with its major trading partners.

The Commission intends to actively participate in these fora in order to create the right conditions to allow European Industry to enhance competitiveness and maximise commercial opportunities.

It is also the Commission's intention to ensure that rules and practices at international level with respect to the use of information technology in the field of public procurement are consistent with its own internal policy on the matter.

4.6.2 Integrating neighbouring economies into the Union's public procurement policy

In some situations our relations in the field of public procurement with third countries go beyond the trade and even the regulatory aspects. This relates in particular to the Central and Eastern European Countries (involved in the pre-accession process) and the Mediterranean Countries. Market opening is not the main objective in this context, but rather a tool to improve the economic situation of these countries. With regard to the CEECs, the adoption of the *acquis communautaire* is also part of the AEU's current policy. Asymmetric liberalisation and the development of comprehensive technical assistance programmes should remain the basis of the AEU's future policy in this area, in particular with respect to the Mediterranean countries.

The Commission is preparing "Road Maps" adapted to the specific situation of each of the candidates for accession which will set out priorities and actions in order to help them in their efforts to take over the *acquis*. The Commission will address this issue in a communication on the single market and the Mediterranean area further to the Barcelona Declaration, which aims at establishing a Free Trade Area.

4.6.3 Ensuring efficiency in the award of contracts financed by the EU within the context of external aid

The Commission is concerned about achieving economy and efficiency in the management of the Community's financial resources. In this respect, the responsibility of the Commission includes not only contracts awarded by the Commission itself (see point 2.2.6 above), but also contracts financed by EU funds in the context of external aid.

On the one hand, it is justified in insisting on ensuring a certain European visibility when awarding contracts financed by the EU funds in the context of the external aid. On the other hand, the Commission believes that countries receiving EU funds need to achieve economy and efficiency in their public sector operations, and should also respect the principles of transparency and accountability in public administration.

To achieve these objectives, it is necessary to apply best practice and best management principles based on competitive procurement in the award procedures. Economic benefits for the recipient countries arise from the use of sound procurement policies and practices (such as value for money, improved competitiveness of local industry, increased efficiency in public administration, more foreign investment etc.).

Joining the WTO Agreement on Government Procurement, which forms a legal basis for open and competitive public procurement on an international basis, would be a desirable objective in this respect. The Commission is nevertheless aware that it will be difficult for most of the countries receiving EU funds to join this agreement or even adopt national procurement rules based on competitive tendering at this stage, since these countries may be economies in transition, developing countries or even least developed countries.

As a result, the Commission will continue to see to it that contracts financed from Community resources in the framework of external aid are awarded in a competitive manner by the recipient countries by respecting the relevant EU rules governing this matter, as well as those established within the framework of bilateral or regional agreements concluded by the European Union. In this regard, the Commission has already presented proposals in order to harmonise the different rules and procedures presently used for awarding certain contracts financed by the EU resources.

In order to improve the protection of the financial interests of the Community, the Commission has improved the legal framework regarding Structural Funds by adopting Regulation no. 2064/97[20], which will also enable better control of public procurement contracts awarded by national authorities but co-financed on the Communities' budget, which will help in fighting corruption and avoiding irregularities.

ANNEX 2

TIME TABLE

PRINCIPAL MEASURES TO BE ADOPTED	ADOPTION BY THE COMMISSION
Legislative package making some adjustments to the legal framework as regards Directive 93/38/EEC, competitive dialogue procedure, framework contracts, concessions. (See point 2.1.2.)	1998
Implementation of Article 8 of Directive 93/38/EEC	Immediately
Communications and interpretative documents (2.1.3.)	2. semester 1998 to 2. semester 1999
Communication on concessions and problems associated with trans-european networks (TENs) (2.1.2.4.) Reflection and discussion on questions connected with various forms of public-private partnership (2.1.2.4.)	2. quarter 1998
Consolidation of the classic directives (2.1.3.)	2001
Improvement of procedures of supervision at Community level (2.2.2.)	Immediately
Launching of measures to encourage the setting up or designation of independent authorities (2.2.3.)	Immediately
Improvement of the Commission's contracting procedures (not requiring legal changes) (2.2.7.)	Immediately
Developing a policy for public procurement training (3.1.3.)	2. semester 1998
Communication on SMEs and public procurement (3.1.4.)	2. semester 1998
Support for pilot operations on electronic tendering (3.2.2.)	2. semester 1998
Establishment of an appropriate set of principles, rules and mechanisms on procurement by the defence sector (4.2)	1998

Public procurement in the European Union: communication

1) OBJECTIVE

To make the public procurement system work better.

2) COMMUNITY MEASURE

Commission communication of 11 March 1998: Public procurement in the European Union.

3) CONTENTS

Public procurement is one of the areas of the single market where the results of the liberalisation drive have not yet measured up to expectations. This communication suggests ways and means of improving contract award procedures, while taking account of the reactions received in response to the publication in 1996 of the Green Paper *Public procurement in the European Union: Exploring the way forward*.

The communication stresses that more efficient public procurement will not only lead to an improvement in the quality of public services, economic growth, competitiveness and job creation, but will also contribute to the fight against corruption in the European Union.

As the discussion launched by the Green Paper has shown, it is essential to simplify the legal framework and adapt it to the electronic age, while maintaining the stability of the basic structure and avoiding unnecessary changes which would involve more legislative work. The measures proposed in the communication are chiefly geared to these objectives. The communication also contains proposals aimed at stepping up compliance with the existing rules, encouraging more suppliers to respond to invitations to tender and strengthening synergy with other Community policies.

Simplifying the legal framework means both clarifying provisions which are obscure or complex and adjusting the rules in force where the problems to be addressed cannot be solved through interpretation of the provisions. The aim is to make contract award rules and procedures clearer and more flexible. The proposed legislative package comprises the following measures:

- submission of proposals to exclude from the scope of Directive

93/38/EEC the sectors or services to which it at present applies (water, energy, transport and telecommunications) and which operate, in each of the Member States, under conditions of effective competition;
- introduction of more flexible award procedures, namely the competitive dialogue, which will replace the existing negotiated procedure with prior publication of a notice, and flexible long-term contracts (framework contracts);
- establishment of a legal framework covering the involvement of private capital in the financing and operation of infrastructures and public services (public-private partnership);
- clarification and consolidation of the existing rules.

Action by the Community to make public procurement work better should not be confined to new legislative initiatives; ensuring that the existing rules are properly applied and enforced is equally important. With that aim in view, the communication proposes the following measures:

- improving checks and enforcement procedures at Community level. The Commission will make more pro-active and systematic use of its powers under EC Treaty Articles 169 (infringement proceedings) and 171 (requesting the Court of Justice to impose penalty payments) where Member States fail to comply with the rules. It will also look into the desirability of setting in place special machinery for dealing with serious infringements in the public procurement field;
- designating independent authorities responsible for handling disputes in the public procurement field at national level;
- improving information on the way in which public procurement operates in practice. The Commission will endeavour to ensure that the obligation to publish contract award notices is complied with and will propose that statistical requirements be scaled down, in order to facilitate the provision of information by public authorities. It will also carry out of its own initiative a number of economic studies that are necessary in order to gain a better understanding of the way in which public procurement operates;
- enhancing the attestation system for suppliers by conferring certain benefits on entities that have agreed to undergo attestation;
- fighting corruption through measures such as a blacklisting system and excluding from public tender procedures applicants who have links with organised crime;
- ensuring that the public procurement rules are observed in the case of contracts concluded by the Commission itself and contracts financed by the Community in the context of external aid and the structural funds.

The success of the Community's public procurement policy depends first and foremost on the extent to which suppliers bid for contracts. So far, too few suppliers have been responding to calls for tenders. The communication therefore proposes a set of measures designed to boost the rate of supplier participation, especially among small and medium-sized enterprises (SMEs):

- making markets more transparent through better information;
- boosting the reliability of contract award procedures through training focused on professionalism and best practice;
- taking action to make public procurement more accessible to SMEs;
- providing for mutual recognition of national supplier qualification systems, so that a supplier who has obtained qualification in one Member State can use that qualification in other Member States without having to demonstrate his suitability over again.

Increased use of the new information and communication technologies in public procurement could allow the current procedures to run more smoothly, efficiently, systematically and rapidly. It could also lead to substantial savings for European taxpayers. The Commission and the Member States are already coordinating their efforts in this area within the SIMAP (information system for public procurement) project. In its pilot phase, the project has already enabled a limited number of purchasers and suppliers to create and transmit contract notices electronically. The Commission intends to extend and develop this project in order to cover the entire public purchasing process; it also plans to replace the hard-copy version of the "S" Supplement to the Official Journal with a CD-ROM version, to make the TED (Tenders Electronic Daily) database accessible free of charge to Internet users and to encourage awarding entities to publish more comprehensive information concerning their tenders on the Internet.

One of the first steps to be taken is to amend the Directives and technical standards in order to put electronic means of exchanging public procurement information on an equal footing with other means. The Commission will also ensure that the requirements of electronic procurement are taken into account in any proposals for standards or Community legislation on digital signatures.

The introduction of electronic procurement systems does not depend on the Commission alone, but also on the Member States and individual suppliers and purchasers, especially for purchases worth less than the thresholds laid down in the Community Directives. The Member States should therefore be urged to encourage the compatibility and interoperability of electronic procurement systems.

With a view to enhancing synergy with other Community policies and making contract award procedures more transparent, contracting entities need to be given clear guidelines on how they can take environmental, social and consumer protection criteria into account. The Commission also announces measures to make defence procurement more transparent and less discriminatory.

The communication repeatedly stresses the need to coordinate Community action in the public procurement field with non-member countries. On the multilateral front - in particular within the context of the Government Procurement Agreement (GPA) - but also in bilateral relations, the Commission will strive for more open public procurement in non-member countries. The ultimate objective of these efforts is adoption of a multilateral code on public procurement under the auspices of the World Trade Organisation (WTO).

4) DEADLINE FOR IMPLEMENTATION OF THE LEGISLATION IN THE MEMBER STATES

Not applicable.

5) DATE OF ENTRY INTO FORCE (if different from above)
